The results obtained demonstrate that the proposed methods adequately reflect areas containing defects and their development. The method has been tested on the real experiments. The application of the developed method significantly reduces the areas of the object that should be checked by a specialist. In the future, it is planned to optimize the metric function in the

DBSCAN algorithm for different types of objects and apply more complex criteria for epsilon.

When developing various methods for working with AE data, it was decided to combine all the results described in this article and the results obtained in previous works into a single code library. The library will allow to apply methods and combine the results more conveniently and faster. The library will contain methods for primary data processing for cleaning them from noise, locating sources of AE signals, and methods for clustering and classifying sources.

To develop the library, the C# programming language was chosen in view of the convenience of working with data, as well as the availability of various packages with functionality for applying machine learning and mathematics methods. At the moment, the problem of combining all the developed methods is being solved in view of the fact that they were written in different programming languages, and therefore it is required to refactor the code written over several years.

## CONTROL OF THE ULTRASONIC EMITTERS PARAMETERS TO DETERMINE THE DEGREE OF TOOL MATERIALS AND PROTECTIVE COATINGS CAVITATION DESTRUCTION

***Abstract:** The article presents the results of studies aimed at identifying the possibility of using piezoelectric ultrasonic oscillatory systems (USOS), used to form cavitation effects in liquid media, as a sensor for controlling the degree of cavitation erosion of materials for working tools and protective coatings. The studies were carried out on the basis of the analysis of the piezoelectric ultrasonic oscillatory systems (emitters) physical equivalent circuits, formed from electromechanical analogues, taking into account the attached test samples. Dependences of the input electrical impedance of ultrasonic emitters and its active and reactive components for different variants of assemblies of ultrasonic emitter structures on the degree of cavitation erosion of individual structural elements obtained. The results obtained made it possible to confirm the possibility and effectiveness of monitoring the ultrasonic oscillatory system parameters to determine the degree of cavitation destruction of tools and protective coatings, as well as to establish the sensitivity of the proposed control method.*

***Keywords:** Ultrasonic; Cavitation Wear; Modeling; Electromechanical Analogies; Control*

### 1. Introduction

Studies of cavitation materials destruction relate to the field of the durability (strength) control of materials and their protective coatings under the influence of concentrated flows of matter and energy. The control can be used to predict the properties of known materials and to search for new materials and coatings that can ensure reliable and long-term operation of parts of mechanisms and machines used in a wide variety of industries.

Cavitation is one of the possible mechanisms of destruction of metals (and other materials) and their coatings. It is a process of formation and subsequent collapse of vapor-gas bubbles in a liquid. This phenomenon occurs everywhere, since hydrodynamic

cavitation occurs as a result of a local decrease in pressure in the liquid. It happens due to the elements of various mechanisms moving in it (pumps, for example) or when liquid flows around stationary elements. Acoustic cavitation occurs in liquid media when acoustic vibrations of high intensity propagate in them.

The cavitation process on the surfaces of products (coatings) accompanied by a number of secondary phenomena. These phenomena include: shock waves, cumulative jets, local temperature rise, electrical discharges, released gases that can be aggressive or contribute to oxidative processes. All these phenomena negatively affect the condition of the surfaces of elements, parts and machines that are directly located or working in a liquid medium. They lead to rapid wear of reactors,

Email: [roman@bti.secna.ru](mailto:roman@bti.secna.ru)

heat exchangers, pipelines, pumps and other elements. They also reduce the productivity of the equipment and shorten its service life.

Therefore, the efforts of the creators of new equipment for special industries (nuclear, chemical and metallurgical) aimed at finding and using such materials and coatings that can ensure long-term reliable operation of equipment, including in conditions of cavitation.

Currently, to determine the degree of cavitation erosion of materials and their coatings, a test method for cavitation erosion used, regulated by the ASTM G32-10 standard "Standard Test Method for Cavitation Erosion".

This method of cavitation erosion testing consists in placing a sample with the tested material or coating in a liquid medium in front of the end surface of the ultrasonic vibration emitter. Next, ultrasonic vibrations of a certain intensity formed to originate in the gap between the end surface of the radiator and the sample of the cavitation process. After the expiration of the ultrasonic exposure time sufficient to destroy the surface of the material or coating under study, their cavitation resistance is determined by changing the mass or thickness of the material or coating under study.

This standard not only regulates the conduct of tests, but also defines the requirements for the equipment used. Thus, for the implementation of this method of testing materials for resistance to cavitation erosion under normal conditions, there is specialized testing equipment.

Currently, the situation is significantly complicated by the fact that the liquid media used in the working mechanisms may have an abnormally high temperature or be under high overpressure, as well as be chemically aggressive due to the presence of chemical reagents in them in the form of acids, alkalis or aggressive gases (such as ozone).

In this regard, the selection and search of materials cannot be provided without studies of cavitation erosion of these materials and their coatings at high temperatures, pressures and in chemically active liquids.

Unfortunately, it is impossible to use this method for testing cavitation erosion of materials (regulated by the ASTM G32-10 standard) at high pressures, temperatures up to 1000 degrees Celsius and in liquid media of various properties (including aggressive ones) for the following reasons:

- due to the impossibility of carrying out tests of cavitation erosion in high-temperature and aggressive environments without the use of special means and methods for the formation of vibrations and their introduction into the media, i.e. without the use of special working tools and special technological volumes;

- due to the inability to control and management the degree of ultrasonic action (the amplitude of the instrument's vibrations) in different environments and conditions to ensure the same ultrasonic effect in different liquid media in which the research carried out.

The revealed shortcomings of the method of controlling the cavitation strength of materials and their coatings (prescribed by the ASTM G32-10 standard) are the reason for obtaining unreliable research results. They also exclude the possibility of making the right decisions when choosing materials for operation under cavitation conditions. This makes it impossible to apply this method of testing materials for cavitation strength under abnormal conditions.

In this regard, there is a need to create a method for testing cavitation erosion of materials and coatings at abnormally high temperatures and overpressure. I.e., a method is required that can ensure high efficiency (accuracy, reliability) of determining the cavitation strength of various materials intended for operation

under conditions of cavitation exposure in abnormal conditions.

The relevance of the works on development of the method and means of control of cavitation destruction of materials and protective coatings (Hardes et al., 2019; Lamana, Pukasiewicz, Sampath, 2018; Lin et al., 2019; Romero, Tschiptschin, Scandian, 2019; Tudela, Verbickas, Burmistroviene, Zhang, 2018) is caused by the need to solve the problem of determining the applicability of created and used materials, especially for their exploitation in abnormal conditions of liquid media at elevated temperatures and pressures. One of the promising directions of solving this problem is the development of the method of indirect control of cavitation wear of materials and protective coatings by changing the electrical parameters of ultrasonic oscillatory systems (USOS). Studies (Khmelev et al., 2020; Khmelev et al., 2019) show the possibility of controlling the properties of media subjected to ultrasonic cavitation by controlling the parameters of piezoelectric ultrasonic oscillatory systems (emitters).

However, the earlier works have not established the dependence between the dimensions of the destructible working tools and protective coatings and the electrical characteristics of USOS with different design features. Determination of the magnitude of the relationship between the parameters of the prototype with the electrical parameters of ultrasonic radiators and the establishment of the sensitivity of controlling the degree of cavitation destruction of materials and coatings makes the presented work relevant.

## 2. Main part

Leave one clear line before and after a main or secondary heading and after each paragraph. Ultrasonic oscillatory systems designed to form ultrasonic oscillations and introduce them into the processed media

contain a certain number of different components, the major of which are: piezoelectric transducer, waveguide structures (boosters), concentrating waveguides (amplifiers of amplitude), working tools (ends), attachment assemblies, etc. The designs of ultrasonic emitters on the one hand determine their functional features, and on the other hand affect their electrical parameters and characteristics, the degree of influence of acoustic load on their electrical parameters and characteristics.

To study ultrasonic emitters and obtain their characteristics, many researchers resort to modeling them using equivalent electrical replacement circuits, relying on a system of electromechanical analogies. This approach makes it possible to avoid solving wave equations when studying various designs of ultrasonic emitters and use modern software packages to simulate equivalent electrical circuits of ultrasonic emitters, as well as to study them and obtain their various characteristics. According to the theory of electromechanical analogies, the electrical analogues of mass, elasticity, active losses, force, and oscillatory velocity are electrical inductance, electrical capacitance, electrical resistance, electrical voltage, and electric current, respectively. There are many variants of equivalent ultrasonic emitter circuits proposed by various authors. They describe the behavior of real ultrasonic emitters in varying degrees of approximation. When considering the operation of ultrasonic emitters near their resonant frequency, their equivalent electrical replacement circuits are significantly simplified.

Based on the theory of electromechanical analogies, such an USOS with a prototype can be presented in the form of a physical equivalent RLC substitution diagram (figure 1).

An equivalent electrical model describing an ultrasonic emitter consists of series-connected four-poles, each of which is an

electrical analogue of the following elements of an ultrasonic emitter: an electromechanical piezoelectric converter, several series-connected waveguides of the same type, an acoustic load. The circuit, which is an analogue of an electromechanical converter, constructed taking into account its transformation coefficient, the physical, geometric and acoustic properties of the materials of its components, its resonant frequency. The circuit, which is an analogue of waveguide elements (concentrators), constructed taking into account the transformation coefficient, physical, geometric and acoustic properties of materials, and the resonant frequency. The scheme, which is an analogue of the acoustic load on the ultrasonic emitter (test sample), is constructed taking into account its physical and acoustic properties.

The equivalent electrical circuit of the ultrasonic emitter replacement (shown in figure 1) is a serial connection of the same type (T-shaped) circuits with each other.

In the scheme shown in figure 1 the test sample is considered as a part of the waveguide system of an USOS and presents an attached half-wave test cylindrical waveguide with or without coating, which parameters will change in the process of its cavitation destruction (erosion). It is obvious that the electrical analogue of the test sample, being a part of the electrical model of the USOS, affects its parameters and characteristics as a whole.

Let us consider how some electrical parameters of ultrasonic radiators change in the process of cavitation erosion of the test sample for different variants of USOS (radiators) assembly. Table 1 shows different variants of USOS assemblies consisting of one transducer, different number of waveguide elements with different transformation coefficients and a half-wave cylindrical test working tool (test sample). Let us consider the influence of the cavitation wear value of the tool in the range of 0...100 μm.

Figure 1. Electrical model of an USOS with different components

Table 1. Variants of USOS assemblies

Converter (half-wave, $K_C = 1, 1.5, 2$ )	Concentrator 1 (half-wave, $K_1 = 1, 1.5, 2$ )	Concentrator 2 (half-wave, $K_2 = 1, 1.5, 2$ )	Concentrator 3 (half-wave, $K_3 = 1, 1.5, 2$ )	Half-wave cylindrical working tool
		...	...	

Let us assume the maximum number of concentrating elements (concentrators) connected in series to the converter is equal to three. Such a number of concentrators is due solely to the practical experience of using ultrasonic emitters of this type. Suppose that each of the hubs has a transformation coefficient equal to 1, 1.5 and 2. The transformation coefficient of the half-wave converter is also assumed to be equal to 1, 1.5 and 2.

The diameter of the half-wave cylindrical working tool is assumed to be equal to the smaller diameter of the concentrator to which the working tool is attached.

In the course of obtaining the dependencies presented below, the transformation coefficient of the converter and the connected concentrators changed in the same range and were assumed to be equal to each other.

An ultrasonic oscillatory system, as an electrical load on an electronic generator, is a complex electrical load. The magnitude and nature of such a load depends on the acoustic load on the ultrasonic emitter, the mode of operation of the ultrasonic emitter (below its resonant frequency, at its resonant frequency, above its resonant frequency). Thus, the impedance  $Z$  of the ultrasonic emitter is complex and has active  $Re$  and reactive  $Im$  components.

It should be note that all curves obtained when the ultrasonic emitter was excited at its resonant frequency.

Figure 2 shows the dependences of impedance  $Z$  of the USOS on the amount of wear  $\Delta L$  of the cylindrical tip for different versions of the assembly (the number of waveguide elements of the same type connected in series) of the USOS and the amplification coefficients  $K$  of its elements.

Three designs of ultrasonic emitters are considered, consisting of a converter and a test sample, between which there are 0, 1, 2 or 3 concentrating links (concentrators). In each

of the structures under consideration, the transformation coefficient of all the elements forming it is taken to be equal to 1, 1.5 and 2.

From the curves shown in figure 2, a, it follows that consecutive build-up of the USOS construction by half-wave elements without gain ( $K = 1$ ) has no effect on the dependence of impedance  $Z$  on the wear value of the test sample (the curves are almost identical). The range of impedance change  $\Delta Z$  when changing  $\Delta L$  with series connection of half-wave elements with  $K = 1$  does not change.

Sensitivity of control of  $\Delta Z$  from  $\Delta L$  is  $\frac{\Delta Z}{\Delta L} = 0.09 \text{ Ohm}/\mu\text{m}$  and does not depend on the parameters of the current assembly.

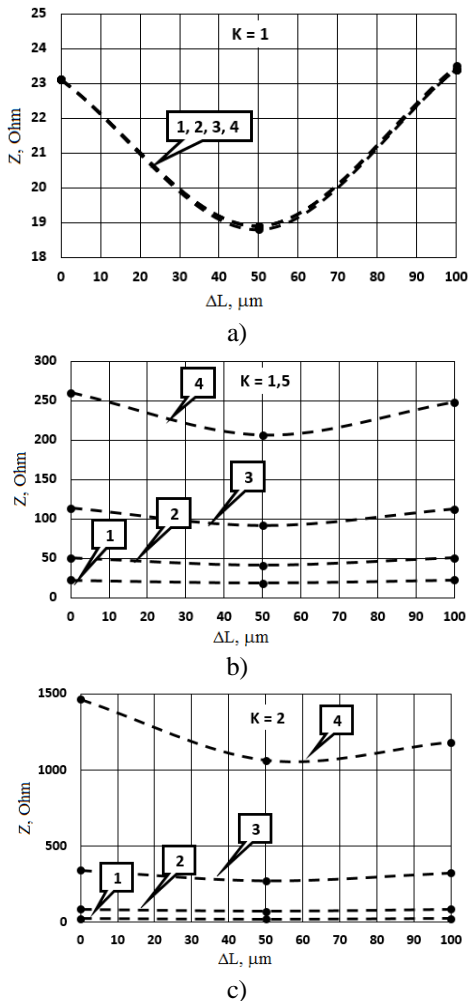

From the curves shown in figure 2, b, it follows that  $t$  consecutive build-up of the USOS construction by half-wave elements with gain coefficients  $K = 1.5$  leads to an increase in the range of impedance change  $\Delta Z$  when changing  $\Delta L$ .

At consecutive increasing of the construction by half-wave elements "Concentrator 1", "Concentrator 2", "Concentrator 3" the range of change  $\Delta Z$  at change  $\Delta L$  increases by 120%, 400% and 1127%, respectively, with respect to the assembly "Converter + Test sample". Absolute values of the range of change  $\Delta Z$  are 4.4 Ohm, 9.7 Ohm, 22 Ohm and 54 Ohm, respectively.

The sensitivity of the control of  $\Delta Z$  when changing  $\Delta L$  is  $\frac{\Delta Z1}{\Delta L} = 0.088 \frac{\text{Ohm}}{\mu\text{m}}$ ,

$$\frac{\Delta Z2}{\Delta L} = 0.194 \frac{\text{Ohm}}{\mu\text{m}}, \quad \frac{\Delta Z3}{\Delta L} = 0.44 \frac{\text{Ohm}}{\mu\text{m}},$$

$$\frac{\Delta Z4}{\Delta L} = 1.08 \frac{\text{Ohm}}{\mu\text{m}} .$$

**Figure 2.** Dependence of impedance  $Z$  of the ultrasonic radiator on the wear value of the cylindrical tip  $\Delta L$  for different variants of the USOS assembly and amplification coefficients of its elements. 1 - converter + test sample; 2 - converter + 1st concentrator + test sample; 3 - converter + 1st, 2nd concentrators + test sample; 4 - converter + 1st, 2nd, 3rd concentrators + test sample; 4 - converter + 1st, 2nd, 3rd concentrators + test sample

From the curves shown in figure 2, c, it follows that consecutive build-up of the USOS construction by half-wave elements with gain coefficients  $K = 2$  leads to a greater increase in the range of impedance change  $\Delta Z$  when changing  $\Delta L$ . At successive increasing of the construction by half-wave elements "Concentrator 1", "Concentrator 2", "Concentrator 3" the range of change  $\Delta Z$  at change  $\Delta L$  increases by 295%, 1700% and 10000% respectively, with respect to the assembly "Converter + Test sample". Absolute values of the range of change  $\Delta Z$  are 4 Ohm, 15 Ohm, 72 Ohm and 405 Ohm, respectively. The sensitivity of  $\Delta Z$  control is

$$\frac{\Delta Z1}{\Delta L} = 0.08 \frac{\text{Ohm}}{\mu\text{m}}, \quad \frac{\Delta Z2}{\Delta L} = 0.316 \frac{\text{Ohm}}{\mu\text{m}},$$

$$\frac{\Delta Z3}{\Delta L} = 1.44 \frac{\text{Ohm}}{\mu\text{m}}, \quad \frac{\Delta Z4}{\Delta L} = 8.1 \frac{\text{Ohm}}{\mu\text{m}}$$

From the dependencies shown in figure 2, it follows that two different values of  $\Delta L$  correspond to one value of impedance. Therefore, the obtained dependencies can be used either in the range when  $\Delta L = 0 \dots 50$  or when  $\Delta L = 50 \dots 100$ .

The presence of a minimum on the curves shown in figure 2 is due to the fact that with the wear of  $\Delta L = 50 \mu\text{m}$ , the length of the cylindrical test sample is equal to half the wavelength propagating in it. In this case, the ultrasonic emitter operates at its resonant frequency, which determines the minimum value of its impedance  $Z$ . Thus, in the process of cavitation wear, the  $\Delta L$  of the test sample in the range from 0 to 100  $\mu\text{m}$ , when the  $\Delta L$  is equal to 50  $\mu\text{m}$ , the ultrasonic emitter begins to work in resonance mode. In other cases, the ultrasonic emitter operates near its resonant frequency.

Figure 3 shows the dependences of the real part of impedance  $\text{Re}$  of the ultrasonic radiator on the amount of wear of the cylindrical tip  $\Delta L$  for different versions of the assembly (the number of waveguide elements of the same type connected in series) of the

USOS and the amplification coefficient K of its elements.

Three designs of ultrasonic emitters are also considered, consisting of a converter and a test sample, between which there are 0, 1, 2 or 3 concentrating links (concentrators). In each of the structures under consideration, the transformation coefficient of all the elements forming it is taken to be equal to 1, 1.5 and 2.

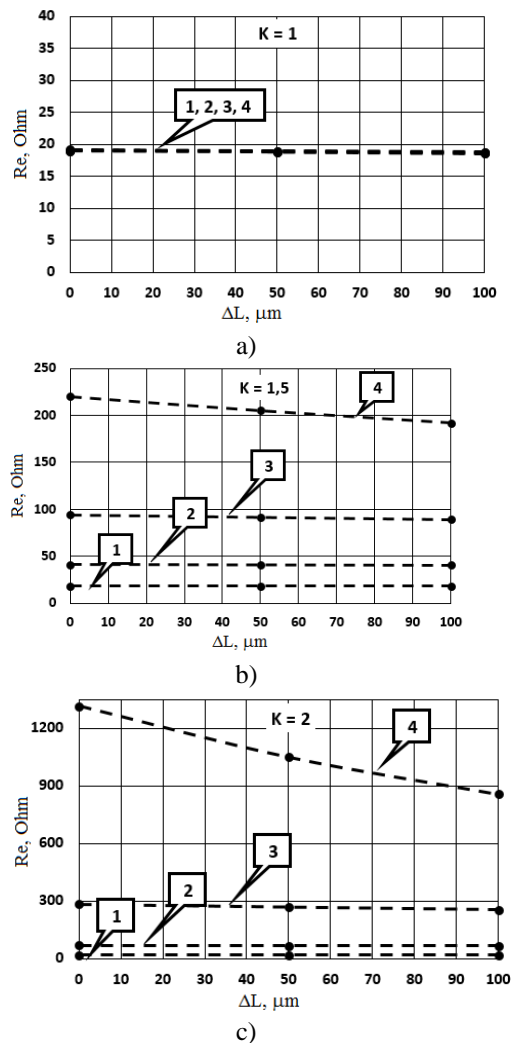

From the curves shown in figure 3, a, it follows that the consecutive build-up of the USOS construction by half-wave elements without gain (K = 1) has no effect on the dependence of the real part of impedance Re on the wear value of the test sample (the curves coincide). The range of impedance change ΔZ when changing ΔL is 0.

From the curves shown in figure 3, b, it follows that consecutive build-up of the USOS construction with half-wave elements with gain K = 1.5 leads to an increase in the range of change in the real component of impedance ΔRe when changing ΔL. If the construction is equipped consequently with half-wave elements "Concentrator 1", "Concentrator 2", "Concentrator 3" the range of ΔRe change at ΔL is 0.8 Ohm, 5 Ohm and 28 Ohm, respectively. Without the elements "Concentrator 1", "Concentrator 2", "Concentrator 3" the range of ΔRe change ΔL is close to zero.

Sensitivity of control of ΔRe parameter by change of ΔL is  $\frac{\Delta Re1}{\Delta L} = 0 \frac{Ohm}{\mu m}$ ,

$$\frac{\Delta Re2}{\Delta L} = 0.008 \frac{Ohm}{\mu m}, \quad \frac{\Delta Re3}{\Delta L} = 0.05 \frac{Ohm}{\mu m},$$

$$\frac{\Delta Re4}{\Delta L} = 0.28 \frac{Ohm}{\mu m}.$$

**Figure 3.** Dependence of the real component of the impedance Re of the ultrasonic radiator on the wear value of the cylindrical tip for different variants of the USOS assembly and the amplification coefficients of its elements. 1 - converter + test sample; 2 - converter + 1st concentrator + test sample; 3 - converter + 1st, 2nd concentrators + test sample; 4 - converter + 1st, 2nd, 3rd concentrators + test sample; 4 - converter + 1st, 2nd, 3rd concentrators + test sample

From the curves shown in figure 3, c, it follows that consecutive increasing of the USOS construction by half-wave elements with gain coefficients  $K = 2$  leads to a greater increase in the range of change of the real component of impedance  $\Delta Re$  when changing  $\Delta L$ . At consecutive increasing of the construction by half-wave elements "Concentrator 1", "Concentrator 2", "Concentrator 3" the range of change  $\Delta Re$  at change  $\Delta L$  increases by 1600%, 28900% and 450000% respectively, in comparison with the assembly "Converter + Test sample". The ranges of change  $\Delta Re$  in absolute values for the considered assembly variants are 0.1 Ohm, 1.7 Ohm, 29 Ohm, 459 Ohm, respectively.

Sensitivity of control of  $\Delta Re$  by change of  $\Delta L$

$$\text{is } \frac{\Delta Re 1}{\Delta L} = 0.001 \frac{\text{Ohm}}{\mu\text{m}},$$

$$\frac{\Delta Re 2}{\Delta L} = 0.017 \frac{\text{Ohm}}{\mu\text{m}}, \quad \frac{\Delta Re 3}{\Delta L} = 0.29 \frac{\text{Ohm}}{\mu\text{m}},$$

$$\frac{\Delta Re 4}{\Delta L} = 4.59 \frac{\text{Ohm}}{\mu\text{m}}.$$

With increasing the number of series-connected elements of the ultrasonic oscillating system construction with amplification coefficients different from 1, the relationship between the actual impedance component  $Re$  and the parameter  $\Delta L$  becomes stronger.

The use of the real component of the impedance  $Re$  of the ultrasonic emitter as an informative parameter depending on the wear value  $\Delta L$  is possible, however, an increase in both the number of sequentially connected concentrators and an increase in their transformation coefficient is required. In most cases, increasing the number of concentrators and their transformation coefficients is not possible, since this may affect the conditions for matching the ultrasonic emitter and the acoustic load. It should be remembered that the task is related not only to increasing the

sensitivity of the proposed method for controlling the degree of cavitation erosion, but also to effectively influencing liquids to create cavitation phenomena in them.

In figure 4 the dependences of imaginary part of impedance  $Im$  of ultrasonic radiator on the value of cylindrical tip wear  $\Delta L$  for different variants of USOS assembly (number of one-type waveguide elements connected in series) and amplification coefficients  $K$  of its elements are shown.

From the curves in figure 4, a it follows, that consecutive build-up of the USOS construction by half-wave elements without gain ( $K = 1$ ) has no influence on the dependence of the imaginary part of impedance  $Im$  on the wear of the test sample (the curves coincide). Range of variation of imaginary part of impedance  $\Delta Im$  for all options under consideration is 27 Ohm. The sensitivity of the control of the parameter  $\Delta Im$

by the change  $\Delta L$  is  $\frac{\Delta Im}{\Delta L} = 0.27 \frac{\text{Ohm}}{\mu\text{m}}$  and is

a constant.

Three designs of ultrasonic emitters are considered again, consisting of a converter and a test sample, between which there are 0, 1, 2 or 3 concentrating links (concentrators). In each of the structures under consideration, the transformation coefficient of all the elements forming it is taken to be equal to 1, 1.5 and 2.

From the curves shown in figure 4, b, it follows that consecutive build-up of the USOS construction by half-wave elements with gain coefficients  $K = 1.5$  leads to an increase in the range of change of imaginary component of impedance  $\Delta Im$  when changing  $\Delta L$ . At consecutive build-up of the USOS construction by half-wave elements "Concentrator 1", "Concentrator 2", "Concentrator 3" the range of change  $\Delta Im$  at change  $\Delta L$  is increased by 124%, 400% and 1000% respectively, in comparison with the assembly "Converter + Test sample". The

ranges of  $\Delta Im$  change in absolute values for the considered assembly variants are 26 Ohm, 58 Ohm, 132 Ohm, 296 Ohm, respectively.

a)

b)

c)

**Figure 4.** Dependence of the reactive component of impedance  $Im$  of the ultrasonic radiator on the wear value of the cylindrical tip for different versions of the USOS assembly and amplification coefficients of its elements.

Sensitivity of  $\Delta Im$  parameter to the change of

$$\Delta L \quad \text{is} \quad \frac{\Delta Im 1}{\Delta L} = 0.262 \frac{\text{Ohm}}{\mu\text{m}},$$

$$\frac{\Delta Im 2}{\Delta L} = 0.588 \frac{\text{Ohm}}{\mu\text{m}}, \quad \frac{\Delta Im 3}{\Delta L} = 1.3 \frac{\text{Ohm}}{\mu\text{m}},$$

$$\frac{\Delta Im 4}{\Delta L} = 2.96 \frac{\text{Ohm}}{\mu\text{m}}.$$

From the curves shown in figure 4, c, it follows that consecutive build-up of the USOS construction by half-wave elements with gain coefficients  $K = 2$  leads to a greater increase of the range of change of the imaginary component of impedance  $\Delta Im$  when changing  $\Delta L$ .

At consecutive build-up of the USOS construction by half-wave elements "Concentrator 1", "Concentrator 2", "Concentrator 3" the range of change  $\Delta Im$  when changing  $\Delta L$  increases by 300%, 1400% and 6000% respectively, in comparison with the assembly "Converter + Test sample". The ranges of change  $\Delta Im$  in absolute values for the considered assembly variants are 24 Ohm, 97 Ohm, 386 Ohm, 1463 Ohm, respectively. Sensitivity of control of  $\Delta Im$  parameter by change of  $\Delta L$  is

$$\frac{\Delta Im 1}{\Delta L} = 0.242 \frac{\text{Ohm}}{\mu\text{m}}, \quad \frac{\Delta Im 2}{\Delta L} = 0.97 \frac{\text{Ohm}}{\mu\text{m}},$$

$$\frac{\Delta Im 3}{\Delta L} = 3.38 \frac{\text{Ohm}}{\mu\text{m}}, \quad \frac{\Delta Im 4}{\Delta L} = 14.6 \frac{\text{Ohm}}{\mu\text{m}}.$$

Thus, when the number of series-connected elements of USOS construction with amplification coefficients different from 1 increases, the correlation between the real component of impedance  $Im$  and the parameter  $\Delta L$  enhance.

From the curves shown in figures 4, a,b,c, it follows that there is a possibility of increasing the sensitivity of the cavitation erosion control method when using the  $Im$  parameter as a controlled parameter.

**Figure 5.**Dependence of the phase  $\varphi$  of the ultrasonic emitter on the wear value of the cylindrical tip for different variants of the USOS assembly and the amplification coefficients of its elements. 1 - converter + test sample; 2 - converter + 1st concentrator + test sample; 3 - converter + 1st, 2nd concentrators + test sample; 4 - converter + 1st, 2nd, 3rd concentrators + test sample

However, there are a number of technological and physical limitations that do not allow to increase the design of the ultrasonic emitter. It makes it possible to increase the transformation coefficient of individual hubs. Nevertheless, the sensitivity of the imaginary component of the impedance  $Im$  to a change in the parameter  $\Delta L$  is higher than the sensitivity of the impedance  $Z$  or its real component  $Re$  to a change in the parameter  $\Delta L$ , other things being equal

Figure 5 shows the dependences of the piezoelectric system phase  $\varphi$  on the wear value of the cylindrical tip for different variants of USOS assembly and the amplification coefficients of its elements.

The parameter  $\varphi$  is a phase shift between the current and voltage on the ultrasonic transducer of the emitter and theoretically can vary in the range from -90 to +90 degrees.

In this case, three designs of ultrasonic emitters are also considered, consisting of a converter and a test sample, between which there are 0, 1, 2 or 3 concentrating links (concentrators). In each of the structures under consideration, the transformation coefficient of all the elements forming it is taken to be equal to 1, 1.5 and 2.

From the curves shown in figure 5 it follows that consecutive build-up of the USOS construction by half-wave elements with different amplification coefficients ( $K = 1, 1.5, 2$ ) does not influence on phase dependence  $\varphi$  of ultrasonic radiator from parameter  $\Delta L$  (the curves for different number of links of the USOS with different amplification coefficients  $K$  coincide). Nevertheless, the variation range of parameter  $\Delta\varphi$  is 60 degrees, the dependence on  $\Delta L$  is close to linear.

Sensitivity of parameter control  $\Delta\varphi$  when changing  $\Delta L$  is  $\frac{\Delta\varphi}{\Delta L} = 0.6 \frac{\text{degree}}{\mu\text{m}}$  and is a constant.

From the curves shown in figures 4, a,b,c, it follows that the parameter  $\varphi$  affected only by the amount of wear of the test sample. This fact is of great practical importance. In practice, the developers of ultrasonic emitters, in order to achieve their specific parameters, often vary the number and characteristics of individual elements of the design of ultrasonic emitters. In this case, this does not affect the sensitivity of the parameter  $\varphi$  to cavitation erosion of the cylindrical tip, which makes it attractive for monitoring the degree of cavitation wear of test samples.

### 3. Conclusion

As a result of the conducted research, the possibility of using piezoelectric ultrasonic oscillatory systems (USOS), used for formation of cavitation impact in liquid media, as a sensor to control the degree of cavitation erosion of working tools materials and their protective coatings was confirmed.

Therefore, the same emitter is capable of performing two functions:

- the ultrasonic emitter is capable of operating in a power mode while providing the intensity of ultrasonic exposure necessary for the formation of cavitation phenomena in a liquid medium. In this case, cavitation wear of the cylindrical working tool or its coating occurs;
- the ultrasonic emitter is capable of operating in measurement mode. In this case, a small voltage is applied to the ultrasonic emitter, at which the greatest amplitude of oscillations of the ultrasonic emitter is achieved. In this mode, the cavitation wear of the working tool or its coating stops and indirect control of the degree of cavitation erosion occurs by changing the parameters of the ultrasonic emitter.

The results obtained on the basis of the analysis of the developed models allowed to identify the dependences of the electrical parameters of ultrasonic oscillatory systems

on the degree of cavitation wear of the coupled half-wave cylindrical working tool.

This effect obviously caused by a change in the resonant frequency of the attached half-wave cylindrical working tool, which is subject to cavitation erosion from the free end. Since the working tool is part of the design of the ultrasonic emitter, the change in its geometric dimensions, even in the range of 100  $\mu\text{m}$ , affects both its parameters and the parameters of the ultrasonic emitter as a whole.

The influence of the constructional composition of USOS and its individual components on the control parameters has been established. This allowed to identify the most sensitive to the value of cavitation erosion characteristics of USOS and to establish the sensitivity of the control of cavitation erosion of the tools depending on the different parameters of USOS.

The following parameters of ultrasonic emitters considered: the input electrical impedance of the ultrasonic emitter, the real part of the input electrical impedance of the ultrasonic emitter, the imaginary part of the input electrical impedance of the ultrasonic emitter, the phase shift between current and voltage on the transducer of the ultrasonic emitter. The evaluation of these parameters carried out when the ultrasonic emitter was excited at a frequency close to its resonant frequency.

On the basis of the developed electrical models, the dependences of the following parameters of ultrasonic emitters were obtained for the first time when they work in pre-cavitation mode:  $Z=f(\Delta L)$ ,  $\text{Re}=f(\Delta L)$ ,  $\text{Im}=f(\Delta L)$ ,  $\varphi=f(\Delta L)$ , where  $\Delta L$  is the magnitude of the change in geometric size a half-wave working tool made of the investigated coated material subjected to cavitation erosion due to its cavitation wear;  $Z$ ,  $\text{Re}$ ,  $\text{Im}$ ,  $\varphi$  –electrical impedance of the ultrasonic emitter, its real and imaginary components, phase shift between current and

voltage on the electromechanical transducer of the ultrasonic emitter, respectively. These dependences were obtained for different variants of the ultrasonic emitter assembly, namely for a different number of sequentially connected concentrating waveguides (from 0 to 3) with different transformation coefficients (from 1 to 2).

The most sensitive (to the degree of cavitation erosion of the connected half-wave cylindrical working tool) parameter of USOS is imaginary part of impedance of USOS, sensitivity of which strongly depends on the number of connected half-wave elements and their amplification factor. The phase-frequency characteristic of USOS is also of interest, which also has a strong correlation with the degree of cavitation wear and does not depend on the design features of USOS.

The sensitivity of the electrical parameters of the ultrasonic emitter to changes in the acoustic load directly depends on the product  $P = K_1 * K_2 * \dots * K_i$ , where  $K_i$  is the transformation coefficient of the  $i$ -th waveguide element,  $i=1\dots N$ , where  $N$  is the number of sequentially connected waveguide elements.

The conducted research and the theoretical data obtained allow us to formulate requirements for the structure and operating modes of ultrasonic equipment of a new generation. It becomes possible to create

ultrasonic devices capable of "feeling" changes in the acoustic load. Devices of this kind are capable not only of influencing ultrasonic objects with energy, but also of controlling the processes occurring in ultrasonic fields. For example, there are opportunities:

–indirectly control the drilling depth of hard and brittle materials when making holes in them by ultrasonic impact method. As the working tool is buried into the drilled object, the degree of its lateral damping increases, which affects the parameters of the ultrasonic emitter;

–indirectly control the process of obtaining mixtures of two or more liquids with different acoustic properties in ultrasonic fields. When mixing such liquids, the acoustic properties of the voiced medium will change for some time. Eventually, when the new medium becomes homogeneous, its acoustic properties will also become stable, therefore, the parameters of ultrasonic emitters will also cease to change.

–other processes occurring in ultrasonic fields, during the implementation of which there is a change in the acoustic properties of objects and media having acoustic contact with the ultrasonic emitter.

## MAIN CHARACTERISTICS OF NONCONTACT CONVERTERS OF LARGE CURRENTS WITH LONGITUDINALLY DISTRIBUTED PARAMETERS FOR CONTROL AND MONITORING SYSTEMS

**Abstract:** *The article shows that the necessity of breaking current circuits to temporarily switch on electric measuring instruments, the presence of large power losses on shunts, undesirability or impossibility under technological process conditions of breaking circuits, as well as safety requirements have caused noncontact conversion and measurement of large direct currents in circuits without breaking them in metallurgy, electrochemical industry, railway transport, melioration, irrigation and in general in agriculture. The results of the development of one of them are presented in the paper. Considered its static characteristic, the error of calculation, which does not exceed 3 percent, its degree of nonlinearity, and its average and current sensitivity, which throughout the range of current transformed practically remain constant in magnitude. The developed galvanomagnetic noncontact converter can be widely used in control and management systems in water supply, melioration, and irrigation, industry, railway transport, metallurgy, science, engineering, as well as for the verification of electric meters at the place of their installation for non-contact control of direct and alternating currents.*

### 1. Introduction

At present, in many domestic enterprises in the production of copper, sodium, tungsten, molybdenum, zinc, hydrogen, oxygen, phosphorus and others, in the rolling of refractory and heat-resistant metals on rolling mills, in the production of products on drawing machines and others, it is very important to control the functioning technological processes and product quality management [1, 2].

From an informational point of view, any technological process has two sides: control and monitoring. The purpose of observation is to ensure the quality of the technological process and the created products by collecting information about the state of the technological process, evaluating this information, building a model of the state of the observed process and making a decision that ensures optimal control of this process [3].

So, in electrolysis shops, full information about the functioning of technological processes in electrolyzers, about the quality and quantity of products being created, is carried by the value of direct current, controlled either by a device or a converter built into the monitoring and control system. Since modern electrochemical enterprises contain many hundreds of electrolyzers, and the domestic instrument-making industry does not produce reliable lightweight non-contact transducers and devices for product quality control, the development of lightweight, both portable and stationary, accurate, simple in design and inexpensive non-contact transducers and devices for non-destructive testing the quality of manufactured products and the functioning of technological processes through non-contact monitoring of currents in circuits without breaking them, i.e. without violating their integrity is important and timely [4].

Similar problems exist in many industries and, in particular, in the production and rolling of molybdenum, tungsten and alloys based on them, in the production of tungsten wires on drawing machines, yellow phosphorus in ore-thermal furnaces, in laser technology in the formation of pulse energy, and others.

All these processes for obtaining industrial products are characterized by the fact that during non-destructive testing of product quality and the functioning of technological processes (TP), including control of the speed of rotation of engines, their main control parameter is a large direct current (BDC), the value of which is used to judge the quality of industrial products and the functioning of technological processes, as well as the speed of rotation of the engines. Its value is controlled by a number of quality control transducers - measuring transducers (MT) [5].

The problem of increasing the accuracy, reliability and efficiency of monitoring these TPs is topical, which together will improve

the quality and quantity of industrial products and the stability of TP, including control of the speed of rotation of engines [6].

As a result of the analysis of the studies carried out, an urgent need was revealed at many enterprises of the Republic of Uzbekistan to conduct non-destructive control of the quality of industrial products and the functioning of TP, including control of the speed of rotation of engines, by contactless control of BPT using both portable and stationary non-destructive non-contact transducers (BP) and meters (BI) for non-destructive quality control with an error of 1 - 3%, using in some cases multi-limit, as well as with a flexible integrating circuit BP and BI [7].

Among the first BP and BI are the designs developed by K. B. Karandeev, M. D. Gurevich, R. E. Albrandt, A. V. Fremke and others [6].

Subsequently, a number of original designs of BP and BI were proposed by Yu. G. Tolstov, S. A. Spektor, A. E. Kaplyansky, I. A. Zaitsev, I. N. Prudnikov, E. A. Meerovich, L. I. Andreevskaya, V. P. Figurnov, V. V. Serkov, V. N. Bogomolov, G. V. Abramzon, N. G. Semenko, Yu. A. Gamazov, A. M. Safarov and others. Noteworthy are the designs of converters that were developed abroad by V. Kremer, E. Reich, L. Zoltan, N. Bardal, A. L. Schilling, R. G. Arey, T. B. Brovn, E. V. Eddy, Jukki, Hitachi and others [6,7].

In view of the ease of manufacture, the speed of signal processing and noise immunity, non-contact MTs using the dependence of the magnetic field on direct current have been predominantly used in technology. Therefore, any device that allows measuring the field strength can be used for non-contact measuring transducers [7]. This includes the following IPs:

1. electromechanical;
2. self-generating;

3. galvanomagnetic;
4. magneto-modulation;
5. magneto-optical based on the Faraday and Kerr effects;
6. quantum based on nuclear magnetic resonance.

The last two groups of converters, due to the complexity of their implementation, high cost, significant dimensions, and low reliability, have not been widely used.

Of the four groups of converters used, the best technical and economic indicators are galvanomagnetic and magneto-modulating non-contact MTs, made on the basis of distributed parameter converters (DRP) [1].

Russian and foreign scientists dealt with the theory and calculation of PRP: V. I. Kovalenkov, B. S. Sotskov, L. F. Kulikovskiy, B. K. Bul, M. I. Belyi, M. F. Zaripov, N. E. Konyukhov, I. Yu. Petrova, M. A. Urakseev, R. K. Azimov, S. F. Amirov, G. R. Shayakubov, A. V. Gordon, A. G. Slivinskaya, G. Kremer, G. Weiss and others [9].

Despite the large number of separate developments in this area, the instrument-making industry both in the Republic of Uzbekistan and in the CIS countries has not yet produced lightweight detachable stationary and portable non-destructive non-contact transducers and devices for non-destructive quality control of industrial products and the functioning of TP by non-contact control of BPT. This is explained, on the one hand, by the lack of a sufficiently tested version of BP and BI, and on the other hand, by the rigidity of the requirements for them [10].

As a result of the analysis of places of non-destructive non-contact quality control, the main requirements for BP and BI were identified. These include: high accuracy, reliability, sensitivity, low weight, dimensions, material consumption and cost, manufacturability of the design, the absence of errors from the influence of external

magnetic fields, the reverse bus with current, the displacement of the bus with current from the center of the integrating circuit, ferromagnetic masses, residual magnetization and the presence of a variable component in the controlled direct current, the absence of energy consumption from the measured circuit, the ability to work in an aggressive environment, explosion safety, as well as the absence of galvanic coupling between the input and output circuits and the presence in some cases of the possibility of both a fixed sensitivity control of the PSU and BI in a wide controllable range and have a flexible integrating circuit, as well as the manufacture of BP and BI portable or stationary [11].

It has been established that none of the known and considered PSUs and BIs fully satisfies the above requirements and that the main element included in almost all designs of light, both stationary and portable PSUs and BIs, is a non-contact ferromagnetic converter of non-destructive quality control, which is a non-destructive non-contact ferromagnetic BPT-to-magnetic flux converter (BFPP), made of ferromagnetic material, and it accounts for the bulk of the mass of the BP and BI, as well as the fact that the main factor limiting the upper limit of the controlled range is the saturation of the ferromagnetic material, therefore, it is important in reducing the mass of BP and BI and in expanding their controllable range belongs to BFPP. It is known, for example, that the I514 DC transformer used in practice for a current of up to 6 kA has overall dimensions of 340 340 175 mm and a weight of up to 42 kg, and the weight of a portable BI according to GOST should not exceed 5 kg [7]. Therefore, the development of light and wide-range BFPs and devices based on them is an important problem [12].

It should be noted that the BFPP, together with the intermediate converter, forms a non-contact ferromagnetic converter for non-destructive quality control of industrial

products and the functioning of the TP (BFP), which converts the constant magnetic flux created by the controlled direct current into an EMF, which is then converted by the processing unit into an output signal in the case of a BP, and in the case of BI, the output signal is fixed by the meter.

In the field of increasing the upper limit of the BFP, the works of both Russian scientists - E. A. Meerovich, L. I. Andrievskaya, V. V. Serkov, D. N. Nasledov, N. V. Zotov, G. V. Abramzon, Yu. A. Andreeva and others, as well as foreign ones - F. Kurt, K. Maz, T. B. Brown, E. M. Eddy and others [11].

All known and proposed methods for expanding the controlled range of the BFP are based on three main methods [7]:

1. a method of increasing the magnetic resistance of a detachable magnetic circuit in the path of a working magnetic flux created by a controlled direct current;
2. method of partial or full compensation of the working magnetic flux;
3. combination method.

According to the first method, the expansion of the controlled range of the BFPP is carried out by increasing the resistance of the magnetic circuit by:

- a) increasing the section of the detachable magnetic circuit  $S_{st}$ ;
- b) inclusion of air gaps  $\delta$  into the detachable magnetic circuit;
- c) reduction of the air gap cross section  $S\delta$ ;
- d) increasing the total length of the working magnetic flux in steel  $l_{st}$ ;
- e) increase in specific magnetic resistance  $\rho\mu$  of the material of the detachable magnetic circuit;
- f) inclusion of transversely distributed gaps;
- g) the inclusion of transversely distributed gaps and an increase in

the total length of the working magnetic flux over steel  $l_{st}$ ;

- h) inclusion of longitudinally distributed gaps;
- i) the inclusion of longitudinally distributed and transverse gaps;
- j) use in combination of methods a, b, c, d, e.

Methods d, f, g, h, and expanding the controlled range of BFPP were first proposed by us [7,11].

Analyzing the above and highlighting as rational

the following ways to expand the controlled range of BFP, the following can be noted:

1. The method of expanding the controlled range of the BFP by increasing the total length of the working magnetic flux over steel in comparison with the method of additional inclusion of air gaps with the same masses and volumes of the BFP makes it possible to increase the sensitivity and reliability of the BFP as a whole.
2. The inclusion of transversely distributed gaps in a detachable magnetic circuit makes it possible to increase the accuracy of the BFP.
3. Expansion of the controlled range of the BFP by including transversely distributed gaps and increasing the total length of the working magnetic flux over steel allows you to fix the sensitivity of the BFP.
4. The inclusion of longitudinally distributed gaps in the detachable BFP magnetic circuit makes it possible to make it flexible.
5. The implementation of a detachable magnetic core with the inclusion of longitudinally distributed and transverse gaps increases the efficiency and versatility of the BFP.

Reducing the mass of the BFP magnetic circuit to a greater extent leads to the appearance of an error from the displacement of the bus under test from the center of the magnetic circuit window and from the influence of external magnetic fields. The reduction of these errors is achieved by increasing the number of "point" meters located evenly along the entire integration contour [12].

At present, it is very important to develop and study BFPs for such BFPs that would have increased efficiency (extended controllable range with small dimensions and weight and increased accuracy, simplified and technological design with low material consumption and cost) and expanded functionality (this is flexibility integrating circuit and the multi-limit nature of the converter).

Therefore, the problem of increasing the efficiency and expanding the functionality of non-contact ferromagnetic converters with distributed magnetic parameters and devices for non-destructive quality control of industrial products and the functioning of technological processes for monitoring and control systems is an important and promising scientific problem, which is of great importance, because. the creation of new non-contact devices and converters for non-destructive quality control, meeting the set of basic requirements for them from monitoring and control systems, will ultimately help accelerate scientific and technological progress and increase the efficiency of numerous enterprises in the chemical industry, non-ferrous and ferrous metallurgy, energy and electrical engineering, electric transport and electrical apparatus construction, as well as in irrigation, melioration and other industries [1,7].

In practice, a large number of individual noncontact converters and large direct current meters are known, the most widely used galvanomagnetic noncontact

ferromagnetic converters of large direct currents (Gilardi, 2013; GB Patent No. 4575111, 2016), but the known converters have some drawbacks, the main of which are: a narrow controlled current range, low accuracy and sensitivity, large dimensions, and mass, and the absence of fixed regulation of their sensitivity. In this regard, the elimination of these disadvantages is an important necessity and the purpose of this work.

## 2. Materials and methods

We have developed some lightweight, universal, energy-saving galvanomagnetic noncontact large direct current converters (GNC), which allow conversion of both direct and alternating large currents in various control and monitoring systems without breaking the circuit. They use different designs of split closed magnetic cores with transversely and longitudinally distributed magnetic parameters and increased path length of working magnetic flux on steel (Plakhtiev, 2017; Plakhtiev et al., 2020).

One of the developed ones is the GNC shown in Figure 1. It is developed based on a galvanomagnetic non-contact ferromagnetic converter of large direct currents (Plakhtiev, 1985). Let's consider its features and static characteristic, its degree of nonlinearity, as well as the issues of its sensitivity.

**Figure 1.** The galvanomagnetic noncontact converter of large direct currents with longitudinally distributed parameters for control and monitoring systems

The GNC contains a closed magnetic core consisting of separate ferromagnetic elements 1 and 2. Ferromagnetic elements 1, as well as ferromagnetic elements 2, are installed with transverse gaps, evenly distributed along the entire length of the split magnetoconductor.

Neighboring ferromagnetic elements 1 and 2 form  $n$  pairs of longitudinal gaps between them, in which Hall elements 3 are placed. The ferromagnetic elements 2 are rigidly fixed on the ring-shaped insulating plate 4, which can be fixedly moved to the set distances, changing the gaps between the ferromagnetic elements 1 and 2, and, consequently, the parameters of transverse gaps. The closed magnetic wire together with the Hall elements 3 is placed in the insulating case 5, which covers busbar 6 with the controlled current in the process of measurement. Current electrodes of Hall elements 3 are connected to the current source. The Hall electrodes of the Hall elements 3 are connected in series with each other, and the Hall electrodes of the Hall elements 3 placed in each pair of transverse gaps formed by one ferromagnetic element 2 and neighboring ferromagnetic elements 1 are connected in opposite directions. To indicate the measurement results, a recording device (not shown) is included in the chain of series-connected Hall electrodes of the Hall elements 3.

The GNC works in the following way. After the busbar 6 with the controlled direct current is encircled by the controlled current, a constant magnetic flux is created in the magnetic core, which, penetrating the Hall elements 3, causes the appearance of the Hall EMF on their Hall electrodes. These EMFs are summed up due to the counter-inclusion of the Hall electrodes of Hall elements 3. As a result, at the output of a chain of series-connected Hall electrodes of Hall elements 3, there is a total output Hall EMF  $E_x$ , which depends on the value of the monitored DC  $I$ .

The value of this total Hall EMF  $E_x$  is measured with a recording device. Increasing the upper limit of measurement of large direct currents is made by increasing the gap between fixed 1 and movable 2 ferromagnetic elements by a fixed transition of plate 4 with ferromagnetic elements 2 at the set distances. This leads to an increase in the longitudinal gaps, and, consequently, to a change in the operating magnetic fluxes, which allows the sensitivity of the GNC to vary over a wide range of currents to be converted. Let's consider the static characteristic of the GNC shown in Figure 1.

### 3. Results

The static characteristic of GNC is a functional relationship between output and input quantities at their steady-state values (Plakhtiev et al., 2021b).

In the GNC the input quantity is the controlled direct current  $I$ , and the output quantity is the Hall EMF  $E_x$ , the expression of which is written in the form

$$E_x = K_x I_p B, \quad (1)$$

where  $K_x$  – Hall transducer proportionality coefficient, which depends on the parameters of the semiconductor material, the ratio of the geometric dimensions of the converter, the mode of its operation, and their number;

$I_p$  – Hall cell supply current;

$B$  – magnetic induction in the longitudinal gap of the split magnetic core.

Let us denote

$$a_x = K_x I_p. \quad (2)$$

For analytical determination of the static characteristic, it is necessary to know in analytical form the dependences  $B = f(H)$ , where  $B$  and  $H$  – induction and strength of the magnetic field penetrating the Hall elements.

To reduce the residual magnetic induction in GNCs, it is recommended to use magnetically soft materials (electrotechnical

steel) (Danilov, 2004). Therefore, we will approximate the main magnetization curve of electrical steel by the sum of the hyperbolic tangent and the straight line with the angle coefficient as

$$B = C_1 th C_p H + C_3 H, \quad (3)$$

where  $C_1, C_2, C_3$  – approximation coefficients.

Taking into account (2) and (3), let us rewrite expression (1) as

$$E_X = a_X \frac{C_3}{C_2} (C_1 \frac{C_2}{C_3} th H + H_x),$$

where  $H_x$  – the strength of the magnetic field permeating the Hall elements, equal to

$$H_x = C_2 H, \quad (5)$$

where

$$H = \frac{I_u}{\pi D_c} \cdot \frac{(1 + C_v) \beta C_v (1 + C_{mv}) \cdot (1 - ch \beta - 4 sh \beta)}{2 \beta sh \beta C_v (1 + C_{mv} + 2 C_v C_{mv}) - (1 - ch \beta) - 2 (C_v (1 + C_{mv}) + 2)}$$

where  $I_u$  – measured direct current;  $D_c$  – diameter of the center axial line of the split closed magnetic core;  $\beta$  – coefficient characterizing the magnetic voltage loss in the magnetic circuit;  $C_v, C_{mv}$  – coefficients that take into account the geometric dimensions of the split closed magnetic core and the grade of steel used in the magnetic core.

Denoting  $C_1 \frac{C_2}{C_3} = C$ , we rewrite (4) as

$$E_X = a_X \frac{C_3}{C_2} (C th H_x + H_x). \quad (7)$$

Denoting in (7)  $a_X \frac{C_3}{C_2} = E_{XB}$ , we obtain the expression of the static characteristic of the GNC in relative units in the following form

$$E_X^* = \frac{E_X}{E_{XB}} = C th H_x + H_x. \quad (8)$$

Figure 2 shows theoretically (solid curve) and experimentally (dashed curve) obtained plots of the static characteristic of the GNC. The use of the intermediate variable  $H_x$  as a

transformed value is justified by the fact that the output EMF of the GNC is an unambiguous function of  $H_x$ , and, on the other hand,  $H_x$  carries complete information about the value of transformed current  $I$  and the type of steel used in the magnetic core.

The experiments showed that the discrepancy between the experimental and theoretically obtained static characteristics of the GNCs does not exceed 3 percent.

Consider the sensitivity of the GNC shown in Figure 1.

**Figure 2.** Static characteristic of the GNC

To analyze the GNC sensitivity, we will use the expression of its static characteristic (8).

Dividing (8) by  $H_x$ , we obtain an expression for the average sensitivity of the GNC in the following form

$$S_{cp} = \frac{E_X^*}{H_x} = C \frac{th H_x}{H_x} + 1. \quad (9)$$

The results of calculating the average GNC sensitivity according to (9) are shown in Figure 3.

The derivative of the output quantity (8) by the measured quantity  $H_x$  is the current sensitivity  $S_I$  of the GNC. The current sensitivity of the GNC is determined from

the expression

$$S_t = \frac{dE_x^*}{dH_x} = \frac{c}{ch^2H_x} + 1. \quad (10)$$

Figure 3 shows graphically the dependence  $S_t = f(H_x)$ , calculated by (10).

**Figure 3.** Graph of the dependence of the average GNC sensitivity on the magnetic field strength

**Figure 4.** Diagram of the dependence of the current GNC sensitivity on the magnetic field strength of the magnetic field

The graphs in Figures 3 and 4 show that the average and current sensitivities of GNCs over the entire range of the converted current are almost constant in magnitude.

Let's consider an important characteristic of GNC - the degree of nonlinearity of its static characteristic.

The definition of the degree of nonlinearity of the static characteristic of the transducer is given in (Plakhtiev et al., 2021a). According to this definition, the degree of nonlinearity of the considered section of the GNC static characteristic is the ratio of the maximum deviation of the characteristic ordinate from the straight line approximating it in this section to the whole range of ordinate change in the same section.

To analyze the degree of nonlinearity of the static characteristic of the GBIT we will use the expression of its static characteristic (8).

The degree of nonlinearity of the static characteristic of GNC is determined from the following expression (see Figure 5)

$$\varepsilon, \% = \frac{E_{xT}^* - (H_{xT}) - kH_{xT}}{2E_{xM}^*} 100, (11)$$

where  $E^*(H_{xT})$  – a value of the output EMF at the point of the static characteristic, where the deviation on the ordinate of the static characteristic from the line approximating it has the maximum value;  $E^*(H_{xM})$  – the maximum value of the GNC output EMF, corresponding to the maximum value of  $H_{xM}$ ;  $E_{aP}^*(H_{xT}) = kH_{xT}$  – equation of the approximating direct static characteristic of GNC;  $k = \frac{E_{aP}^*(H_{xT})}{H_{xT}} = \frac{E(H_{xM})}{H_{xM}} = \text{tg} \varphi$  – coefficient characterizing the slope angle of the approximating line to the abscissa  $H_x$ .

The values  $E^*(H_{xT})$ ,  $E^*(H_{xM})$ ,  $E_{aP}^*(H_{xT})$  are respectively:

$$E^*(H_{xM}) = CthH_{xM} + H_{xM}, (12)$$

$$E_{aP}^*(H_{xT}) = H_{xT} \frac{E^*(H_{xM})}{H_{xM}} = \frac{H_{xT}}{H_{xM}} = (CthH_{xM} + H_{xM}), \quad (13)$$

$$E^*(H_{xT}) = CthH_{xT} + H_{xT}. (14)$$

**Figure 5.** Determination of the degree of nonlinearity of the static characteristic of the developed GNC

Substituting (12) – (14) in (11), we obtain an expression of the degree of nonlinearity of the static characteristic of the GNC in the following form:

$$\varepsilon, \% = 50 \left( \frac{CthH_{xT} + H_{xT}}{CthH_{xM} + H_{xM}} - \frac{H_{xT}}{H_{xM}} \right). \quad (15)$$

The coordinate  $H_{xT}$ , at which the deviation on the ordinate of the static characteristic from the approximating line has a maximum value, can also be determined graphically, as shown in Figure 5, by drawing a tangent to the curve of the static characteristic at the point  $H_{x1}$  parallel to the approximating line.

After substituting the values of  $H_{xT}$  and  $H_{xM}$  into expression (15), we can obtain the value of the degree of nonlinearity  $\varepsilon$ , %. For example, for a static characteristic with  $H_{xT} = 0.625$  and  $H_{xM} = 1$ , its degree of nonlinearity will be  $\varepsilon = 2.83\%$ , which is acceptable for the GNCs under study.

Consider the transfer coefficient of the GNC. The steepness of the GNC characteristic is determined by its sensitivity to a given input signal. It is estimated by the value of the

corresponding transfer coefficient (Amirov et al., 2019). Consequently, the transfer coefficient for a GNC is adequate to its current sensitivity and can be determined by an expression similar to (10) in the following form:

$$K = \frac{dE_x^*}{dH_x} = \frac{c}{ch^2 H_x} + 1. \quad (16)$$

As a result, it should be noted that the transfer coefficient  $K$  of the GNC can be increased by increasing the thickness and width of the ferromagnetic elements of the split magnetic core, the width of the air gap, and reducing the length of these ferromagnetic elements, the number of air gaps between the ferromagnetic elements in the split magnetic core and the specific magnetic resistance of ferromagnetic elements.

We have developed some lightweight, universal, energy-saving galvanomagnetic noncontact large direct current converters (GNC), which allow conversion of both direct and alternating large currents in various control and monitoring systems without breaking the circuit. They use different designs of split closed magnetic cores with transversely and longitudinally distributed magnetic parameters and increased path length of working magnetic flux on steel (Plakhtiev, 2017; Plakhtiev et al., 2020).

## 4. Discussion

A universal energy-saving galvanomagnetic noncontact converter of large direct currents has been developed, which, unlike the known noncontact converters of large direct currents, has a wide controllable range of currents with small dimensions and mass, a simple and technological design at low material consumption and cost, and can be multireference in a wide controllable range of measured currents with high sensitivity and control DC and AC currents with an

error of 1.5%.

The static characteristic of the universal energy-saving galvanomagnetic noncontact converter of large direct currents has been obtained and studied. The discrepancy between the experimentally and theoretically obtained static characteristics of the converter does not exceed 3%.

The average and current sensitivities of the developed galvanomagnetic noncontact converter of large direct currents, which remain practically constant in magnitude over the entire range of the current being converted, were investigated.

An expression for determining the degree of nonlinearity of the static characteristic of a universal energy-saving galvanomagnetic noncontact converter of large direct currents at any point of the static characteristic, depending on the range of the current to be converted, is obtained.

The transfer coefficient of the GNC is considered, which is adequate to its current sensitivity and its value can be increased by increasing the thickness and width of the ferromagnetic elements of the split magnetic core, the width of the air gap, and reducing the length of the ferromagnetic elements of the split magnetic core, the number of air gaps between the ferromagnetic elements in the split magnetic core and the specific magnetic resistance of the ferromagnetic elements.

## 5. Conclusion

Universal multidisciplinary wide-range noncontact galvanomagnetic converters of large direct currents have been developed for modern control and monitoring systems in helio- and laser technology, agricultural sector, and railway transport, characterized by an expanded controllable range of converted direct currents with small dimensions and weight, improved accuracy and sensitivity, simple and manufacturable

design at low consumption of materials and costs, the possibility of non-contact control of direct and alternating currents, as well as the fixed sensitivity control in a wide controllable range.

The static characteristic of the universal energy-saving galvanomagnetic contactless converter of large direct currents is obtained and investigated. The discrepancy between the experimentally and theoretically obtained static characteristics of the converter does not exceed 3%.

The developed converter has an increased sensitivity due to the Hall elements evenly distributed along the whole length of the split magnetoconductor on the path of the working magnetic flux. The average and current sensitivity of the developed galvanomagnetic noncontact converter of large direct currents, which practically remain constant in value over the whole range of the transformed current, were investigated.

The expression for determining the degree of nonlinearity of the static characteristic of the universal energy-saving galvanomagnetic noncontact converter of large direct currents in any point of its static characteristic and taking into account the range of the converted current, which value does not exceed 3%, is obtained.

The developed GNC can contactlessly control direct and also alternating currents with an error of 1.5 % in many modern control and monitoring systems in land reclamation, irrigation, solar and laser technology, renewable energy sources, solar power plants, solar power plants, direct conversion of solar energy into electrical energy using photovoltaic and thermoelectric conversions, in renewable energy sources, laser systems, power supply systems for focusing and turning electromagnets of elementary particle gas pedals, at many domestic enterprises in the production of copper, sodium, tungsten, molybdenum,

zinc, hydrogen, oxygen, phosphorus and others, rolling of refractory and high-temperature metals in rolling mills, in obtaining products on drawing machines, in monitoring and control systems in non-ferrous metallurgy, in railway transport, irrigation, and land reclamation, as well as in the verification of electric meters at the place of their installation.

The authors plan to organize the future serial production of lightweight multipurpose wide-range noncontact galvanomagnetic converters and meters of large direct and alternating currents.

**Acknowledgement:** The study was supported by the NRU (TIAME), and the authors would like to express their deep gratitude to the University administration for their assistance.

## APPROXIMATION OF THE NONLINEAR DEPENDENCIES IN HARMONIC BALANCE EQUATIONS

**Abstract:** In the author's previous works, the new idea for solving of harmonic balance equations was proposed. In this paper, it is proposed to use the method of averages in the algorithms for solving the harmonic balance equations to approximate the Jacobian. It is important to note that the approximation is performed once and before the start of the main iterations. In our approach the discretized input and output waveforms of responses derivatives of currents of nonlinear elements can be collected in one single matrix form (snapshot matrix). The singular value decompositions method then used for reduce and obtain the average matrix. This matrix reflects all the main changes in nonlinear dependencies with changes in the amplitudes of the input effect and over time. This algorithm reduces computational costs in solving harmonic balance equations. Comparison of the proposed algorithm with the standard harmonic balance method and algorithms developed by the author earlier showed its high efficiency.

**Keywords:** Harmonic Balance, Electronics, Singular Values, Computational Costs

### 1. Introduction

Harmonic balance (HB) methods are widely used for modeling nonlinear circuits in CAD systems in electronics (Rizzoli et al., 1988, Gilmore & Steer, 1991, Kundert, 1999). The main problems of algorithms and software tools of CAD systems based on HB methods are significant memory requirements and huge computational costs for simulation of complex nonlinear electronic circuits containing thousands of electronic components and hundreds of thousands for circuit model equations (White & Sangiovanni-Vincentelli, 1987, Kundert et al., 1988, Rizzoli et al., 2011).

For example, for circuits containing about 10 thousand of circuits nodes and taking into account about one thousand harmonics (with multifrequency excitation), the number of variables (unknowns, equations) of the model will be approximately 10 million. If we use for solving the harmonic balance equations the Newton method when the square of this number of unknowns or the size of Jacobian matrix will be 100 million. All this suggests that new more economical methods of storing and solving of harmonic balance equations in modern electronic CAD systems are needed (Nastovet al., 2007, Lantsov, 2020).

In recent years the methods and algorithms for reducing the memory and computational costs for nonlinear circuits on

---

Corresponding author: Vladimir Lantsov  
Email: [lantsov@ieee.org](mailto:lantsov@ieee.org)

the base the ideas of model order reduction (MOR) were used (Bond & Daniel, 2007, Bond & Daniel, 2009, Lantsov&Dolinina, 2016). Model order reduction methods replace the original model by a system of much smaller dimension, which can be solved by suitable solvers. Model order reduction seeks to reduce the computational complexity and computational time of large-scale dynamical systems by approximations of much lower dimension that can produce nearly the same input/output response characteristics (Lantsov&Dolinina, 2016).

The two best-known methods for reduction of nonlinear systems are Proper Orthogonal Decomposition (POD) (Chaturantabut& Sorensen, 2010), and trajectory techniques (trajectory piecewise-linear, TPWL) (Rewienski& White, 2003).

TPWL techniques linearize the nonlinear system around selected states by a piecewise linearization that is obtained from combining the (reduced) linearized systems via a weighting procedure. The final TPWL model is constructed as a weighted sum of all locally linearized reduced systems (Rewienski& White, 2003).

TPWL method has the advantage that it really approximates the system behaviour of the linearised model. Well-developed linear model reduction techniques can be used to reduce the linearised models. However, to obtain good accuracy a large number of linearisation point is required, which implies a large extraction time. In addition, there are still many nonlinear functions that may not be approximated well by using low degree piecewise polynomials unless there are very many constituent polynomials.

Proper Orthogonal Decomposition extends the projection-based methods that are used for linear systems to nonlinear systems. Consider POD method more detailed because we'll use some ideas of POD in our

new approach of this paper (Chaturantabut& Sorensen, 2010).

Let us the nonlinear systems described the next differential equations

$$dv(t)/dt = Av(t) + F[v(t)]. \quad (1)$$

Here  $t \in [0, T]$  denotes time,  $v(t) = [v_1(t), \dots, v_N(t)]^T \in \mathbb{R}^N$ ,  $A \in \mathbb{R}^{N \times N}$  is a constant matrix, and  $F$  is a nonlinear function evaluated at  $v(t)$  componentwise, i.e.,  $F = [F(v_1(t)), \dots, F(v_N(t))]^T$ . The matrix  $A$  is the discrete approximation of the linear operator, and  $F$  is a nonlinear function of a variable  $v$ .

POD construct a reduced-order system of order  $k \ll N$  that approximates the original system from a subspace spanned by a *reduced basis* of dimension  $k$  in  $\mathbb{R}^N$ . Let  $V_k \in \mathbb{R}^{N \times k}$  be a decomposition matrix whose orthonormal columns are the vectors in the reduced basis. Then, by replacing  $v(t)$  in (1) by  $v(t) = V_k \hat{v}(t)$ ,  $\hat{v}(t) \in \mathbb{R}^k$  and projecting the system (1) onto  $V_k$ , the reduced system of (1) is of the form (Chaturantabut& Sorensen, 2010)

$$d\hat{v}(t)/dt = V_k^T A V_k \hat{v}(t) + V_k^T F[V_k \hat{v}(t)]. \quad (2)$$

The choice of the reduced basis clearly affects the quality of the approximation. The decomposition matrix  $V$  captures the dominant dynamics of original system. For constructs the matrix a time domain simulation of the complete system is done and snapshots of the states are collected in the state matrix, for example  $X$ . It is expected that the samples of snapshots will be on or near the attractive manifold. To extract the dominant dynamics  $V$ , the singular value decomposition (SVD) (Antoulas& Sorensen, 2001, Lantsov, 2012, Charumathi et al., 2019) of  $X$  is computed. Once the reduced model has been constructed from this reduced basis, it may be used to obtain approximate solutions for a variety of initial conditions and parameter settings, provided

the set of samples is rich enough.

The paper (Chaturantabut& Sorensen,2010) illustrates the computational inefficiency that occurs in solving the reduced-order system that is directly obtained from SVD approach. Equation (2) has the nonlinear term

$$NE(\hat{v}(t)) = V_k^T F[V_k \hat{v}(t)].$$

$NE(\hat{v}(t))$  has a computational complexity that depends on  $N$ , the dimension of the original full-order system (1). It requires a full evaluation of the nonlinear function  $F$  at the  $N$ -dimensional vector  $V_k \hat{v}(t)$ . As a result, solving this system might still be as costly as solving the original system(Chaturantabut& Sorensen, 2010).

One of way to overcome the difficulty is to approximate the nonlinear function in  $NE(\hat{v}(t))$  by projecting it onto a subspace that approximates the space generated by the nonlinear function and that is spanned by a basis of dimension  $k \ll N$ . The discrete empirical interpolation method (DEIM) was proposed in paper (Chaturantabut& Sorensen,2010)for these purposes.

In DEIM nonlinear function  $F[V_k \hat{v}(t)]$  or  $f(\tau)$  approximated using new reduced variable as

$$f(\tau) \approx U c(\tau), \quad (3)$$

where decomposition matrix  $U = [u_1, \dots, u_m] \in R^{k \times m}$ , and  $c(\tau)$  is the coefficient vector. To determine  $c(\tau)$ , we select  $m$  rows from the overdetermined system  $f(\tau) \approx U c(\tau)$ (Chaturantabut& Sorensen,2010).

In (Chaturantabut& Sorensen,2010) the special selection matrix is introduced as

$$P^T f(\tau) \approx (P^T U) c(\tau).$$

where  $P = [e_{q_1}, \dots, e_{q_m}] \in R^{k \times m}$ ,  $e_{q_i} = [0, \dots, 0, 1, 0, \dots, 0]^T \in R^k$ ,  $q_i$  is column of identity matrix  $I_k \in R^{k \times k}$  for  $i = 1, \dots, m$ .

The interpolation indices  $q_1, \dots, q_m$ , used for determining the coefficient vector  $c(\tau)$  in the

approximation (3), are selected inductively from the basis  $\{u_1, \dots, u_m\}$  by the DEIM algorithm introduced in (Algorithm 1, Chaturantabut& Sorensen, 2010).

The Algorithm 1 from (Chaturantabut& Sorensen, 2010) select the columns which have the strongest nonlinear dependences. Such selection very important for nonlinear differential equations in general form, but in circuit simulation the selection of columns will depends from the columns where nonlinear elements  $NE(\hat{v}(t))$  are placed.

Although POD has been successfully used in many applications, it has some drawbacks that could make it less applicable in circuit simulation (Chaturantabut& Sorensen, 2010). The TPWL and POD methods use the simulation tools in time domain, and they not applicable to frequency domain like harmonic balance methods.

In the author's previous works, the new idea for solving of harmonic balance equations was proposed. In (Lantsov, 2020a), a new method for solving HB equations was proposed, based on dividing the equations into two components of very small dimension. The reduction of memory and computational costs in the new method was determined by the significantly smaller dimension of the equations and the fact that they were used in solving sequentially.

In (Lantsov, 2020a), a simple iteration method was used to solve the equations. Further development of the method was proposed in (Lantsov, 2020b), where relations were obtained and an algorithm for implementation in software tools based on the use of Newton's iterative method was developed. Further development of the method and implementation algorithms was proposed in (Lantsov&Papulina, 2021), where detailed algorithms for implementing of method in CAD software tools for

electronics are presented.

The method and algorithms of its implementation in the software for modeling complex electronic circuits have shown high efficiency, especially when solving problems of very high dimension (Lantsov, 2020, Lantsov&Papulina, 2021).

The experience of using previously developed software tools has shown that the main costs of computer memory and simulation time are associated with the storage and processing of the Jacobian of full dimension. In this paper, an algorithm is proposed to significantly reduce computational costs using an effective method of approximation of the Jacobian of the harmonic balance equations when solving by the Newton method.

## 2. Basic equations of Harmonic Balance method

The basic relations and algorithms for solving the HB equations for electronic circuits by the new method are given in detail in (Lantsov, 2020b, Lantsov&Papulina, 2021), so here we will give only some basic relations necessary for the presentation of the proposed approach.

Consider the nonlinear circuits which described by the system of nonlinear integro-differential equations

$$f(v(t), t) = i(v(t)) + \frac{dq(v(t))}{dt} + \int_{-\infty}^t y(t - \tau)v(\tau)d\tau + i_E(t) = 0. \quad (4)$$

Here,  $v(t)$  is a vector of node voltages with dimension  $N$ ;  $i(v(t))$  is a vector of currents for resistive elements;  $q(v(t))$  is a vector for capacitor charges;  $u(t)$  are a input sources;  $y(t)$  describes linear part of circuits;  $i$  and  $q$  describe a nonlinear elements; the size of

equations is  $N$ (Lantsov, 2020a).

In the HB method, it is assumed that functions  $v$  and  $f$  are represented as a Fourier series (so, the HB method is referred to as methods in the frequency domain):

$$x(t) = \sum_{k=-\infty}^{\infty} X(k)e^{j\omega_k t},$$

where  $\omega_k = k\lambda$ ,  $\lambda = 2\pi/T$  is the base frequency.

The equations (4) then can be transformed into next form of nonlinear system of equations(Lantsov, 2020a)

$$F(V, k) = I(V, k) + j\omega_k Q(V, k) + Y(k)V(k) + I_E(k) = 0.$$

In vector-matrix form

$$F(V) = I(V) + YV - I_E = 0, \quad (5)$$

where  $V$  is a vector of unknowns (nodal voltages in the circuit); the first term  $I(V)$  describes nonlinear elements; the second term  $YV$  characterizes the linear part of the circuit; the element  $I_E$  is a vector of input sources. The dimension of the equations is equal to  $[N \times (2K+1)]$ , where  $N$  is the number of nodes in the circuit,  $K$  is the number of harmonics taken into account (Lantsov, 2020a).

The solution of harmonic balance equations (5) in the frequency domain is most often performed by the Newton iterative method(Lantsov&Papulina, 2021)

$$J(V^i) \cdot \Delta V^{i+1} = -F(V^i), \quad (6)$$

where  $J(V^i)$  is a Jacobian matrix;  $\Delta V^{i+1} = V^{i+1} - V^i$ ;  $i$  is iteration number. The Jacobian matrix can be found as

$$J(V^j) = \frac{\partial F}{\partial V} |_{V^i} = Y + \frac{\partial I}{\partial V} |_{V^i}. \quad (7)$$

In HB method the dimension of Jacoby matrix  $([(2K+1) \times N] \times [(2K+1) \times N])$  which for complex malty components circuits becomes too large and needs excessive

computer memory and computational costs.

In (Lantsov, 2020) to replace the vector of variables  $V$  of the HB equations (5) with two matrices of reduced dimension (Figure 1) was proposed

$$V = V_H \cdot V_N,$$

where the matrix  $V_H$  reduces the number of harmonics and has dimension  $[N \times R]$ ,  $V_N$  - reduces the number of nodes of the circuit and has dimension  $[R \times (2K+1)]$ ,  $R$  is the reduced dimension of the equations,  $R \ll N$ ,  $R \ll (2K+1)$ .

**Figure 1.** Replacing the matrix  $V$  with two new matrices of reduced dimensions

Replacement of (5) leads to two systems of balance equations of reduced dimension as it was obtained in (Lantsov, 2020a)

$$F(V_H) = I(V_H V_N) \cdot V_N^T + Y V_H - I_E \cdot V_N^T = 0 \quad (8)$$

and

$$F(V_N) = V_H^T \cdot I(V_H V_N) + Y V_N - V_H^T I_E. \quad (9)$$

The equation (8) reduces the number of harmonics in the balance equations and has dimension of equations as  $[N \times R]$ . The equation (9) reduces the number of circuit nodes and has dimension of equations as  $[R \times (2K+1)]$ . Equations with reduced dimension are solved sequentially (Lantsov, 2020a).

In the traditional circuit simulators, the more convenient form of the equations for Newton's method is on the new value  $V^{i+1}$

instead of the increment  $\Delta V^{i+1}$  in (6) (Lantsov, 2020b)

$$\begin{aligned} J(V^i) \cdot (V^{i+1} - V^i) &= -F(V^i), \\ J(V^i) \cdot V^{i+1} &= I_E + \partial I / \partial V |_{V^i} - I(V^i), \end{aligned}$$

As a result, the final expression for calculations (8) by Newton's method gives us the following iterative formula in the form of the system of linear algebraic equations (SLAE) (Lantsov, 2020b)

$$J(V_H^i) \cdot V_H^{i+1} = I_H^i. \quad (10)$$

Here the Jacobi matrix is defined as

$$J(V_H^i) = \partial F / \partial V_H = \partial I / \partial V \cdot V_H^T + Y. \quad (11)$$

The vector of the right parts of the system of equations (10) will have the form (Lantsov, 2020b)

$$I_H^i = I_E V_N^T - \partial I / \partial V V_H^i - I(V) V_N^T. \quad (12)$$

Similarly, to solve the system of equations (9), we have the following basic iterative formulas (Lantsov, 2020b)

$$J(V_N^i) \cdot V_N^{i+1} = I_N^i, \quad (13)$$

$$J(V_N^i) = \partial F / \partial V_N = V_H^T \cdot \partial I / \partial V + Y, \quad (14)$$

$$I_N^i = V_H^T I_E - \partial I / \partial V V_N^i - V_H^T I(V). \quad (15)$$

### 3. Approximation of derivatives for nonlinear dependencies

Note that in equations (12) and (15) there is an element  $I(V)$  that determines the dependence of current on voltages on nonlinear elements in the frequency domain. In standard of circuit simulation tools, all models of nonlinear devices (elements) are described by dependencies in the time domain  $i_{NE}(t) = f[v_{NE}(t)]$  (Lantsov, 2020). The basic HB equations are solved in the frequency domain. Therefore, at each iteration of Newton method, when solving

equations, it is necessary to make transformations from the frequency domain to the time domain and back using the Fast Fourier Transform (Lantsov,2020, Carvalho et al., 2006, Nastov et al., 2007, Lantsov&Papulina, 2021)

$$I(V) = \Gamma \{i(t) = f[v(t)]\} \Gamma^{-1}. \quad (16)$$

Here  $\Gamma$  is the forward and  $\Gamma^{-1}$  is the inverse Fourier transform. The relationship between the representation of the signal in the time and frequency domains will be defined as  $V = \Gamma v$  and  $v = \Gamma^{-1}V$ . Similarly, in the iterative formulas there is an element of calculating the derivatives of currents of nonlinear elements according to the corresponding voltages(Lantsov, 2020b)

$$\partial I / \partial V = \Gamma \left\{ \frac{\partial i(t)}{\partial v(t)} \right\} \Gamma^{-1}. \quad (17)$$

Earlier, in previous works (Lantsov, 2020, Lantsov&Papulina, 2021), the standard part of traditional HB-based software tools and the full dimensions of these equation elements were used to calculate (16) and (17).Unfortunately, the experience of using software tools implementing previously developed methods and algorithms has shown that the main computational costs (memory and time) are associated precisely with the calculation of element  $I(V)$ , and especially with the calculation of the derivative for the Jacobian  $\partial I / \partial V$ .

Note that the element  $\partial I / \partial V$ . will be the same for equations (11 and 12), (14 and 15).

It is proposed to approximate this element and reduce its dimension. This approximation will correspond to the methods of averages used in the algorithms for solving the HB equations to approximate the Jacobian in (Filicori& Monaco, 1988, Kundert et al., 1990, Ushida et al., 1992), where equation (3) can be replaced as

$$J(V^j) = \partial F / \partial V |_{V^j} = Y + G_{av}.$$

In (Kundert et al., 1990) average value was obtained as

$$G_{av} = \frac{1}{T_0} \int_0^{T_0} \frac{\partial i[v(t)]}{\partial v(t)} dt.$$

It is important to note that the approximation is performed once and before the start of the main iterations.

To calculate the average value  $G_{av}$  we use approach which was proposed in POD method. The collection of output waveforms (snapshots or samples of trajectories) is discretized and the times at which the derivatives are crossed are recorded. The discretized input and output waveforms can be collected in one single matrix form (snapshot matrix) of responses of nonlinear elements in the form

$$G(t) = [g_1(t), \dots, g_n(t)]^T \in R^n,$$

where  $g_k(t) = \frac{\partial i(t)}{\partial u(t)} |_{u_k(t)}$  are

derived currents of nonlinear elements (usually in circuit simulators, these derivatives are in analytical form); time  $t \in [0, T]$ ,  $T$  is the period of the lowest harmonic spectrum at the output of the circuit;  $n = N_{NE} \cdot N_{IN}$ ;  $N_{NE}$  is a number of nonlinear dependencies;  $N_{IN}$  is a number of analysis when we change the amplitude of the input.

The total dimension of the matrix of sets  $G$  will be defined as  $n \cdot Nt$ , where  $Nt$  is the number of time (discrete) samples on the period  $T$ .The correct and sufficiently large for selection of a set of snapshots is a decisive factor in building of the SVD algorithm. This choice can greatly affect the approximation of the initial description (Ramalingam, 2007).

It is assumed that the sample set will correspond to the dominant states of the model and the sample set is large enough.

The SVD method creates a reduced basis, which is optimal in the sense that the approximation error with respect to data sets is minimized (Ramalingam, 2007).

The SVD algorithm with respect to the matrix of sets  $G$  gives the following decomposition

$$G = U \Sigma V^T, \quad (18)$$

where the matrices  $U := (u_1, \dots, u_r) \in R^{r \times r}$  and  $V := (v_1, \dots, v_r) \in R^{Nt \times r}$  are orthogonal, i.e.  $UV = I$ , where  $I$  is the unit matrix,  $\Sigma = \text{diag}(\sigma_1 \geq \sigma_2 \geq \dots \geq \sigma_r \geq 0)$  is a diagonal matrix of singular values (Antoulas & Sorensen, 2001, Iantsov, 2012, Charumathi et al., 2019).

The matrix  $U$  is called the left singular matrix and its columns provide the orthogonal basis for the columns of  $G$ . The matrix  $V$  is called the right singular matrix and its columns provide the orthogonal basis for the rows of  $G$ . As noted above, the columns of  $V$  provide the orthogonal basis for the rows of  $G$  and since each row contains a discretized waveform, the columns of  $V$  turn out to be the orthogonal basis for the waveforms in matrix  $G$  (Antoulas & Sorensen, 2001).

Now (18) can be rewritten by post-multiplying both sides by  $V$ . Since  $V$  is orthonormal ( $V^T V = I$ ) we get  $GV = U\Sigma$ . We denote the resultant product matrix as  $M$  called the moments matrix (Ramalingam, 2007)

$$M = GV = U\Sigma.$$

The moments matrix defined here is a linear combination of time points weighed by the right singular vectors (rsv)  $V_j$ :

$$m_{ij} = G_i \cdot V_j = \sum_{k=1}^n g_{ik} v_{kj},$$

where

$$G = \begin{pmatrix} g_{1,1} & g_{1,2} & \dots & g_{1,n} \\ g_{2,1} & g_{2,2} & \dots & g_{2,n} \\ \dots & \dots & \dots & \dots \\ g_{Nt,1} & g_{Nt,2} & \dots & g_{Nt,n} \end{pmatrix}.$$

The right singular vectors transform a waveform from time domain  $t = (t_1, t_2, \dots, t_n)$  to moments domain  $m = (m_1, m_2, \dots, m_n)$  through  $m = tV$  and vice-versa through  $t = mV^T$  (Ramalingam, 2007).

This equivalent representation leads to an interesting possibility in the context of timing analysis. If a waveform can be represented accurately using a few moments then by propagating these moments, one can do an accurate waveform analysis instead of propagating all the  $n$  time points.

A reduced matrix of averaged values of  $G_{av}$  is obtained using the following relation (Ramalingam, 2007)

$$G_{av} = U \Sigma V^T = U \text{diag}(\sigma_1, \sigma_2, \dots, \sigma_r, 0, 0, 0) V^T.$$

The final expressions for calculation by iterative formulas will look like this. For equations (11-12)

$$J(V_H^i) = Gav \cdot V_N^T + Y, \quad (19)$$

$$I_H^i = I_E V_N^T - Gav \cdot V_H^i - I(V) V_N^T. \quad (20)$$

For equations (14-15)

$$J(V_N^i) = V_H^T \cdot Gav + Y, \quad (21)$$

$$I_N^i = V_H^T I_E - Gav \cdot V_N^i - V_H^T I(V). \quad (22)$$

### Algorithm 1 (Solution of equations 10)

- 8: go to 4.

---

All the developed algorithms are implemented as a supplement to the general-purpose circuit modeling program SMORES

(Bond, 2010), implemented as open code in the Matlab/Simulink system.

Verification of the proposed algorithms based on the circuit simulation software tools (Lantsov, 2020, Lantsov&Papulina, 2021) was performed on a well-known example from the author's previously published works and examples known from publications in the world literature (Fig. 3, Bond& Daniel, 2007, Fig. 1, Lantsov&Dolinina, 2016).

This example is characterized by the fact that by changing the number of nonlinear cascades of the circuit, it is possible to increase the dimension of the circuit to very high dimensions determined by the memory of a particular computer.

The comparison was performed both with the standard HB method and with previously published results. Since the convergence in all the examples coincided with the calculations by the standard HB method, we do not provide graphs of the results. The table below shows the results of the comparison.

**Table.** Comparison of methods by calculation time

	Calculation options: the number of repeating cascades of the circuit, the number of nodes, the number of harmonics taken into account	New algorithm	Standard HB method	The algorithm is in paper (Lantsov, 2020a)]
1	3, 11, 3	5 s	4 s	6 s
2	3, 11, 99	9 s	9 s	11 s
3	14, 42, 3	20 s	22 s	23 s
4	14, 42, 99	112 s	135 s	128 s
5	45, 135, 3	175 s	206 s	196 s
6	45, 135, 99	271 s	342 s	302 s

#### 4. Conclusion

As in POD methods and like in our approach the choice of the number of snapshots depends on many factors. On the one hand one desires the number of snapshots to limit the computational costs involved with the

SVD, on the other hand all the dominant states should be captured. Also, the choice of the snapshot discreet times can be a challenging task. Third, the influence of the training input may be very big, making the reduced order models unsuitable for reuse in practice.

## THE NEW PROCESSING METHOD OF QUASI-PERIODIC PULSE SIGNALS USING WAVELET ANALYSIS AND HERMIT TRANSFORM

**Abstract:** *The article considers the basic principles of constructing a method for processing quasi-periodic pulse signals. The method is based on the combined use of wavelet analysis and the Hermite transform, in particular, the Gauss-Hermite function. Wavelet transform is considered as a cross-correlation function. The Gauss-Hermite functions are used as a basis in the wavelet analysis. Approbation of the method is carried out as on a test signal, in the form of a rectangular pulse with additive noise, which at some point in time has a local inhomogeneity, also on the real signal received from the bearings of the gas turbine engine.*

**Keywords:** *Wavelet Transform, Gauss-Hermite Functions, Gas Turbine Engine*

### 1. Introduction

The analysis of form and parameters of quasi-periodic pulse signals against the background of noise, which is a slowly changing process, is an integral part of the information processing procedure in order to diagnose the state of an object. For example, signals appear during the functioning of dynamic systems: various machines and mechanisms, living organisms and other objects. In most cases, these objects operate in a cyclical manner. In mechanical systems, this is due to the presence of rotating parts, in a living organism - the leading centers of nervous excitation. Very often, such systems are subject to random disturbances. In particular, in a biological object due to various pathologies, disturbances in the rhythm of its functioning occur. In mechanical systems due to interaction with the environment, under the influence of a time factor or other reasons, disturbances in the cyclicity of work occur. If these

violations go beyond the permissible limits, then there is a reason to draw a conclusion about the malfunction of machines and mechanisms or about a person's disease.

The most common processing method to state the value of quasiperiodic impulse systems is spectral analysis. Due to well-studied mathematical apparatus, it allows you to detect various defects in the system. Spectral analysis confidently copes with the task of diagnosing dynamic systems if the defect is of a periodic nature. This is expressed by the characteristic frequency components in the spectrum of the signal under investigation. But if the defect is not periodic or quasi-periodic, has a random character, then the efficiency of the spectral analysis is significantly reduced.

This problem can be partially solved using the windowed Fourier transform. In this case, the frequency resolution depends on the duration of the window, and the dynamics of the system functioning is assessed by using the average frequency. It

---

Corresponding author: Dmitry Balakin  
Email: [dabalakin@yandex.ru](mailto:dabalakin@yandex.ru)

is difficult to estimate the quasiperiodicity of the system from the average frequency, thereby reducing the accuracy of its diagnostics. In addition, using this processing method, we are faced with the uncertainty of the choice of the window width. With a small width, we lose exactly in frequency. With a large width, the estimate of quasiperiodicity is lost.

Thus, to solve the above problem, it is necessary to measure the distance between quasiperiodic pulses. Then we are faced with the need to adapt to the shape of the impulses so that the assessment of the dynamics of their repetition is more accurate. This is complicated by the fact that the shape of the pulses is constantly changing, i.e. the system under study is nonstationary.

The method that is based on the combined use of wavelet analysis and Hermite transform was developed to eliminate the above disadvantages.

The basic functions in the Hermite transform are the Gauss–Hermite functions. The Gauss–Hermite functions are the product of the Hermite polynomials and the Gaussian function. Hermite polynomials have a number of advantages over other polynomials known in mathematics: Chebyshev and Legendre. The Chebyshev polynomials are orthogonal on the interval  $[-1,1]$  and beyond it rapidly increase in comparison with polynomials of the same degree, which contributes to the design of linear filters. However, such a small orthogonality interval does not allow more accurate adaptation of the reference signal to the local properties of the signal, in contrast to the Hermite polynomials, in which the orthogonality interval is  $(-\infty, \infty)$ . As well as for Chebyshev polynomials, the orthogonality interval for Legendre polynomials lies in the range  $[-1,1]$ . Similar properties to the Gauss–Hermite functions have the Gauss–Laguerre functions, which are actively used in image analysis. Due to their properties, Gauss–Laguerre functions

are excellent for analyzing circular image neighborhoods. It is possible to make a transition from circular harmonic Gauss–Laguerre functions to Gauss–Hermite functions, thereby achieving acceleration of calculations due to the fact that the Gauss–Hermite functions are separable, i.e., independent of each other. In the context of signal processing, an important distinguishing feature of Gauss–Hermite functions compared to Chebyshev and Legendre polynomials and Gauss–Laguerre functions is that they are orthogonal in both space time and the frequency domain. This allows you to synthesize filters not only by matching impulse responses, but also by direct synthesis with a given frequency response.

## 2. Basic principles of the method

The traditional interpretation of the wavelet transform is based on the consideration of basis functions as time-limited oscillation segments. Variation their scale is equivalent to changing the frequency composition of these functions.

$$W_s(a, \tau) = \int_{-\infty}^{\infty} S_m(t) \Psi_{a,\tau}(t) dt \quad (1)$$

As can be seen from (1), the wavelet coefficients in the general case are determined by the integral transformation of the signal. Continuous wavelet transform  $W_s(a, \tau)$  is the scalar product of the process under study  $S_m(t)$  and basis functions  $\Psi_{a,\tau}(t)$ .

The basic functions are real, defined on a certain interval and fluctuate around the abscissa axis:

$$\Psi_{a,\tau}(t) = \frac{1}{\sqrt{a}} \Psi\left(\frac{t-\tau}{a}\right) \quad (2)$$

$\tau$  – shift parameter, shows the location in time,  $a$  – scale parameter.

The pulses of a quasi-periodic signal can have an arbitrary shape. Therefore, for more efficient diagnostics, it is necessary to use orthogonal basis functions. The most popular orthogonal wavelets are the Haar and Daubechies. They have a number of limitations and disadvantages. Haar wavelets poorly describe smooth functions, and Daubechies functions have an asymmetric shape, which narrows the area of their practical use. Thus, with the help of classical wavelets, it is not possible to take into account all the features of the signal shape. In addition, when processing real signals, it is necessary to construct basis functions based on the discrete recording of the signal, and this is absent in the classical interpretation of the wavelet transform. As a basic function, it is proposed to use the Gauss-Hermite functions (FGH), defined in the Hermite transform. The energy of the FGH is concentrated on a limited interval in both the time and frequency domains. Therefore, FGH work with a finer time-frequency localization. This representation of the process under study is less robust to noise, but it retains a much larger number of characteristic features of the signal. The inherent localization of the FGH in the time domain makes them very suitable for representing the bearing support signals in the form of a generalized Fourier series based on these functions.

The FGH have the following form:

$$\Psi_n(t) = H_n(t) \exp(-0.5t^2) / \sqrt{n!2^n \sqrt{\pi}} \quad (3)$$

where  $H_n(t)$  – Hermite polynomials,  $n$  – FGH order.

The feature of functions (3) is that they are eigenfunctions of the Fourier transform in the space  $L_2(-\infty, \infty)$  with values  $\pm 1, \pm \sqrt{-1}$ . Also, an important advantage is that FGH are localized from a computational point of view on a finite time interval as a consequence of

$\lim_{|t| \rightarrow \infty} (H_n(t) \exp(-0.5t^2) / \sqrt{n!2^n \sqrt{\pi}}) \rightarrow 0$ , and the localization segment is the interval  $[-\sqrt{2n+1}, \sqrt{2n+1}]$  containing all inflection points (3).

Transformation (1) can be considered as a cross-correlation function of the signal and the basis function sliding over it. The higher the upper limit of the correlation integral, the greater the degree of similarity between the signal and the function. Taking into account the above said, substituting expression (3) into expression (1) taking into account expression (2), we have the following correlation integral:

$$R_{out}(a, \tau) = \int_{-\infty}^{\infty} S_{in}(t) \tilde{S}_{ptrn}(a, t - \tau) dt \quad (4)$$

where  $\tilde{S}_{ptrn}(a, t)$  – basic function.

In turn, the basic function has the following form:

$$\tilde{S}_{ptrn}(a, t) = \frac{1}{\sqrt{a}} \sum_{n=0}^{\infty} W(n, n_c) A_n(a) \Psi_n(t/a) \quad (5)$$

where  $A_n(a)$  – the spectrum of the signal in the FGH basis,  $W(n, n_c)$  – the smoothing window for weakening the Gibbs effect in the FGH space,  $n$  – the number of the FGH. For a more detailed understanding of the formation of the basis function, consider the rectangular pulse shown in Figure 1a.

Traditionally, in radio engineering and digital electronics, a rectangular pulse is of great importance both from a theoretical and practical point of view. A good model for debugging various algorithms is a square wave. Within the framework of the model problem being solved, a rectangular pulse with an unknown duration is considered as an input signal  $S_{in}(t)$ . For the formation  $\tilde{S}_{ptrn}(a, t)$ , we represent the pulse in the

basis of the PGE, using the following decomposition into spectral components:

$$A_n(a) = \int_{-\infty}^{\infty} S_{in}(t) \Psi_n(t/a) dt \quad (6)$$

**Figure 1.** Function in the form of a rectangular pulse (a) and its spectrum in PGE space (b)

The spectrum of a rectangular signal in the FGH basis is shown in Figure 1b. Moreover, at this stage, it does not matter what scale the FGH has, since for any parameter, an infinite number of FGH accurately reproduces the process under study. Figure 1b shows that the signal spectrum in the FGH space has a discrete form, since each spectral component of a rectangular pulse corresponds to a FGH of an integer order.  $\tilde{S}_{ptrn}(a,t)$

Since the FGH system is complete, an infinite number of discrete FGH provides a

zero value of the standard deviation (RMS) of the sum of the series from the function. However, in reality the series is always finite. The scale parameter allows you to reduce the standard deviation of the truncated series. Figure 2 shows the dependence of the RMS on the scale parameter for different numbers of FGH ( $n = 0, 5, 10$ ) in (5).

It is clearly seen that the minimum standard deviation is reached at  $a \approx 1,6$ . Based on the results of our calculations, it can be argued that for a rectangular pulse, the optimum of the parameter weakly depends on the FGH number. From this it follows that for a rough definition of the scale, the zero-order FGH is sufficient - the Gaussian function.

**Figure 2.** RMS dependence on the scale parameter, numbers are the limiting values of the sum of the inverse Gauss-Hermite transform (basic function)

Figure 3 shows the basis function (5) derived from the calculated scale parameter ( $a = 1,6$ ) consisting of 140 FGH.

The rectangular pulse is reproduced inaccurately, with small oscillations, due to a sharp transition from the transmission frequency to the suppression frequency in the FGH space. This effect, as well as in harmonic analysis, is called the "Gibbs phenomenon", the essence of which is that the Fourier series of a discontinuous function does not converge to the expanded function in the vicinity of the discontinuity.

**Figure 3.** Rectangular pulse and basic function

The truncation of the FGH series can be considered as low-frequency filtering in the FGH space. With the help of such filtering, the influence of the “Gibbs phenomenon” can be weakened. As filter prototypes, we use filters whose frequency response are based on the classical approximations of Gauss, Butterworth, Chebyshev and Bessel. As the frequency in the corresponding formulas, we will use the FGH order, for simplicity, assuming it to be a continuous value. Based on the property of the FGH localization segment, it can be expressed  $n_c$  in terms of the cutoff frequency  $f_c$ :

$$n_c = 0,5 \left[ (2\pi f_c a)^2 - 1 \right].$$

Thus, the value can be calculated from a priori information about the spectrum of the signal under study.

As an example of the attenuation of the “Gibbs phenomenon” in the FGH space, we will use the frequency response of the following filters: Gauss, Butterworth of the 1st order, Chebyshev of the 2nd order, Bessel of the 3rd order. The simulation results for are shown in Figure 4.

The Butterworth filter provides the flattest passband response, at the cost of smoothness in the transition region between the passband and stopband. When using the Chebyshev filter, significant ripples in the passband are visible. However, it provides the highest slope in the transition region. The Bessel

filter has the flattest portion of the latency curve in the passband, but has the flattest transitional portion between the passband and stopband. The Gaussian filter has a sharp slope of the frequency response and a flat section in the passband.

**Figure 4.** Frequency response of filters: 1 - Gaussian filter, 2 - Butterworth filter of the 1st order, 3 - Chebyshev filter of the 2nd order, 4 - Bessel filter of the 3rd order

The result of low-frequency filtering in the FGH space of a rectangular pulse with a fixed scale parameter is shown in Figure 5

Based on the calculated frequency response of the filters (Figure 4), we can conclude that the basis function most accurately describes a rectangular pulse, built using a 3rd order Bessel smoothing filter. A better match can be achieved by increasing the order of the filter, however, this entails the complexity of the filter gain in a digital implementation. Acceptable frequency response results can be achieved using Gaussian and Butterworth filters.

Chebyshev filters give significant distortion in the form of a basis function, and therefore they cannot be recommended for use.

In the presented article, as a smoothing filter, a Gaussian approximation filter is used, since it is optimal from the point of view of digital implementation and filtering properties (frequency response shape).

**Figure 5.** Rectangular pulse after filtering: 1 – initial rectangular pulse, 2 – after Gaussian filter, 3 – after Butterworth filter, 4 – after Chebyshev filter, 5 – after Bessel filter

Summarizing, we note that by applying a low-pass filter in the FGH space, it is possible to weaken the "Gibbs phenomenon" and thereby more accurately bring the reference signal closer to the standard, which, in turn, increases the probability of a more confident signal detection.

Having determined the main points in the construction of the basis function, let us consider a test example of the calculation: a rectangular pulse with additive noise, which at some point in time has a local inhomogeneity in the form of a third order FGH with a fixed scale parameter (figure 6a).

Since the inhomogeneity is characterized by one feature, the correlation integral (4) has the following form:

$$R_{out}(a, \tau) = \int_{-\infty}^{\infty} S_{in}(t) \Psi_3(a, t - \tau) dt \quad (7)$$

By varying the scale parameter, the duration of the local inhomogeneity and its location can be found. The results of such a procedure are reflected in the form of level lines (figure 6b). Having found the local maximum of the surface in figure 6b, one can find the location ( $t = 0$ ) of the local

inhomogeneity and its duration 0.2. The result of calculating the correlation integral (7) with the scale parameter  $a = 0.2$  is shown in figure 6c.

We can compare the obtained result with the classical wavelet transform. Figure 7 shows the wavelet spectrograms of a rectangular pulse, constructed with various basic functions. The construction of the basic functions was carried out with the standard tools of the MATLAB package, so the values of the scale parameter are different. It is advisable in this case to compare not quantitatively, but qualitatively: to identify the fine structures of the process under study.

Local inhomogeneity is more confidently distinguished by processing using the MHAT function, since it is adapted for analyzing complex signals due to its narrow energy spectrum and two moments (zero and first) equal to zero.

The key difference between the two processing approaches is that at the output of the algorithm under consideration we have a cross correlation function, which allows us to estimate the degree of similarity of the reference signal and the reference, and at wavelet processing, the spectral distribution.

The main idea of the processing method is as follows: from the investigated quasi-periodic pulse signal, we select a fragment, on the basis of which we construct the basis function (5). A fragment can represent a local inhomogeneity, the dynamics of which we want to trace. Next, we calculate the correlation integral (4), where the result is a cross correlation function, which is a complex surface with many local extrema, due to the scale variation and time shift. Supposing that a working system operates cyclically, we determine the distance between each extremum. If this distance is in the limit of the confidence interval, then the system is in good order, otherwise it is not.

**Figure 6.** Processing results: rectangular pulse with a singularity in the form of a third order FGH(a), the result of calculating the cross correlation function (b, c).

It is convenient to reflect such a dynamic picture using scatterograms. The speed of calculating the correlation integral can be increased by going to the frequency domain.

**Figure 7.** The results of processing using: MHAT function(a), Gauss 3 orders(b), Gauss 4 orders(c), Morlet wavelet(d)

For this, it is necessary to replace the operation of calculating the correlation integral by filtering in the spectral region. This procedure is carried out using the generalized Rayleigh formula. As a result, the correlation integral has the following form:

$$R_{out}(a, \tau) = \frac{1}{2\pi\sqrt{a}} \int_{-\infty}^{\infty} \mathcal{S}_{in}(\omega) \mathcal{K}_n(a\omega) \exp(j\omega\tau) d\omega \quad (8)$$

where  $\mathcal{S}_{in}(\omega)$  – complex Fourier spectrum,

$\mathcal{K}_n(a\omega)$  – complex filter gain, which is

$$\mathcal{K}_n(a\omega) = j^n \sqrt{\frac{\sqrt{\pi}}{n!2^{n-1}}} \exp(-0,5a^2\omega^2) H_n(a\omega) \quad (9)$$

Let us consider in more detail the operation of the method using the example of bearings of rotor supports.

### 3. Signal processing of bearings of a gas turbine engine

Gas turbine engines (GTE) are one of the most complex technical developments of mankind and are widely used in aviation, energy, marine and other fields. The complexity of GTE is evidenced by the number of parts in their design, the variety of loads acting on them, the modes and conditions of operation, the implemented parameters of the working cycle, the complexity of control and maintenance of performance. As a result, even small deviations from the calculated operating conditions, the slightest inaccuracy in control can lead to failure and destruction of the gas turbine engine. Trends in the improvement and development of these engines are always aimed at improving their specific characteristics, which always leads to an increase in stresses that occur in structural details, and even minor deviations in parameters during production or the development of a malfunction caused by functional damage or aging can lead to catastrophic consequences. This fact indicates a constant increase in the need for timely fault diagnosis.

A gas turbine engine is a complex technical system with many different vibration sources. One of these sources is the rotor bearing arrangements, the failure of which interrupts the further operation of the gas turbine engine. In good condition, the bearing arrangements function cyclically. However, it is at an early stage of development that the cyclicity is violated, which manifests itself in the form of quasi-periodicity of pulse repetition. At the same time, not one method of technical diagnostics used in various branches of mechanical engineering is not able to determine this malfunction and only states the fact of engine destruction. Currently, an urgent task is not only the assessment of the current technical condition, i.e. determining

the actual characteristics of gas turbine engines that change over time, but also forecasting and assessing the life cycle of a gas turbine engine as a whole or its individual components. Let us estimate the quasiperiodicity using the method presented.

Figure 8 shows fragments of three bearings. The first one is in good condition, the other two are defective. In accordance with the processing method, first one need to isolate the local heterogeneity from the process under study.

**Figure 8.** Bearing vibration recordings: a – no damage, b and c – there is damage.

After analyzing the records of a bearing without a defect, a fragment was selected, which is shown in figure. 9, since it is most often found in the record.

**Figure 9.** Basic function (black dash-dotted line), selected fragment (red solid), N - number of samples.

Based on (5), we construct a basis function from a fragment of a record of a serviceable bearing. Given the approximation error, one can find the optimal number of FGH in (5). Figure 5 shows a 5% approximation error for various parameters of the scale and the number of FGH.

The approximation error in the general case can be calculated using the following formula:

$$Er(a, n) = \left( \frac{\int_{-\infty}^{\infty} (\tilde{S}_{ptm}(a, t) - S_{ptm}(t))^2 dt}{\int_{-\infty}^{\infty} S_{ptm}(t)^2 dt} \right) 100\% \quad (10)$$

Then in accordance with (4), we construct the correlation function. Fragments of the cross-correlation function for bearing signals are shown in figure 10. By finding the distance between the extrema, for example, using the steepest descent method, one can display the dynamics of pulse repetition or quasiperiodicity.

**Figure 10.** The result of calculating the cross-correlation function: a – no damage, b and c – there is damage.

It is convenient to display quasi-periodicity using rhythmograms and scatterograms. To build a rhythmogram, the correlation function was subjected to threshold processing. As a threshold, the minimum positive value from the set of maxima of the correlation function of the signal in Figure 10 is used. The rhythmogram is a random

process with many outliers. Rhythmogram surges indicate an increase (upsurges) or a decrease (downsurges) of vibration non-linearity parameters. A scatterogram is a correlation rhythmogram or a topographical equivalent of Puncaré's spots. The more clustered the points are, the less the quasi-periodicity. The shift of the points to the right along the coordinate axis reflects a decrease in the rhythm, while the shift to the left reflects an increase. If the points are far from the whole population, then this may indicate a defect. More details about the processing of rhythmogram and scatterogram of a GTE can be found at the links provided.

## 4. Conclusions

The presented processing results both on the test signal and on the real signal allow us to state that the method based on the combined use of the wavelet transform and the Hermite transform can be applied to detect and estimate the quasiperiodicity of various local inhomogeneities. A fundamentally new element in the proposed processing method is the construction of a basis function based on the Hermite transform. Also new is the construction of a correlation integral based on the integral of the wavelet transform. Due to the main properties of the wavelet transform (scaling, localization), it is possible to construct a basic signal with lower computational costs, as well as to track the dynamics of changes in the duration of the reference signal in the process under study. The use of mathematical techniques embedded in the wavelet transform takes the processing method to a qualitatively new level. It is able not only to detect a useful diagnostic signal, but also to diagnose one or another anomaly or inhomogeneity in cyclic systems, for example, in a gas turbine engine.

In turn, inhomogeneities can characterize both the correct operation of the system

under study and the system defects. The choice depends on the thing, the dynamics of which process the researcher wants to trace. The key feature of the method is that it is possible to display the dynamics of pulse repetition of arbitrary shape in order to diagnose quasiperiodic pulse systems. The obtained processing results confirm the state of the system under study, in particular the bearing arrangements. The presented method in turn can be applied as an additional diagnostic tool to the proven classical spectral analysis.

As a result, the proposed unique diagnostic method allows not only to solve the problems of determining and predicting the technical condition of engine components that previously did not have such an opportunity, but also to determine the quality of manufacture and assembly of rotor systems.

In the future, it is planned to establish general and particular patterns of behavior of common faults originating in a GTE or its components. Deciphering the algorithm for the occurrence of key mechanisms, the

appearance of such malfunctions will make it possible to create special software that will find its practical application in industries where GTE are actively used.

The scientific novelty of the project lies in the use of innovative interdisciplinary approaches to the processing and analysis of vibration signals generated by a GTE, combining developments in the fields of vibration diagnostics, radio engineering and medicine, which will make it possible to create an integrated system for diagnosing and predicting the technical condition and improve the existing class of analytical equipment for development of new generation diagnostic systems. The implementation of the development will reduce material costs, due to a decrease in the likelihood of a complete or partial destruction of the GTE and the object on which it is installed (aircraft, stand, vessel, etc.), as well as additionally avoid human casualties, which will undoubtedly increase public and social significance of the project.

## **COMPARATIVE ANALYSIS OF SOFTWARE TOOLS FOR AGILE PROJECT MANAGEMENT**

**Abstract:** *In order to achieve a competitive advantage on the market, companies must effectively manage projects, which includes the application of different methodologies, skills and knowledge during the planning, implementation and monitoring of projects. Also, the quality of the software product is largely determined by the management of the realization of that project. Therefore, the use of automated software tools is essential for successful project planning and management. There are many project management tools and software being developed every day to help managers automate the tracking of key parameters of projects throughout their life cycle. This paper describes in detail the features, advantages and disadvantages of the five most commonly used agile project management software, namely Jira, Trello, Asana, Basecamp and MS Project. These software are used in a large number of not only large corporations but also small and medium-sized enterprises. The main goal of the work is a comparative analysis of these software according to criteria such as the size of the organization, the size of the team, the type and scope of the project, for which a certain software is intended/suitable. Different projects require the use of different software tools. When choosing a tool, it is very important to consider the fact that the chosen tool corresponds to the requirements of the project. Each of these project management tools has its own unique features and strengths. It is important to evaluate each tool carefully and consider factors such as ease of use, feature set, and pricing before making a decision.*

**Keywords:** *project planning, management, project management tools, agile project management software*

### **1. Introduction**

Increasing project success rates is one of the biggest challenges facing modern organizations. The authors (Tawfik M. Samarah and Sulieman Al-Safi, 2020) conclude that agile project management tools have a positive impact on project success, but their effectiveness depends on how well

they are used by the project team. Due to the failure of the project, large amounts of financial resources can be lost. In order to meet project requirements, projects must be managed effectively. Modern projects are more and more complex, at the same time data monitoring is more and more complex. The use of software tools makes it much easier to see all important project parameters

---

Corresponding author: Đorđe Milojević  
Email: [djordjevnilojevic@gmail.com](mailto:djordjevnilojevic@gmail.com)

and enables better project management. Project management software tools are used for project planning, scheduling, resource allocation and change management, control costs and manage budgeting, quality management and documentation etc (Jones, C. 2004).

Agile project management software tools enable tracking and more efficient and effective project management throughout its life cycle by ensuring tracking of data that is critical to increasing project success. In a study by Toor and Ogunlana (2010), it was found that agile project management practices, including the use of agile project management tools, were associated with higher project success rates. The study found that the use of agile practices led to increased customer satisfaction, better team performance, and higher project quality.

The most significant advantages of agile project management software are: project planning (Multiple project views for planning and scheduling), team collaboration, document management, task management (Gantt charts, kanban boards or task lists to schedule and manage tasks), resource management, cost management etc. There is a large number of solutions on the market and each of them has some specific features. Some of the software is based on the traditional waterfall methodology, which involves planning all aspects of the project in advance, and some solutions are agile, i.e. adapted to the needs of the environment, i.e. user requirements (Bernardino, 2013). When choosing the appropriate software, it is necessary to take into account several factors - the complexity of the project, the size of the team, the type of project, its scope, etc. On the market there are available proprietary solutions, but also a large number of open source tools (Ferreira & Tereso, 2014). Choosing the right software tool for project management will increase productivity and effectiveness and direct the work of the team in the direction of improving project results.

It is important to evaluate each tool carefully and consider factors such as ease of use, feature set, and pricing before making a decision. Each of the software tools has its advantages and disadvantages. Agile tool selection process should consider the project size, complexity, and team characteristics to ensure that the selected agile project management tool is suitable for the specific needs of the project. So, for example Jira is the most comprehensive tool for managing big agile projects, while Asana and Trello are more suitable for small teams and startups. (Fadwa Ahmed and Ahmed M. AlEroud, 2019 ).

The paper provides a comparative overview of agile tools for project management. The motivation for writing the paper is found in the fact that a small number of research papers have been written that provide a comparative analysis of agile project management tools. The contribution of the research paper is reflected in the systematization of the basic characteristics, advantages and disadvantages of each tool in one place.

## 2. Literature review

Research paper evaluates five popular agile project management tools, including Trello, Jira, Asana, Microsoft Project, and Basecamp (A. Elshafei, M. Azab, and E. Hammad, 2019). The authors compare the features, capabilities, and limitations of each tool, and provide recommendations for selecting the best tool based on the needs of the team and project. The authors conclude that Trello and Asana are suitable for small teams, while Jira and Microsoft Project are more appropriate for larger teams with complex projects. Basecamp, according to the authors, is ideal for small projects with simple requirements. Paper (N. Qureshi, M. Iqbal, and A. Khalid, 2019) show survey of agile project management tools and techniques used in software development.

The authors analyze the popularity, features, and limitations of different tools, and discuss the benefits and challenges of using agile methodologies in project management. According to that paper, Jira is the most effective tool for managing agile projects, followed by Trello, Asana, and Basecamp. The authors also identified factors such as ease of use, customization, and integration with other tools as important considerations when selecting an agile project management tool. Paper (" S. Seetharaman and K. Ramanathan, 2018) proposes a framework for selecting agile project management tools based on the project characteristics, team characteristics, and tool features. The authors use a case study to demonstrate the effectiveness of the framework in selecting the appropriate tool for a specific project. The authors suggest that the tool selection process should consider factors such as project size, complexity, and scope, team size, experience, and location, and tool features such as project tracking, team collaboration, and reporting. Paper ( M. Iqbal and N. Qureshi, 2017) presents an empirical study of agile project management tools used in software development. The authors evaluate the effectiveness of different tools in supporting agile methodologies, and identify the factors that influence the selection and adoption of agile project management tools. The authors evaluated the effectiveness of different tools in supporting agile methodologies and identified the factors that influence the selection and adoption of agile project management tools. The study found that Jira is the most commonly used tool for managing agile projects, followed by Trello, Asana, and Basecamp. The authors also found that Jira is the most effective tool for managing agile projects, followed by Trello, Asana, and Basecamp. However, the authors noted that the effectiveness of each tool depends on the specific needs of the team and project. Also, the authors identified

several factors that influence the selection and adoption of agile project management tools, including ease of use, customization, integration with other tools, cost, and team preferences.

Similarly, in a study ( N. Nasser and N. Aldmour ,2016) authors showed comparative analysis of some popular agile project management tools, including Trello, Jira, Asana, Redmine, and Agilefant based on various criteria such as project tracking, team collaboration, reporting, customization, and pricing. The study found that Jira is the most comprehensive tool in terms of project tracking and reporting, while Trello and Asana are more suitable for small to medium-sized teams with less complex projects. Basecamp is ideal for small projects with simple requirements, while Agilefant is suitable for distributed teams with a high level of customization. A study by Patah and Carvalho (2016) found that agile project management tools, specifically Jira and Trello, were associated with improved communication and collaboration among team members. The study found that the use of these tools led to better team coordination, faster decision-making, and improved project visibility. Najafi and Mohammadi (2016) found that the use of agile project management tools, including Jira and Trello, led to higher project success rates. The study found that the use of these tools led to improved project planning, better team communication, and more effective project monitoring. In a study by Schuh et al. (2019), it was found that the use of agile project management tools, including Trello and Jira, led to improved project performance in terms of project duration, budget, and quality. The study found that the use of these tools improved team communication, reduced project risks, and increased project transparency.

### 3. Methodology

Software tools can be classified based on the size of the software, the difficulty of use and the scope of the projects for which it is intended. Based on these criteria, the software is divided into three categories: light, medium and heavy. Lightweight software is meant to be designed for short-term, temporary projects or teams and is easy to use. Their disadvantage is that they are not flexible, i.e. do not offer the possibility of adaptation to the needs of a specific company. Trello belongs to these softwares. Middleware is more complex and is used in more complex projects where a balance between ease of use and adaptability needs to be established. Examples of these software include Basecamp and Asana. Heavy software stands out because it is highly customizable and has a steep learning curve. They are used for very complex projects and when it is necessary to manage large teams. Representatives of these software are Jira and Ms Project. Jira is more intended for agile projects while MS Project is intended for both traditional or waterfall model projects and agile projects. The paper presents the following software tools for agile project management: Jira, Trello, MS Project, Basecamp, Asana.

Jira is a project management tool developed by Atlassian (see more on <https://www.atlassian.com/software/jira>).

Jira is one of the most popular project management tools and is a safe choice for organizations. Jira is used by agile teams to plan, track, and manage their work. It provides a range of features, such as sprint planning, backlog management, and progress tracking, that support agile workflows. It is used for agile software development, but can also be used for other types of project management. Jira allows teams to create and track issues or tasks, assign them to team members, and track their progress. It also allows for the creation of custom workflows

and issue types to fit the needs of a specific project. Jira has a range of features including a customizable dashboard, agile boards, reports and charts, time tracking, and integrations with other tools like GitHub, Bitbucket, and Confluence.

The biggest benefits are for large companies, which have to coordinate multiple complex projects and need to adjust the work flow. It allows teams to plan and track their work using agile methodologies such as Scrum and Kanban. Jira enables the planning of tasks that need to be performed, monitoring the execution of tasks, managing stakeholders and their requests, creating reports on the results that have been achieved, and managing the budget. This tool features outstanding adaptability and the ability to analyze huge amounts of data. It offers a wide range of features, including backlog management, sprint planning, issue tracking, and reporting. Jira Software also integrates with other Atlassian tools, such as Confluence and Bitbucket, to provide a complete software development solution. Jira is highly customizable, with a wide range of configuration options that allow you to tailor the tool to fit your specific needs. Jira offers a range of collaboration features, including comments, attachments, and mentions. This makes it easy for team members to communicate and share information, and to keep everyone on the same page. The most common disadvantages of this tool are its price, inability to manage costs and assess risks. Also, some plugins and integrations don't work well.

Trello is a simple and easy-to-use visual project management tool that is particularly useful for agile teams (see more at <https://trello.com/agile>). Jira can handle large and complex projects, making it a good fit for teams of all sizes. It enables teams to create boards, lists, and cards that represent their workflow, and to move items between these elements as they progress through their work. Trello boards are organized into lists,

and each list contains cards. Agile teams can use Trello boards to create a Kanban board that represents their workflow. This can help teams to visualize work in progress, identify bottlenecks, and optimize their workflow. This tool can be used to plan sprints by creating a new board for each sprint. Teams can then create cards for each task, prioritize the cards, and assign them to team members. Trello's drag-and-drop interface makes it easy to move cards between lists as work progresses. Trello can be used to manage a product backlog, which is a prioritized list of features or tasks that need to be completed. Agile teams can create a backlog board in Trello and use cards to represent features or tasks. They can then prioritize the cards and move them to the appropriate list when they are ready to be worked on. Trello provides a range of collaboration features that enable teams to communicate, share files, and work together on tasks. Trello has a range of power-ups that can be added to boards to extend their functionality. Agile teams can use power-ups like the Agile Tools power-up to add features like burndown charts, velocity tracking, and cumulative flow diagrams to their boards. Trello also offers a range of integrations with other tools, such as Slack and Google Drive.

Some of the basic functions that can be performed within the software tool Trello are: agile project management, budgeting, monitoring problems that arise during project implementation, reporting, resource management, etc. Trello is a highly flexible tool that can be adapted to fit a wide range of project management workflows and use cases. Trello allows team members to collaborate and communicate in real-time, making it easy to share updates, feedback, and ideas. Its commenting and tagging features make it easy to stay connected and on the same page. Its customizable boards, lists, and cards make it easy to create a system that works for your team. Its user-friendly interface and flexible design make it

easy to customize to fit a wide range of workflows and use cases.

Trello may have some limitations when it comes to certain project management requirements. One potential deficiency is that Trello may not provide robust reporting capabilities for tracking project progress or generating detailed reports. Additionally, Trello may not be the best choice for large-scale or complex projects, as it may not offer the same level of functionality as more advanced project management tools. It also may not be the best fit for teams that require extensive collaboration features or complex task dependencies.

Asana is a flexible project management tool that can be used for both traditional and agile projects (see more on <https://asana.com/agile>). Asana provides agile teams with a range of features, such as task tracking, project management, and team collaboration. It can be used to manage all aspects of agile projects, from planning to execution. Asana can be used for task tracking because Asana enables teams to create tasks, assign them to team members, and track progress on these tasks. This can be particularly useful for agile teams, as it enables them to break down work into small, manageable tasks and track progress on these tasks over time. Also, Asana can be used to manage a product backlog, which is a prioritized list of features or tasks that need to be completed. Agile teams typically use a backlog to prioritize work and ensure that the most valuable items are completed first. This software tool is used to plan sprints, which are short periods of time (typically one to four weeks) during which a team works to complete a set of tasks. Agile teams typically plan sprints based on their backlog, with the most important items being selected for each sprint. This tool provides a visual project management feature called Kanban boards, which can be used to visualize work in progress and optimize workflow. Agile teams often use Kanban boards to track

progress on tasks and identify bottlenecks in the workflow. Asana provides a range of collaboration features that enable teams to communicate, share files, and work together on tasks. Agile methodologies emphasize collaboration, so these features can be particularly useful for agile teams.

Asana provides extensive reporting capabilities, with built-in reports that show key metrics such as project progress, task completion rates, and team workload. Asana is highly customizable, with a range of features that allow you to tailor the tool to fit your specific needs. You can create custom fields, project templates, and automation rules to match your team's processes and requirements. Asana also offers a range of integrations with other tools, such as Google Drive and Slack. Asana also has certain disadvantages. While Asana offers many powerful features and customization options, some users may find it overwhelming or difficult to navigate. The sheer number of options and settings can be daunting for new users, and it may take some time to fully understand how to use the tool. Also, Asana price can be relatively high compared to some other project management tools, particularly for larger teams or organizations that require more advanced features. Asana does not include built-in time tracking functionality, which may be a drawback for teams that require this feature for accurate project management or billing.

Microsoft Project is a project management tool developed by Microsoft, which supports both traditional and agile project management methodologies. In Microsoft Project, agile project management can be implemented through the use of agile boards, which provide a visual representation of work in progress, and through the use of sprints, which are time-boxed iterations of work. Microsoft Project enables team members to collaborate in real-time, share ideas, and provide feedback on tasks. Team members can use Teams, Outlook, or

SharePoint to communicate and share files (Microsoft. Collaboration in Project for the web, <https://support.microsoft.com/en-us/office/collaboration-in-project-for-the-web-8d4b3644-4efc-444c-aeaa-9b78c2b1d3c3>).

Microsoft Project includes powerful scheduling features that allow to schedule and track tasks, assign resources, and manage timelines. This can be useful for managing agile sprints or iterations. Microsoft Project allows you to manage resources such as team members, equipment, and materials, which can be useful for agile teams that need to manage resource availability and allocation. Another feature of this tool is that it supports the creation and tracking of agile artifacts such as user stories, backlogs, and burndown charts. Agile project management is based on an iterative approach, with regular feedback and adaptation. While Microsoft Project can support this to some extent, it may not be as flexible as other agile project management tools.

Microsoft Project is not specifically designed for agile methodologies, and it lacks some of the features that are essential for agile teams, such as sprint planning, task prioritization, and backlog management. Microsoft Project can be complex and difficult to use, particularly for teams that are new to project management or agile methodologies. Agile project management emphasizes collaboration and communication between team members, and Microsoft Project may not offer the same level of real-time collaboration features as other agile project management tools. Microsoft Project relies on a fixed hierarchy of tasks, which can be challenging for agile teams that need to manage changing requirements and prioritize tasks dynamically.

Basecamp is a simple and straightforward agile project management tool that offers a range of features for task management, team collaboration, and reporting (see more on

<https://basecamp.com/>). It is suitable for smaller teams or simpler projects. Basecamp has a simple and intuitive interface that is easy to use, which can be helpful for agile teams that want to focus on their work rather than spending time learning a new tool. Basecamp offers a range of collaboration features, including message boards, to-do lists, file sharing, and real-time chat, which can help agile teams stay connected and communicate effectively. Basecamp includes time tracking features, which can help agile teams monitor their progress and track how much time is being spent on each task or project. As a disadvantage of this tool we can state that Basecamp has limited customization options, which may not be suitable for agile teams that need more flexibility and control over their workflows. Also, Basecamp has limited reporting capabilities compared to other agile project management tools, which may make it difficult to track and analyze project metrics.

#### 4. Results and discussion

Trello is ideal for small, agile teams. It is easy to use and offers excellent flexibility and customization options. However, it may not be the best choice for larger teams or complex projects. Asana can be used for a wide range of projects, while Jira is specifically designed for software development and agile project management. Asana has more collaboration features, such as team communication and file sharing, which can help team members work together more efficiently. Jira offers a wide range of features, including sprint planning, backlog management, and reporting. It is suitable for larger teams and complex projects, but it may have a steeper learning curve and be more expensive than other tools. Jira offers more options for customization and automation of workflow, which can be very useful for complex projects, while Asana offers a more straightforward approach to

workflow management

Asana provides a clear overview of the project, allowing team members to see what needs to be done, who is responsible for each task, and the project's overall progress (see more on "The Best Agile Project Management Tools of 2021," The Blueprint, <https://www.fool.com/the-blueprint/agile-project-management-tools/>). Asana offers more advanced workflow features, such as task dependencies, custom fields, and automation, which can be very useful for complex projects. Asana includes task management, collaboration, and reporting. However, it may not offer as many agile-specific features as other tools, and the reporting capabilities may be limited for some users. While Microsoft Project can be used to support agile project management, it may not offer as many agile-specific features as other tools. It may also be more complex and time-consuming to set up and use effectively, which may not be suitable for agile teams that need to be nimble and adaptable. Basecamp offers collaboration features, task management, and time tracking, but it may lack some of the advanced agile-specific features that are available in other tools.

Basecamp has a simpler and more user-friendly interface compared to Jira, which can be more complex and overwhelming, especially for beginners. Basecamp is designed to encourage team collaboration, with features like message boards, group chat, and file sharing. Trello has a more visual and intuitive interface, which makes it easy to use and understand, especially for beginners. Trello, on the other hand, offers a simpler approach to workflow management. Table 1. provides a comparative analysis of tools for agile project management.

**Table 1.** Comparative analysis of agile project management tools

	Kanban Board	Scrum	Gantt Chart	Time Tacking	Calendar View	Mobile Apps	Desktop Apps	API	Free Trial
Trello	Green	Red	Yellow	Yellow	Green	Green	Green	Green	Green
Basecamp	Yellow	Yellow	Yellow	Yellow	Green	Green	Green	Green	Green
Asana	Green	Yellow	Green	Yellow	Green	Green	Red	Green	Green
JIRA	Green	Green	Yellow	Yellow	Yellow	Green	Yellow	Green	Green
MS Project	Green	Green	Green	Yellow	Green	Yellow	Green	Green	Green

### 5. Conclusion

Different projects require the use of different tools. When choosing a tool, it is necessary to take into account the type of project, the complexity of the project, the size and choose the tool that corresponds to the requirements of that project. For example, maybe the team is used to using Jira, but for short and simple projects, Trello is a better choice. Jira offers a range of features, including user story mapping, sprint planning, backlog prioritization, and real-time reporting. Jira integrates well with other tools such as GitHub, Confluence, and Slack, making it a popular choice for Agile teams. Trello allows teams to organize tasks into boards, lists, and cards. It offers a range of

features, including team collaboration, task assignments, and due dates (The Digital Project Manager, "Trello vs Asana: The Best Project Management App?", <https://thedigitalprojectmanager.com/trello-vs-asana-best-project-management-app/>).

Trello has a more visual and intuitive interface, which makes it easy to use and understand, especially for beginners. Asana enables task management, team collaboration, and project tracking. It has a user-friendly interface and allows teams to track progress in real-time. Basecamp is suitable for smaller teams or simpler projects. It enables task management, team collaboration, and reporting. Trello has a more visual and intuitive interface, which makes it easy to use and understand, especially for beginners (Adams, P. B., Preston, D. S., & Tilley, S. R., 2014). Microsoft Project provides a robust set of features for project scheduling and tracking, including Gantt charts and resource management and integrates with other Microsoft tools such as Teams, Excel, and Power BI (TechRepublic, "Microsoft Project vs. Asana: Which is better for project management?", <https://www.techrepublic.com/article/microsoft-project-vs-asana-which-is-better-for-project-management/>).

<https://www.techrepublic.com/article/microsoft-project-vs-asana-which-is-better-for-project-management/>.

## BUSINESS INTELLIGENT SYSTEMS AND DISCOVERY OF KNOWLEDGE IN DATA

**Abstract:** *Knowledge discovery in data (DM -data mining) is a discipline that is growing extremely fast, currently representing one of the most important paradigms of advanced intelligence systems and decision support systems. In this paper, based on a systematic review of the relevant literature and research conducted in practice, an analysis will be presented and the advantages, opportunities and benefits will be presented on the one hand, as well as weaknesses, threats, challenges, obstacles and limitations that the projects of introduction and implementation of business intelligent systems and techniques and methods will present. the discovery of knowledge in data (DM -data mining) carries with it. The fundamental goal of the research is to determine the key factors for the final success of the data mining implementation project in business through case study analysis. The process of discovering knowledge in data consists of: understanding the field of study, understanding data, data preparation, modeling, evaluation of results, implementation in practice, commonly used methods and techniques of machine learning and basic information about specific software tools.*

**Keywords:** *business intelligence, intelligent systems, data mining*

### 1. Introduction

The term business intelligence has multiple meanings and describes both business information and business analysis within business processes. Business intelligence is essentially an area within information technologies, the goal of which is to put the total information potential of the company into the function of making the best business decisions, in order to achieve the established and planned strategic goals of the company. Since it is a complex field, it includes various types of technologies and approaches from the fields of information technology, management, statistics and mathematics.

Companies in today's business conditions receive huge amounts of data on a daily basis, both from internal and external sources, which presents them with a problem of how to process these large amounts of data and obtain information from them that will be useful for their business. The estimated amount of information in the world doubles almost every 20 months (Dwivedi, Kasliwal, & Soni, 2016, p. 1).

In this sense, one of the possibilities available to business systems is the application of modern information systems with elements of business intelligence, the functional application of which can have a significant and in many cases decisive impact on the improvement of business

---

systems. Some authors point out that the process of introducing business intelligence should be seen as an organic cycle that develops over time (Olszak & Ziemba, 2012, p. 9). In order to confirm the initial hypotheses of this paper about the influence of business intelligent systems and knowledge discovery techniques in data on the operations of business systems, adequate systematic research of the relevant literature as well as research in practice was carried out, which unequivocally confirmed that the functional application of business intelligence systems and tools and techniques of business intelligence has a significant impact on the overall operation of business systems. Based on the review of the literature, it is evident that business intelligence comes to life in the full sense of the word only after several years of production and regular improvement of the original prototype.

In this direction, many business systems highlight the choice of technology when introducing business intelligence, at the same time neglecting the importance of organizational approaches, process changes and the introduction of good practices. Certain authors emphasize that for a successful business intelligence implementation project, an activity plan should be developed, including the start of the project, transformation and growth of business systems, that is, it is necessary to harmonize strategic goals with operational activities, establish basic indicators for determining the success of the introduction of business intelligence.

The process of implementing business intelligence into business systems is extremely complex and process oriented and requires the application of appropriate project management methodologies.

## **2. Business intelligence and intelligent systems**

Some authors emphasize that business intelligence is a common term that describes concepts and methods that improve business decisions or provide assistance in the decision-making process (Williams, 2016, p. 52). In this sense, the famous Greek businessman Aristotle Onassis once said: "The secret of business is to know something that no one else knows" [Lorange, 2001, page 32]. In the last decade, many business systems have invested heavily in IT operations. Despite these huge investments, a large number of business systems still have bulky data warehouses, but management is still faced with limited business information, which in principle would lead to a significant increase in productivity and profits (S.Williams and N.Williams, 2007, p. 20). Also, the same authors point out that business intelligence is, on the one hand, a way of business behavior, which enables business decisions to be made at all decision-making levels based on relevant and up-to-date business information, and not on intuition, premonition and subjective impression. Business intelligence is key to decision-making at all levels of management and leads to greater business efficiency, which represents a competitive advantage in challenging market conditions. In this sense, it can be found in the literature that business intelligence develops from increasing the productivity of employees in the first stages of development to the complete automation of decisions. Business intelligence is introduced into the work process to help people work and make decisions. Among other things, benefits from the introduction of business intelligence should be sought in quickly obtaining better quality information, better graphical visualization of results and therefore in faster and quality decision-making. In business practice, contextual graphic visualization is also used to show a

more efficient representation of decision options and the simultaneous possibility of updating decision options in real time directly in workshops with stakeholders. For example, with a contextual diagram, we visualize possible alternatives, and for each of the alternatives in the workshop, strengths, weaknesses and fears are expressed (Taylor, 2014, pp. 83-88). The decision-making process is thus more optimal, because it contains elements of creativity and, at the same time, due to visualization, it is also more useful, because with contextual diagrams we take all aspects of every decision that makes decisions, and therefore it is easier to cooperatively adopt an optimal balanced decision, taking into account all currently known aspects .

In the representative literature and business practice, among the various business opportunities that have already enabled the digitization of business, one of the possibilities stands out as intelligent sales, which, through the collection and processing of large amounts of data, calculates optimal service offers, optimizes the use of sales channels and, among other things, enables automation. and personalization of promotional activities and rewarding sales teams.

Well-known authors emphasize that from the IT point of view, business intelligence is a complex information system that collects data from various sources using automated procedures, processes them, transforms and integrates them, and provides users with access to quality information in an intuitive and easy-to-understand manner, and tools are connected to by detailed, thorough analysis of historical transaction data, stored in the DataWarehouse, or online server connected to the database [Williams, 2007].

According to eminent authors, the process of business intelligence is divided into several subfields (Klisarova-Belcheva, Ilieva and Yankova, 2017, p. 298; Williams, 2016, p. 28):

- ad hoc inquiry;
- indicators and control panels;
- e-mail alerts;
- data mining;
- inquiry and reporting;
- statistical analyses;
- multidimensional analysis.

The potential of business intelligence is being able to process large amounts of different data on a regular basis. Modern algorithms can process unstructured data, such as images and text, with the help of which you can read the mood of the party (Power, 2015, p. 2). In the future, business growth will be ensured by advanced algorithms of business intelligence, which will become a necessary tool for ensuring effective marketing, organizing work, motivating employees, partners and clients. Smart devices will become an increasing part of everyday activities.

In their research, some authors emphasize that the business value of business informatics should be sought in the ability to increase the efficiency of existing work processes (S.Williams & N.Williams, 2014, pp. 2-3). The quality of the established partnership between the information technology sector and the users greatly influences the readiness of the introduction. Poor cooperation resulted in poor planning, leading to significantly higher than planned project closure costs, mutual accusations and reduced engagement of key stakeholders (S. Williams and N. Williams, 2014, pp. 4-6).

The successful introduction of business intelligence is based on a consistent plan for the introduction and maintenance of business strategies and business processes, focusing on core business processes that create added value and alignment of business strategies with the strategy of developing business information, organizations and architectures (S. Williams and N. Williams 2014 , page 7). According to the same authors, when setting the tactics of introducing business intelligence, the decision-making culture

must also be taken into account and even the culture of using information and analytical applications (S. Williams and N. Williams, 2014, pp. 8-9).

One of the fundamental goals of applying business intelligence is to support the decision-making process based on relevant analytical data and thus alleviate the gap between current and desired performance on the company [Turban et al., 2011: 28]

The data readiness analysis should include confirming the complexity of the required information, the quality of the existing data and the convenience of alternative software solutions, taking into account the data and applications of state-owned technology companies (Cordoba, 2016, pp. 1-3).

Research indicates that the main drivers of the introduction of business intelligent systems can often be internal, but also external in nature. Previous research provides an overview of modern business intelligent systems, their evolution and increasing impact on business processes in organizations, as well as analysis through managerial aspects related to implementation based on already available information and interview results in the case of a company generated by a set of guidelines and recommendations for the implementation process business intelligence.

Well-known authors point out that a business intelligence system includes business models, data models, data sources, ETL (Extract, Transform and Load) tools for transforming and organizing data into useful information, data storage, OLAP (Online Analytical Processing) analyzes and reporting tools [Volitich, 2008]. A new approach called data mining appears as one of the recognized terms for the business data processing process (Dwivedi et al., 2016, p. 1).

### **3. Discovering knowledge in data (DM - data mining)**

Data mining is the most important product from the family of Business Intelligence products, the purpose of which is to find hidden patterns in data, increase their usability and transform that data into useful knowledge (Denić N. 2022). Data mining, an interdisciplinary subfield (Paiano & Pasanisi, 2017, p. 66), is a rapidly growing discipline, one of the most important current paradigms of advanced intelligence and decision support systems. There are several definitions of Data Mining. One of them is that, in principle, it is a data search technique in order to identify the required patterns and their mutual relations. Simply put, DM is the process of extracting interesting, new and potentially useful information or samples, contained in large databases, all with the aim of making correct business decisions. It can be defined as the discovery of useful information and knowledge from databases (Verma & Nashine, 2012, p. 604). If they recognize the benefits of using data mining and different data sources, they are likely to be more motivated to invest resources in data analytics in the future (Coleman Shirley, 2016, pp. 850-851).

The process of discovering knowledge in data-Data mining requires intelligent technology, adequate knowledge of the approach and the desire to discover potentially hidden knowledge from the mass of structured and/or unstructured data (Amani & Fadlalla, 2017, p. 2; Farooqi & Raza, 2012, p. 1). In this sense, some authors emphasize that the main purpose of data analytics is the application of advanced analytical techniques to large and diverse data sets (Dwivedi et al., 2016, p. 1). It is very important to note that it is only an approach that does not eliminate the need for knowledge of the business, data and analytical methods behind the tool (Amani &

Fadlalla, 2017, p. 2).

Because of the above condition, discovering interesting, useful patterns in uncertain data is more difficult and the potential benefit is commensurate with it (Leung, MacKinnon, & Jiang, 2017, p. 22). By this we mean return on investment (ROI) or a similar indicator that will be able to measure the benefits of implementation). Data mining is most effective in business systems that can link transactions to specific customers. Discovering knowledge in data offers challenges and opportunities in many fields, including economics, astronomy, chemistry, engineering, climate studies, geology, ecology, physics, biology, health, and computer science (Rawat & Rajamani, 2010, p. 1).

The described measures contribute to higher profitability, because the business system has more good customers in the long term, which is reflected in a better business result. 10 to 20% of customers make 50 to 80% of the profit of the business system and with the help of data mining it is possible to identify the relevant ones in the database of all persons. Business systems that have been operating in the market for several years are faced with a decline in the growth rate, and at the same time they have at their disposal a history of transactions or a huge amount of unused potential (Farooqi & Raza, 2012, p. 2; Gupta & Gupta, 2012, p. 5)

#### **4. Application of knowledge discovery in data in practice**

The use of data mining in practice is not so widespread or the probability of its introduction is lower due to its complexity. (Denić N. 2018). If we exclude the world's largest business systems today, many companies still do not use Data Mining methods to support the decision-making process. The reason is the complexity of these processes, which require many

interested parties with different knowledge and perspectives from different perspectives. According to a 2003 survey by the Cutter Corporation, an IT consulting corporation in the USA, only 15% of companies believe that the use of DM methods contributed to the improvement of their business. Research in practice has confirmed that the key factor is the sponsor of the project, i.e. the person who, with his status in the business system, contributes to the realization of tasks, regardless of the obstacles that appear on the way.

Data mining has found a wide application in the field of business systems in all areas, economics, mechanics, medicine, genetics, traffic, criminology, etc. Data mining can be applied in all those areas where large amounts of data are available, the analysis of which is intended to reveal certain rules, laws and connections. A prerequisite for the realization of the set goals is the right data, collected in an appropriate way. Some authors emphasize that the business system must evaluate the quality, content, availability and quantity of available data (Saarevirta, 1998, p. 5). Data mining may stop at this point for one or more of the reasons listed above. The results of research in practice indicate that new business systems usually do not have a large amount of data available about their clients. One of the largest British agencies for Direct Marketing, Rapp Collins, states that when analyzing databases through DM, only 18% of information from existing databases is used on average.

In terms of applying the technique of knowledge discovery in data, some authors point out that probably the most recognizable is the marker-basket analysis, whose main purpose is for the seller to obtain information about shopping behavior or what things people often buy together (Kaur & Kang, 2016, p. 78). This is compounded by the notion that the discovered relationships bring potential

value to other data mining techniques (Aggarwal, 2014, p. 130), because we already know the relationships between objects in advance. Using association analysis, we can predict a combination of many attributes, which gives freedom compared to prediction, where predictions are limited to a predetermined number of classes (Witten, Hall, & Frank, 2011, p. 72).

The literature emphasizes that the business data of a company is usually private, intended for use only within the organization (Coleman Shirley, 2016, p. 854). In this sense, data confidentiality is defined as data secrecy, which hides a set of attribute values from an unauthorized user. We consider the data of identified persons as personal data. Behavioral data refers to people's behavior in certain circumstances. Data mining includes both personal data and behavioral data. A person who consents to the use of his personal data by business systems must be aware of the purpose of use, confidentiality and integrity protection measures, consequences of non-compliance with agreed frameworks and other rights arising from this relationship (Witten et al., 2011, p.34). In the process of discovering knowledge in data, the quality of business data and information is very important (Denić N. 2016). In the relevant literature, it can be found that the quality of business data means the level to which the data meet the criteria of purity, completeness and sufficiency (Bole et al., 2015, p. 3). Practice shows that business system data is usually collected for immediate needs. In this sense, it is emphasized that satisfactory quality for current activities is not a guarantee that the quality is at a sufficient level for other purposes (Coleman Shirley, 2016, p. 856). Choosing the right data source is essential to the entire project of discovering knowledge in data. Incorrect records, irrelevant or conflicting fields, and outdated data need to be corrected (Verma & Nashine, 2012, p. 607). We also do not want imbalances or

missing values (Cao, 2017, pp. 64-65). Missing categorical values can be replaced by the most common value, and missing numerical values by the inverse value. Discretization is used to convert numerical values into categorical values (Goncalves, Barros, & Vieira, 2012, p. 3). With the mentioned operation, we reduce the number of values of a certain attribute by grouping them into interval values. With the help of normalization, we reduce the differences between data from different sources and enable their comparison (Sullivan, 2012, pp. 200-227).

## 5. Discussion

Although data mining is used in many business activities, research results indicate that it is not suitable for every business model. Then comes the question of where it pays to use. Those activities in which the work with the customer is exclusively electronic and the purchase potentially happens several times are very suitable. As an example of such a business model, I cite an online sports nutrition store. In this case, the human factor in the purchase process itself, which is difficult to include in the model, is minimal or zero. It's also fairly easy to measure user behavior online. In activities where a product or service is sold to a customer only once, the use of data mining does not make the most sense. The time of the company's existence on the market, the level of development and above all the quantity and quality of available data are important. An organization that is only in its first year of operation probably does not have enough data. We can conclude that the volume increases with age, but the quality of the data is questionable. Some customers were already suitable for a novelty such as the introduction of data mining in their business ecosystem at a given moment, some will be in the future. A huge amount of data was available for analysis, so for easier

understanding, a relational model was created that well identified potential problems in data integration and preparation. The understanding of the data is facilitated, among other things, thanks to the precisely given meta-description of the variables.

## 6. Conclusion

Business systems generate huge amounts of data every day that are difficult to analyze. Approaches that have yielded results in the past are no longer sufficient. The research results indicate that business intelligent systems are developed and designed to, among other things, support and facilitate the decision-making process in business systems and companies, which must be able to respond quickly and efficiently to the changing requirements of the business environment. The results of studious research indicate that the biggest contribution to the efficiency of the company is a quick insight into a large amount of data and shortening the time of accessing information. A thorough analysis of reports from business intelligent systems provides the possibility of developing a pattern, improving the company's operations with the possibility of timely influencing and intervening on the business processes of business systems and improving the overall operation. Discovering knowledge in data - Data mining is one of the possible answers to the growing analytical needs. When discovering knowledge in data, there are many opportunities, challenges, limitations and, above all, potential great benefits, which, with adequate effort, are also reflected in the financial sense. Therefore, it is very important that key users in business systems become familiar with the concept and methods of tools and techniques for discovering knowledge in data, because the amount of available data and information will surely increase in the future, and it is evident that it will not become clearer and

easier to understand and make decisions. The key success factors of the data mining implementation project can be identified through case analysis, namely: appropriate approach or selected data mining methodology, clearly defined and measurable goals, developed project plan with deadlines for the completion of each phase, composition of the project group with different knowledge, project sponsor with influence in the company, sufficient quantity and satisfactory quality of available data, provide meta description or meaningful interpretation of data, appropriate knowledge and tools for data preparation and modeling, realistic evaluation and presentation of obtained results. Research in practice shows that, on the other hand, you should not have unrealistic expectations. Data Mining cannot solve all the problems that business systems and their managers are trying to solve. In this sense, it is important to emphasize that DM only determines patterns in the data, new knowledge, which will help managers in the decision-making process, after they determine the problems they want to solve or the opportunities they want to use. On the basis of the above, the obvious conclusion is that Data Mining techniques, methods and tools are not and cannot be a substitute for effective management bodies of business systems. The research results of this work confirm the possibilities of using data mining in business systems, as well as the fact that the acquired knowledge can be applied to similar cases in all business systems in the country and abroad. Due to the combination of the maturity of machine learning algorithms, sufficient capacity and affordability of computers and software, and affordable cloud services, artificial intelligence, including data mining, is expected to be the driving force behind business decisions in the future. In the next few years, it is impossible to imagine a business system that will not use the potential of the data collected so far.

## IT PROJECT PLANNING PROCESS PARADIGMS

**Abstract:** *By implementing modern IS, companies today implement the best practices in their business processes and provide key users with easy access to business information that they use in the business decision-making process. Previous studies of the IT project planning process in practice indicate that the introduction of these sophisticated systems is not an easy task and in most cases 70% fail and represent a difficulty in business systems that try to implement them. In this direction, this research paper aims to find out whether companies and business systems that plan ERP (ERP-Enterprise Resource Planning) implementation in advance and whether such practice brings a positive contribution to the success of the implementation process. The results of previous research show that companies in the area today implement general practices in project planning, although they do not consider the planning process to be a separate phase in ERP implementation. However, they do not use some commonly known methods, techniques and tools for project planning. It is assumed that this is due to the lack of specific competencies, expertise and skills in the project management process. The research results indicate that experiences based on case studies, project scope and basic plan are mostly applied, while knowledge and risk management skills are applied the least.*

**Keywords:** *project planning, IT projects, ERP systems*

### 1. Introduction

Project management is essentially a rather complex and complex process. In this sense, many organizations decide to purchase software tools for project management purposes, but often without a detailed consideration of their specific needs and requirements. (Crawford, 2011). In this paper, based on relevant literature and experience in practice, an overview of some of the techniques, methods and tools that project managers usually use in project management. The results of the research indicate that project management is a really

complex job and an important matter, in this sense it is necessary to understand the reason and motivation for the application of methods, techniques and tools that can facilitate and speed up some of the stages in the project management process. One of the most widely used definitions is the one by the Project Management Institute (hereinafter: PMI) (2000, p. 4), which gives an idea of what distinguishes a project from other business models of a company. In this regard, PMI defines a project as "a temporary undertaking undertaken to create a unique product or service". Certain authors such as Weaver (2007, p. 16) emphasize that

---

Corresponding author: Zoran Nešić  
Email: zoran.nesic@ftn.kg.ac.rs

project design and management have existed since people began planning to achieve certain goals with limited resources. A closer definition according to PMI (2000, p. 6), is that "Project management is the application of knowledge, skills, tools and techniques to project activities in accordance with project requirements". Based on the above, it can be concluded that project management represents a set of tools and skills that help predict and control the results of efforts undertaken in the organization. In order to successfully manage projects, it is very important that they are completed on time, that they remain within the budget limits, and that the clients are satisfied with the results. The well-known author Schwalbe (2010, p. 63) in his research points out another specific feature of IT projects related to the project life cycle. Also, Schwalbe (2012, p. 8) states the three main limitations of any project, namely: scope, time and budget. In the professional literature of project management, these constraints are commonly called the triple constraint.

It is obvious that three key limitations lead to the success of an IT project: time, scope and costs, i.e. budget, however, in addition to these fundamental limitations, other types also appear in practice. In this sense, Schwalbe (2010) points out that good project management contains more than just taking into account the triple boundary as shown in Figure 1. The life cycle of an IT project can cover or contain several different models (life cycles) of software development (a single component or part software can be developed separately from the whole and with a different methodology), which again differs from specific project to project

There are significant differences between standard types of projects and IT projects, and that it is necessary to apply in these projects some specific techniques and methodologies that are suitable for the particularities of these projects. In this research, the emphasis is on the IT project

management process. This process involves the application of various skills, tools and techniques. By applying these skills, project teams can successfully manage all phases of a project: project initiation, project planning, project execution, and project closure. Managing these phases of an IT project can become even more challenging due to the continuous improvements that technology brings.

## **2. Theoretical background of IT project planning**

IT project management is essential because it should help business systems in their operations, to deal with these issues and overcome difficulties. In this sense, project planning is recognized as one of the most important phases of the project life cycle. The results of the review of the relevant literature indicate that also in the field of information technology, the project way of working is increasingly used and often work is done on complex projects, where, without the use of various methods, techniques and tools that help in risk management, their execution would not be possible.

Some authors in this sense emphasize that careful planning, according to Little (2011, p. 36), is one of the principles that must be followed in order to successfully implement the project. Other authors state that many IT projects fail before they are completed, due to insufficient planning (Phillips, 2011). Thus, in his research, Patrick Meehan, vice president and director of research at Gartner, a research and consulting company in the field of information technologies, points out that from 70% to 80% of failed projects are business intelligence [Meehan, 2011]. Good planning is, in fact, half the way to success. According to Marchewka (2002, p. 13), the project plan should provide answers to certain specific questions that more closely define all the frameworks of IT projects: resources, time frame, work method, job

description, cost price, answers to potential risks, etc. This is followed by authors who point out that the project planning process predetermines the work to be done in order to achieve the project's goal (Haugan, 2002, p. 3). It provides team members with detailed, precise instructions to follow throughout the rest of the project's life cycle and the tools to exercise control. This makes other activities in project management far more efficient and better.

Table 1, according to the well-known authors Brewer and Dittman (2013), presents the observed most significant differences recorded between construction and IT projects

**Table.1.** Comparing the differences between construction and IT projects (Source: J. L. Brewer & K. C. Dittman, *Methods of IT project management*, 2013, p. 1).

Category	Construction projects	IT projects
Change requests	Slow, gradual	Very fast, unplanned
Source of change	Known, predictable	Often unknown
Requests	A clear plan	Often ambiguous
Uniqueness	Often repeated	Rarely recur
Resources	Constant	Hesitating
Use	Structured, under control	Often chaotic
Examination	Defined, measurable	Difficult to verify all options

The results in Table 1 clearly indicate significant differences in these types of projects and that it is necessary to apply a special methodology to IT projects. Certain authors such as Aladwani (2002, p. 223), point out that planning plays a major role in achieving success in IT projects. IT project planning requires an adequate methodology, including various practices, as well as tools

and techniques that facilitate the introduction of such practices, for this purpose some of the most popular are the Gantt diagram, the network diagram and the critical path method (Schwalbe, 2010, p. 12).

### 3. Characteristics of the process of introducing IT projects

Each area of project management has some specific characteristics, and thus differences that distinguish it from other projects, this also applies to IT project management. Many IT projects fail precisely because they fail to deliver an acceptable product on time and within budget. IT project management deals with the management of the application of new modern technologies, and at the same time it includes methods and techniques for leading and motivating project team members. One of the main problems of IT projects lies in predictability itself, that is, there will be unpredictability. The results indicate that this primarily relates to scope and quality, as these projects are difficult to identify at the outset and often change during the project. It is important to note that its goal is not the technology itself, but the achievement of specific business goals, such as improved customer service or increased profitability.

The one who leads the project must take care of the balance of the team, human resources and the technology itself, and that it is precisely this that conditions the increase in productivity and the creation of profits of the business system. In the relevant literature, so-called project information systems are mentioned as a tool for the aforementioned needs. This type of system is characterized by several definitions, one of them is the PMBOK definition (PMI, 2008, p. 443) which points out that a project information system is defined as an information system that consists of tools and techniques for collecting, integrating, combining, searching and disseminating information and

documents that are generated within the project management process. In addition to the known functionalities, Portny (2010, p. 241) adds the analysis of collection and reporting and the storage of information. Building on previous views, some authors (Caniëls in Bakens, 2011; Karim, 2011) emphasize the use of an information system that supports decision-making at all levels of the organization, especially in planning, organizing and project control in independent complex projects as well as in a multi-project environment. Moszkiewicz and Rostek (2011) list other important characteristics of a project information system, especially related to data management, such as knowledge retention, standardized data record, data confidentiality (data access management), data integrity (relevance, completeness, accuracy, timeliness of data), availability of data (data available on request), easier data search, ensuring data durability (storage). Certain authors, such as Raymond and Bergeron (2008), point out that the information system project would contribute to the effectiveness of the project to a certain extent, which, in their opinion, states that the planning, monitoring and control of the project should be improved, as well as the timely making of business decisions and better control over the use of resources.

One of the characteristics of IT projects is that it is difficult to obtain the requirements and wishes of the users, and even more difficult or almost impossible, that the requirements do not change for a long period of time. In addition, such planning is often used in such projects, when a milestone represents the completion of an individual phase of the project's life cycle. All this leads to the conclusion that the IT field is very broad and includes various types of IT projects. Cadle and Yeates (2008, p. 3) group them into nine broad categories: software development, package implementation, system improvement,

sonsalting and business analysis tasks, system migration, infrastructure implementation outsourcing (and insourcing), damage remediation and minor IS projects.

In the relevant literature, certain factors are mentioned for the selection of project management tools. For example, Brandon (2006, p. 344) mentions the following typical elements in selecting the appropriate software package: required performance and functionality, complexity and number of projects, size and complexity of the organization, methods and techniques used, limitations on the platform, locations and types of users and budget constraints. Certain authors such as Young (2007, p. 265) emphasize that even expert and extensive knowledge of the project management process and access to appropriate software tools still do not guarantee a carefree and smooth project flow (if it exists at all). Similarly, Brandon (2006, p. 344), who mentions that modern IT projects are the most suitable web tools, since they use wide relational databases, are very flexible and have a modern graphical user interface.

Many of the selected project management software tools could also be called software packages or even information systems, which is not wrong from a certain point of view because they offer a very wide range of functionality. The results of research in practice say that no tool is perfect, but that it is important to take into account that the decision to choose depends primarily on the nature of the company, needs, types of projects, current processes and tools, and last but not least, the culture and company policy (McCormick, 2012). The tools, techniques and knowledge areas as described in The Guide to the Project Management Body of Knowledge (hereafter: PMBOK) published by PMI have become a widely practiced standard in many branches of business worldwide (Hewagamage and Hewagamage,

2011 , p. 91). The implementation of this standardized practice or the development of an internal methodology is, according to Weaver (2007, p. 6), a key instrument for the successful completion of projects, programs and portfolios. Below are some of the most commonly used project management tools. One of the most famous is certainly the Microsoft Project software tool, which can without a doubt be considered one of the most widely used tools and as much as statistics show that it is the most widely used software tool in this field. In addition to the above, a software tool for project management support - Zoho Projects - is often used in practice. This software tool is used in a wide range of areas, especially in small and medium-sized organizations, for personal use, or even in departments of larger organizations. The following project management software called Celoxis is developed by Celoxis Technologies and has received a lot of attention for its product. It is one of the software tools available in both desktop and web version. Software support for all key areas: planning and monitoring, resource and cost management, error tracking system, portfolio project management, reporting, etc. ProjectManager.com, which is a relatively new player on the market and was developed by Online Manager, is also widely used in practice. The software tool is available only as a cloud-to-cloud service and is intended for individuals or project teams in primarily small, medium and even large enterprises. Also another tool that ranks quite well is OpenProject which has a number of useful features and functionalities, which are welcome in the IT project management process, such as a bug tracking system, document management, reporting and project progress monitoring.

#### 4. Characteristics of the process

Most of the analyzes of unsuccessful introduction of IT projects, which are carried out after their completion, point to the causes and problems that arose during the life cycle of the project, which could have been avoided if they had been identified at an early stage of the project, i.e. if the high-risk elements had been addressed then. .( Denić N, 2020) Some authors sorted and presented the differences between certain types of projects depending on certain categories. In Canada, in 1997, a study was conducted that focused on the problems that arise in the management of IT projects. This survey covered 1,450 organizations from the public and private sectors (Whittacker, 1999, p. 23). Research has shown that the three most common causes of IT project collapse are:

- poor project planning, i.e. poorly prepared project plan and inadequate risk management project,
- bad business example,
- lack of participation and support of the company's top management when establishing the project.

IT projects are proven to be the most difficult projects to implement, the success of which depends on many factors. (Denić N, 2020) Their complexity requires a very high degree of expertise, they contain a large number of interconnected and dependent activities in which a large number of people from different fields with different approaches, motivations and experience participate. The results of the research carried out in 1995 by the Standish Group under the name "CHAOS" in which it was stated that only 16.2% of IT projects were successfully completed. The survey also found that 31% of IT projects were abandoned before completion, costing US companies and government agencies more than \$81 billion. This is followed by later research by the consulting firm McKinsey

from 2012, in which it was found that large IT projects in 45% of cases are not realized within the planned budget, and in 7% of cases they are not realized on time (McKinsey&Company, 2012). Gartner research predicts that by 2025, all industries will be transformed into new digital approaches (Cearley, Burke, & Walker, 2016, p. 2). In order for the IT project to be successfully implemented, it is necessary to adapt the project management, so that it reflects the current business environment. It is also necessary that there are processes and tools adapted to take into account the characteristics of the information technology environment.

Below are the results of the research where some of the most commonly used software packages for project management were investigated and evolved in detail: Microsoft Office Project 2013, Zoho Projects, Celoxis "project2manage" and OpenProject. The results of the research show that the application of the Microsoft Office Project program package in planning, organizing and implementing the information system greatly facilitates the work of the key users who perform these tasks, and above all the immediate implementers, that is, company managers. Namely, this software package can be used to plan needs, as well as keep complete records of cars, customers, transactions, and therefore also of the potential engagement of personnel and equipment, required purchases, time of engagement, cost prices, preparation of reports with various indicators, etc. In addition, the results show that the software application "project2manage" for project management can be very useful, because it facilitates the tasks related to project management, which are listed at the beginning of the paper. But of course it is not a done deal and "project2manage" will not be able to be a substitute for a real engineer and manager at all times. The following table 3 shows the results of the

comparison of the analyzed software tools for project management.

When it comes to the success of IT projects, the authors often mention the so-called Chaos Report, conducted by The Standish Group. The first such survey was conducted in 1995, and the results were surprising, as only 16.2 percent of projects were completed on time, within budget, and within budget. 52.7 percent were only partially successful, meaning that at least one of the above-mentioned limits was exceeded. 31.1 percent of projects were unsuccessful or terminated too late. In the following years, a number of such studies were carried out, where there was a slight trend of increasing successful projects. According to the Standish Group, the latest data for 2012, the article states, 37% of IT projects are successful, 42% are partially successful, and 21% are unsuccessful. Based on the results of this research, the main recommendation would be that although every project planning process is important for the success of the project, as stated in the literature, it is necessary to put more effort into the development of the business case and the basic plan.

## **5. Conclusion**

IT project management is one of the specific areas of project management. The implementation of IT projects today represents a great challenge, primarily due to the increased needs and demands of IT applications and the growing complexity of the development and integration of IT systems with business processes. The test results indicate that virtually no software tool is designed solely to support IT projects, and therefore there are some software tools that offer additional functionality that can provide more efficient project management and project work. There is rapid and continuous development of hardware, software and ICT infrastructure. Also, the

results of the relevant literature research and on the basis of implemented projects in practice, it is evident that a small number of IT projects were completed in the agreed time. Based on the previous research, the conclusion is that IT project management is generally different from any other area of project management. In this research work, based on a comprehensive survey, it was proven that IT projects have their own specifics from company to company, as well as that specific project management activities should be adapted for each type of business, according to the specifics of business processes, for which an analysis of new concepts and management methodology is necessary. projects and determining which one is most suitable for each activity and specific company. The research results of this paper indicate that inadequate project planning, insufficiently prepared project plan and poor risk management project lead to the failure of IT projects. Also in this paper it is shown that no project methodology by itself guarantees the successful completion of the project, but is only a tool that makes the work of project teams, led by the project manager, easier and increases the possibility and probability of success.

It is important to emphasize once again that IT projects often fail, due to non-fulfillment of the agreed time limit and breaking through the budget, and in this sense, the application of software for control, monitoring and cost management of IT projects is needed. jeron provides significant positive results in the business of the company. The research results indicate that it is best and necessary to learn from past mistakes and to improve project management techniques, so as not to endanger the company or organization due to unforeseen costs caused by the failure of IT projects. IT project management is of great importance for the company and it is always possible to further examine and analyze it, because it can still be observed and analyzed

from different perspectives. Each novelty for this is a step forward, a step that can contribute to a better understanding and clearer definition of individual factors that influence the success of an IT project, and thus indirectly increase the probability of success in the implementation of IT solutions or draw attention to aspects that lead to the failure of such projects A better organization of project management in the implementation of strategic projects in IT can improve efficiency and ensure the successful completion of projects. A prerequisite for successful projects is a close connection between strategic business planning and strategic information technology planning. In addition to project management in all phases of IT project management, it is very important that the project manager has knowledge in the field of human resources. IT project management represents the future, which is also the reason why an increasing number of companies are project-oriented when it comes to activities related to modern technologies. The conclusion is that the choice of the right software tool for project management is sensitive and systematic, as well as that in every case, before making a final decision on the choice, the software tool must be tested. MS Project has proven to be one of the tools without which no serious IT project can be managed today. The program itself covers all the options required for successful project management. The results of the study show that SMEs implement general practices in project planning, although they do not consider the planning process to be a separate phase in the implementation of IT projects. However, they do not use any special project planning tools, such as a Gantt chart or WBS. It is assumed that this is due to a lack of project management skills within the surveyed companies. From the project planning practices that have been observed, the most practiced are those involved in the

development of the business case, the scope of the project and the basic plan. Practices for risk planning were practiced the least, which is in accordance with the results of the relevant literature research.

## SOFTWARE IMPLEMENTATION OF IC TOPOLOGY TRANSFORMATIONS FOR PROTECTION AGAINST HARDWARE TROJANS

**Abstract:** *This article focuses on software methods for detecting and preventing the introduction of hardware trojans into the topology of integrated circuits at the design stage. An additional recommendation for typical procedures of receiving GDSII files that significantly complicates the introduction of HTs into the topology is to facilitate detection methods by including special self-test structures created after performing transformations of the initial topology and ensuring the effective examination of ICs at the post-manufacture test stage. The proposed method is based on the analysis of synthesis results at the level of netlist description, its subsequent software conversion into a topological drawing, shifting standard cells and filling created voids with special self-test cells. The method is simple to implement during the topology design stage and can be recommended for use in design centres for machine learning of computer-aided design systems.*

**Keywords:** *Hardware Trojans; Topology Transformation; Built-In Self-Authentication Scheme*

### 1. Introduction

Intentional and malicious modifications of integrated circuits designed to change the behaviour of a circuit and achieve a certain goal are called hardware trojans (HTs) (Bhunja & Tehranipoor, 2018; Kuznetsov & Saurov, 2016a). Trojan attacks can be carried out by changing a technology (for example, by replacing the doping type), introducing analog and digital components (for example, by switching on an external chain when charging a parasitic capacitor or adding functions of a finite-state machine that are actuated from unused conditions). The article (Chaduvula et al., 2018) discusses different security techniques in the field of digital technologies, such as

encryption and shared use of know-how, as well as in areas related to design and manufacture, such as physically unclonable functions (PUFs) and watermarks attached to a physical part to protect it against counterfeiting and unauthorised access. It is proposed to classify these methods depending on their effectiveness for various competition models at different stages of product development. This classification can help developers make reasoned decisions on security practices during product development.

One of the first methods of synthesising reliable microchips using unreliable CAD tools is proposed in the work (Knechtel et al., 2020). This approach allows us to use CAD tools for complex synthesis tasks and

very simple reliable tools that can be used by designers to verify results and change specifications. The main idea is to limit the design tools used so that an unreliable tool has no room to add any malicious changes to the design.

Short-term and medium-term possibilities for integrating design methods based on the safety of EDA tools are presented in the work (Potkonjak, 2010). The article considers conceptual problems for the safe organisation of countermeasures against different threat vectors and security indicators.

Since there are different types and size of hardware trojans, a combination of protection methods is required to ensure an acceptable level of security, both in design at different levels of abstraction and in IC testing after manufacture. In the latter case, verification will require a combination of operation logic verification and side channel analysis to cover trojans of different types and sizes with large variations in parameters. The main development problems in this area include: mechanisms for detecting analog trojans that can carry out numerous types of activation and observation conditions, as well as a comprehensive metrics for quantifying the level of confidence that combines the analysis of design and testing methods.

In recent years, trends have included more advanced functions, such as temperature activation, radio channel and power activation, optical side channel reading, accelerated chip aging, and denial of service (DoS). According to the currently established classification (Chakraborty et al., 2009; Pevtsov et al., 2019), it is customary to distinguish hardware trojans by introduction phases, abstraction levels, activation methods, effects and locations. This classification implies that each of the above categories contains several attributes and is based on the fact that a classification should cover all trojans and should describe all

methods of how they cause harm.

The classification by introduction method describes the stages of the design route where a project is vulnerable to malicious modifications.

The classification by abstraction level describes the different stages of IC development, including IC introduction before their manufacture. This level covers both the design of topology (i.e. at the physical level) and the determination of a netlist and communication protocols used in an IC (i.e. at the system level).

The activation method describes the means by which an undeclared function is activated. This includes permanently active backdoors, as well as trojans that require certain triggers to be activated, such as internal sequential counters or external triggers from input data flows.

The category of harmful effects describes the undesirable result of a malicious change, which can manifest itself as a change in functions or even a complete failure of a microchip.

The location category describes where a change in the initial design can be physically implemented within a microchip or equipment. In this case, the target of an attack may be either one component, for example, a system clock with introduced timing errors, or several complex components, for example, processors for changing the order of command execution.

A new classification is also proposed, based on the location of IC protection means (the chip itself or its packaging) and the type of protection: protection against unauthorised access or authentication (Fievrea et al., 2015). It is concluded that security methods should be aimed at meeting the requirements of new technologies, such as 3-D systems-on-chip and wearable devices. It is noted that it is promising to use new optical means, such as arrays of nanowires or a method where technical defects are used to create

“fingerprints” as information encoded in the form of electromagnetic radiation from a working circuit.

## 2. Previous work

Since all modern VLIC developments are carried out with a certain degree of participation of other companies, a prerequisite for ensuring the reliable operation of these products is to develop and perform special organisational and technical activities to analyse, identify and eliminate possible design distortions in the form of software and/or hard-ware backdoors directly during the design or manufacture stages.

The website <https://www.trust-hub.org> regularly updates a collection of hardware trojan tests that have been developed and updated by researchers in the hardware security and trusted design community.

The works regarding IC countermeasures consider the issues of both detecting (Huang & Wang, 2020; Khairallah et al., 2018; Kuznetsov Saurov, 2016b; Kuznetsov Saurov, 2017a; Moein et al., 2017; Yuan et al., 2021) and preventing hardware backdoors to protect ICs (Chakraborty & Bhunia, 2009; Herder et al., 2014; Kulkarni et al., 2016; Kuznetsov & Saurov, 2017b; Shekarian et al., 2013).

The authors of the publication (Moein et al., 2017) note that hardware trojans have a number of properties that can be used to systematically develop detection methods. Based on this concept, they present a detailed overview of modern methods for detecting trojans and the characteristics of existing hardware trojans, and also propose a new approach to identifying and classifying hardware trojans. This identification can be used to compare the risk or seriousness of trojan programmes with the effectiveness of trojan detection. Identification vectors are generated for each hardware trojan and

trojan detection method based on corresponding attributes: insertion methods, abstraction levels, influence effectiveness, type of logic, influence method, activation method, physical implementation at the topology level, location within the IC, etc. Based on the system of quantitative assessment of these attributes, vectors that reflect the risk or seriousness of trojan attacks and the effectiveness of their detection are determined.

Another method of detecting hardware backdoors is proposed in the work (Khairallah et al., 2018). For hardware encryption systems, there is a design method based on the integration of a specially developed sensor circuit based on a ring oscillator located around potential targets of a trojan attack without any loss of circuit performance.

Unlike the existing solutions at the IP core level, solutions presented in the work (Huang & Wang, 2020) also take into account architecture-level security threats and use a strategy of introducing distributed IP security units to ensure reliable SoC operations with unreliable IP units. Special side channel attack protection modules built into the IC, physically unclonable modules and circuit abnormal behaviour monitoring modules were installed on a FPGA platform. The experimental results show the effectiveness of the proposed approach for ensuring that a system is protected against various attacks. Built-in IP units bring low overhead expenses, do not affect main IP units and have such characteristics as flexibility, scalability and diversity.

In the context of HT detection measures, works aimed at ensuring the security of built-in processor cores deserve special attention. In particular, the work (Yuan et al., 2021) notes that hardware trojans are one of the main hardware security threats for general-purpose registers (GPRs) of processors. This article presents a new method for detecting HT attacks by

comparing the conditions of GPRs with a built-in reference model in real time. The authors used this method in the design of a RISC-V core and studied its effectiveness. The experimental results show that all accidentally inserted HT attacks can be detected in real time with a delay of two cycles.

The article (Kulkarni et al., 2016) presents a method for detecting hardware trojans during the operation of a multi-core processor using machine learning. The support-vector method (SVM) is used for machine learning. A data set is generated based on the behaviour of a multi-core router in a normal mode and when a hardware trojan is activated. The article discusses various communication attacks initiated by hardware trojans, namely: spoofing, redirection of one traffic packet to a random core, routing loops. An algorithm based on the support-vector method has the detection accuracy of 94% ÷ 97%. The implemented structure for detecting trojan attacks increases the chip area by 2%.

Software and hardware methods for counteracting HT introduction are considered in the work (Kuznetsov & Saurov, 2017b). In one option in the article (Herder et al., 2014), it is suggested to use physical unclonable functions (PUFs) in low-cost applications for the authentication and generation of encryption keys. It discusses the weaknesses of PUF implementations and their use in key generation applications associated with constructing error correction schemes based on sample matching and index-based coding.

Another protection option is to use a key-based obfuscation method to ensure protection against hardware trojans (Chakraborty & Bhunia, 2009). The obfuscation method is based on changing the state transition function of this scheme by extending its reachable state space, allowing it to operate in two different modes—normal mode and obfuscated mode. This

modification makes it difficult to insert difficult-to-detect trojan backdoors into the design at both the software and hardware levels. The authors presented a functional OBISA circuit (obfuscated built-in self-authentication). This circuit is connected to the initial design circuit and achieves the goal of deceiving the attacker by reducing the empty chip space and making it difficult to interpret the functional purpose of a particular circuit element. The mechanism for selectively disabling various circuit sections and the method for selecting the path of a useful signal proposed in this article reduce resources potentially expended for filling.

The work (Shekarian et al., 2013) suggests a method called DfHT (Design-for-Hardware-Trust). The purpose of this method is to construct a scheme with maximum density. Instead of non-functional filling cells, it uses functional testing ones. However, functional cells can greatly limit design traceability. This paper also presents an improvement algorithm to minimise limitations imposed on tracing.

This method, in particular, was developed in the works (Xiao & Tehranipoor, 2013; Shiet al., 2019). The work (Xiao & Tehranipoor, 2013) suggests to include built-in self-authentication (BISA) circuits in the design for protection against HT introduction. The idea of this method is to fill unused spaces in a chip with functional cells—fillers that form logic devices of combinational or sequential logic, the correctness of which is checked by the BISA device itself, as a result of which a digital signature is formed. Any change in BISA chains will result in a different signature. Thus, BISA can be used to prevent or extremely obstruct the introduction of trojan programmes. BISA is applicable to any single-module or hierarchical design.

The work (Shi et al., 2019) suggests the joint use of the BISA concept and split manufacturing. It is noted that split manufacturing is designed to prevent IP

piracy and IC cloning, but it does not prevent the untargeted introduction of hardware trojans and results in considerable overhead expenses when a high level of security is required. Built-in self-authentication (BISA) is an inexpensive method of preventing and detecting the introduction of hardware trojans, but it is vulnerable to IP piracy, microchip cloning or attempts to hack original circuit features. This article suggests an obfuscated BISA method that combines and optimises both methods so that they complement and enhance protection against both vulnerabilities, while minimising design overhead expenses to such an extent that the proposed method does not require excessive expenses for industrial-level designs. According to the authors' estimate, the proposed method more than doubles the level of security, while reducing overhead expenses from hundreds of percent to less than 13% in capacity, 5% in delay and zero percent in area compared to the best declared performance in the existing technologies.

A number of publications address the application of symmetry principles for detecting and preventing HTs.

The article (Vaikuntapu et al., 2016) suggests a method for detecting trojans inserted after the completion of development, i.e. a trojan is inserted at the topology level. Since golden ICs, guaranteed to be free of trojans, are not always available in all cases, it is relevant to develop a detection methodology that does not require any gold microchips. This work uses the concept of asymmetric path delays to detect trojans, taking into account changes in delays of symmetric pairs due to the insertion of a trojan. Proposals are formulated on the methods of detecting suspicious ICs by comparing the metrics of two symmetric signal propagation paths. It has been shown that the proposed method is quite resistant to the influence of changes in the manufacturing process. In particular, the modelling results show that the total

probability of trojan detection is close to 100% with a maximum change in threshold voltage and gate length of 8% in one chip and with a variation of 10% between batch chips.

The article (Xue & Ren, 2018) suggests a novel microelectronic HT detection circuit based on timing analysis. This detection method can be applied in both combinational and sequential circuits. The proposed technique is implemented in the IBM 90 nm CMOS processor and Xilinx ISE PLD. Experiments have shown that one detection circuit embedded in the test-path can detect a HT with a size that is 2.81% of the host-circuit size with a detection probability of 90%. The probability of false positives is controlled effectively by the testing clock frequency. For 90nm CMOS ASIC tests, the ratio of the detectable HT size to the host-circuit size ranged from 2.81% to 3.37% with a detection probability of 90% at 10% FP. For PLD implementation, the ratio of the detectable HT size to the host-circuit size ranged from approximated 0.5% to 0.9% with a detection probability of 90%. The detection probability decreases with a decrease in the HT size, but can be additionally improved by applying a larger number of detection circuits on a test-path. Moreover, a ring oscillator can be introduced to estimate operating temperature and changes in the test-path process for calibrating detection parameters, which eventually increases detection probability.

A similar method based on delay analysis is proposed in the work (Jin & Makris, 2008). To reduce the overhead expenses of analysis, the authors proposed to divide the design into separate sections, each of which has much smaller dimensions than the initial dataset, but reflects the main characteristics in the initial datasets. The results of experiments with circuit sections with comparators and counters show that the detection rate of payload trojans is 100%. However, the authors note that this method

does not work well in the case of trojans, the effect of which is activated only after the occurrence of their activation event.

The articles (Cui et al., 2018; Yoshimizu, 2014) suggest a two-phase technique based on signal symmetry analysis that determines delays in path pairs for HT detection. At the design stage, a full-cover path set that covers all the nets of the design is created. At the test stage, the actual path delay in the full-cover set is extracted from manufactured circuits, and the travel of signals in path pairs is compared to a reference order generated at the design stage. A mismatch between them indicates the existence of HTs. Both process changes and measurement noise are taken into account. The efficiency and accuracy of the proposed technique are confirmed by a series of experiments, including the examination of both violated path pairs caused by HTs and their false activation rate.

Therefore, currently there is no clear trend in the development of HT detection methods. The variety of detection and anti-implementation techniques proposed so far provide the opportunity to combat various types of HTs in various hardware platforms. An obvious condition for IC design for trust (DfT or DfS—Design for Security) is the preliminary analysis of possible trojan attack models and the development of appropriate detection and/or prevention measures.

Such measures, in particular, are:

- Analysis of standard element libraries used in the design, with a full disclosure of their specifications, i.e. descriptions at the level of topology, circuit diagrams and methods for checking design and verification rules.
- Application of trusted complex functional units, control of the design route, introduction of the designed node circuit into the topology, which perform the functions of obfuscation,

camouflaging, filling of the topology free spaces. Obfuscation is a method of hiding circuit functionality by inserting an additional logic-locking circuit into the design in order to conceal its functions and intended topology. Camouflaging is a method of creating indistinguishable layouts of gates using additional dummy contacts and fake connections between layers, which prevents the attacker from re-designing the circuit's netlist. When filling empty topology spaces, additional functional elements are intentionally added to the design, which form combinational logic that can be tested during the design process and whose mal-function can serve as evidence that the topology has been distorted during manufacture.

- Implementation of split manufacturing where the factory with design rates of 40...7 nm produces the main part of a circuit without revealing its functions, and the final stage of IC manufacture is carried out at a trusted factory.
- Creation of VLIC nodes based on new principles of digital electronics, in particular, based on quantum effects and microelectromechanical nodes.

Development of special hardware measurement methods and analysis of their results for monitoring the functioning of manufactured circuits and their parameters.

### 3. Problem statement

Depending on the attacker's potential possibilities, a HT can be introduced, in one way or another, at any stage of IC creation, however, this action can be relatively easily carried out and relatively easily detected or

prevented during the design stage. At the same time, the cost of localisation and control of the development and design process is millions of times lower than the cost of localisation and control of the IC manufacture process, which makes the task of counteracting the introduction of HTs at the manufacture stage a high priority.

In order to choose the optimal method of counteracting the introduction of hardware backdoors, it is necessary to separately consider the characteristic advantages and existing disadvantages of the above methods. We can divide the methods of counteracting the introduction of hardware backdoors into two groups: DfT (design for trust) and SMfT (split manufacturing for trust).

The methods of the DfT group usually involve inserting additional circuit components, obfuscation functions into the design or reducing the empty space of a chip. This also results in additional overhead expenses in the form of increased chip area, increased dissipated power and signal propagation delays, which is a major limitation of the DfT approach. However, for some specialised mission-critical ICs produced in small batches, this method is an excellent protection option. The method can significantly improve the security of ICs.

The main idea of the SMfT methods is to share out the stages of IC manufacture among several factories. These methods allow to effectively implement mutual physical isolation of untrusted and trusted manufacturers, thereby minimising the probability of HT introduction. At the same time, the SMfT methods have a long production cycle and higher production costs than the DfT methods, and cannot be used for large-scale production. It is necessary to separately consider the logistics problems during the movement of plates between factories, and the issues of economic efficiency in case of a sharp drop in the release of suitable products in case of violating the standard technological process.

In the current conditions of extreme technological dependence in the field of semiconductor production with nanometre topological norms and the absence of appropriate trusted manufacturers in the country, technological methods of counteracting the introduction of hardware backdoors are still not applicable.

Based on the assessment of the attacker's high potential (capabilities of the enterprise/group of enterprises/state's level to develop and use special means of exploiting vulnerabilities), measures to counteract the introduction of hardware backdoors that make it difficult to analyse initial circuits and topological drawings may be ineffective due to the potential attacker's ability to extract initial design documents.

Therefore, the only group of methods applicable in this situation are methods of increasing testability and filling the area of a topological drawing. Testable design and testability improvement are currently a standard approach to VLIC design, are well studied and will not be discussed in this work.

A universal approach to counteracting the introduction of HTs into a topological drawing is to limit the free area on the chip (filling the empty space of the chip): the filling is associated with minimising the use of non-functional cells in the circuit, inserting a specially designed detection circuit (BISA) or removing the empty space, in order to limit the space where HTs can be inserted.

Summarising the known approaches to counteracting the introduction of HTs into IC topological drawings after obtaining a final design solution in the form of a topological drawing, we have formulated the following main requirements for solving the problem of ensuring protection against hardware backdoors in the IC design:

- filling the entire area of an IC digital core with standard library

elements that are part of the circuit suitable for functional testing (the main functional diagram of the design and the BISA scheme);

- fully controlling the integrity of the protection circuit using functional testing methods;
- minimising the effect of the protection circuit on the functional characteristics of the main device circuit;
- implementation of the protection circuit within the standard IC design route.

The above procedures are universal and can be effectively used in existing design centres to train and instruct staff in basic HT countermeasures during the design phase.

### 3.1 Implementing the self-testing circuit of an IC digital core

The idea of the BISA circuit implementation proposed in this work is to perform symmetric topology transformations in the obtained design solution of the IC topology that provides all the required functions in accordance with the technical specifications. Moreover, these symmetric topology transformations should not impair the circuit functionality, but allow the installation of additional BISA cells. This intermediate topological solution is then symmetrically displayed in a new drawing where empty spaces are filled with standard cells that form BISA circuits. The empty spaces should be filled with BISA cells in such a way that it is impossible to add a cell to any part of the topology that has the smallest size of all standard cells in the design library. The symmetry of the topology display ensures that all required functions of the main circuit are maintained in accordance with the specifications.

Assuming that the functionality of a HT circuit should not be less than a logic

function with three inputs, the equivalent area occupied by a HT circuit in the topological drawing should not be less than the area of four inverters in this process. Therefore, the total area available for locating active semiconductor devices within the boundaries of a digital core should not exceed this value. Despite the fact that in the process of locating standard library elements within the boundaries of the digital core, the location pitch can be several times less than the width of the smallest inverter, we assume that an attacker can change the topological drawing in such a way as to combine unoccupied areas, as well as locate HT parts (up to one transistor) in unoccupied areas in different parts of the digital core.

Simply eliminating the free area by compacting the topological drawing of the main IC may lead to a fatal violation of design rules and design limitations:

- A violation of topological design rules, namely the inability to provide the required minimum distances between metallisation buses with a high-density location of input and output ports of library elements.
- A violation of electrical design rules, namely exceeding the permissible dissipated power per area unit in highly loaded parts of the circuit.
- A violation of design time limits, namely increasing parasitic capacities of metallisation buses with an increase of their location density.

Based on this, additional elements that are not part of the main circuit and do not have dynamic consumption during its operation should be used to fill the unused space, while the ratio of the area of these elements to the area of the required metal layout should be maximum.

Free space can be filled by various circuits, if only they can be controlled by non-invasive methods. In general, they can be divided into two types:

- digital ones (based on logic gates and memory circuits), during the control of which their logical function is checked;
- analog ones (based on passive and active elements), during the control of which their electrical and time parameters are checked.

At the same time, the protection circuit should not have a destructive effect on the main circuit. For example, it is permissible to increase the static current consumption of the circuit, but it is not permissible to reduce the maximum clock frequency of the main circuit or limit its any other functions.

This work uses GSCL (general standard cell library) as an example. It is a library of standard 150 nm process cells containing 42 elements of different widths that implement basic logical operations and auxiliary functions.

Names and types of the library cells are shown in Table 1.

To meet all requirements, we analysed the composition of the GSCL standard cell library to assess the effect of each of its functional elements (except for buffers and inverters) on the traceability of the main digital core circuit. Elements with the same functional purpose and different output stage power were also excluded from the analysis (only single-power elements were assessed). The assessment results are presented in Table 2.

Based on this assessment, a D-trigger named DFFX1 is selected as the main element of the integrity control circuit of the topological drawing of the IC digital core. This element is the simplest one, so its circuit cannot be optimised to reduce the area of its topological drawing, while the minimum number of involved ports without loss of control can be reduced to 3, which allows to achieve the best ratio of the controlled area and the spent tracing resources.

The proposed circuitry and algorithmic solutions were tested in this work using the example of the core of the RISC-V Steel Core RTL microprocessor whose code is open for free use.

**Table 1.** Elements of the GSCL standard cell library

Cell type	Cell name
Inversion	INVX8, INVX4, INVX2, INVX1
“AND”	AND2X1
“OR”	OR4X1, OR2X1
“AND-NO”	NAND4X1, NAND3X1, NAND2X2, NAND2X1
“OR-NO”	NOR4X1, NOR3X1, NOR2X1
“EXCLUSIVE OR”	XOR2X1
Two-level logic	OAI33X1, OAI22X1, OAI21X1, AOI22X1, AOI21X1
Multiplexer	MX2X1
D-triggers	DFFX1, DFFSRX1, SDFFSRX1
Clock buffers	CLKBUF1, CLKBUF3, CLKBUF2
Three-state buffers	TBUF1, TBUF2, TBUF4, TBUF8
Adders	ADDHX1, ADDFX1
Buffers	BUF1, BUF3
Filling cells	FILL1, FILL2, FILL4

**Table 2.** Analysis of the GSCL library topological parameters

Element	Linear size, $\mu\text{m}$	Number of vertical tracks (pitch of $0.6 \mu\text{m}$ )	Number of ports	Number of effective vertical tracks
NAND2X1	3.3	5.5	3	2.5
NOR2X1	3.3	5.5	3	2.5
AOI21X1	3.96	6.6	4	2.6
AND2X1	3.96	6.6	3	3.6
OR2X1	3.96	6.6	3	3.6
NAND3X1	4.62	7.7	4	3.7
AOI22X1	5.28	8.8	5	3.8
NAND4X1	5.28	8.8	5	3.8
OAI21X1	5.28	8.8	4	4.8
XOR2X1	7.26	12.1	3	9.1
MX2X1	7.92	13.2	4	9.2
NOR3X1	7.92	13.2	4	9.2
OAI22X1	8.58	14.3	5	9.3
OR4X1	9.24	15.4	5	10.4
OAI33X1	11.22	18.7	7	11.7
TLATX1	11.22	18.7	4	14.7
NOR4X1	12.54	20.9	5	15.9
DFFX1	18.48	30.8	4	26.8
DFFSRX1	20.46	34.1	6	28.1
TLATSRX1	21.12	35.2	6	29.2
ADDFX1	24.42	40.7	5	35.7
SDFFSRX1	35.64	59.4	8	51.4

This core contains three pipelining stages: extracting instructions, decoding instructions, executing instructions. The small number of pipelining stages eliminates the need to implement conflict resolution units and other complex microarchitectural solutions. Figure 1 presents a microarchitecture diagram of this processor at the level of register transmissions.

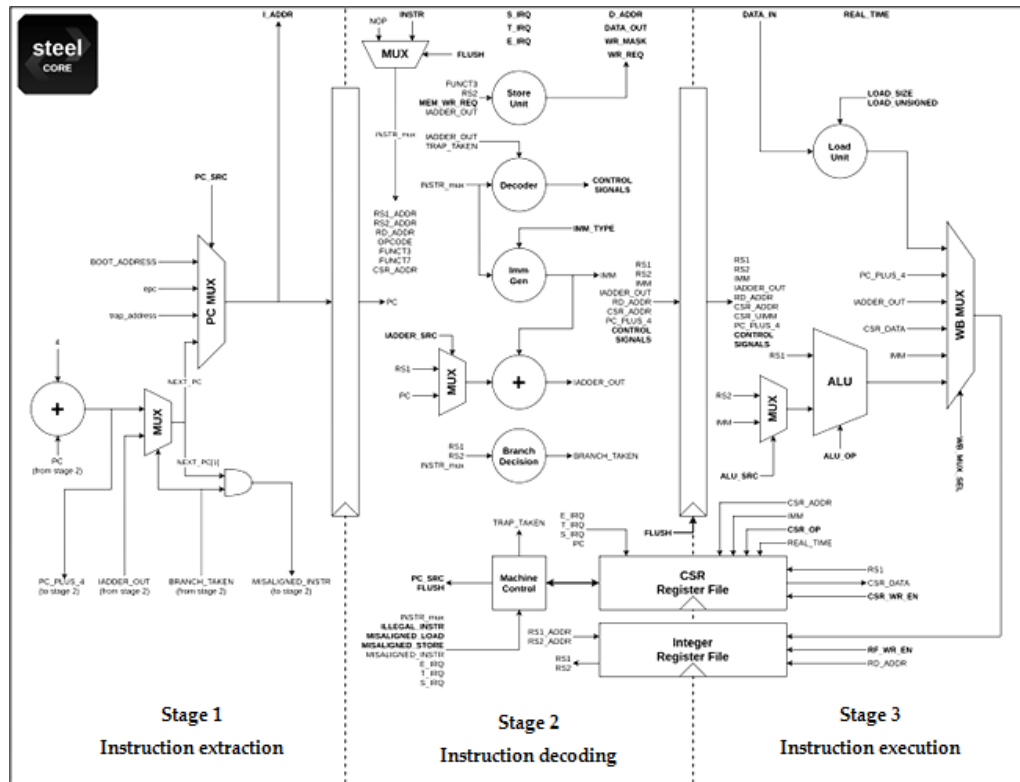

The main functional units of this processor are as follows:

- A decoder that decrypts instructions and generates signals to monitor the processor data path.
- An arithmetic-logic unit (ALU) that implements 10 logical and arithmetic operations on two 32-bit operands.
- Register files (IRF, CSR) that contain 32 general-purpose registers and support writing and reading operations.

- A branch unit that predicts when to perform the operation of moving to another address in the executed programme.
- A load unit that is required to load data into a register file.
- A store unit that controls signals of the memory interface.
- An immediate generator that expands immediate operands to 32 bits if necessary.
- A special machine control that controls the processor instruction counter.

In general, the design route is shown in Figure 6. Parallel branches of the circuit show that the design of analog and digital parts can be carried out parallelly and independently.

**Figure 1.** The RISC-V Steel microprocessor core at the level of register transmissions

The entire design route can be nominally divided into 5 stages: architecture development, development of non-standard library elements (analog components and SF units), logical synthesis (digital components), chip planning and physical synthesis (combining all parts of the design), mixed modelling and verification. At the same time, the introduction of BISA elements is a separate stage, the role and place of which in the design route are given in Figure 2.

At this stage, DEF (design exchange format) files that contain information about cell coordinates, chip sizes, power lines, etc., and LEF (library exchange format) files that contain data about the size of standard cells, the location of their ports and the metallisation paths within a cell should

already be retrieved from the design database. These files are required to implement the BISA filling cell location algorithm.

Based on D-triggers, when they are switched on sequentially, a shift register circuit can be implemented (trigger chains, Figure 3), which allows to monitor the presence of all its elements (links), for which it is enough to use only three additional ports (Si, So, Clock).

By replacing all the free areas of the IC digital core with D-trigger cells and then combining them into a shift register of any length, the location density of standard cells approaching 100% can be achieved, while the integrity control of the chain itself, which is performed once, can be carried out in a number of cycles equal to twice the number

of triggers in the chain. By supplying an arbitrary, unknown binary sequence to the input of the shift register and reading it from the output of the shift register through the number of cycles equal to that of triggers in

the circuit, the integrity of the proposed integrity control circuit of the topological drawing of the IC digital core can be precisely estimated.

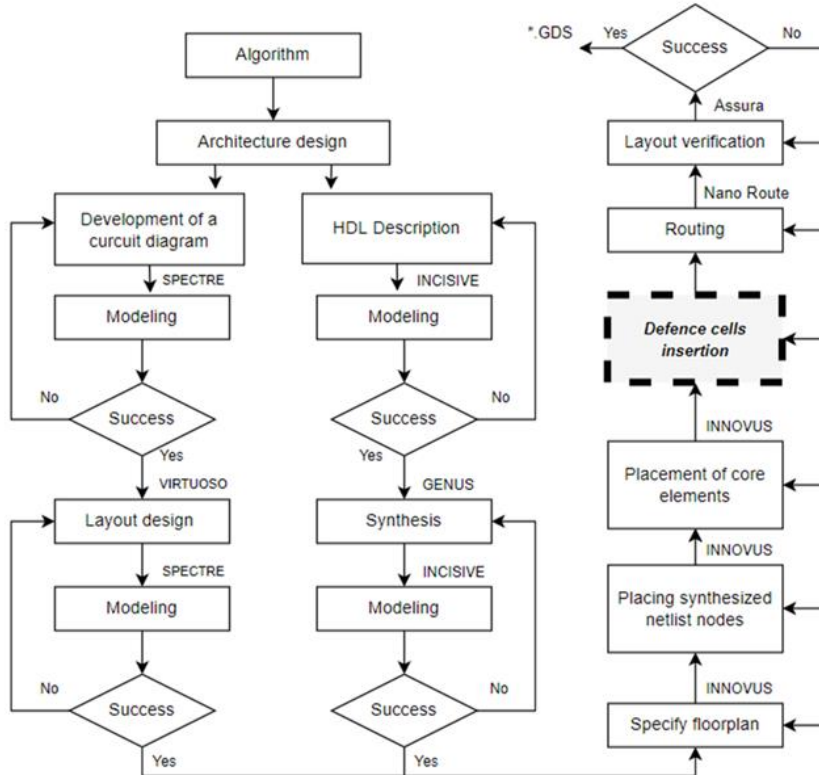

Figure 2. The design route of the topology of trusted ICs

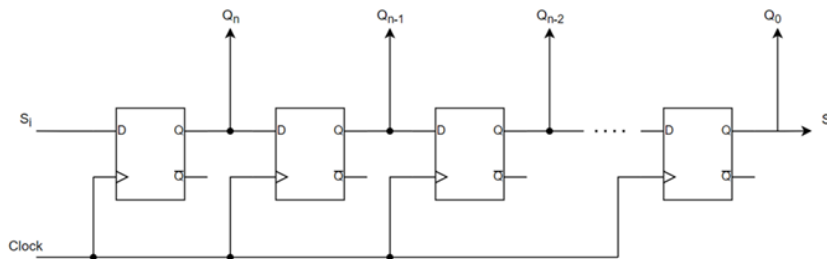

Figure 3. The diagram of a shift register

One of the disadvantages of the previous methods is the inability to achieve 100% use of the free circuit space, since possible voids

may be smaller or be not a multiple of the dimensions of the test circuit elements inserted into them. The remaining voids can

be smaller in size than the NAND gate. But the total area of all such voids may be critical. And when a HT is introduced, this space can be used, for example, by combining individual voids into one due to small movements of the main circuit elements (displays symmetrical with respect to the main functions of the circuit). Insignificant movements (comparable to the size of the simplest gate), for the most part, have a minimal effect on the main circuit, since the average location density of the elements does not change. Therefore, if an additional location optimisation cycle is performed prior to the introduction of the protection circuit, which provides voids equal to or being a multiple of the dimensions of the filling elements of the protection circuit, 100% use of the free area can be achieved. After such optimisation, re-checking the time characteristics of the main circuit allows to verify that its parameters meet the requirements. If the requirements are not met, several optimisation stages can be performed to achieve the required results. After the voids are compensated through optimisation, the previously described integrity control circuit can be implemented.

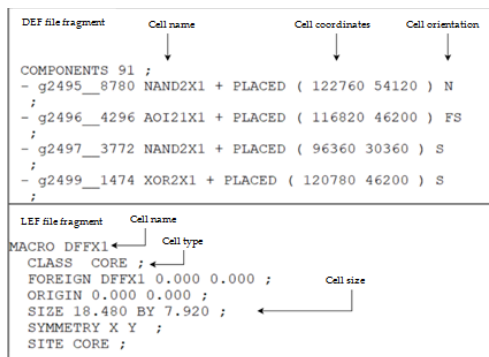

To ensure 100% filling of the free space inside the digital part of the design, it is necessary to set the dimensions of the voids to multiple sizes of the filling elements. Initially, the dimensions of the voids are arbitrary and are chosen by means of locating the main circuit, based on the requirements of the optimal design tracing. Setting the voids to multiple dimensions results in the movement of the main circuit elements, while their significant movement may negatively affect the parameters of the main circuit. Therefore, setting the voids to multiple dimensions should be carried out while maintaining the average density of the design. To construct a clock tree for the shift register, the circuit should have room for clock signal buffers. The location of these

buffers should be strictly consistent with the direction of signal propagation (towards the data flow) and meet a number of requirements for the maximum distance between the buffers and the maximum number of the triggers per buffer. Since the operation is carried out with the digital circuit elements, only the width of the elements is taken into account, since the height of all elements is the same. When levelling the voids, the following actions can be carried out:

- decreasing the size to a multiple size
- increasing the size to a multiple size
- combining adjacent voids up to a multiple size
- creating voids of specified size in places required for setting clock buffers

The cell location programme is implemented in the Python programming language and contains three main stages: reading data from .def, .v and .lef files; an algorithm for optimising and locating cells; recording data to new files with the same extensions.

An example of text data contained in the LEF and DEF files is shown in Figure 4.

**Figure 4.** The fragments of LEF and DEF files describing the parameters and coordinates of the location of the standard cells used in the design

**Figure 5.** The IC core topology drawing after converting DEF file data

**Figure 6.** The fragment of the IC digital core after locating elements of the synthesised netlist (the initial back end)

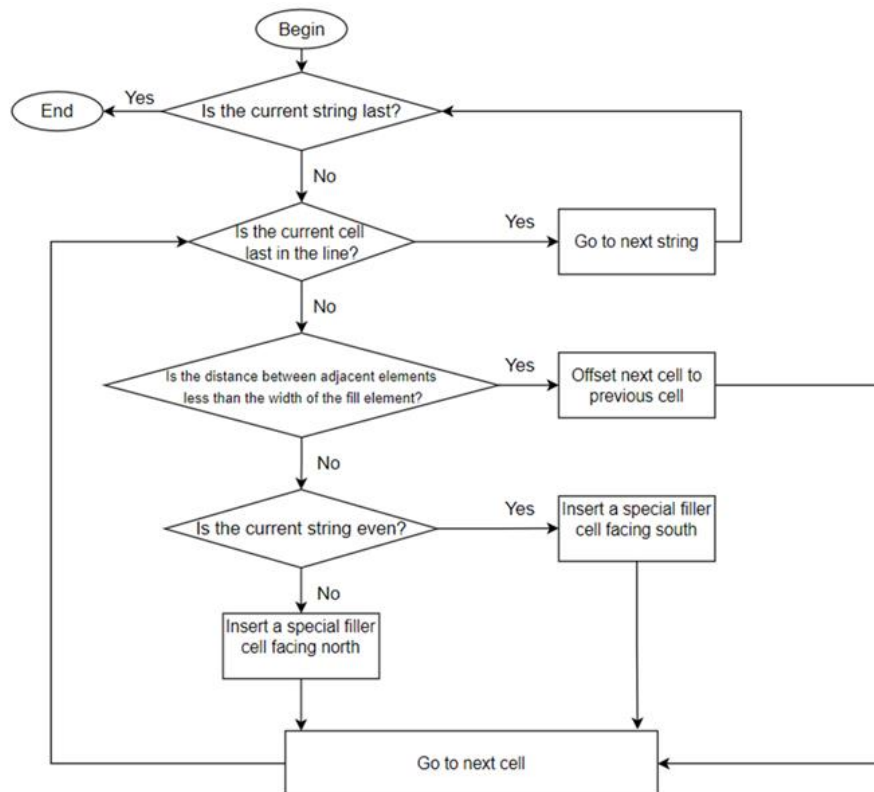

All stages of the unit design route, including the location of specialised elements of the digital core, are carried out in the standard route using standard tools. At the preparatory stage, a special Python programme converted data from a DEF file format into a cell topology drawing. The result of the conversion programme is shown in Figure 5.

An enlarged fragment of the digital core drawing highlighted in the lower left corner of Figure 5 is presented in Figure 6.

This topology is initial for subsequent symmetric transformation in order to introduce BISA cells, which is performed in two stages: 1) analysis of free areas and symmetric shift of standard cells, 2) location of BISA cells. This optimisation algorithm can be implemented as follows. Since all

logical elements of the digital core are located sequentially in strings, optimisation should also be carried out string by string. At the first step, the string start and end coordinates should be obtained. Next, the centre of the string is determined, relative to which the cell shift algorithm will be implemented. After marking all reference points, the optimisation of cell space in strings is carried out by shifting them and filling the freed space with filling elements, in our case with D-triggers. In this case, it is necessary to take into account the orientation of the filling cell in space, since the orientation of the power lines alternates in each string.

A block diagram of the location algorithm is shown in Figure 7.

**Figure 7.** Block diagram of the location algorithm for filling cells

The programme that implements this algorithm is also written in Python. An example that illustrates the operation of the standard cell symmetric shift programme is shown in Figure 8. The filling cell is marked as DFFX1. At the first step, the distance between adjacent elements is checked, including the line start coordinate. If the  $D_0$  distance is less than the width of the filling cell, the right cell is shifted to the left one; in this case, the cell with coordinates  $(X_1, Y_0)$  to

that with coordinates  $(X_0, Y_0)$ . At the next step, the distance between the next two elements is checked; if it is larger than the width of the filling element, it is located in this place, otherwise a verification similar to the first step is carried out. At the last step, the filling cell extends the array of the string, then the same conditions are checked on the string as in the previous two steps.

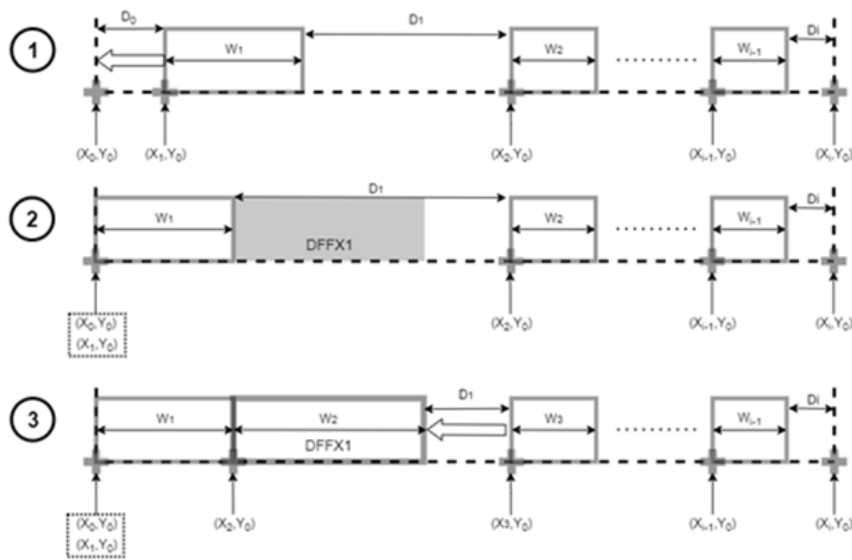

Figure 8. Visualisation of the filling cell location algorithm

At the stage of introducing protection elements for the IC digital core into the design, the following sequence of actions is performed:

- 1) Uploading information on the location of library cells of standard digital elements of the synthesised netlist and specialised elements.
- 2) Optimising the location of library cells of standard digital elements of the synthesised netlist, taking into account the requirements for free areas.
- 3) Locating the triggers of the specialised scan chain in the voids

of the optimised digital core.

- 4) Finding the best way to connect the triggers of the specialised scan chain.
- 5) Downloading information on the location of library cells of standard digital elements of the synthesised netlist and triggers of the specialised scan chain.
- 6) Downloading information on the interconnections of triggers of the specialised scan chain in the format of a synthesised netlist for

subsequent tracing.

The algorithm for optimising the location of library cells consists in shifting elements within strings so that, after displacement, the voids or free areas between adjacent elements have certain width.

Elements in a string can move in an arbitrary order to the left or right, but the elements cannot swap places.

After optimising all free areas in a string, one can proceed to the next string and so on until the strings are complete. After all strings have been optimised, new element coordinates are recorded, their dimensions and the list of elements are downloaded in an input format. At this stage, the percentage of the occupied core area is 69.99%.

As a result of changing the input data, only the coordinates of the logical cells change, the remaining input data do not change,

namely, the size of the cells, their names and the dimensions of the workspace should remain in their original form. As a result, the digital core takes the form shown in Figure 9.

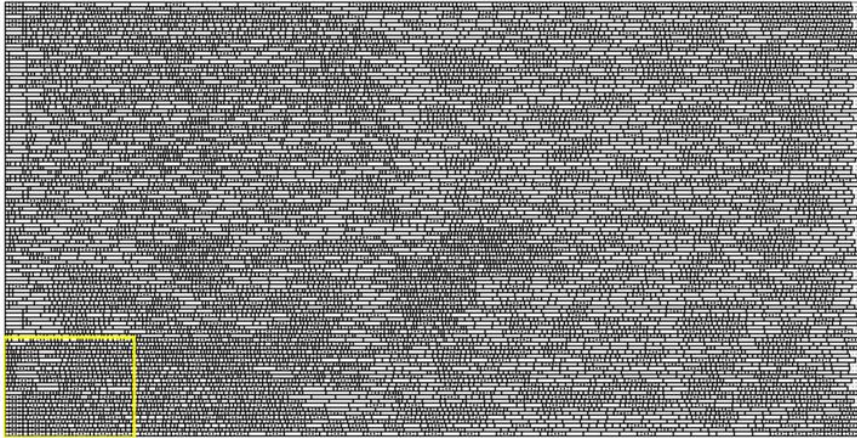

As a result of locating the triggers of the specialised scan chain in the free areas of the design strings, the location of library cells of standard digital elements of the synthesised netlist and specialised elements is optimised so that the voids between the elements in the string are multiple of the size of the trigger of the specialised scanning chain.

After replacing all voids with the cells of the trigger of the specialised scan chain, new element coordinates are recorded, as well as their dimensions and the supplemented list of elements are downloaded in an input format.

As a result, the digital core takes the form shown in Figures 10 and 11 (a highlighted fragment).

**Figure 9.** A fragment of the IC digital core after the stage of locating the elements of the synthesised netlist

**Figure 10.** The IC digital core with located protection elements

**Figure 11.** A fragment of the IC digital core with located protection elements (inserted standard elements are highlighted in dark grey)

In this case, the percentage of the occupied chip area is 98.95%.

At the next design stage, the process of sequentially forming logical interconnections

between the nearest triggers of the specialised scan chain takes place, as a result of which the input of each subsequent trigger is connected to the output of the previous one independently of the location string. The

result is a netlist file for the triggers of the specialised scan chain in the Verilog hardware description language. The resulting netlist is included in the main netlist file of the design, and then we return to the stage of tracing the standard design route.

## 4. Conclusion

Although a conclusion may review the main points of the paper, do not replicate the abstract as the conclusion. A conclusion might elaborate on the importance of the work or suggest applications and extensions. Research has been carried out on software methods for detecting and preventing the introduction of hardware Trojans into the topology of integrated circuits at the stage of their design. An additional recommendation for typical design procedures for obtaining GDSII files, which significantly complicates the introduction of hardware Trojans into the topology, is to facilitate detection methods by including special self-testing structures in the project, formed after performing symmetrical transformations of the original topology and providing effective verification of integrated circuits at the testing stage after manufacturing. A method is proposed for introducing BISA self-testing cells into the project, which is based on the analysis of the results of synthesis at the level of description of the list of circuits, its subsequent program transformation into a topology drawing, symmetrical shift of standard cells and filling the voids formed in this way with

special self-testing cells. The result is a netlist file for custom scan chain flip-flops in the Verilog hardware description language. The resulting netlist is included in the project's main netlist file, after which it returns to the tracing phase of the standard design route.

The proposed method makes it possible to build a very simple and efficient protection scheme based on the operation of symmetrical transformation of the topology drawing and shift of standard design elements.

Advantages of the method:

- the simplicity of the scheme and its strict determinism, when controlling the scheme, you can accurately determine the number of protection triggers and, if they are absent, you can talk about possible changes to the scheme
- the minimum necessary amount of required additional tracing resources.

The method is simple to implement at the topology design stage and can be recommended for use in design centers for machine learning of computer-aided design systems.

## OBJECT-ORIENTED METRICS PREDICTION AS A TOOL FOR SOFTWARE QUALITY EVALUATION

**Abstract:** *Chidamber & Kemerer metrics as a set of six basic metrics, in combination with Lines of Code, is used as a quantitative measure of object-oriented software characteristics. Guided by the fact that these measurements are not an easy task and time consuming, we propose an artificial neural network with optimal three-layer back-propagation for quick object-oriented metrics' prediction, based on measured values of Weighted Methods per Class and Lines of Code. The study is conducted at the sample of 367 cases of metrics' values taken for jedi 4.2. Performances in the form of correlation coefficient and mean square error are measured, as well as the performance during the learning process in terms of gradient, momentum and validation checks with respect to number of epochs. Obtained values indicate a significant and almost perfect adaption of outputs to the targets, creating an opportunity get all the values for basic metrics, with proper accuracy.*

**Keywords:** *Chidamber & Kemerer metrics, software assessment, artificial neural network*

### 1. Introduction

Quality attainment is the most critical issue in software development, especially in today's dynamic environment. Therefore, ensuring the software's commercial success implies conforming to a number of client requirements with zero error, under specified conditions. Meeting the internal and external set of features and characteristics should be achieved through continuous monitoring and software quality evaluation (Arvanitou et al., 2016). The most common way to do this is to conduct different software measurements with the aim to obtain numeric data related to software projects, and to determine factors such as project size, time spent, cost, etc. (Yücalar & Boranda, 2016). These measurement are useful in assessing

software quality attributes and could be used in predicting software testability (Badri & Toure, 2012; Juliano et al., 2014), as well as evaluating maintainability, understandability, and reliability (Desai, 2014; Juliano et al., 2014).

Series of International standards ISO/IEC 25000 SQuaRE (Software Product Quality Requirement and Evaluation) has been developed with the aim to provide proper framework for evaluating software quality. Due the fact that SQuaRE is the result of evolution of several standards, it consists of five divisions: Quality Management (2500x), Quality Model (2501x), Quality Measurement (2502x), Quality Requirements (2503x) and Quality Evaluation (2504x). According to ISO/IEC 25000, evaluation could be done by

measuring internal or external properties, such as static measures or by measuring code's behavior during execution (Perdomo & Zapata, 2021; Norbert & András, 2021).

Different aspects of quality require different software metrics that are used to provide a quantitative way to assess the quality, through objective reproducible measurements (Dubey et al., 2012). This resulted in development of a large number of metrics, as well as many tools for collecting metrics from software (Singla & Singh, 2014). These tools can be general or dependent on programming language, provided as stand-alone software or integrated, in the form of plugin (Molnar et al., 2019). Thereby, regardless of the type or form of these tools, it is necessary to know the context of the measured object for software evaluation (Dahab & Maag, 2019).

Object-oriented approach to software development, as an expansion of procedural approaches, separates data and control. Due to the fact that the system is viewed as a collection of objects, object-oriented metrics must provide measurements that can be applied on classes and characteristics such as object abstraction techniques, encapsulation, inheritance, polymorphism, and information hiding. There are three categories of this metric, namely process metric, product metric, and project metric (Kumar & Vijayaraghavulu, 2021; Shaik et al., 2010). Different sets of object-oriented metrics are proposed: Chen metrics, Chidamber & Kemerer (CK) metrics, Martin metrics, Lorenz and Kidd metrics, MOOSE (Metrics for Object-Oriented Software Engineering) metrics, MODD (Metrics for Object Oriented Design) metrics, Goal Question metrics, QMOOD (Quality Model for Object Oriented Design) metrics, Li and Henry metrics, and SATC (Software Assurance Technology Center) for object-oriented metrics (Desai, 2014; Dubey et al., 2012; Yücalar & Boranda, 2016). CK recommends six basic metrics: Weighted Methods per

Class (WMC), Depth of Inheritance Tree (DIT), Number of Children (NOC), Coupling Between Object Classes (CBO), Response for a Class (RFC), and Lack of Cohesion in Methods (LCOM) (Chidamber & Kemerer, 1994; Desai, 2014; Juliano et al., 2014; Dubey et al., 2012; Molnar et al., 2019; Padhy et al., 2017; Sabhat et al., 2017; Tirban, 2018; Yücalar & Boranda, 2016). Li and Henry took five metrics from CK (WMC, DIT, NOC, RFC, and LCOM), and added five more metrics: Message Passing Coupling (MPC), Data Abstraction Coupling (DAC), Number of Methods (NOM), Number of Semicolons (SIZE1), and Number of Properties (SIZE2) (Desai, 2014). Martin focuses on architectural design issues, defining six metrics (Relational cohesion (H), Afferent coupling (CA), Efferent coupling (CE), Abstractness (A), Instability (I), and Distance from main sequence (D)), with the aim to reduce dependencies between classes (Desai, 2014). MOOD metrics deal with basic object-oriented paradigms, covering six metrics, namely Method Hiding Factor (MHF), Attribute Hiding Factor (AHF), Method Inheritance Factor (MIF), Attribute Inheritance Factor (AIF), Polymorphism Factor (POF), and Coupling Factor (COF). MHF and AHF cover encapsulation, MIF and AIF cover inheritance, POF covers polymorphism, while COF deals with message passing (Desai, 2014; Yücalar & Boranda, 2016). QMOOD set of metrics allows total quality index of the software calculation based on seven metrics (Lines of Code (LOC), Average Complexity (AC), Number of Instance Variables (NIV), WMC, DIT, RFC, LCOM) (Dubey et al., 2012; Yücalar & Boranda, 2016). Some traditional metrics include Cyclomatic Complexity (CC) to measure algorithm complexity in the class method, and LOC (Dubey et al., 2012).

Different values for metric numbers have been proposed for requirement, design, and testing phases of software development

lifecycle, such are 27, 42, and 46 metrics, respectively (Singla & Singh, 2014). The fluctuation analysis of 19 object-oriented metrics, conducted at 20 open-source software projects shows that the source code metrics are more sensitive, compared to design metrics (Arvanitou et al., 2016). Object-oriented metric has proved to be successful with identifying classes that should be tested first (Yücalar & Boranda, 2016). Basic six CK metrics were combined into three metrics for software quality assessment: WMPRC (WMC + RFC), DITNC (DIT + NOC), and CBLCM (CBO + LCOM) (Padhy et al., 2017). Software CK metrics for Java and C++ projects that can indicate possible failures with high probability were analyzed (Juliano et al., 2014). Some automated tool for software code quality assessment based on inheritance, encapsulation, and polymorphism, was considered (Mwangi et al., 2014). WMC and LOC were considered as the class size factors with the aim to develop models for software defects prediction (Jureczko & Spinellis, 2010). There is a possibility to predict class fault-proneness using five out of six CK metrics (Basili et al., 1996).

Different open source and licensed tools were used for Geant4 software metrics. Some examples include CCCC (C and C++ Code Counter), CLOC (Count Lines of Code), Pmccabe, SLOCCount (Source Lines of Code Count), Unified Code Count, and DiffTool (Ronchieri et al., 2016; Vijay, 2016). The metrics were aggregated in categories like Program Size, Code Distribution, Control Flow Complexity, and Object-Orientation (Ronchieri et al., 2016). Coupling, inheritance, cohesion, and structural complexity as internal characteristics were computed using VizzAnalyzer tool. The metrics used for coupling are extracted with CBO, DAC, and Message Pass Coupling (MPC). The inheritance is measured via DIT, NOC,

LCOM, Improvement to Lack of Cohesion in Methods (ILCOM), and Tight Class Cohesion (TCC), while the metrics related to the structural complexity of classes is derived using Locality of Data (LD), Number of Attributes and Methods (NAM), NOM, RFC, and WMC. The metric related to code documentation include Length of Class Name (LEN) and Lack of Documentation (LOD), as well as LOC. The measurements were done at three open-source applications developed in Java, and the obtained values were analyzed using statistical tools, followed by establishing proper correlations between pairs of metrics (Molnar et al., 2019).

Ten different metrics were used for: complexity (WMC, DIT, RFC, and Average Method Complexity (AMC)), coupling (CBO, CA, and CE), and cohesion (two versions of LCOM and Cohesion Among Methods of a Class (CAM)) (Bos, 2019). System which calculates CK metrics, as well as hierarchical metrics, and project and module metrics, was deployed and used for Java application (Thirugnanam & Swathi, 2010). Web-based tool that enables standard software metrics and statistic calculations was developed (Vijay, 2016). Model for predicting bugs in object-oriented software using metrics was established (Kumar & Vijayaraghavulu, 2021). CK metrics related to the JUnit test cases, together with LOC, was used to evaluate the relationship between object-oriented metrics and unit testing effort, with the aid of multivariate logistic regression models (Badri & Toure, 2012). Statistical analysis was used for establishing correlation between reliability and object-oriented metrics. WMC, RFC and LOC show strong correlations with reliability, while CBO and LCOM have moderate correlations. NOC has weak correlation (Tirban, 2018). The results of the study conducted at 10 software modules indicate that optimal metrics for object-oriented software are RFC, LOC and WMC,

while NOC and DIT are less important (Lamba et al., 2017).

Improving the software measurement process was done using unsupervised learning algorithm X-MEANS, with the aim to generate a reliable analysis model from a historical database (Dahab & Maag, 2019). The possibilities for the application of machine learning techniques for software quality assurance and automatic testing, such as Neural networks (NNs), Support Vector Machine, Clustering, Decision Tree, Grammar Induction, Bayesian Based Method, Random Forest, Generic ML Techniques, have been studied (Chen & Hossain, 2022). Board-based software games, written in object-oriented programming languages, were used for obtaining a regression-based size estimation model for software metrics. The results of the study indicate that forward stepwise multiple linear regression has acceptable accuracy with the value for coefficient of determination (R) of 0.756 (Sabhat et al., 2017).

This study is guided by the idea to use artificial neural networks (ANN) with optimal three-layer back-propagation architecture to identify and find patterns between CK six basic metrics (plus LOC), with the aim to obtain optimal number of input metrics, which will be sufficient to get all the values for basic metrics, with proper accuracy. This approach represents the base for further expansion of metrics sets and model propagation in the cases of object-oriented metrics.

## 2. Methodology

Study is conducted through following steps:

- determining the set of metrics,
- data normalization,
- determining sets of input, output and hidden layers,
- testing neural networks, and

- choosing the most appropriate set of input variables.

The sample consists from 367 cases of object-oriented metrics taken for programmer's text editor written in Java, jedit 4.2 (Deepti, 2021). These metrics, among the others, include WMC, DIT, NOC, CBO, RFC, LCOM, CA, CE, LOC, CC (with values of max\_cc and avg\_cc), number of bugs, etc. For the purpose of this study, we have chosen six basic CK metrics, as well as LOC. WMC represents the sum of all complexities for all methods in the given class (Dubey et al., 2012; Țirban, 2018; Yücalar & Boranda, 2016). DIT measures the length of the path from derived class to its root in the inheritance tree. This value is equal to zero in the case of underived class, while in the case of multiple inheritances DIT represents the distance to the farthest root (Dubey et al., 2012; Molnar et al., 2019; Țirban, 2018; Yücalar & Boranda, 2016). NOC counts the number of subclasses in the inheritance tree that are directly derived from a given class. It should be used for determining the amount of time that would be spent on class testing (Chidamber & Kemerer, 1994; Dubey et al., 2012; Molnar et al., 2019; Țirban, 2018; Yücalar & Boranda, 2016;). CBO counts the number of classes from which the observed class depends on (Chidamber & Kemerer, 1994; Dubey et al., 2012; Țirban, 2018). Number of all methods that might be invoked when calling the methods of an object in the class represents RFC (Chidamber & Kemerer, 1994; Dubey et al., 2012; Molnar et al., 2019; Țirban, 2018; Yücalar & Boranda, 2016). Compatibility between the methods in the class is expressed with LCOM (Țirban, 2018; Yücalar & Boranda, 2016). LOC, as a universal software metric, counts the total number of lines (excluding blank lines or comments) in the class, giving the basic information about the project size (Chidamber & Kemerer, 1994; Molnar et al., 2019; Yücalar & Boranda, 2016).

Data about measured values is analyzed using statistical tools and appropriate correlations between them are established. Based on the correlation values WMC, DIT, NOC, CBO, RFC, LCOM, and LOC are separated. WMC and LOC are easily measurable and therefore are taken as input variables, while all other metrics are used as output variables. The values of WMC, DIT, NOC, CBO, RFC, LCOM, and LOC are normalized using robust scaling and used as initial dataset for ANN modeling. These inputs are taken individually or in combination as neurons for the input layer in the ANN. For input layer with 1 neuron WMC metrics or LOC metrics are taken separately, but the results were not satisfactory. Best results are in the case when the input layer has two neurons as their combination. NOC is excluded from the study due to the fact that the measured values after robust scaling don't have proper values, so the output layer consists of 4 neurons (DIT, CBO, RFC, and LCOM). Trial-and-error method is used to determine the number of hidden neurons. Proposed NNs are trained with 10 and 20 neurons in hidden layer via back-propagation Levenberg - Marquardt (LM) algorithm, with the aid of nntaintool in Matlab 2018R. LM algorithm proved to be fastest method for training moderate-sized feed forward neural networks. Initial dataset is divided into three parts in relation 257:55:55, respectively for training, validation and testing set, with the aid of function divider. Performances for different numbers of hidden neurons are expressed in the form of correlation coefficient (R) and Mean Square Error (MSE).

### 3. Results and discussion

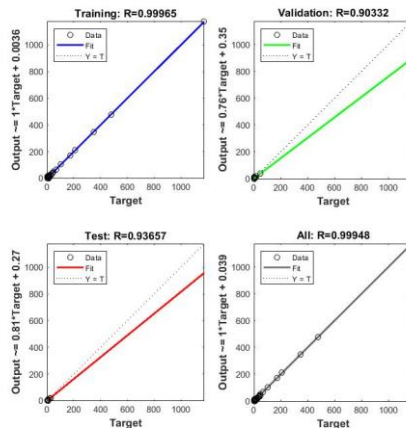

The best results are in the case of neural network with 2 neurons in input layer, 20 neurons in hidden layer with sigmoid activation function, and 4 neurons in output

layer with linear activation function. The values of WMC and LOC metrics represent the inputs' data in the form of 367x2 matrix, while the values of DIT, CBO, RFC, and LCOM metrics represent the target's data in the form of 367x4 matrix. Proposed ANN architecture is presented in Figure 1.

**Figure 1.** ANN architecture for object-oriented metrics' prediction

Values of R for training is 0.99965, for testing 0.93657, for validation 0.90332, and for all 0.99948 for proposed ANN architecture (Figure 2).

**Figure 2.** Linear regression between target and predicted values

Based on these values, it can be concluded that the network has been accurately trained, and there is a close relationship between the outputs and the targets. These values for the NN architecture with 10 neurons in hidden layer are 0.99953, 0.93811, 0.84997 and

0.9993. The values for MSE are 1.22988, 2.30203 and 0.629841 for training, testing and validation, while in case of NN architecture with 10 neurons in the hidden layer these values are higher (1.65175, 2.80312, and 1.02848 for training, testing and validation, respectively).

The best validation performance is 2.302 at epoch 11 (Figure 3). The plot shows the L-shaped distribution and follows the horizontal line trends for trained, validation and test data, with negligibly small differences in slope, indicating that there is no overfitting.

Figure 3. Performance plot

The performance during the learning process in terms of gradient, momentum gain (Mu) and validation checks with respect to number of epochs is shown in Fig. 4. It should be noticed that during the learning process, the gradient from around epoch 7 was near zero, indicating on the fact that there are slight changes in bias and weights which will improve the learning process for the validation. Convergence in ANN training model is achieved after 17 epochs (iterations) with a gradient value of 3.299. Value's changes in Mu, which is used to control weight updating process, are presented for each successive learning epoch. Its value reaches 0.1 at epoch 17, showing that chosen ANN has sufficiently large capacity to predict CK metrics. According to “validation checks” chart

(Figure 4), zero values indicate that the learning process was carried out without increasing the values of MSE in the validation phase. Some non-zero values with an upward trend are noticed after 11th epoch, which could be the consequence of the outlier's presence in the sample.

Figure 4. Gradient, momentum, and validation check values during the learning process

#### 4. Conclusion

Proposed ANN model allows quick basic object-oriented metrics' prediction and is valid enough to estimate CK metrics. Taking into account that the values for R indicate a significant and almost perfect adaption of outputs to the targets, some improvements should be made with increasing the number of input/output data, in order to reduce the value of MSE.

Another issue that should be taken into consideration is the fact that it is enough to measure only the values of WMC and LOC metrics, while DIT, CBO, RFC, and LCOM metrics could be predicted. This plays a role in reducing time and effort for obtaining numeric data related to the software projects, which leads to better and faster software quality attributes' assessment, evaluation, and above all, improves the software quality.

## MODERN TECHNOLOGY FOR OLD-FASHIONED USERS: THE POWER OF E-WOM (ELECTRONIC WORD OF MOUTH) ON MOBILE PHONES PURCHASE AMONG OLDER GENERATIONS

**Abstract:** *The intention to purchase a mobile phone can be influenced either internally or externally. This study investigates the influence of electronic word of mouth (eWOM) particularly the source's expertise, the source's trustworthiness, the richness of message content, strength of advocacy, and tie strength towards such intention among consumers from the older generation. Compared to the younger generation, the possibility of older consumers having higher purchasing power is likely and without many people being aware of it. Some of them are interested in new technologies that will not want to be left behind. They are willing to learn and know more. Empirical data analysis involving 180 respondents aged more than 50 years old showed that the hypothesized relationships were all supported. Findings suggested that older consumers were more prone to act on their purchasing intent with credible eWOM recommended by others whom they trust. They are also attracted by strong emotional appeal from highly informative messages delivered through eWOM.*

**Keywords:** *Electronic Word Of Mouth, Purchase Intention, Mobile Phone, Older Consumers*

### 1. Introduction

Nowadays cell phones are more than a curiosity but a requirement to be up-to-date with the latest developments. As a result, market demand for mobile phones continues to grow and potential buyers are being faced with a wide variety of product choices that they can choose from to cope with this demand. Epstein (2016) describes the propensity of mobile phone firms to use new marketing approaches as an attempt to achieve a competitive advantage in their crowded market. Nonetheless, the proliferation of different product choices could become overwhelming for some

(Bughin et al., 2010), as customers are exposed to numerous marketing tactics used by cell phone companies. It is even more so since researchers such as Chung et al. (2018), Fung and Carstensen (2003), Wolfe (2005), and Tongren (1988) concluded that younger generation and older generation customers have different marketing preferences.

In this study, the focus is on the older generation customers as their number especially those aged 60 years and above is growing whereby by the year 2050, it could reach 2 trillion (UN, 2015). They thus would probably possess higher purchasing power in the years to come. Such probability is

statistically reinforced through a survey conducted in the United States by Pew Research Center that found approximately 77% of senior citizens bought cell phones in 2014 compared to 69% in 2012 (Smith, 2014). Wong (2011) considered the Asian region to have the most aging population due to statistics showing longer life expectancies and low birth rates. Malaysia is projected to be similarly populated at least 12% in the year 2030 (Wong, 2011). Cell phones here are more commonly called mobile phones for their mobility. Locals especially those having reached the age of 60 years old, use their mobile phones to communicate with loved ones or for emergencies. Such usage aid in sustaining older generation's social relationships as well as provide them with an added sense of security and safety (Hassan & Nasir, 2008). Complex features of mobile phones nevertheless might become a hindrance to older users as they are known to be less fond of innovative addition compared to their younger counterparts (Malik & Azuddin, 2013). Yet, Malik and Azuddin (2013) discovered that some older users of mobile phones are open to innovation if the outcome gained will outweigh the complexity and cost of the device. It is thus unwise to not tap into this potentially lucrative market segment since the older generation will keep on growing and the trend of mobile ubiquitous technologies will keep on being in our daily life actions.

As older consumers' purchase intention is focused on, the theoretical framework in this study is supported by Aristotle's rhetorical theory of reasoned action as well as Selective Optimization with Compensation (SOC). Kennedy (1991) explained that rational action theory concerns the resultant effect of subjective standards towards the buying intent. Concerning eWOM, older consumers' intention to buy can be affected but the degree of such impact (resultant effect) is dependent on how well the opinion of others is valued by the customer

(subjective standard). Similarly, Johnson and Mutchler (2013) explained that SOC concerns life choices made by strategizing to pick possible outcomes in their chronological age and thereby maximizing personal satisfaction while at the same time compensating for the conditions resulting from old age. Concerning eWOM, older consumers tend to deliberate their purchasing intent (strategizing) based on available options that best suit them under current circumstances (maximizing and compensating).

### **Older generation's intention to purchase**

Intention to buy is the propensity of personal behavior against a specific brand (Spears & Singh, 2004; Chang & Wildt, 1994). Such a propensity can be intentionally or unconsciously influenced by others, particularly when those important to consumers are involved (Tsai et al., 2010). This echoes previous studies (e.g. Ajzen & Fishbein, 1977; Cialdini & Goldstein, 2004; Tsai et al., 2010) that support the importance of social influence in consumer behavior. Tsai et al. (2010) however emphasized that intention would always affect individual action in a positive light. Studies by Carrington et al. (2010), Chang and Wildt (1994), and Middleton and Smith (2011) also noted similar findings that significantly associate purchase intention with brand consumption. This study deemed the driving force behind a purchasing action to be purchase intention. In a survey involving American consumers, Kitterman (2018) found those aging up to 40 years old tend to trust others that are around their parents' age and older. The trust will prevail until they reach the age of 60 years old which they then would also start to trust others that are similar in age to their children. Akhter (2003) reasoned consumers become more discerning with age as they tend to be more vigilant in decision making when they grow

older. Such behavior is apparent when the current older generation of consumers frequently act upon their buying intent if the purchase results in a beneficial outcome (Szimigin & Carrigan, 2001). However, their deteriorating cognitive abilities make it harder for them to fully appreciate items that are technologically advanced than the standard. Older consumers compared to younger ones who take advantage of the development of today's technology daily thus favor technological innovation that eases the daily routine (i.e. electronic fund transaction). Older people often act upon their buying intent until their ulterior motives, cognitive ability, and financial benefits are aligned for the purchase. In terms of commercial appeal, Williams and Drolet (2005) projected that the risk of drawing older audiences to the emotional appeal of adverts rather than reasonable ones is greater. This is because they are more inspired by emotionally stimulating, advertising messages. Henceforth, purchase intention in this study looks at the actual behavior of older consumers towards purchasing mobile phones as their intent can be influenced by the source's characteristics (i.e. expertise and trustworthiness) and message characteristics of eWOM (i.e. richness of message content and strength of advocacy).

### **The electronic word of mouth**

Cooke and Buckley (2008) noticed the popularization of adverts through social media means whilst Friebe and Campbell (2010) crowned Facebook and Twitter as the most used social media platforms for marketing purposes in the hospitality industry. Such literature suggests that online advertising is the future direction of marketing. Moreover, it is favored by companies with a limited budget for advertising as it is deemed more cost-efficient to communicate their product

online. Küster and Vila (2011) adds that the chances of achieving global recognition are also rather high than the previous offline advertisement. As a result, businesses can expand their product advertising outside of the regional market and attained prospective consumers worldwide. Further understanding of consumer behavior is thus necessary to stay competitive on the global scale (Teo & Yeonh, 2003) as business expansion necessitates changes in complementing 'global' consumers. Consumers nevertheless remain vigilant in deliberating any purchasing related decision. At times, consumers deliberate their purchase intention by considering what was mentioned online on social media as well as search engines (Ghose & Han, 2011; Geissler et al., 2006). Dellarocas (2003) views consumers nowadays as tech-savvy hence they can know what others are mentioning and even express themselves online by using the internet. Consumers might even find this sort of eWOM to be useful in aiding their purchasing deliberation. It is evident as consumers actively read various reviews and opinions posted online (Gretzel & Yoo, 2008) that are a representation of actual consumers' views in writing (Bhatnagar & Ghose, 2004). The same can be said in regards to Malaysian consumers. In the past years, reliance on online comments and reviews about certain products or services has become more prominent among conscious-minded locals. Some even considered it to be a wise choice in searching for such electronic postings as they could save on valuable time plus avoid any further hassle. Nonetheless, consumers, particularly from the older generation, may opt to not make such a choice as they might be limited by their physical and non-physical changes that come with age (Malik & Azuddin, 2013). Wong (2011) reassured that older users require more time to fully adopt the available mobile technologies hence those opting otherwise would surely rise in

numbers. Reasons for triggering their intent to purchase mobile phones includes staying in touch with acquaintances, fostering closer familial relationship through sharing emotions, aiding tool for health deterioration and personal guide for directions or places (Wong, 2011). Some of the reasons can be done remotely via social media platforms such as Facebook and Instagram as well as through communication apps such as WhatsApp and Twitter.

The purchasing intention of older users though is susceptible to likely being influenced by eWOM. This is because online eWOM might provide a more detailed and durable source of information for consumers (Banarjee & Chai, 2019). Some have even treated eWOM as a countermeasure for quality assurance (Blal & Sturman, 2014; Vermeulan & Seegers, 2009). Consumers for instance would often rely on online reviews of hotels when they intend to book for their next holiday accommodation. Such reliance affects consumers' perception and in turn their consideration when booking. A study by ComScore and the Kelsey Group (2007) gives support whereby they concluded that consumers are willing to spend more for a service that is rated higher online in exchange for higher quality service.

## **2. Hypotheses**

Consumers think eWOM message material is more trustworthy if it comes from an expert. Determining if someone possessed the expertise is a subjective matter yet, anyone who can make valid statements (Yoon et al., 1998) based on their own experience and abilities (Gotlieb & Sarel, 1991; Sweeney et al., 2014) can be called an expert. So experts are considered to have a stronger understanding of the commodity. Schiffman et al. (2013) added that the personal perception of an expert could be affected by his or her related work position, social training, or experience. Therefore,

consumers often counseled someone who possessed perceived higher expertise as the probability that they have more product insights is likely. Information received from experts has more persuasive power as their opinions are higher in value (Gilly et al., 1998; Jun et al., 2011). Ohanian (1990b), Pornpitakpan (2004), and Sternthal et al. (1978) collectively indicated that there is a positive relationship between source expertise and persuasiveness. As a result, it plays a substantial role in the consumer's purchasing deliberation (Bansal & Voyer, 2000; Money, Gilly, & Graham, 1998). Lim and Chung (2014) relate an individual's information acceptance with the source's degree of expertise, credibility, and risk. A higher degree of expertise, credibility, and lower risk increases the likelihood of affecting consumer's intentions particularly the older generation without further pondering (Bohner, Ruder, & Erb, 2002; Jun et al., 2011; Strutton & Tanner, 1994). How well older consumers perceived the information source either positively or negatively, therefore, would affect their information-seeking behavior. Strutton and Tanner (1994) discovered that such perception could result in a lower or higher affinity towards relying on a particular source. Consumers should also trust their eWOM more as the intention to buy entails unknown risks (Lim & Chung, 2014). The interest entrusted to the message content represents the faith of the receiver in the sender otherwise known as trustworthiness (Ohanian, 1990a). Chu and Kamal (2008), Priester and Petty (2003), and Ohanian (1990b) collectively described confidentiality as the degree of customer trust that knowledge derived from the content of the message is truthful, genuine, reasonable, and honorable. The following are the hypothesized relationships between eWOM source reputation and older customer buying intent:

*H1a: The expertise of eWOM sources is positively related to older consumers' purchase intention towards the mobile phone.*

*H1b: The trustworthiness of the eWOM source is positively related to the older consumers' purchase intention towards the mobile phone.*

Collectively, Chu and Kamal (2008), Priester and Petty (2003), and Ohanian (1990b) defined confidentiality as the degree of customer confidence that information derived from the message content is authentic, real, fair, and honorable. The following are the hypothesized relationships between the credibility of eWOM sources and the buying intent of older customers. The quality of message content is measured by how much the recipient values the information obtained while the strength of the advocacy is determined by how well the message delivery result is perceived (Sweeney et al., 2012). In terms of advertisement, marketing information transmitted by a narrative message is considered by Phillips and McQuarrie (2010), Adaval and Wyerjr (1998), and Padgett and Allen (1997) to be the best choice as such eWOM is more convincing because of its factual basis and not produced by the sender. In turn, both the sender and the receiver interpret the eWOM message which is transmitted with intensity and excitement more significantly. This is more evident among older generation users, as their declining cognitive capacities and perceived restricted time forced them to prioritize emotional social goals fulfillment. The following are the hypothesized relationship between eWOM message and purchase intention of older consumers:

*H2a: The richness of eWOM message content is positively related to older consumers' purchase intention toward the mobile phone.*

*H2b: The strength of advocacy of eWOM is positively related to older consumers' purchase intention on the mobile phone.*

This research contains a moderating variable, i.e. the tie intensity between eWOM sender and recipient to further shed light on customer behavior in such a relationship (Baker et al., 2016; Wang et al., 2012). Money et al. (1998) defined tie strength as a "multidimensional construct that in the context of social networks represents the strength of dyadic interpersonal relationship" (p.79). Those who received eWOM are most likely to react if the message delivered is from strong ties. It is deemed more trustworthy thus reliable compared to weak ties (Baker et al., 2016 and Wen et al., 2009). Koo (2016) reasoned that individuals involved in a strong tie often have a greater understanding of each other and in turn, they can offer suitable information that aids the other's information-seeking process. A strong tie nonetheless could bring either a positive or negative eWOM effect on branding. This is evident as a positive eWOM about a brand entices consumer's intent to buy far better than a negative eWOM would despite both having strong ties (Baker et al., 2016; Chu & Kim, 2011; East et al., 2008). Jun et al. (2011) and Wangenheim and Bayon (2004) considered tie strength as a significant moderator of interpersonal influence. It is so as older consumers have a profound appreciation towards their social relations with others. Moschis (2003) clarified that personal relationships are valued once they come into a realization of the other's affectionate feelings for them. As consequence, older consumers tend to act based on suggestions made by those who have demonstrated their affection. Fall and Knutson (2001) exemplified that the tendency often originates from friends and family. They also would probably make changes in terms of values, beliefs, and decisions to avoid being excluded from their circle of friends.

Trocchia and Janda (2000) attribute the change possibility to the older generation's desire of staying connected with cherished individuals. In this analysis, the strength of the relationship between the message sender and the receiver of the information is calculated according to the classification of strong links and weak links by Baker et al. (2016). Strong links indicate a significant relationship involving regular contact with those close to the receiver of the message while weak connections indicate a non-significant relationship involving casual contact with acquaintances or strangers. Baker et al. (2016) found close links to be reflective of a greater degree of confidence in the relationship as the message originates from a reliable source. This is therefore more effective towards recipient actions which include their intention to purchase. On the other hand, weak links suggest that even though it is distributed infrequently and originates from an untrusted source, the message has potential novel content. The hypothesized relationships between tie strength and buying intention are as follows:

*H3a: Tie strength positively moderate the relationship between the expertise of eWOM source and older consumers' purchase intention.*

*H3b: Tie strength positively moderate the relationship between the trustworthiness of eWOM source and older consumers' purchase intention.*

*H3c: Tie strength positively moderate the relationship between richness of message content of eWOM and older consumers' purchase intention.*

*H3d: Tie strength positively moderate the relationship between the strength of advocacy of eWOM and older consumers' purchase intention.*

### 3. Method

#### 3.1 Respondents

This study gathers empirical data from older consumers. Yoon et al. (2005) grouped the older generation as those aged 50 years and above. In general, older people are expected to experience deteriorating physical, motor, cognitive and memory abilities. Despite that, they possessed invaluable life experiences, accumulated knowledge, and practical skills compared to the younger generation in their respective field (Wong, 2011). They were chosen due to the increasing size of the market for older consumers. The market increase is considered a tempting business venture to marketers as it is a rapidly growing population that possesses higher disposable income and purchasing power (Eastman & Iyer, 2004). Specifically, in this study, the targeted respondents are older customers with their age varying from 50 years of age who buy cell phones or plan to do so. Wong (2011) discovered that local historical instability contributed towards Malaysians born earlier than 1953 to have undergone less formal education. The diversity of culture and ethnicity nevertheless enable locals to have a good command of different languages though most can master the country's mother tongue. Today's older generation is said to have experienced changes in their behavior as current older people achieve higher education and income leading to different lifestyles from their predecessors (Ong et al., 2008). Also said to be more insightful about what they perceive and more innovative than the previous generation (Szmigin & Carrigan, 2001).

Hence, the perceived technophobia among older people may not be relevant anymore in modern times. Wagner, Hassanein, and Head (2010) shed light on the increasing number of older consumers using online services such as surfing the internet and emailing

which contradicts the belief that older consumers are not too keen on new technology. Therefore, it is considered appropriate for this study to target older people to investigate the influence of eWOM on the purchase intention among older consumers towards mobile phones. A total of 180 questionnaires were distributed to selected representative respondents, which included 91 women and 89 males. They were chosen based on simple random sampling that allows the sample to be taken from the target population in a manner that mitigates any bias and prejudice (Kumar et al., 2013).

### 3.2 Data collection

A survey approach is applied in this study to gather equal and detailed data from respondents. Kumar et al. (2013) explained that a survey includes gathering data from a selection of respondents by using a pre-designed questionnaire. The selected respondents, therefore, are considered as representative of consumers from the older generation. This research also collected offline data, as it was proposed by Gunter et al. (2002) that better respondent control and higher response levels could be feasible if data collection were carried out offline. The overall data collection covers Klang Valley, where about 7.2 million reside in one of the rapidly growing metropolitan cities in Malaysia (Sumarjan et al., 2013). It is thus an ideal scope of the area to investigate the influence of eWOM on older consumers' purchase intention towards mobile phones. Data collected were measured against a Likert scale of 7 points and all of the variables used in the questionnaire were built based on previous studies. However, each of the variables has been changed to fit this study's context. A total of 25 questions were posed in six parts; purchase intention, source expertise, source trustworthiness, the richness of message, the strength of

advocacy, and tie strength. The completed questionnaire as per the Appendix was pilot tested beforehand to ensure the reliability and validity of data collection. Bryman and Bell (2015) asserted the importance of piloting especially when the questionnaire is self-administered as the presence of an interviewer to clarify any uncertainty would be absent. It also gives assurance that the intended survey purpose would be addressed. The test was conducted among a small group of 30 people with criteria similar to those in the sample population. Muijs (2011) recommends doing so would determine the need for further amendment to ensure that the posed questions are wholly understood by respondents.

### 3.3 Statistical procedure

Babbie (2010) emphasized that an analysis of the association between an independent variable and a dependent variable will determine the hypothesized relationship. Such an experiment is carried out in this study using the program IBM Statistical System for Social Science (SPSS). The software provides results through descriptive statistics, reliability analysis, bivariate correlation analysis, multiple regression analysis, and moderation tests based on data collected from the survey. Data collected from respondents were filtered based on their demographic differences such as age, race, gender, and level of education. The data filtering was done through descriptive analysis. O'leary (2004) explained that descriptive statistics facilitate a better understanding of the respondent's criteria through its measurement of dispersion, central tendency, and distribution shape. Such statistics permit better control of respondent selection hence allowing exclusion of data from respondents that did not meet the required criteria before further analysis is made.

**4. Results**

**4.1. Reliability analysis**

Golafshani (2003) describes reliability as the consistency shown through performance over time. Therefore, it is considered accurate if the findings of this analysis are compatible with the findings of other related research (Kimberlin & Winterstein, 2008). Reliability analysis was performed to evaluate the reliability of the data collected

for this study. The results as shown in Table 1 indicated that all of the variables in this study (i.e. purchase intention, source’s expertise, source trustworthiness, the richness of message content, strength of message delivery, and tie strength) can be accepted as the range of each variable for Cronbach’s Alpha is between 0.841 and 0.929. These were in agreement with Meyers et al. (2013) who suggested that a robust Cronbach’s Alpha should be more than 0.7.

**Table 1.** Results for reliability analysis.

Variables	Cronbach’s alpha	Number of items
Purchase intention	0.929	5
Source’s expertise	0.841	4
Source’s trustworthiness	0.891	5
The richness of message content	0.923	3
Strength of message delivery	0.911	3
Tie Strength	0.915	5

**4.2. Bivariate correlation analysis**

The bivariate correlation analysis tests the relationship between variables (Raykov & Marcoulides, 2012) through the Pearson correlation. Taylor (1990) considered the correlation efficiency of r; when it is 0.35 to be weak or low, 0.36 to 0.67 to be moderate or medium, and 0.68 to 1.0 to be either high or heavy. Findings based on such analysis as can be seen in Table 2 suggested that the relationship between the competence of the

message source and the intention to buy, the trustworthiness and buying intention of the source message as well as the wealth of message content and buying intention are moderately positive while the relationship between message delivery intensity and buying intention is weak but positive. Also, the results indicated a value of 0.000 for all variables hence statistical relationships among variables in this study are less than 0.01 in p-value.

**Table 2.** Results for bivariate correlation analysis.

	Source’s expertise	Source’s trustworthiness	The richness of message content	Strength of message delivery
Pearson Correlation	.639	.643	.582	.314
Purchase Intention Sig. (2-tailed)	.000	.000	.000	.000
N	180	180	180	180

*Note.* Correlation is significant at the 0.01 level (2-tailed)

**4.3. Multiple regression analysis**

Multiple regression analysis in this research links multiple independent variables to a

given dependent variable. Such analysis is used to investigate the relationships hypothesized, and the results are summarized in Table 3. Beta’s ( $\beta$ )

importance for knowledge, trustworthiness, message material richness, and advocacy power suggest that the experience of the message source has the most effect on the buying intention of the older people. Meanwhile, the t-statistics showed that a confidence interval of  $t > 1.960$  (2-tailed) supports the relationship between variables. These implied that the expertise of eWOM source is positively related to consumers' purchase intention (H1<sub>a</sub>), the trustworthiness of eWOM source is positively related to consumers' purchase intention (H1<sub>b</sub>), the

richness of eWOM message content is positively related to consumers' purchase intention (H2<sub>a</sub>) and the strength of advocacy of eWOM message is positively related to consumers' purchase intention (H2<sub>b</sub>), are supported. The results replicate similar findings of a positive relationship between source's expertise and persuasiveness (Ohanian, 1990b; Pornpitakpan, 2004; Sternthal et al., 1978) that subsequently influence consumer's purchase decisions (Bansal & Voyer, 2000; Money, Gilly, & Graham, 1998).

**Table 3.** Results for multilinear regression.

Model	Unstandardized coefficients		Standardized coefficients	t	Sig.
	B	Std. Error	Beta		
(Constant)	-.226	.401		-.563	.574
Expertise	.483	.121	.368	3.996	.000
Trustworthiness	.308	.156	.236	1.975	.050
Richness of message content	.307	.137	.249	2.240	.026
Strength of advocacy	-.195	.084	-.173	-2.313	.022

#### 4.4. Moderation test

This research performed a moderation test to investigate whether the hypothesized relationships of the dependent variable (purchase intention) and independent variables (expertise and trustworthiness of the message source, the richness of message material, and advocacy power) shift with specific moderating variable, i.e. tie intensity (Cohen et al., 2003). Results from the test can be seen in Table 4a, Table 4b, Table 4c and are collectively for H3a. Findings in Table 4a showed that a large pattern exists between variables with 41.33% of the variables being described. In Table 4b, the tie strength as the moderating factor between the competence of the message source and

the purpose of the purchase was found to be moderate. However, its p-value was not statistically significant in terms of tie strength at a significant 5% level and the relationship between tie strength and message source expertise at a significant 5% level, whereas it was statistically significant in terms of the expertise of the message source at a significant 1% level. In Table 4c, the p-value of the expertise of the tie strength and message source was not statistically significant as  $p > 0.05$ , thus implying that bond strength positively moderates the relationship between the expertise of the eWOM source and the purchase intention of older consumers is not supported.

**Table 4a.** Results for moderation analysis (H3<sub>a</sub>).

R	R-sq	MSE	F	df1	df2	p
.6429	.4133	1.1701	41.3321	3.0000	176.0000	.0000

**Table 4b.** Results for moderation analysis (H3<sub>a</sub>).

Model	Coefficient	SE	t	p
Constant	.6371	.7333	.8688	.3861
Tie Strength	-.2156	.2173	-.9924	.3224
Expertise	.8128	.1724	4.7147	.0000
int_1	.0273	.0420	.6512	.5158

**Table 4c.** Results for moderation analysis (H3<sub>a</sub>).

	R2-change	F	df1	df2	p
int_1	.0014	.4240	1.0000	176.0000	.5158

Results from the test can also be seen in Table 5a, Table 5b, Table 5c and are collectively for H3b. Findings in Table 5a showed that there is a substantial trend between variables with 42.29% of the variables being described. In Table 5b, the tie strength as the moderating factor between the trustworthiness of the message source and the purpose of the purchase was found to be moderate. Nevertheless, its p-value was not statistically significant for the tie strength at a significant 5% level and the relationship

between the tie strength and the reliability of the message source at a significant 5% level, whereas it was statistically relevant for the reliability of the message source at a relevant 1% level. In Table 5c, the p-value of the connection intensity and the trustworthiness of the message source is not statistically relevant as  $p > 0.05$ . This indicates that binding intensity positively influences the relationship between the trustworthiness of the eWOM source and the purchasing intention of older consumers is not endorsed.

**Table 5a.** Results for moderation analysis (H3<sub>b</sub>).

R	R-sq	MSE	F	df1	df2	p
.6503	.4229	1.1511	42.9857	3.0000	176.0000	.0000

**Table 5b.** Results for moderation analysis (H3<sub>b</sub>).

Model	Coefficient	SE	t	p
Constant	.2236	.7178	.3115	.7558
Tie Strength	-.1079	.2218	-.4867	.6271
Expertise	.9830	.1691	5.8115	.0000
int_1	-.0078	.0419	-.1870	.8519

**Table 5c.** Results for moderation analysis (H3<sub>b</sub>).

	R2-change	F	df1	df2	p
int_1	.0001	.0350	1.0000	176.0000	.8519

Additionally, results from the test can be seen in Table 6a, Table 6b, Table 6c and are collectively for H3b. Findings in Table 6a showed that there is a large model between variables with 34.81% of the variables being described. In Table 6b, the results based on the intensity of the tie as the moderating

factor between message material richness and purchase intention found a moderate relationship between the variables.

Nevertheless, its p-value was not statistically significant in terms of tie strength at a significant 5% level and the relationship between tie strength and message content

richness at a significant 5% level, whereas it was statistically significant in terms of message content richness at a significant 1% level. In Table 6c, the p-value of the binding intensity and richness of message content is

not statistically important as  $p > 0.05$ , thus suggesting that binding intensity positively affects the relationship between the richness of eWOM message content and the buying intention of older consumers.

**Table 6a.** Results for moderation analysis (H3<sub>c</sub>).

R	R-sq	MSE	F	df1	df2	p

	R2-change	F	df1	df2	p
int_1	.0072	1.9557	1.0000	176.0000	.1637

Results from the test which are collectively for H3d can be seen in Table 7a, Table 7b, and Table 7c. Findings in Table 7a showed that there is a considerable trend between variables with 19.16% of the variables being described. In Table 7b, the results based on the tie strength as the moderating factor between advocacy strength and purchasing intention found a moderate relationship between the variables. The p-value was

statistically important in terms of tie strength and the relationship between tie strength and advocacy strength was at a modest 1% level. In Table 7c, the p-value of bond strength and advocacy strength is statistically significant as  $p > 0.05$ , thus suggesting that bond strength positively influences the relationship between eWOM advocacy strength and purchasing intention of older consumers is not supported.

## **5. Conclusion and discussion**

This study aims to understand the power of eWOM, in particular the knowledge of the source, the trustworthiness of the source, the richness of the quality of the message, the strength of the advocacy, the strength of the bond, and the intention of the older consumer to buy the mobile phone among the older consumers. In order to do so, Aristotle's rhetoric theory of reasoned action and Selective Optimization with Compensation (SOC) theory were integrated into the theoretical framework in this study. The integration of both theories provided necessary perspectives to better grasp the relational antecedents of eWOM influence on consumers' buying behavior. The theory of reasoned action sheds light on how the influence of eWOM from people around the consumers can impact their purchasing intent. Meanwhile, the SOC theory sheds light on the norming process adapted by aging consumers when they have the intention to buy. The process though is liable to external influences such as eWOM that bring possible impact towards the buying intent. Such impact is henceforth examined as a moderator between variables using the hypothesized relationship and tie power. Results from data analysis give support to all of the variables used in this study. A bivariate correlation analysis showed a positive relationship between the message source's competency and trustworthiness, the richness of message content, and the strength of message delivery with purchase intention respectively. It also suggested that the experience of the message source has the most impact on purchase intention among older consumers. Tie strength tested showed that binding intensity only has a positive impact on the relationship between the richness of eWOM message content and the purchasing intent of older consumers.

In summary, a review of empirical evidence gathered supported all of the hypotheses in

this study suggesting that the source and content of eWOM messages also affect the buying intent of older people. Findings indicated that trustworthy advice from those they trust and considered experts encourages older consumers to act upon their intention to buy. That is because they are more likely to embrace information delivered in eWOM messages instead of challenging it. Nevertheless, the trust they place in others allows them to be exposed to the risk of being vulnerable to others' actions. When the suggestions obtained are insightful and have a clear emotional appeal, older consumers are often encouraged. This form of commercial appeal is more successful because ads that are filled with high emotions due to their perceived limited time and diminishing cognitive capacities appear to convince them.

## **6. Implications and future recommendations**

The population of older consumers is growing in numbers which subsequently gives stakeholders promising business opportunities. Efforts to sell cell phones to older generation customers are missing though. These efforts are advantageous not only to advertisers but also to customers if pursued. This study henceforth helps to undertake such efforts by providing a basis for a better understanding of how eWOM could influence the purchase intention of consumers towards mobile phones, particularly among older people. This research also complements previous consumer behavior studies particularly those that are tech-savvy (e.g., Ye et al., 2019; Shah et al., 2019). Findings will help strengthen the existing practice of advertisement for mobile phones while strategizing further advancement based on the newly learned insight from this report. It also helps marketers understand better on older consumers. This study's limitation

stems from the fact that it focuses solely on older consumers within a certain area only, hence further studies should involve

different age groups of consumers and wider study scope.

## MOBILE GAME DEVELOPMENT OVERVIEW

**Abstract:** *Mobile game development is a rapidly evolving field that has gained immense popularity in recent years due to the widespread adoption of smartphones and tablets. Game developers now have access to powerful tools and technologies that allow them to create engaging and immersive games that can be played on a variety of mobile devices. The development process involves multiple stages, including concept design, prototyping, coding, testing, and publishing. Developers need to pay close attention to factors such as gameplay mechanics, user interface design, and performance optimization to ensure that their games provide a seamless and enjoyable user experience. Mobile game development is a complex and challenging process, but it offers tremendous opportunities for developers to showcase their creativity and talent while reaching a massive global audience.*

**Keywords:** *Mobile game development, android, java programming language, technologies, concept design*

### 1. Introduction

Mobile game development is a rapidly evolving field that has gained immense popularity in recent years due to the widespread adoption of smartphones and tablets. With access to powerful tools and technologies, developers can create immersive and engaging games that can be played on a variety of mobile devices. This has led to a surge in demand for skilled game developers who can design and develop high-quality games for the mobile platform.

The process of mobile game development involves several stages, starting with concept design, which is the process of coming up with an idea for a game. Once the concept is finalized, the next step is prototyping, where a basic version of the game is created to test the gameplay mechanics and user interface design. The development process then moves on to coding, where the game is programmed using various programming languages and software tools. Testing is a critical stage of game development where

the game is tested to ensure that it works correctly and is free of bugs.

Publishing is the final stage of mobile game development, where the game is made available to the public on various app stores such as Google Play or the Apple App Store.

Developers must pay close attention to several factors during mobile game development to ensure that their games provide a seamless and enjoyable user experience. For example, gameplay mechanics, user interface design, and performance optimization are crucial factors that must be carefully considered to create a game that is both fun and engaging.

Mobile game development is a complex and challenging process that requires a high level of skill and creativity. However, it also offers tremendous opportunities for developers to showcase their talent and reach a massive global audience. With the continued growth of the mobile gaming industry, it is an exciting time for aspiring game developers to enter this dynamic and rewarding field.

## **2. Platforms for Developing Mobile Games**

With the growth of the mobile gaming industry, game developers have access to a range of platforms to develop games that can be played on mobile devices. In this chapter, various platforms will be presented which are available for mobile game development (Dimitriadou et al., 2021).

### **2.1. iOS Game Development**

iOS is a mobile operating system developed by Apple and is used in its iPhone, iPad, and iPod Touch devices. iOS game development is popular due to its strong user base and the Apple App Store being one of the largest app stores in the world (Zirkle and Hogue, 2014). iOS game development requires developers to use Xcode, Apple's integrated development environment (IDE), to create games for iOS devices. Developers can use various programming languages, such as Objective-C or Swift, to develop iOS games. iOS game development requires developers to pay close attention to factors such as user interface design, gameplay mechanics, and performance optimization to create high-quality games that provide a seamless and enjoyable user experience (Manning and Buttfield-Addison, 2014).

One of the key benefits of iOS game development is the standardization of Apple's hardware and software ecosystem, which provides a more streamlined development process. As such, iOS game developers have a more predictable development environment, enabling them to create high-quality games that work smoothly across all Apple devices.

### **2.2. Android Game game design problemDevelopment**

Android is an open-source mobile operating system developed by Google. Android game development is popular because it allows

developers to reach a massive audience. With the Google Play Store being the largest app store in the world, game developers have a vast market to target with their games.

Android game development uses the Java programming language and can be done using Android Studio, an integrated development environment (IDE) specifically designed for Android app development. Android game development requires developers to consider various factors such as device fragmentation, which refers to the varying screen sizes and hardware configurations across Android devices. As such, developers must optimize their games to work smoothly on a range of devices.

In addition, Android game development requires developers to be familiar with the Android SDK, which provides the tools and APIs necessary for building Android applications. Developers must also consider factors such as user interface design, game mechanics, and performance optimization to ensure that their games provide a seamless and enjoyable user experience.

## **3. Objective C vs Java progaming**

Objective-C and Java are two programming languages commonly used for game development on mobile platforms such as iOS and Android. Main differences between Objective-C and Java for game development will be provided in next chapters as well as examples of games developed using each language.

### **3.1. Objective-C for Game Development**

Objective-C is a programming language used primarily for developing iOS and macOS applications. It was the primary programming language used for iOS app development before the introduction of Swift. Objective-C is a high-level language that combines the features of C programming with object-oriented programming (Kochan, 2014; Hillegass,

2011).

Objective-C is commonly used for game development on the iOS platform because it provides access to various iOS APIs, such as the Core Animation and Core Graphics frameworks (table 1). These APIs enable developers to create high-quality graphics and animations for games. Objective-C also has a large developer community, making it easier for developers to find support and resources when developing games.

Example of Games Developed Using Objective-C:

1) Infinity Blade: Infinity Blade is an

action game developed by Chair Entertainment and Epic Games using Objective-C. It was released in 2010 for iOS devices and was one of the first games to demonstrate the capabilities of the iOS platform

2) Temple Run: Temple Run is an endless runner game developed by Imangi Studios using Objective-C. It was released in 2011 for iOS devices and became an instant hit, spawning numerous sequels and spin-offs.

**Table 1.** Objective-C Code Example

```
#import "ViewController.h"
#import <QuartzCore/QuartzCore.h>
@interface ViewController ()
@property (nonatomic, strong) CALayer *ball;
@end
@implementation ViewController
- (void)viewDidLoad {
    [super viewDidLoad];
    self.ball = [CALayer layer];
    self.ball.bounds = CGRectMake(0, 0, 50, 50);
    self.ball.position = CGPointMake(self.view.bounds.size.width / 2, self.view.bounds.size.height / 2);
    self.ball.backgroundColor = [UIColor redColor].CGColor;
    self.ball.cornerRadius = 25;
    [self.view.layer addSublayer:self.ball];
    CADisplayLink *displayLink = [CADisplayLink displayLinkWithTarget:self
selector:@selector(moveBall)];
    [displayLink addToRunLoop:[NSRunLoop mainRunLoop] forMode:NSDefaultRunLoopMode];
}
- (void)moveBall {
    CGPoint center = self.ball.position;
    center.x += 5;
    center.y += 5;
    if (center.x >= self.view.bounds.size.width || center.y >= self.view.bounds.size.height) {
        [self.ball removeFromSuperlayer];
    }
    self.ball.position = center;
}
@end
```

This game creates a red ball that moves diagonally across the screen until it reaches the edge of the screen. It uses a **CALayer** to draw the ball and a **CADisplayLink** to update the game state and redraw the screen.

Note that this is just a simple example to demonstrate the basic structure of an iOS game written in Objective-C. More complex games will require more advanced coding techniques and frameworks.

### 3.2. Java for Game Development

Java is a popular programming language used for game development on the Android platform (Liang, 2014; Ogihara, 2018). Java is an object-oriented language that is easy to learn and provides a wide range of libraries and frameworks that make game development easier (table 2).

Java for game development on the Android

platform provides access to the Android SDK, which includes tools such as the Android Studio IDE and the Android Virtual Device (AVD) manager. These tools enable developers to create and test games on a range of Android devices.

Example of Games Developed Using Java:

- 1) Candy Crush Saga: Candy Crush Saga is a popular puzzle game developed by King using Java. It was released in 2012 for Android devices and has since become one of the most popular mobile games in the world.
- 2) Angry Birds: Angry Birds is a physics-based puzzle game developed by Rovio Entertainment using Java. It was released in 2009 for iOS devices and later ported to Android, becoming one of the most popular mobile games of all time.

**Table 2.** Java Code Example

```
public class MyGame extends AppCompatActivity {  
    private MyView myView;  
  
    @Override  
    protected void onCreate(Bundle savedInstanceState) {  
        super.onCreate(savedInstanceState);  
        myView = new MyView(this);  
        setContentView(myView);  
    }  
    class MyView extends SurfaceView implements Runnable {  
        private Thread thread;  
        private boolean isRunning;  
        private Paint paint;  
        private int x, y;  
  
        public MyView(Context context) {  
            super(context);  
            thread = new Thread(this);  
            isRunning = true;  
            paint = new Paint();  
        }  
    }  
}
```

```
x = y = 0;
}
public void run() {
    while (isRunning) {
        if (!getHolder().getSurface().isValid()) {
            continue;
        }
        Canvas canvas = getHolder().lockCanvas();
        canvas.drawColor(Color.WHITE);
        paint.setColor(Color.RED);
        canvas.drawCircle(x, y, 50, paint);
        getHolder().unlockCanvasAndPost(canvas);

        x += 5;
        y += 5;

        if (x >= getWidth() || y >= getHeight()) {
            isRunning = false;
        }
        try {
            Thread.sleep(16);
        } catch (InterruptedException e) {
            e.printStackTrace();
        }
    }
}
}
```

The same example as presented above programmed in java language. It uses a SurfaceView to draw on the screen and a separate thread to update the game state and redraw the screen.

Note that this is just a simple example to demonstrate the basic structure of an Android game written in Java.

#### 4. Mobile Gaming Performance on iOS and Android

Mobile gaming performance can vary between iOS and Android devices due to a variety of factors, including hardware, software, and optimization. Some authors

said (Journal, 2022), iOS devices tend to have better performance than Android devices, but there are exceptions and variations depending on the specific device and game being played (Figure 1).

**Hardware:** One factor that can affect mobile gaming performance is the hardware of the device. iOS devices tend to have higher-end hardware components, including processors, GPUs, and memory, which can result in better gaming performance. However, there are many high-end Android devices that are capable of delivering excellent gaming performance as well.

**Software:** Another factor that can affect mobile gaming performance is the operating system software. iOS devices tend to have better optimization and more consistency in terms of software and hardware integration,

which can result in smoother and more reliable gaming performance. Android, on the other hand, can have more variations in software and hardware, which can result in less consistency in gaming performance.

Source: (<https://www.mobigaming.com/2020/10/23/android-vs-ios-who-leads-in-mobile-gaming/>)

**Figure 1.** iOS vs Android gaming performance

**Optimization:** Finally, optimization can also greatly affect mobile gaming performance. Game developers may optimize their games differently for iOS and Android devices, which can result in different performance levels. Additionally, device manufacturers may optimize their devices differently, which can also affect performance. Overall, good optimization can greatly improve mobile gaming performance regardless of the platform.

iOS devices generally have better gaming performance than Android devices due to

higher-end hardware, better software optimization, and more consistency in software and hardware integration. However, there are exceptions and variations depending on the specific device and game being played, and good optimization can greatly improve gaming performance on both platforms.

## 5. Conclusion

In conclusion, mobile game development has become a highly competitive and lucrative industry, and choosing between iOS and

Android platforms can be a critical decision for game developers.

Both platforms have their strengths and weaknesses when it comes to mobile gaming performance. iOS devices tend to have better hardware, software optimization, and consistency, resulting in smoother and more reliable gaming performance. However, Android devices have made significant strides in recent years, and many high-end Android devices are now capable of delivering excellent gaming performance.

Ultimately, the choice between iOS and Android platforms will depend on various

factors, such as the target audience, game genre, monetization strategy, and development resources. Developers should consider these factors carefully when deciding on the platform to develop their mobile game.

Regardless of the chosen platform, good optimization is crucial for achieving optimal gaming performance. Game developers should focus on optimizing their games for the target platform, taking into account the hardware and software differences and testing their games on a range of devices to ensure consistency.

## **GAME DEVELOPMENT AND CONNECTION TO MODERN SOFTWARE ENGINEERING**

***Abstract:** Modern software engineering principles must be thoroughly understood for the complex process of game creation to be successful. This entails integrating cutting-edge software tools and technology to build interesting and enjoyable games while implementing industry-standard techniques, such as Agile development. Building a flexible, maintainable, and scalable foundation of code is essential to creating a successful game. This may be done by using efficient project management, a collaborative team, and industry best practices.*

***Keywords:** game development, software engineering, Agile development, software tools, modern technologies, project management, teamwork, code quality, scalability, maintainability*

### **1. Introduction**

Video games today require a combination of expertise in game production and software engineering. Both professions are rooted in the same fundamental concepts of creating software and applications for computers, but there are some essential differences between them. Game production requires a deeper understanding of the art and narrative side of gaming, while software engineering is all about developing and coding the necessary technical features for an application to work properly.

The field of software engineering is centered on the orderly and effective creation of software. This includes using tried-and-true methods, strategies, and equipment for creating, coding, testing, and maintaining software. Producing high-quality, dependable, and maintainable software that satisfies user needs is the aim of software engineering (Farley, 2021, Sommerville, 2020).

On the other hand, game development refers to the process of making video games. This

covers the creation of video games, as well as their design and programming. To produce games that are both entertaining and technically sound, game creators apply the principles and methods of software engineering. Also, they use specialized platforms and tools to create games, such as level editors and game engines.

Creating a realistic and engaging game world is one of the major problems in game creation. A thorough understanding of computer graphics, physics, and artificial intelligence are necessary for this. These technologies are employed by video game designers to produce dynamic characters, realistic landscapes, and fun gameplay (Flanagan, 2009).

Game creation and software engineering share certain difficulties as well. Developers, artists, and designers must work closely together and communicate effectively in order to succeed in both industries. Both also need for thorough testing and debugging procedures to guarantee that the final output is of the highest caliber and free of errors and flaws.

## **2. Problems of Game Development in Classic Software Engineering**

The design and implementation of a game is a complicated process that calls for the use of software engineering techniques. There are difficulties in game creation, just as there are in every software development effort. These difficulties may appear at various stages of game development, from game design through implementation, and they may have a big impact on how well the game performs.

Meeting player expectations is a big challenge in game creation. Gamers anticipate an interesting, difficult, and enjoyable game. Game developers must have a thorough awareness of the gaming business, be up to date on trends and advances, and be able to produce original and cutting-edge game mechanics if they are to live up to these expectations.

Project scope and timeline management is a big obstacle in game development. Games development projects sometimes have tight deadlines, and adjustments to the project's scope might affect the budget and schedule. Game developers must be able to prioritize activities, manage resources effectively, and have a clear idea of the project's scope in order to overcome this difficulty.

Technical intricacy is a major obstacle in game creation. To create engaging and convincing environments, game developers need to have advanced programming and design skills. To create realistic worlds, dynamic characters, and fun gameplay, game creators need a thorough understanding of computer graphics, physics, and artificial intelligence.

Game creators must use software engineering development techniques to solve these obstacles. This comprises developing, coding, testing, and maintaining software using tried-and-true procedures, methods, and tools. For instance, game developers can

successfully control project scope and timeframes by using agile development approaches. Agile development places a strong emphasis on iterative development and ongoing feedback, which enables game creators to adjust to shifting requirements and deliver high-quality games on schedule.

Using already-developed game engines and libraries is another strategy for addressing the difficulties associated with game development. By giving game developers a framework, game engines enable them to produce games faster and more affordably. On the other side, libraries offer pre-built elements that can be used to increase the functionality of the game, such as music libraries and physics engines.

Game creation poses particular difficulties that can be resolved by using the concepts of software engineering. In-depth knowledge of the gaming sector, project management expertise, technological know-how, and the capacity to use the appropriate procedures and tools are requirements for game developers. By overcoming these obstacles, game creators may produce captivating and engrossing games that live up to users' expectations.

## **3. Project management practice**

Project management is the practice of planning, organizing, and managing resources in order to achieve specific goals or objectives. A project is a temporary endeavor designed to produce a unique result, product, or service. Project management is used in a variety of industries and fields, including construction, engineering, software development, and business.

The project management process typically involves five stages: initiation, planning, execution, monitoring and control, and closure. During the initiation phase, the project is defined and stakeholders are identified. The planning phase involves

developing a project plan, which outlines the project's scope, objectives, timeline, budget, and resources. The execution phase involves carrying out the project plan and completing the work. The monitoring and control phase involves tracking progress, identifying and addressing issues, and making adjustments as needed. Finally, the closure phase involves wrapping up the project and delivering the final product or service to the client.

One of the key principles of project management is that it is focused on achieving specific goals or objectives. These goals or objectives should be clearly defined at the outset of the project and communicated to all stakeholders. In addition, project management emphasizes the importance of planning and preparation. A well-planned project is more likely to be successful than one that is not.

Another key principle of project management is that it is a collaborative process. Projects typically involve a team of people with different skills and expertise. Project managers must be able to work effectively with their team members and stakeholders in order to achieve the project's goals.

Effective communication is also critical in project management. Project managers must be able to communicate clearly and effectively with their team members, stakeholders, and clients. They must be able to provide regular updates on the project's progress and address any concerns or issues that arise.

Project management also involves risk management. Projects are inherently risky, and project managers must be able to identify potential risks and develop strategies to mitigate them. This may involve developing contingency plans, allocating resources to manage risks, or making adjustments to the project plan as needed.

Finally, project management emphasizes the importance of continuous improvement.

After a project is completed, project managers should evaluate the project's success and identify areas for improvement. This feedback can be used to improve future projects and ensure that the organization continues to improve and grow.

Overall, project management is a complex and dynamic process that requires a range of skills and expertise. Effective project managers must be able to plan and organize effectively, communicate clearly and work collaboratively, manage risk, and continuously improve their processes and practices. By following these principles, organizations can successfully manage their projects and achieve their goals.

#### 4. Modern Principles of Software Engineering Project Management to Proper Game Development

The success of a game development project depends on how well it is managed. Therefore, it is crucial to apply project management principles to ensure that the project is delivered on time, within budget, and with the desired quality. As many authors show (Adams, 2014; Adams and Dormans, 2012; Flanagan, 2009, Cruz and Paiva, 2006) some project management principles that are commonly used in game development practice:

- 1) **Define the project scope and objectives:** Defining the scope and objectives of the project is the first step in project management. This involves identifying the features, functionality, and content of the game, as well as the target audience and business goals. Defining the scope and objectives helps to establish a clear vision of what the project should accomplish and ensures that all team members are on the same page.

- 2) **Develop a project plan:** A project plan is a roadmap that outlines the tasks, activities, and timelines for the project. It includes a schedule, a budget, and a list of resources needed to complete the project. The project plan serves as a guide for the team to follow and helps to identify potential risks and challenges that may arise during the project.
- 3) **Assign roles and responsibilities:** Assigning roles and responsibilities is critical to the success of a game development project. Each team member should have a clear understanding of their role and responsibilities, and how they fit into the overall project plan. This ensures that everyone is working towards the same goal and that there is no duplication of effort.
- 4) **Communicate effectively:** Effective communication is essential in game development projects. Regular team meetings, progress reports, and status updates help to keep everyone informed and aligned with the project goals. Effective communication also helps to identify issues and risks early, so they can be addressed before they become major problems.
- 5) **Manage risks:** Game development projects are often complex and unpredictable, with many potential risks and uncertainties. Effective risk management involves identifying, assessing, and mitigating risks throughout the project lifecycle. This ensures that potential problems are addressed before they become critical and helps to keep the project on track.
- 6) **Use agile methodologies:** Agile methodologies are widely used in game development projects due to their flexibility and adaptability. Agile approaches involve iterative development and continuous feedback, which allow for rapid prototyping and

testing. This enables the team to respond quickly to changing requirements and make adjustments to the project plan as needed.

- 7) **Quality assurance:** Quality assurance is critical to ensure that the final product meets the desired standards. This involves testing the game thoroughly and identifying and fixing any bugs or issues. Quality assurance should be integrated into the project plan from the beginning and should be an ongoing process throughout the project.

Project management principles are critical to the success of game development projects. Defining the project scope and objectives, developing a project plan, assigning roles and responsibilities, communicating effectively, managing risks, using agile methodologies, and ensuring quality assurance are all essential components of effective project management in game development. By following these principles, game development teams can ensure that their projects are delivered on time, within budget, and with the desired quality.

## 4.1. Agile Technologies in Game Development

Agile project management technologies are becoming increasingly popular in video game development. An agile approach is flexible and can adapt to changing requirements and priorities during the course of a project, making it ideal for the dynamic and creative environment of video games.

One of the most common agile approaches is Scrum, which consists of several phases such as Sprint planning, Daily Scrum, Sprint review and Sprint retrospective. These phases are repeated in cycles until the project goal is achieved. This approach allows for faster decision-making and flexibility in the team, as well as the ability for the client to be involved in the development of the game and provide feedback during the project

(Keith, 2010).

Another agile technology often used in video game development is Kanban. This methodology is focused on visual work management and continuous product delivery. Each task is displayed on the board and goes through several stages until it is completed. This method allows a clear visualization of the progress of the project and facilitates the identification of problems during the work.

Agile project management technologies in video game development also include test-driven development (TDD), which is based on writing tests before developing code. This method enables early identification of problems and reduces the number of errors in the final product. It also enables faster deliveries and adaptation to changes in requirements.

## 5. Conclusion

While software engineering and game development may seem distinct, they are inextricably linked when it comes to video game production. Software engineering provides the underlying structure and architecture for the game, while game development focuses on designing and implementing gameplay mechanics, graphics, and sound. The successful integration of these two disciplines is essential for the creation of a high-quality video game that is engaging and enjoyable for players.

## References:

One of the main challenges of game development is the need to balance creativity with technical proficiency. Game developers must be able to think creatively in order to design engaging gameplay mechanics and characters, but they must also have a deep understanding of software engineering principles in order to implement these ideas effectively. Similarly, software engineers must be able to design flexible and scalable systems that can accommodate the ever-changing demands of game development.

Another challenge in video game production is the need to work effectively in a team. Game development typically involves a large team of artists, designers, programmers, and testers, all working together to create a cohesive and engaging experience for players. Effective communication, collaboration, and project management are essential for ensuring that everyone is working towards the same goals and that the project stays on track.

Despite the challenges, the fusion of software engineering and game development has led to some of the most popular and beloved video games of all time. From classics like Super Mario Bros. and The Legend of Zelda to modern hits like Fortnite and Overwatch, video games have become an increasingly important part of our culture and entertainment industry. As these two disciplines continue to evolve and innovate, we can expect to see even more groundbreaking and memorable video games in the future.

## ALGORITHM FOR THE DEVELOPMENT OF INFORMATION REPOSITORIES FOR STORING CONFIDENTIAL INFORMATION

***Abstract:** Due to the intensive use of the Internet, network security is becoming a key foundation for all web applications. Intrusion detection by analysing records in network processes is an important way to solve problems in the field of network security. It has been identified that an intrusion can threaten not only the integrity of the data but also the system itself. With the development of information technology and an increase in data transfer speeds, there are threats of incorrect use of the Internet. The authors determine that more reliable control systems are needed that solve the problem of network protection without human intervention. In a number of sources, attention is focused on the possibility of autonomous detection of the vulnerability of programmes and protocols by analysing the criteria for the behaviour of the system itself. Many models are built on informal methods, such as signature ones, in which it is difficult to obtain a correct assessment of effectiveness and completeness. The authors start from the fact that the attack is characterised by states and transitions. The possibility of using neural networks has been tested. A distinctive feature of a neural network is that they start working only after the learning process. This is one of the main advantages of a neural network over conventional algorithms. The paper shows that the development of information storages is possible provided that an equilibrium state is reached when the system does not allow expanding the attack space and the information storage is available for both external access and remote disconnection. The learning model consists of arrays of data with a distributed storage environment. This is the main component of improving the performance of the intrusion detection system. The experimental results obtained showed that the proposed approach identifies anomalies more effectively than known methods. The paper is devoted to the development of a method for detecting attacks based on information about the behaviour of deviating values in the network.*

**Keywords:** Databases, Unauthorised Access, Internet Security, Network Processes, Virus Software.

### 1. Introduction

One of the first works in this field was a work from the USA, which defined the basic

concepts and solutions to problems. The first works were rather conceptual – there was an attempt not to build instrumental filters or methods but to try to apply probability

---

Corresponding author: Zohid A. Hakimov  
Email:

theory to solve these problems. A number of sources describe the attack from the intruder's standpoint and are based on the concepts of the invasion target. The use of anomaly detection and attack detection tools is hampered by the areas of destination. The narrower the scope of application, the easier it is to apply certain research tools to it since it is easier to choose the appropriate model of network objects' behaviour (Song et al., 2015). Learning is based on connections between neurons that determine the ratio of input and output signals of a neuron. The neural network is based on the "level of training" and does not allow analytical calculation of errors. The disadvantages include the fact that the network topology and the location of nodes are determined only after a sufficiently large number of trials and errors. The main disadvantages of the neural network are inefficiency in User to Root (U2R) and right-to-left (R2L) intrusions and low reliability (Xiaoru & Ling, 2021). To solve these problems, a new approach to the deviation method based on intrusion detection is proposed. The detection of deviations is carried out to increase the stability of intrusion detection. This approach consists of two stages: training with working datasets and testing with datasets with intrusion patterns. Such data is used to prepare intrusion detection at the initial stage of implementation. Normal data sets increase the performance of intrusion prevention. If the number of errors exceeds the threshold value, the tested data set will be characterised by the system as an unauthorised action. Various methods can be used to detect intrusion but each of them is specific to a particular method. The main purpose of the intrusion detection system is to detect attacks effectively. It is important to identify the attack at the initial stage to reduce its negative consequences. In this paper, an approach of deviating values is proposed, in which the anomaly is measured by deviation factors (Gaoyu et al., 2019).

In recent years, not only the complexity of software products has increased but also the threat from virus software (Lavrov et al., 2017). It is precisely such software elements that are very popular in the black markets and are currently evolving very rapidly. They enable corporations and sometimes countries, to cause great harm to their economic and political opponents (Zhang, 2021). The virus software market is constantly growing and developing (Son et al., 2008). From small programme blocks embedded in executable files of other programmes to complex independent multi-level systems consisting of a large number of components that have different goals and objectives: installers, loaders, masking programmes, etc. The main medium of distribution of such software in the modern world is the Internet. There are a lot of intrusion detection methods but most of them are either impossible to apply in practice or are so cumbersome that they considerably reduce the performance of the user's system or the network itself. Therefore, the question of the relevance of these developments lies in the concretisation and modernisation of existing methods that theoretically fulfill the set goals but in practice they are difficult to implement (Wang et al., 2021). The use of anomaly detection and attack detection tools is complicated by the areas of destination. The more specific the speciality is, the easier it is to apply certain tools to it. Most often, certain methods come from the specific features themselves, which can "cover" all the weaknesses in ensuring the operability of the system (Dong et al., 2019).

The possibility of working with neural networks was also considered but a huge disadvantage when working with them was the difficulty of verifying the results of the study of training samples (Liu & Zhang, 2020). The adaptive method is suitable for working with network elements. It is characterised by the fact that even with low

computational complexity it will have a low level of false messages (Akritidis et al., 2020). Since this method has high performance and minimal computing power, it is suitable not only for working with databases (for which it was originally developed) but also for describing the behaviour of network elements. This method will provide high reliability when detecting attacks or unrecorded actions (Sivapriya & Kartheeban, 2018). Adaptability, in turn, will help to attract a solution to the problem in one system for a number of others. It is the problem of adaptability that is critical for most ready solutions. By combining this method, it is possible to preserve and improve the very formula of attacks using network elements (Aksvonov & Antonova, 2018). The relevance of these works is to obtain a product that can be used for any systems (Rui et al., 2020).

## 2. Materials and Methods

Given the growing threats of unauthorised access to user or company data, enterprises must constantly spend huge amounts of money to protect their data. Small enterprises are under threat, as well as large companies and holdings (Sivaram et al., 2021). Security for small businesses can depend on many aspects, such as:

- defining security policies and procedures;
- IT investment solutions;
- personnel security issues;
- data security issue;
- network security;
- virus protection;
- intrusion detection policy;
- using access cards;
- backup procedures and disaster recovery plans.

Unauthorised access is often referred to as a weakness in a controlled system where control elements cease to be effective. In

addition, unauthorised access to the system can be opened due to an error in the software, which can be used by attackers to gain access to the system or network. Detection of vulnerabilities and unauthorised actions are essential to improve the security of the network. The operating system is exposed to unauthorised access only when there are all the prerequisites for running the application, not part of it. Such applications can be various kinds of editors (photo, video), as well as numerous software complexes for performing various tasks (players, engineering applications, navigation centres) (Lavrov et al., 2015). Both the system and all applications that are compatible with this system can be subjected to unauthorised access. The reason for the occurrence of such illegal actions and abuses is the fulfilment of the following conditions:

1. wide application of this system;
2. open core access (opensource systems);
3. insufficient protection.

All these conditions are necessary to gain unauthorised access to the network, programme, or operating system. The condition of popularity is necessary for the attack to make sense and its impact to have visible consequences. It makes no sense to hack or gain access to networks that several people know about. If the system has only a couple of copies and is used by a narrow circle of specialists, then its attractiveness for hacking decreases. Another condition is the widespread distribution of the system, which affects its attractiveness for hackers (Jeong et al., 2008). System security is based on architectural or software solutions that prevent unknown functions from accessing user files and vital parts of the system. Security blocks unauthorised activity but therewith imposes certain restrictions on the capabilities of some software elements of the user (Tian, 2021). Most of the methods and software solutions available on the market cannot guarantee a consistently high level of

protection of the system, local and global networks. The problem lies in the rapid growth of new threats. The main danger of such growth is that with intensive flows of intrusions, it is almost impossible to ensure their detection by 100%.

The reasons for this increase in threats are the following factors. Mostly, the threats are created to defeat computers on the global network and the volume of writing viruses is growing every day. At such a pace of development of tools for gaining access to network components, it is impossible to write signature database updates to antivirus companies on time and considering the number and variety of threats (Jain et al., 2013). The rapid growth of threats implies that the vast majority of computers will be affected even before the release of new virus signatures. Antivirus companies need to constantly release signature updates to compete with each other and this reduces the time for analysing malicious code and negatively affects the quality of the final product. Employees simply do not have enough time for qualitative analysis of intrusion codes (Shokrzadeh et al., 2015). Neutralising malicious code is also not an easy task. Since the writing of viruses stands on a commercial basis, technologies using methods of hiding from antiviruses based on the vulnerabilities found are being developed and applied. These technologies complicate the task of recognising and removing intrusions. Threats can encapsulate self-defence procedures to prevent deletion by deactivating system utilities for registry access or process control. It also uses code that monitors the integrity of threat files and the keys necessary for operation in system registries. There are acute problems of efficient consumption of system resources. To track traffic in real time, antiviruses must have modules for working with system events, which will allow filtering streams and making threats that can compromise protection impossible. Most system events

and the frequency of their occurrence can greatly slow down the work when elaborating on threats. There are problems of incompatibility of antiviruses. Often, due to conflicts of system event interception routines, it is impossible to work with different antiviruses at the same time. There is a need for new methods of combating threats that will be based on behaviour analysis and will be able to bypass encryption. Such approaches should effectively combat old and new modifications of viruses, while maintaining high performance and minimally loading the system. It is also important to teach the system to autonomously detect unauthorised actions without accessing databases.

### 3. Results and Discussion

Modern malicious software contains a wide range of viruses that harm not only the infected system but sometimes the entire local or global network. Viruses are divided into classes with common characteristics: habitat; algorithms of operation, and destructive power. The habitat is divided into: file; boot; macro viruses, and network. File viruses are mounted in files. Boot ones are hidden in boot sectors on the hard disc. Macro viruses infect documents and spreadsheets of text editors. Network viruses spread through mail or networks. Viruses can be combined to complicate their detection. Combining masks, the presence of viruses in the system while attackers destroy it or steal user data. Examples of such combinations are file-boot and network macro viruses. They have a complex algorithm of operation and use stealth and polymorphic technologies to get into the system. Virus algorithms characterise:

1. residency;
2. using stealth algorithms;
3. self-encryption and polymorphism;
4. the use of non-standard measures.

The resident virus encapsulates its part in RAM, which then intercepts the operating system's access to the infected objects and is written in them. Resident viruses are stored in memory and are active until the computer is turned off or the operating system (OS) is restarted. Stealth algorithms hide viruses in the system. The most common stealth algorithm is the interception of OS requests to read/write infected objects. Stealth viruses therewith "substitute" unaffected areas of information instead of themselves. In the case of macro viruses, this is a ban on calls to the macro viewing menu (Liu et al., 2020). Self-encryption and polymorphism are used by all types of viruses to complicate the virus detection procedure as much as possible. Polymorphic viruses have no signatures and do not contain a single permanent piece of code. In most cases, two samples of the same polymorphic virus will not have a match. This is achieved by encrypting the main body of the virus and modifying the decrypting programme. According to destructive capabilities, threats are divided into:

1. harmless viruses – do not affect the operation of the computer in any way, except for the reduction of free memory on the disc as a result of their distribution;
2. safe viruses – the impact of viruses is limited by the reduction of free disc memory and graphic, sound, and other effects;
3. dangerous viruses – can lead to serious computer failures;
4. very dangerous viruses can lead to programme loss, data destruction, erasure of information necessary for computer operation, which is recorded in system memory areas and even contribute to accelerated wear of mechanisms, such as hard disc drive heads.

The analysis shows that it is necessary to develop methods and models for recognising both old and new modifications. Signatures allow detecting already known viruses. A signature is a set of features that can be used to characterise an object. The signs allow briefly describing huge objects. Hash functions that characterise an object using short features also function on this principle. Signs of file type, date, address, and size are called "weak signatures". A signature is a unique sign of an intrusion, through which a fragment containing it can be attributed to threats. If the intrusion is not unique, the signatures that describe it will be of the same type and will be a sequence of consecutive bytes and addresses in the file of this sequence. If the file size is known, this will be an additional trigger for the reliability of threat detection. The more information there is about the attack, the more accurately it can be characterised. Different signatures are used for different types of intrusions. The strongest signature includes an unchanged part of the virus (if it is polymorphic), which considerably increases the size of the signature. Fragmentation is used to minimise the size and length of signatures. Fragmentation allows using intermittent signatures that have two parts: common (characterising the entire type of intrusion) and unique (manually modified).

There is also a method of "halved" signatures, which allows using parts of different signatures when identifying polymorphic threats. The method operates with bit fields and may not be used with all signatures (everything will depend on their type). The difficulty of recognising polymorphic intrusions is that they remain unchanged after decoding the body into memory. The difficulty consists in the determination of the decryption time, which is the timer for the start of the intrusion. Halved signatures can detect even such intrusions by decrypting the executing fragment and already executed one. The

disadvantage of the method is the size of the signatures, so control codes are used. They are formed from the virus code and are unique. There may be several intrusions with the same control codes (collisions) but this will not affect their detection. Control codes can replace the hash functions Secure Hash Algorithm (SHA) and Message Digest 5 (MD5), despite the complexity of their application they are very compact and fit into one word (32 or 64 bytes) and eliminate the possibility of collisions. When using hash functions, the following fields are available in the antivirus database: offset, length, and hash of the file. When working with a file, the antivirus checks the hash of the fragment in the database with the specified offset and compares it with the reference value. The values are equal, which means the fragment will be the one of interest. This method is not inferior in accuracy to signature methods and has high performance and minimal requirements for system resources. The main advantage of signature methods is the accurate detection of the type of virus. This feature allows adding both signatures and methods of blocking threats to the database. Disadvantages of the signature method: threat samples are needed; the need for updates; manual threat analysis in case of collisions; identifies only known threats.

The main disadvantage of the method is minimal autonomy and dependence on updates. This method is the best from the standpoint of monetisation – the user should always pay for the possibility of updating his system. The main purpose of heuristic analysis is to track unknown and new modifications of unauthorised actions. It accepts and examines programme files, and based on the results of the work, a conclusion is made about the presence of intrusions. To get the correct result, the following steps should be performed:

1. Semantic analysis It allows recognising and converting the

executed commands into an operable form. After that, these commands are analysed to find sequences in the code of programmes that implement dangerous actions.

2. Interpretation. This step helps to find polymorphic programmes (when the action begins to perform an intrusion not immediately but at the end of a certain predetermined time or cycle). This step requires launching the application. A command stream is used for detection, which can have negative consequences for user information, so executing this code on a computer is not desirable. To do this, the emulator simulates hardware and software functions that record the activity of the executable code.
3. Pragmatic analysis. Allows determining the purpose of the attack algorithm based on the content of the teams and their groups.

**Semantic analysis** The programme affects many factors (values of registers, processor flags, memory areas). Most of these parameters will not be considered when detecting intrusions. When detecting, discrete models of viruses are used, and not every programme action acquires the status of "events", which are programme actions related to system calls that lead to changes in the system. Semantic analysis searches for and recognises sequences of commands in the disassembler listing that implement events belonging to "discrete" models. Recognition occurs as follows: a set of any elements (bits, bytes, words, or their sequences) that can be represented as an "alphabet", and these elements themselves are "letters of the alphabet". Combining elements and making different sequences out of them, different "phrases" are acquired.

Many phrases are described and will be the "language". For reference types of intrusions, finite automata are created to recognise a sequence of assembler commands that implement their behaviour. The programme is first disassembled and then recognised by automata. Based on the number of recognised fragments and their functionality, the analyser makes a verdict on the harmfulness of the executable file. Semantic analysis is divided into static and dynamic. Static one consists in disassembling the executable file image from the drive and analysing it by finite automata. This method is ineffective due to the distribution of packers and anti-hacking software protection systems. Such programmes archive/encrypt the contents of executable files, after which the programme code cannot be disassembled. The problem is solved by using libraries of unpacking algorithms, with which the antivirus can extract packaged files. The effectiveness of the method depends on timely updating of the packer type and unpacking support.

The dynamic approach uses semantic analysis with a debugger/emulator. In this case, it is not the disassembler listing that is checked but code fragments during step-by-step execution or interpretation that have preprocessing. Commands arrive at the input of the machine sequentially, as they are interpreted by the emulator, which gives an advantage when analysing packaged or self-modified objects since it becomes possible to examine objects after the wrappers/cryptographers restore the original bodies in memory and transfer control to them. This method works without using packer libraries but is resource-intensive. Dynamic semantic analysis is widely used in most antiviruses. Its advantage is a low level of possible errors and the disadvantage is low efficiency when working with non-standard codes since the machine is most often configured to recognise a given sequence of certain characters. It is enough

to find a sequence equivalent in functionality, for the recognition of which the automat is configured, and the method will lose effectiveness. For example, replacing some commands with equivalent blocks. An application programming interface (API) functions can be used instead of InternetOpenURL, and wsock32.dll, socket, send, recv instead of InternetReadFile libraries to perform similar functions. This will lead to the fact that the machine will not be able to switch to its final state and recognise the threat. For the automat to continue recognising the fragment, it is necessary to modify it considering all possible variants of the equivalent code, and this is practically impossible.

Interpretation of malicious code by the emulator. The emulator creates an artificial environment to simulate the necessary functionality for research with a high level of protection of the user's system. Even if a malicious programme or virus is running, it will not be able to harm the system or network from the emulator. The need for emulation is that the programme is not a static object, and it is not always possible to recognise it by static methods. Examples of such programmes are polymorphic viruses and packers. The static signature is programmed to appear after executing a certain number of commands. Commands can be executed, as well as debuggers – sequentially, making a stop after executing the command, setting the processor to single-stepping mode. This is how code tracing is used in real conditions. The condition will be the need to monitor the work of the human debugger to control the process and stop it. In addition, the operator will be able to determine any access of programmes to the external environment. Antiviruses, when monitoring the actions of running programmes, also use debuggers that are completely controlled by their internal

control system – the proactive protection module. This module can recognise and block standard types of unauthorised actions, working as a kind of filter. Notably, such an analysis will take place in real-time execution of programmes, and this will allow receiving up-to-date data on the presence of threats. The analyser examines the interaction of the programme with the system (checks the arguments of API function calls), giving the programme the access to real computer resources, which guarantees the correctness of the results. The disadvantage of this method is the possibility of threats entering the system and malfunction. For security purposes, programmes are run in the emulator to proactively protect against unauthorised access. During emulation, the programme is executed on an interpreter that reproduces the external environment: devices, memory, system calls. The logic of threat recognition remains similar to proactive methods. The disadvantages of emulation are:

1. The need to model computer hardware nodes and OS components. This is a complex process and requires a detailed study of the systems on which these methods and software products will work. There are many programmes on the market that emulate the main modules of the system when working with intrusions but virus writers do not stand still and have learnt to bypass even emulators. Important in emulation is modelling of work on the Internet. Here it is necessary to simulate the functions of downloading and receiving files and then saving them to disc.
2. Low performance. The emulator describes the processes of a running system, and this requires the use of huge computing resources. The speed of the software model is much lower than that of the hardware counterpart, even considering its maximum possible optimisation. Some developers create special emulation systems using physical processors, which allows them to

conduct research with maximum capacity.

3. The limitation of the "depth of emulation". Most often, a limited set of commands is used during emulation. Only a part of the programme is emulated and the emulator stops working either after executing each instruction, or by emulating the operation of blocks, and only then conducts tests for threats. At the end of the programme, its emulation loses its meaning since it goes through a cycle of waiting for new events. Such actions can be new input data or commands. When switching to standby mode, the emulator should shut down and move on to the next programme. There are two approaches to determine the onset of such a cycle. The first is by setting the emulation steps. For example, to finish the emulation after performing a specified number of different steps or operations. To finish the emulation by completing a certain number of steps or a certain number of different commands. The second approach is to set the time for emulation. After the time allotted for execution, the programme finishes the emulation. This method will be able to bypass the limitations of the command counter. It will not slow down the system because empty cycles do not load the system even when repeated. The time for performing these operations is set experimentally.

The disadvantages of heuristic methods are that heuristic analysis produces a lot of false detections when working, as well as complexity: despite the complexity of the correct setup, the method can slow down the system. These disadvantages, due to the specific features of heuristic methods, are difficult to compensate even with hardware. With their further use, it is advisable to modify and refine them to fulfil the intrusion detection task assigned to them. For the effective use of heuristic analysis methods, it is necessary:

1. To increase the effectiveness of recognising new threat modifications.
2. To reduce the level of false responses.
3. To increase the speed of the method.
4. To minimise the degree of use of system resources.
5. The possibility of adaptability.

Modern heuristic methods based on behavioural analysis and emulators allow effectively identifying unauthorised actions of a known type and unknown to the system. Artificial intelligence methods allow implementing learning opportunities for threat diagnostics. These methods can considerably improve the reliability and protection of computer systems and networks. Numerous heuristic methods are implemented based on the use of neural networks, artificial immune networks, and multi-agent systems that can detect intrusions. Notably, these methods have certain disadvantages that either slow down the overall performance of data processing systems or sacrifice accuracy. To choose the optimal tools, let us consider the most popular methods of threat detection. Production systems are systems that use a production model of knowledge representation. The production model of knowledge representation is one of the most common. The representation of knowledge through the rules has similarities in some respects with the rules of inference of logical models. This allows carrying out effective inference through products and, in addition, due to the natural analogy of the human reasoning process, these models more clearly reflect knowledge. In production systems, knowledge is represented using sets of rules of the form: "if A, then B". Here A and B can be understood as "situation – action", "cause – effect", and "condition – conclusion". However, one should not equate the production rule and the logical

sequence relation. The fact is that the interpretation of products depends on what is located to the left and right of the logical sequence sign. Commonly, A implies some information structure (for example, a frame), and U implies some action that consists in its transformation (transformation). The logical interpretation of the expression under consideration imposes restrictions on A and B. Generically, such a model has the following form:

$$P = (K, U, A \rightarrow B, E), \quad (1)$$

where: K is the class of this situation; U is the activation condition;  $A \rightarrow B$  is the essence of the product; E is the termination condition. The production model can be simplified by the order or priority that the entire set of products can be introduced. The order means that each subsequent product is used only when the previous product is not suitable. With priorities, the products with the highest priority are initially used. To combat contradictions when expanding databases (for example, the same priority), it is possible to use returns. The components of such a system are a knowledge base, working memory, and an output mechanism. The knowledge base, using products, describes the subject area. The working memory contains facts about the current stage of logical inference. The output mechanism selects the rules that the product data can fulfil. Production systems are used in the signature analysis method. Such an analysis is effective only when intrusions occur according to the same algorithms (signatures). If the attack scenario is known, then it is compared with the user's actions and if actions similar to intrusions are detected, they are blocked or deleted. If the signature does not fully correspond to the user's action but partially, then the option of notifying the operator or the antivirus system about the possibility of intrusion is possible. Most often, this method is used by network

attack detection systems (Snort, RealSecure, eTrustID, Antivirus by Zaitsev (AVZ), KasperskyLab, Microsoft Security Essentials (MSE)). Signature methods are widely used today and need constant updates to maintain efficiency and competitiveness. Production models can confirm an intrusion by working through audit files, running processes, and network ports. The advantages of production systems are as follows:

1. modularity – each rule describes a small, relatively independent piece of knowledge;
2. incrementality – the ability to add new rules independently of other rules;
3. The convenience of modification as a consequence of modularity and incrementality;
4. transparency of the system (ease of tracing the logic and explanation of the conclusion).

Disadvantages of production models:

1. the withdrawal process has low efficiency since, with a large number of products, a considerable part of the time is spent on non-production verification of the conditions for applying the rules;
2. checking the consistency of the production system becomes very difficult due to the non-deterministic choice of the products to be performed from the conflicting set.

Most of the shortcomings can be corrected by optimising for a particular production system. The statistical method considers the appearance of characteristic signs, according to which it is concluded that there is unauthorised activity. This method produces probabilistic conclusions about the presence of intrusions (when the behaviour of the system has stopped proceeding in a routine way, the statistical method will be able to identify it). When calculating the frequency of access to processor commands, a table of

their activity is built, based on which a decision is made about the presence or absence of an intrusion. This method perfectly detects polymorphic viruses that use a minimal set of commands in the descriptor. A popular method is based on the operators of probability theory and described by the following Bayes' equation:

$$P(D_i|S_j) = \frac{P(D_i) P(S_i|D_j)}{P(D_1) P(S_j|D_1) + P(D_2) P(S_j|D_2) + \dots}, (2)$$

where:  $S_j$  – events;  $D_i$  – diagnosis;  $P(D_i|S_j)$  is the probability of correctness of the  $i$ -th diagnosis detection of the  $j$  event;  $P(D_i)$  is the probability of the  $i$  diagnosis;  $P(S_j|D_i)$  is the conditional probability of occurrence of the  $i$  feature of the event  $j$ . A sample of viruses and programmes is being built, where the final data will be designated  $P(D_i)$ . Then viruses are taken and ratings  $P(S_j|D_i)$  are determined. The results are used to build data on the presence of threats. Intrusions are scanned in the system to generate a sample of events  $K, S = \{ S_1, S_2, \dots, S_K \}$ . Then the probability is found that this activity will be diagnosed  $D_i$ . To diagnose, the probabilities  $P(D_i|S_j)$  for  $S_j$  from the set  $S$  are calculated. Next is the probability:

$$P(D_i|S) = P(D_i|S_1) * P(D_i|S_2) * \dots * P(D_i|S_K). (3)$$

Then the probabilities of intrusions are calculated and the largest one is selected. This approach is not effective when working with email clients since not all signs can be described by this method. Artificial neural systems (ANN) are models of the neural structure of the brain that mainly learn from experience. The natural analogue proves that many problems that are not yet subject to the solution by machines can be successfully solved through neural networks. The ANN is a network of processors (neurons). They

process and transmit information to the following neurons. ANN are solving increasingly complex tasks step by step. The feature of ANN is training. During training, connections of neurons are detected that determine the ratio of input and output signals. During training, the ANN begins to identify additional dependencies between input and output data. When the network is trained, it can get the correct answer for new data that was not in the initial sample. The correct solution will be obtained if the original data is incomplete. The ANN allows independently receiving and processing data and the ability to generalise data. The ANN is combined with various types of architectures. The most popular application of ANN is recurrent and of direct distribution architectures. The training of the ANN can be carried out according to the initial data, without the initial data (the ANN produces a solution from the input data) and with reinforcement (using penalties). ANN can be implemented with existing complexes (Neuro solutions, Matrix Laboratory (MATLAB)) or known algorithms. To build such a network, it is necessary to have training samples. The development of a training sample depends on the process and purpose of implementation. ANN can also be implemented when building network protection systems. Based on the ANN, it is possible to organise the detection of unauthorised behaviour in networks.

The main thing in the development of the ANN is to set up the initial sample since if an error occurs, the learning process will take a lot of time and will consume a lot of resources. After the selection is set, the process is irreversible since it will be completely controlled by the embedded algorithm. It can only signal the input and check the output. Due to this, tracking the work of the ANN is quite difficult. The network topology is selected according to the implementation environment. The method has a number of disadvantages since

it is impossible to correctly select all the functions and their description from the first time. But the configuration of the entire system and its testing before implementing it into the network allows getting excellent performance both in speed and reliability. The most important thing will be to describe the algorithm considering all the subtleties of the process.

Multi-agent systems consist of agents performing tasks assigned to them. They work out only those tasks for which they are designed. Such agents are independent among themselves and there are no disputes between them. The main task is divided into subpoints, the elaboration of which is responsible for the relevant agents. The correct organisation of agents will allow correctly and quickly completing the task, which is performed through the distribution of the entire task into sub-tasks. To solve the problem, agents are grouped under the direction of the operations centre. Multi-agent systems have proven themselves well in protecting against Distributed Denial-of-service attacks (DDoS), which result in the failure of hosts, services, or the shutdown of DNS servers (Domain Name System server) and disruption of the network. This method is proposed in the works when working out DDoS attacks. User agents, violators, and defenders are programmed that can interact. Then the agents of the violators are divided into "demons" (the attack itself) and "masters" (control the attacks). Defenders are divided into: "samplers", "detectors", "filters", and "investigation agents". The "sampler" accumulates information and transmits it to the "detectors", which are responsible for responding to the onset of an attack. "Filters" monitor incoming information, and "investigation agents" counteract attack agents. An agent-oriented system has been created, which shows the work of agents to detect intrusions in the network. The test results showed satisfactory effectiveness of the method in laboratory

conditions. This method has enough positive aspects both for independent use and for combining it with other methods to increase productivity. Currently, all modifications are applied mutually with the methods of both neural networks and artificial networks since this is facilitated by sufficiently high adaptability of multi-agent systems.

Artificial immune systems are one of the tools for detecting threats. They interact closely with neural networks, genetic algorithms, and artificial neural networks. Artificial neural networks that work based on immunological methods that were first discovered in medicine and were based on the work of leukocytes. The natural immune system consists of many functional complexes. The function of the immune system in the classification of body cells for the organisation of the immune response. The analysis of works and models allows identifying the characteristics of immune systems that can be adapted to detect threats in computer networks:

- the use of antibodies to process antigens (similar to forming a response to an intrusion into a computer network);
- the use of antigens as intrusions and the development of appropriate immune responses using antibodies;
- the possibility of training antigens to work on the detection of antigens. Cloning, selection, and removal allow detecting antigens quickly and as correctly as possible through antibodies;
- the possibility of forming an immune response to any invasion (by preserving antibodies corresponding to antigens);
- regulation of the mode of selection of the necessary antibodies by working with the similarity of antibodies (threshold of compliance of the antibody to the antigen). The

similarity allows counteracting the antigen with an antibody as close to it as possible;

- the immune system allows remembering and storing all antibodies that correspond to the antigen known to the system (the memory of the immune system is formed, which functions as a database of signatures);
- the use of antibodies with high similarity allows responding to new unknown intrusions;
- the ability for scaling and adaptability.

By describing the functions of antibody paratopes and epitopes, it is possible to create mathematical models of natural neural networks and apply them in their implementation into information systems. It is through paratopes and epitopes that antibodies and antigens are combined. Such systems have a wide range of applications, ranging from optimisation tools, scanning and pattern recognition systems, building computer and network systems, and ending with the classification of information. Natural neural networks can be used to solve the following tasks: computer security, optimisation of numerical functions, combinatorial optimisation, training, bioinformatics, robotics, adaptive control system, data output, anomaly detection or error diagnosis. Immune systems are a universal model that can be used to solve a variety of tasks. At the moment, natural neural networks are of the greatest interest for use in computer systems. It is in the works that the principles of natural neural networks are used to detect intrusions and attacks in networks. The work describes the creation of natural neural networks with process monitoring elements based on the principles of negative selection (removal of unnecessary antibodies from the memory matrix) when identifying differences in user actions and attacks on the system. Various

methods based on differential equations of delay or derivatives, as well as agent-based models and stochastic differential equations are used to describe the operation of natural neural networks.

A model for detecting unauthorised actions using elements of immune models has been developed. The work of anomalies used in the construction of hybrid elements of network security and capable of detecting attacks with a low level of false responses is described. There is a disadvantage in such systems, which consists in generating a large amount of attack traffic before starting the method. Thus, these methods cannot work in real-time conditions. An adaptive approach based on immune mechanisms has been developed. Natural neural networks repeat the behaviour of the defence of the immune systems of living organisms. The above works demonstrate the prospects of natural neural networks and when working out errors. The application of natural neural networks for error processing is described. The work of agents in the implementation of the detection of unauthorised actions is described. These methods are also based on algorithms of the immune systems of living organisms. Agents act as monitors for each other when performing a common task for them. Each agent monitors other agents for compliance with their task. If the agents cannot deal with the task, they are removed and replaced by others. Most often, the agents work on the algorithms of dendritic cells of the immune system.

The method of combined use of neural networks when working with traffic is described. Such a system is independently trained on input data for the possibility of self-detection of intrusions. The main advantages of such a system are autonomy and high accuracy of threat detection. Low performance is conditioned upon the long learning process. Describe the creation of a multi-agent neural network with the ability to maintain statistics of vulnerable network

elements. The approach allows not only monitoring such nodes more closely but also testing them for intrusion. The possibility of predicting the values of time series using a neural network is considered. A method of clonal selection has also been developed for evaluating the correctness of data. The works are based on the application of diagnostic methods of diseases in medicine to build systems for detecting computer attacks using the theory of neural networks. The search for unauthorised actions was carried out based on combining methods of immune and neural networks. The analysis of modern intrusion detection methods shows that the main area of improving the efficiency of systems lies in combining various methods and technologies to solve problems. There is also a need to create software systems that will help to improve the reliability and efficiency of existing systems for detecting unauthorised actions in computer networks.

In the field of computer security, many resources are aimed at improving the effectiveness of protecting users from unauthorised actions in cyberspace. One of the ways to increase the security of a computer system is to use an intrusion detection system. The diagnostic method is related to intrusion detection systems but is based on principles developed in medicine. Through informatisation in the field of medicine, the development of new milestones in computer technology becomes possible. Unfortunately, such methods are often purely theoretical, that is, those that work only on paper and mathematical models. The main difficulty in their design is the selection of the right technological and methodological base, which will allow such methods to be applied in real conditions. Such methods are based on the diagnosis of intrusions. When diagnosing intrusions, the corresponding functions of the system are monitored, in the same way as in medicine, an examination is carried out, and symptoms of the disease are detected. Symptoms use

the values of examinations to calculate the probability of detecting a certain disease in the human body. Binary symptoms, as a special class of symptoms, use change detection algorithms: threshold or Correspondences by Sensitivity to Movement (CSM) to calculate and form signatures of attacks or unauthorised actions. The Dempster-Schafer theory (Liu et al., 2020) is used to characterise such beliefs, operating with the basic concepts of combining and using merge operators.

The diagnosis is made by analysing the probability of assessment reliability of various sets of the combined evidence penetration structure states of symptoms for the diagnostic tree represented by the specification tree to determine the security of the system or organism as accurately as possible. With this process, the intrusion detection system can combine the characteristics of both signatures and anomaly detection systems, and can detect known or new attacks and unauthorised actions of the system. The system can detect previously known and new attacks similar to the types of intrusions previously declared by the system. The systems built in this way have shown good efficiency when working with pre-defined DoS attacks. The intrusion detection system was built and configured against several known cases of Transmission Control Protocol (TCP) and DoS attacks, which the method could correctly diagnose at runtime. Pseudo-intrusions that were not known to the system in advance were also declared. Such types of intrusions were constructed from the characteristics of known attacks for the testing system and were quite correctly diagnosed and detected. Existing software solutions have some support in terms of intrusion prevention and detection but they lack the ability to diagnose. There are prerequisites for the application of medical diagnostic methods in computer systems. Existing methods cannot fully identify all threats in networks, so

combining new approaches with existing methods can give good results and increase reliability. These systems have disadvantages in the timeliness of detecting attacks but the use of diagnostic methods can positively affect the performance of known methods, minimising the cost of monitoring the network and streams.

#### 4. Conclusions

Collecting information at multiple architectural levels using multiple security filters to perform a correlation analysis of intrusion symptoms allows identifying the symptoms of intrusion first, and then their causes. With their use, it is possible to assess losses in individual components of the system. Previous theoretical methods have shown effectiveness but have not been implemented in real conditions and systems. When talking about diagnostics, the authors imply the ability to clearly identify the causes of intrusions and assess their effects on an individual system of components. Through diagnostics, it is possible not only to detect an intrusion but also to prevent it in advance, using methods of constructing a tree of diagnoses (similar to signatures but working without updates and identifying new forms of attacks and modifications of old ones). This technology can expand the capabilities of intrusion detection systems, raising them to a qualitatively new level. The main idea is to collect information at several architectural levels (network, operating system, databases, and applications) using security filters and complex event processing technology to perform a correlation analysis of intrusion symptoms.

The idea of collecting information from sources was theoretically described earlier. The methods presented in this paper use the concepts of correlation and multi-analysis but do not solve the problem of diagnosing anomalies in the system. The proposed approach considers the process of escalation

from the symptoms of the invasion to determining the causes of the invasion and assessing the damage caused using ontologies. Two sets work in pairs: the first allows observing the symptoms, and the second allows making verdicts about the presence of attacks or anomalies. The output of this process can then be used for recovery processes, and eventually to ensure the reliability of detecting unauthorised actions.

Theoretical tests have shown that this approach improves the results of detecting unauthorised actions in terms of increasing the reliability of the decision-making process. This method can detect new attacks without having any information about them. It is possible to encapsulate signatures, which will not only detect an intrusion but also determine the class and type of attacks.

## DESIGN AND ANALYSIS OF THE CHAMELEON SCHEDULING ALGORITHM FOR RECONFIGURABLE COMPUTING

**Abstract:** Conventional power generation is the source of widespread worry over the depletion of nonrenewable energy sources and the environmental difficulties that this would inevitably cause. As a direct consequence of this, an increasing number of people are gravitating toward renewable energy sources like as photovoltaic boards and wind generators. Wind power is being put to use for a vast array of applications, some of which include the charging of batteries, the pumping of water, the generation of electricity for homes, the heating of swimming pools, the operation of satellite power systems, and many more. However, despite the fact that they do not need any sort of upkeep and do not result in any kind of pollution, their installation costs are high in many different contexts. Wind energy is quickly becoming a more significant contributor to the total installed power capacity around the globe. In the field of wind energy, the PMSG-based wind turbine equipped with a variable-speed and variable-pitch control system are the most common type of wind power generator. This device is capable of operating either independently or while linked to an existing grid. It is necessary to have a complete understanding of the machine's modelling, control, dynamic, and steady-state analyses in order to obtain the maximum possible amount of power from the wind, researchers must make an accurate prediction of the machine's performance in either mode of operation. The complexity of the systems, the sensors required, the speed of combination, the cost, the breadth of effectiveness, the technology employed, and the popularity of the systems all vary. Multiple control computations are performed on the Wind Energy Conversion System (WECS) in order to produce maximum power in a variety of wind speed scenarios. This is done so that the system can respond appropriately. The purpose of this work is to suggest several methodologies for obtaining dynamic features from the WECS integrated grid. The first technique makes use of the Firefly Algorithm (FA) as well as the Artificial Neural Network (ANN) methods. Both are classification algorithms. By utilizing the most effective parameters for design, the design of the grid-integrated power system design was able to achieve a voltage THD of 11.47 percent.

**Keywords:** Wind Energy, Control Algorithm, ANN

### 1. Introduction

Wind energy is quickly becoming one of the most promising and competitive alternatives

to traditional forms of energy production throughout the world. The utilization of this energy is necessary for socioeconomic

growth as well as economic success. In this day and age, renewable and other nonconventional sources of energy are gaining more attention than they ever have in the past. Wind energy conversion systems, often known as WECS, take use of the wind in order to transform mechanical energy into electrical energy. Control of the speed can be either fixed or variable when using WECS. Operating a wind turbine at varied speeds has a number of advantages, some of which include less strain on the gearbox, higher annual energy collection, elimination of the requirement for blade control devices, and enhanced controllability. In order to keep up with the tremendous rise in size and technology of wind turbines, a control system that was far more complicated was necessary. This item investigates the power flow analysis of grid-connected WECS in a setting with a significant amount of wind variability. It's possible to get the maximum power out of a wind turbine if you control it the right way. Wind turbines are made up of two parts: one that monitors the DC connection voltage and another that determines where the turbine is producing the most electricity. In this chapter, a general introduction to the WECS is presented, including topics such as its dynamic modelling structure, classification, and control topology. During the course of the ongoing inquiry, a filter is being implemented between the WECS and the network in order to enhance power quality during interruptions, reduce total harmonic distortion (THD), power factor, islanding, and frequency, and reduce power factor.

It is possible to use wind power to regulate either mechanical or electrical power; however, electrical power generation is one of the forms of energy generation that is expanding at one of the quickest rates in the world today. Since at least three thousand years ago, people have been taking use of the power of the wind. Around the start of the 20<sup>th</sup> century, windmills were first put to

use to grind grains and pump water. Prior to this time, these tasks were performed by horses. As a direct consequence of this, early phases of the development of modern industry saw a shift away from relying on wind power in favour of fossil fuel-powered engines and electrical networks, which offered a more reliable supply of electricity. The production of mechanical power and the creation of electrical power are the two primary applications for wind energy. The flow of air across the earth is referred to as wind. Because of the sun's influence, the surface of the Earth is heated in an uneven manner. There is a wide range of rates of solar heat absorption over the surface of the Earth due to the differences in land and ocean cover. The atmosphere over land has a speedier ascent in temperature compared to the atmosphere above water. When air that is lighter and colder than the surrounding air rushes up and expands and rises above the air that is heated by the earth, winds are produced. Because the air cools off more quickly over land than it does over water, the winds switch directions as the sun goes down. Significant air winds are produced in the region surrounding the equator because it is exposed to a greater amount of sunlight than the land that is between the North Pole and the South Pole. Wind power is regarded to be a form of renewable energy due to the fact that it is a constant force in the environment. Wind energy is produced when Hydrogen (H) is converted to Helium (He) as a byproduct of nuclear fusion in the centre of the sun. The sun generates heat and electromagnetic radiation as a byproduct of the fusion of hydrogen and helium, and this heat and radiation is sent into space in all directions. Even though just a minute fraction of the sun's rays reaches Earth, they provide most of the energy that sustains life on this planet. Wind power is a significant contributor to the global energy market and a well-established foundation for the development of cutting-edge methods of

power generation. Wind power is a leading energy technology due to the technological maturity of the technology and the speed with which it can be implemented. There is no realistic upper limit to the percentage of wind energy that can be integrated into the electrical grid, making wind power a potentially limitless source of power. This is because there are no upper limits on the amount of wind energy that can be incorporated into the electrical grid. This allows for a much greater potential for its use. The Earth receives approximately  $(1.8 * 10^{11})$  MW of solar power, but only about  $3.6 * 10^{19}$  of this power is converted into wind energy, and approximately 35 percent of this wind energy is lost within 1000m of the Earth's surface, according to a study published in Nature Geoscience. The capacity of the world's wind farms to convert wind power into other forms of energy is approximately  $1.26 * 10^9$  megawatts. Wind power has the potential to satisfy the total demand for electricity around the world, despite the fact that the global consumption of energy has increased by a factor of 20 in the past 20 years. Wind power is the process of harvesting the kinetic energy of the wind and converting it into a form that can be used by humans. This process is referred to as "harvesting the wind." Systems that use the power of the wind as a source of propulsion are included in this category, as the name of the category suggests. To put it another way, the electricity is produced by a pair of wind turbines that are in close proximity to one another. A wind farm is currently being built offshore, and it is anticipated that it will be operational in the not-too-distant future.

## 1.1 Need for wind energy system

The depletion of environmental variables and fossil fuels served as a driving force behind the development of clean and safe renewable energy sources such as wind,

solar, and hydropower. By incorporating WCS, the impact that the conventional electricity system has on the surrounding ecosystem can be reduced. Traditional wind power systems, on the other hand, have a number of technological challenges that will need to be overcome before they can be integrated. All of this contributes to the fact that it is absolutely necessary to find solutions to the difficulties associated with overcoming the nature of distributed wind generators, concerns regarding the power quality of large wind farms, and the need to overcome difficulties associated with the integration of large wind farms (Bondalapati, 2001).

## 1.2 Growth of wind energy systems

Wind power is produced by harnessing the power of the wind to drive electric generators and carry out mechanical work such as milling and pumping. Wind power is an environmentally friendly and renewable form of energy, especially when compared to the combustion of fossil fuels. A wind farm is constructed from a large number of separate wind miles, all of which are connected to one another to create a bigger total.

Onshore wind turbines are a relatively inexpensive method of generating power when compared to coal and gas plants. Onshore wind farms have a considerable impact on the environment due to the fact that, in comparison to other types of power plants, they typically need to be dispersed across a wider geographic area and built in remote or wilderness locations. Wind turbines installed offshore are more powerful and stable than those positioned on land; nonetheless, the construction and maintenance costs of offshore wind turbines are higher. Small onshore wind farms have the ability to sell some of their electricity to the grid or to power regions that are not connected to the grid.

Wind is a fluctuating energy source, and as such, it is unable to create or distribute electricity when it is required. As a direct consequence of this, the amount of power generated changes significantly across very short time periods yet stays the same from one year to the next. Because of this, it cannot be used alone to produce a consistent supply of electricity; rather, it has to be combined with other types of power generation. In order to support the rising usage of wind power in a region, there is a demand for additional conventional power sources (such as electricity generated by fossil fuels and nuclear power, for example). When wind output is low, demand can be lowered by employing various power management strategies. These strategies include having dispatchable power sources, having adequate hydroelectric power with extra capacity, geographically spreading out power generation, and exporting and importing power to neighboring boring regions.

### **1.3 Wind energy conversion system and components**

A wind turbine and generator are included in the setup, in addition to the necessary connection and control systems. Wind turbines can be broken down into two primary categories: those with a vertical axis and those with a horizontal axis. The movement of the turbine is controlled by one or more blades in the majority of modern wind turbines. These blades can direct the turbine either downwind or upwind, depending on which direction the wind is blowing. The orientation of a wind turbine is the primary factor that determines whether it has a constant or variable speed when operating. Electronic electricity converters are necessary for variable-speed wind turbines because they are unable to supply their loads with a constant frequency and voltage without them. This is due to the fact

that wind turbines with variable speeds produce more overall energy. The vast majority of turbine manufacturers employ reduction gears as a means of striking a balance between the requirements of high-speed three-phase generators and low-speed turbine rotors. Direct drive systems offer wind turbines a number of benefits, including high levels of reliability, low levels of maintenance requirements, and reduced overall costs. Direct drive systems are utilised by certain types of wind turbines. In recent years, a number of turbine manufacturers have moved toward employing the direct-drive method in their products. The squirrel cage type and the wound rotor type of wind turbines can now make use of synchronous generators, permanent magnet generators, and induction generators. Previously, only induction generators were available. Two common varieties of generators used in wind turbines are known as squirrel cage induction generators and permanent magnet synchronous generators. There are benefits to be gained from utilising either of the two different types of generators. Induction generators, synchronous generators, and winding-field synchronous generators are the three distinct varieties of generators that are suitable for use in high-power wind turbines.

Utilizing connectivity devices allows for power regulation, a gentle starting process, and other connecting procedures to be carried out. Power electronic converters are often the gadgets that fall within this category. In current turbine inverters, the usage of forced commutation inverters, also known as pulse width modulation inverters, is prevalent because these inverters provide a steady output voltage and a consistent frequency. Inverters for wind turbines have been able to make use of both voltage source voltage-controlled models as well as voltage source current-controlled models. The use of dual PWM converters makes it possible for high-power wind turbines to establish a two

way directional flow of electricity between the generator of the turbine and the utility grid. It is not out of the ordinary for a wind energy system to consist of blades and a tower, a rotor and gearbox, in addition to an alternator. The rate of wind speed rises proportionally with the height of the tower. It is utilized to raise the height of the rotor in order to collect a greater amount of power from the wind.

**Rotor:** It is constructed out of anything that resembles the wing of an aeroplane. When air moves across the blades of a wind turbine, it results in the generation of mechanical power.

**Nacelle:** This apparatus is integrated into the rotating rotor of the turbine itself and is situated at the very top of the tower that houses the turbine. The generator, the gearbox, and the motor are all examples of mechanical components that make up the turbine rotor. The nacelle is able to rotate in response to the direction that the wind is blowing in order to maximise the amount of wind energy that can be harvested.

**Gearbox:** In all other respects, the vast majority of machines have rotor speeds that are lower than one hundred revolutions per minute (rpm). To generate electricity, electrical generators require anywhere from 1,000 to 3,600 revolutions per minute in their motors. In order to generate electricity from a turbine, gearboxes are constructed with the capability of increasing the low speeds of the turbine's rotor to high speeds.

**Alternator:** Alternators are devices that directly convert mechanical energy, such as wind potential, into electrical energy. However, among all of the electrical machines that are used for maintaining a constant speed in wind turbines, the Squirrel Cage Induction Machine (SCIM) is the most well-known. Additionally, it is one of the most significant sorts of wind turbine generators that is now on the market. The rotor of the wind turbine is connected to the

capacitors of the bank, whilst the stator of the bank is connected directly to the grid. This type of machine has a few drawbacks, including a poor efficiency in the system that converts energy, greater maintenance expenses, and a restricted capability to control both active and reactive power. It should come as no surprise that the Doubly Fed Induction Machine, often known as the DFIM, is one of the wind turbine machines that is utilised the most. Roughly half of all wind turbine systems currently in operation make use of this machine's variable speed technology. This helps to lower drive train mechanical stress as well as power oscillation, all while increasing the power that can be mechanically collected. When contrasted to SCIM, DFIM utilises pitch control to restrict the quantity of wind energy that can be captured at higher wind speeds. This is done in order to maximise efficiency. Because DFIM decreases mechanical stress and increases maximum power point tracking (MPPT) for speed controller techniques, it is now able to regulate both active and reactive power with more flexibility. It has been pointed out that the use of brushes in double-fed induction machines (SCIMs) is a disadvantage for wind energy conversion systems, despite the fact that SCIMs are more durable and require less maintenance.

### **Synchronous generators:**

The fundamental advantage of the design of the machine is that it may deliver reactive power to other components of the power system that demand it. This capability is found in sophisticated synchronous generators. In most cases, a synchronous generator is used in wind-diesel hybrid systems. This generator is normally linked to the diesel engine. Synchronous generators that are put on a wind turbine need to have rigorous controls applied to them so that the rotor speed does not go over the synchronous speed when turbulent circumstances are present. In addition to this,

the utilization of spring-mounted or damper-mounted gearbox assemblies is required in order to contribute to the reduction of turbulence. This is a requirement in order to help with the reduction of turbulence. When it comes to applications involving smaller size ranges, synchronous generators typically have a higher price tag than induction generators do. Synchronous generators, to put this another way, are more prone to malfunctioning than asynchronous ones are.

**Permanent Magnet Synchronous Generator (PMSG):**

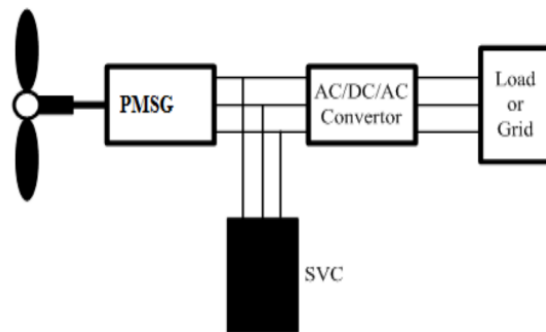

As can be seen in Figure 1, a grid-connected PMSG is required in order to connect direct-drive wind turbines to the electrical grid. The following is a condensed version of the advantages that PM machines have over

machines that are electrically excited:

- Enhanced capabilities in terms of both energy production and efficiency.
- Excitation of magnetic fields does not call for the use of any supplementary power source. The thermal characteristics of the PM machine have significantly improved as a result of the elimination of field losses.
- Increased reliability is achieved through the elimination of mechanical components such as slip rings.
- A greater power-to-weight ratio as a direct result of the reduced overall weight.

The following is a condensed list of the drawbacks associated with PM machines:

One of the most significant drawbacks of utilizing this material is that it loses its magnetic properties when subjected to high temperatures.

**Figure 1.** The General Arrangement of the Full Variable – Speed System Using PMSG

To put it another way, particle matter (PM) has become more desirable as a result of improvements in its performance as well as a decline in the cost of the material. As a result of recent developments in technology, direct-drive wind turbines are increasingly reliant on PM machines that are outfitted with full-scale power converters. This trend is expected to continue. Consider putting variable speed concepts into action, such as those that involve a full-scale power

converter and either a single-stage or multiple-stage gearbox drivetrain, so that you can cut down on the amount of money you spend on your annual energy bill. An illustration of this would be PMSG systems that either have multiple-stage gearboxes or single-stage gearboxes because both types of gearboxes are in high demand on the market.

## 2. Literature survey on grid integrated wind energy conversion system

The idea that wind power can be utilised in a diverse range of ways that are not only good for the environment but also socially and economically acceptable has gained widespread acceptance in recent years. As a result of the diminishing availability of fossil fuels and the growing significance of concerns regarding the environment, there has been an increase in the utilisation of wind power. Wind power generation has been determined to be the renewable energy source with the highest annual growth rate. This is due to the fact that producing electricity with wind is not only beneficial to the environment but also economical. Wind energy conversion systems, abbreviated as WECS, are the devices that are currently responsible for transforming the kinetic energy of the wind into useful forms of power. The mechanical energy produced by wind turbine generators and windmills is then converted into electrical energy. This kinetic energy could be used for a variety of purposes, including pumping water, grinding grain, or powering machinery. Wind turbines garner a lot of attention when it comes to the topic of meeting the targets for renewable energy that have been set by governments all over the world. Wind farms that contain turbines with multiple megawatts of capacity are able to accomplish these goals. In the past year, offshore wind resources have become increasingly more important. Wind turbines on land have been limited in their ability to generate renewable energy due to environmental regulations and controversy; however, offshore wind turbines have a significantly greater potential to do so. Offshore installations require the construction of substantial platforms that are capable of supporting the combined weight of the structure and the wind energy conversion system. Efficiency and

dependability aren't the only factors that need to be taken into consideration for offshore installations. The security of offshore installations is another important factor that needs to be taken into account. The utilisation of wind power in the generation of electrical power is becoming increasingly recognised as a technology that is both beneficial to the environment and economically advantageous. The generation of wind power has witnessed rapid expansion over the course of the last decade, earning it this honour as a result. This chapter covers a wide variety of wind turbine systems, each of which has its own set of distinguishing qualities as well as applications. This introduction to wind energy conversion will cover topics such as how wind energy is generated, what components make up a wind energy system, how the system operates, and what kinds of wind turbines are available (WTs).

### 2.1 Wind energy conversion system

As a result of the growth of the global economy, there is an increasing demand for dependable sources of energy. Because of how favourable the conditions currently are, it is feasible to meet the ever-increasing demand for electricity by harnessing the power of the wind. Wind power has reached a point where it can now be routinely used by utilities as a source of energy generation. This was previously not possible. The improvements that have been made in the industry are to blame for this level of readiness. Reliability, availability, and maintainability of WTG are crucial factors that must be met before wind power can be used extensively. Efficiency in the conversion of wind energy is also very important.

Mittal et al. have compiled a list of the aspects of WECS that pose the greatest amount of difficulty. This report examines the most recent developments in wind

energy conversion systems and discusses them in detail. This course covers a variety of topics, including the categorization of systems, the various options for generators, as well as the social and environmental benefits of these systems. In addition to these topics, a report on the progress of Canadian and IEEE1547 interconnection standards will be presented. This report will cover issues with connectivity for dispersed resources such as wind and electric power systems and hybrid power systems, and it will discuss how the standards are progressing.

A generator that can change its speed and is connected to the grid WECS adhere to the straightforward method of control proposed by Kesraoui et al. for this kind of system in order to achieve the highest possible output power. When it comes to getting the most power out of a wind turbine, the Maximum Power Point Tracking (MPPT) system is the way to go. This system only makes use of direct current (DC) link electricity. MATLAB-SIMULINK was used to develop models of MPPT and search methods, as well as DC-DC and DC-AC converters and PWM controllers. The simulations indicated that the system would be capable of harvesting the maximum amount of wind power and precisely distributing that power throughout the system.

According to C. Xia and colleagues direct-driven WECS equipped with three-level inverters have neutral-point potential balancing. During this training session, the direct-driven WECSs were supplied with power by a three-level (TL) chopper that was positioned in front of a diode-clamped inverter. By utilising a switch-signal phase delay control, also known as SSPDC for short, we were able to achieve a state of equilibrium with regard to the NP potential of the TL inverter. In addition to tracking the maximum power point, the controller that was developed for the boost chopper was also used for this purpose. It contains two PI

regulators and was used for both of these purposes.

The research of Toledo and colleagues looked into the most recent developments in wind energy conversion systems. It would be helpful if you could provide a citation for this. Conducting research on the various aspects of the process that are pertinent to the transformation of wind energy is necessary if one wishes to achieve maximum efficiency.

This study ought to centre on the technical aspects of offshore wind turbine nacelles in addition to the most recent advancements in the field of renewable energy technology. In this article, the technological obstacles, current research and development trends, and potential future study areas for reducing the weight and volume of the nacelle are discussed. This page also includes, for your research and consideration, a comprehensive review of the more conventional methods for generating electricity using wind power.

Both vertical and horizontal axis wind turbines, abbreviated as VAWT and HAWT respectively, are the most common types of wind turbines (VAWT). Activities conducted downwind as well as those conducted upwind are both possible with a HAWT having two or three blades. This HAWT gives you the option to operate at either a constant or a variable speed depending on your needs.

In power plants that operate on renewable energy sources, induction machines are utilised quite frequently. This is due to the fact that not only are they easily accessible, but they also have a reasonable price point. However, static and reactive compensating capacitors can be used in conjunction with large power systems to correct power factor and reduce harmonics. Utility grids have the ability to control voltage and frequency. Asynchronous generators are by far the most common type of generator used in hydroelectric and wind power plants.

Depending on the application, they can also be used in prime movers that are powered by diesel, biogas, or natural gas. Alternatively, they can be powered by gasoline or alcohol-based fuels. An induction generator can be utilised not only as a generator but also as a motor, and it does an excellent job of fulfilling both of these roles. In addition to being the most cost-effective generators currently available on the market, these models feature a sturdy construction that enables them to withstand short circuits.

There is a connection between Sliding Mode Control (SMC) and Field Oriented Control, which is based on dual-stator induction generators (FOC). [11] (FOC). The nonlinear properties of wind turbines that are fitted with electric generators necessitate some interesting control requirements for wind energy conversion systems (WECS) that are connected to the standard electrical grid. The SMC is a robust nonlinear approach that utilises discontinuous control in order to bring the system state trajectories into alignment with a predetermined sliding surface. Getting this done might be possible through the SMC. It is frequently used in situations in which the modelling parameters are uncertain or when there are interruptions from the outside.

Djurovic et al. developed condition monitoring systems for induction generators that are used in wind turbines with electrically asymmetrical rotors. These monitoring systems are used in wind turbines. In order to verify the findings of the study, a time-stepping electromagnetic model as well as experimental data gathered from two distinct test rigs were utilised. The accuracy of analytical expressions that characterise the variation in fault frequency with operating speed has been confirmed by measurement, which paves the way for real-time tracking of fault frequency within a system. These expressions can be found in this section of the article.

Magnets can be used in place of the

excitation windings in synchronous machines due to the lower cost of the magnets and the improved magnetic material they use. The pole pitch on conventional generators is significantly greater than that of permanent magnet excitation machines. Because of this, these machines can be constructed to rotate at speeds ranging from 20 to 200 revolutions per minute (r/min), depending on the rated output of the generator. r/min stands for revolutions per minute. Multi-pole permanent magnet generators may or may not be included in the products that a given manufacturer of wind turbines offers, depending on the nature of their business (e.g. Jeumont, Lagerwey). Changing the speed of the turbine's rotation when the wind is blowing is one way to maximise the amount of energy that can be extracted from the wind.

A method for measuring the maximum power point was developed by Xia et al. in order to determine the maximum power point of WECS that make use of permanent magnet generators. Using this method, one can determine the amount of power that the WECS produces.

It is anticipated that systems that convert wind energy into a form that is usable will benefit from the addition of a device that detects their peak power point. These systems use permanent magnet synchronous generators. During training, an algorithm can be used to quickly discover the ideal relationship that should exist between the voltage at the rectified DC output and the current. By implementing innovative P&O practises, it is possible to reduce the impact of variable wind conditions to some extent. In order for the system to operate in a manner that is congruent with this hypothetical relation, it was made operational.

PI control is essential in order for a process to maintain a constant output over the course

of its lifetime. This suggests that the procedure is operating as it should at the present time.

A PI-based control design approach has become available thanks to the work that was done by Hwas et al. for the purpose of managing the pitch angle of blades on variable-speed wind turbines. When calculating the PI enhancements, one of the possible approaches can be analytical, while the other can be based on simulation. Both of these approaches are distinct from one another. It has been demonstrated through simulations that both of the PI methods have the potential to produce favourable outcomes. In order to construct an experimental test bench in a laboratory and evaluate the performance of the proposed controller in both steady and transient modes, DSPACE 1104 cards were utilised as the primary building material. According to the findings of the tests, FFOPI+I over FOPI controllers proved to be very effective and reliable across the broad spectrum of wind speeds that were evaluated.

Experimentally enhanced fuzzy-fractional order PI+I controllers were developed by Beddar et al. for grid-connected variable-speed wind energy conversion systems. Both a nonlinear load and an ACDC/AC converter that was connected to the grid needed to be controlled using pulse width modulation (PWM). The control system of the MSC is designed to generate the maximum amount of power possible, regardless of the wind speed.

## 2.2 Mathematical modeling of permanent magnet synchronous generator

It is possible that the robustness of a variable-speed wind turbine could be significantly improved by installing a direct-drive permanent magnet synchronous generator (PMSG). PMSGs have garnered a great deal of interest in the field of wind energy applications due to their capacity to function at high power factors while still

preserving a high level of efficiency. The variable wind speeds will cause the output of a PMSG to have an amplitude and frequency that are not stable. Inverters are required for all of these different approaches in order to keep the dc voltage at a constant level. The following expression can be used to describe the voltage produced by the generator in terms of the d-q rotating reference frame:

Equation:

$$V_{ds} = -R_s i_{ds} + \omega_r L_{qs} i_{qs} - L_{ds} \frac{di_{ds}}{dt} \quad (2.1)$$

$$V_{qs} = -R_s i_{qs} - \omega_r L_{qs} i_{qs} + \omega_r \partial_f - L_{qs} \frac{di_{qs}}{dt} \quad (2.2)$$

Where,

$R_s$ - the stator resistance

$i_{qs}, i_{ds}$ - the stator direct and quadrature currents

$\partial_f$ - the rotor flux and

$L_{qs}, L_{ds}$ - the stator direct and quadrature inductance

The electromagnetic torque is expressed as

$$T_e = \frac{3}{2} P [\lambda_f + (L_{ds} - L_{qs}) i_{ds}] i_{qs}$$

The machine equivalent mechanical equation is

$$T_m - T_e = J \frac{d\omega_m}{dt} + B\omega_m$$

Where, H are the inertia constant and equals

$H = \frac{1}{2} \left( \frac{J\omega_b^2}{P_p^2 P_b} \right)$  and friction coefficient in per

unit equals  $B_{pu} = \left( \frac{B\omega_b^2}{P_p^2 P_b} \right)$

The mathematical model using these methods and improving the performance of the grid integrated WECS.

### 3. Analysis of wind energy conversion system using fa-ann technique

Solar, wind, and hydropower are examples of renewable energy sources that produce no harmful byproducts and are simple and inexpensive to deploy. Oil and natural gas have the potential to take the place of more traditional forms of energy. However, as a result of overgrowth, both the output and validity of these systems have decreased. Inadequate alternating current (AC) networks have proven to be troublesome for the operation of big wind turbines because to stability and power quality issues. This article provides an explanation of an alternative wind turbine drive-train layout that utilises the adaptive strategy and combines a number of Permanent Magnet Synchronous Generators (PMSGs) with a cascaded multilevel converter. Combining Artificial Neural Networks (ANNs) and Firefly Algorithms results in a method that is highly flexible. The ANN's capacity to acquire new knowledge is improved with the utilisation of the FA. As a consequence of this, it is possible to reduce the switching losses that occur on cascaded multi-level inverters. The adaptive method, which is computed utilising a PID controller, is utilised in the process of computing the WECS stability study. This portion in whole

#### 3.1 Problem formulation

To achieving the most optimal controller gain settings, the FA-ANN method is applied. To conduct an analysis of the actual power being produced by the proposed system, a PID controller is used. To begin, an inaccurate power value is input into the PID controller, and the gain settings are adjusted so that they are accurate. The method is optimised through the application of the FA-ANN approach. The error data is used as a source of information for the gain

parameters  $k_p$  ( $K_p$ ),  $K_i$  ( $K_i$ ), and  $K_d$  ( $K_d$ ). To achieve synchronisation of the grid as well as the transformation of the coordinates, an integrated phase-locked loop is utilised (PLL). This approach's internal control loops make it possible for it to respond quickly to transients and to achieve excellent static performance in general. Grid currents can be broken down into d-axis and q-axis currents, which enables active and reactive power to be adjusted in a manner that is independent of one another. By utilising this method of control, one is able to realise both a high power factor and sinusoidal grid currents. In order to calculate the total amount of active and reactive power that a wind energy conversion system produces, equations are required.

$$P = \frac{3}{2} (E^d i^d + e^q i^q) + (R^d i^d + R^q i^q) + (L^d i^d + L^q i^q)$$

$$Q = \frac{3}{2} (E^d i^d - e^q i^q) + (R^d i^d - R^q i^q) + (L^d i^d - L^q i^q)$$

The d-axis reference is usually obtained from DC-link voltage controller.

$$P = \frac{3}{2} (E^d i^d)(R^d i^d)(L^d i^d)$$

$$Q = -\frac{3}{2} (E^d i^q)(R^d i^q)(L^d i^q)$$

The three-phase inverse output is denoted by the letters  $i_{abc}$ . Control of a cascaded cascaded H-bridge MLI converter is achieved by first determining the three-phase actual current, then determining the reference current, and finally producing the ideal pulses. This is done in order to ensure that the controlled cascaded H-bridge MLI converter is able to produce the best possible pulses. The performance of the cascaded H-bridge MLI converter was improved by increasing the ideal gain parameter of the converter. This improved the performance of the converter in both control loops. The measured values are additionally affected by

the PLL loops. The utilisation of three PID controllers within the framework of the proposed system enables it to function in complete congruence with the grid. Setting the zero point as the reference point on the q-axis is one way to arrive at the power factor of one. As a result of the superior dynamic responsiveness of the system, switching pulses for inverters can be generated by the system itself. As a result of the PLL, the grid harmonics and phase shifts that would normally have an effect on the source parameters are eliminated. Putting an LC filter between the inverter and the grid helps improve power quality while also lowering the number of harmonics that are produced by the WECS system.

### 3.2 Modelling of wind energy conversion system

There are many different forms of renewable energy, but the one that is expanding at the greatest rate is wind power. A variable speed wind turbine (VSWT), is able to harness the maximum amount of power regardless of the speed of the wind. There are a number of different designs that can handle the variable-speed duty of the PMSG wind turbine framework. These designs include staggered converters and two-dimensional converters. Wind turbines are typical devices that are used to create energy by harnessing the power of the wind. Kinetic energy, denoted by the symbol  $E = W = Fs$ , that was put in to bringing an object from a state of rest to a certain distance, denoted by the symbol  $s$ , while the acceleration is held constant. The following equation can be used to describe Newton's second law: (3.1).

$$F = ma \quad (3.1)$$

The actual wattage of the rotor blades' mechanical power is calculated by subtracting their upwind and downwind powers from their total value in the calculation (3.2).

$$P^w = \left[ \frac{1}{2} \cdot \rho A v_w \cdot (v_u^2 - v_d^2) \right] \quad (3.2)$$

Where  $v_u$  represents the velocity of the rotor blades as they enter the upwind direction in metres per second, and  $v_d$  represents the velocity of the rotor blades as they exit the downwind direction in metres per second, respectively. These two speeds are used as the foundation for the calculation that determines the ratio of the blade tip speed. Now, with the mass flow rate serving as a point of reference:

Equation (3.3), can be written as,

$$\rho A v_w = \left( \frac{\rho A (v_u - v_d)}{2} \right) \quad (3.3)$$

Where  $v_u$  is the average of the velocities that the rotor blades of the turbine experience while they are entering and exiting the machine. The wind turbine has a tip speed ratio that can affect it in a variety of ways. The symbol  $T_s$  stands for ratio between the wind speed blowing downwind to the wind speed blowing upwind, which is defined by the equation (3.4).

$$T_s = v_d / v_u \text{ or } T_s = \text{blade tip speed} / \text{wind speed} \quad (3.4)$$

In the following section, we will discuss the WECS stability study that was conducted using adaptive FA and ANN modelling techniques.

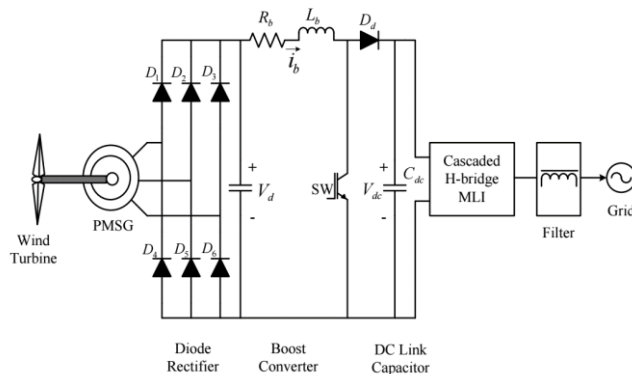

### 3.3 Analysis of ann algorithm based grid integrated wecs

The discussion in this article is focused on a cascaded multilevel H-bridge inverter stability analysis using the ANN algorithm. There is an option for an inverter-based wind energy conversion system like the one shown in figure 3.1. The WECS consists of the elements  $R_b$ ,  $L_b$ , and  $V_{dc}$ . Components such as these are utilized in order to symbolically represent the DC link voltage, in addition to the resistance and inductance. The PMSG has a connection to WECS as part of its mandate to play a part in laying the foundation for the region. It is possible to

eliminate the need for gear or drive train systems in order to reduce the overall cost and size of the system by employing PMSG-related WECS. This will allow for the elimination of the need for gear systems. The PMSG initiator, which is a variable-speed generator, is activated with the assistance of data regarding the wind speed. Dynamic Braking Resistors, also known as DBRs, are an excellent choice for the design of synchronous generators because they do not need to be magnetised by a current. By utilising the DBR, alternating current can be converted into pure direct current, which is then free of any unwanted harmonics. This is possible because of the DBR. It is possible to exert control over the torque and, as a result, achieve maximum power levels when the boost converter and the DBR are responsible for supplying the DC voltage. The smoothing capacitor known as the  $C_{dc}$  is what is utilized to stop the DC voltage from increasing.

This article presents a discussion on the ANN algorithm-based cascaded multilevel H-bridge inverter stability analysis. Figure 3.1 illustrates how the wind energy conversion system works by using an inverter with

multiple levels that are cascaded together. This diagram of the WECS illustrates the resistance  $R_b$ , the inductance  $L_b$ , and the DC-link voltage  $V_{dc}$ . All three of these characteristics are shown. The PMSG, which is responsible for determining the region's basis, is connected to the WECS grid. The complexity of the system, as well as its overall size and cost, can be decreased through the utilisation of PMSG-related WECS, and this can be accomplished without the utilisation of gear or drive train systems. The PMSG initiator, which is a variable speed generator, is activated after a comprehensive collection of wind speeds is made. The Dynamic Braking Resistors, also known as DBRs, are a pattern that is suitable for use in synchronous generators because they do not call for a magnetising current. It is possible to get rid of harmonics by converting the AC into DC, which is why the DBR is used in the process. Utilizing both a boost converter and a DBR, which are connected to one another, is required in order to achieve the highest possible DC voltage. Utilizing a smoothing capacitor like  $C_{dc}$  helps reduce the DC voltage swell that can occur.

**Figure 3.1** Structure of the WECS with Multilevel Inverter

The cascaded H-bridge Multilevel Inverter is responsible for the current variation of the system's output voltage, which consists of five levels (MLI). It is used to develop the

presentation by keeping the regulator's expansion limit and causing the most favorable pulses for the cascaded H-bridge MLI to be created. Both of these things are

necessary in order to develop the presentation. In order for this to be successful, the expansion restriction must be maintained at all times. The WECS gain optimizer, in conjunction with another algorithm, is used to optimize the gain parameters of the cascaded H-bridge multilevel inverter.

### 3.4 Analysis of wecs using adaptive fa - ann technique

A new control strategy has been implemented here in order to improve the power quality provided by WECS. The minimization of WECS consonants can now be improved by utilising a combination of FA calculation and an ANN system. This was not previously possible. It is common practise to make use of the cascaded H-bridge multilevel inverter in order to enhance the ANN strategy for controlling quality concerns regarding the WECS force. In the section that follows the WECS, a calculation of the FA is provided for your reference.

#### 3.4.1 Introduction of Fire Fly algorithm

A model of a firefly was crafted by Yang. Because of their alluring appearance, fireflies are most active at night. They enjoy living in warm environments, and because of their allure, they tend to be most active during the night. There are a number of fascinating aspects related to flame flies, such as the following:

- A model of a firefly was crafted by Yang. Because of their alluring appearance, fireflies are most active at night.
- They enjoy living in warm environments, and because of their allure, they tend to be most active during the night.
- There are a number of fascinating aspects related to flame flies, such as the following:

The bioluminescence technique is in charge of the glinting light of fireflies. There are a couple of theories about the aim and position of blasting light in fireflies' life cycle yet huge quantities of them converge to mating stage. The simple focus of bursting light is to attract the mating associates. The case of these melodic flashes is fascinating and it relies upon the mind-set of flashes, rate of blasting, and proportion of time for flashes are recognized.

#### 3.4.2 Proposed Methodology

The research has been undertaken in the following stages  $\pi$  MATLAB /SIMULINK 7.10.0 is R2010a simulation of Grid integration of Wind Energy Conversion System using FA-ANN algorithm. Performance metrics like PMSG active power, PMSG reactive power, DC-link voltage, wind speed, and THD.

#### 3.4.3 Classification of FA

The algorithms used by Firefly have been through a variety of iterations over the course of their development. Tuning, also known as adaptive parameter control, is a technique that has been utilized in the search for the optimal combination of parameters. A number of different modified and combined firefly algorithms are presented in Figure 3.2.

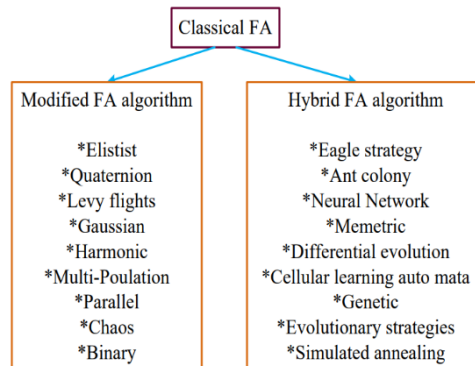

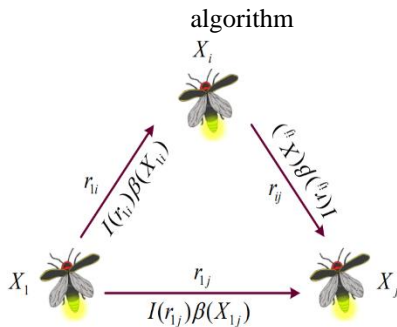

Figure 3.2 Classification of Firefly

**Figure 3.3** A Conceptual View of the Firefly Algorithm which includes locations  $X$ , Distance  $r$ , Brightness  $I(r)$  and Attractiveness  $\beta(r)$ .

### 3.4.4 Adaptive FA-ANN Technique Based Cascaded H- Multi Level Inverter Using Grid Side Variation

In this proposed scheme, the Adaptive FA-ANN strategy has used out the control parameters improvement for WECS structure dependent on the Cascaded multilevel inverter utilizing matrix side variety. The Cascaded Hbridge multilevel inverter can coordinate the controlling of the exchanging problem and matrix side variety. The proposed methodology is the mix of FA and ANN procedure. The FA calculation is to build up the information of ANN. The FA advancement calculation favours the most ideal readiness dataset to direct the ANN for improving the learning introduction. ANN incorporates three layers, for example, input, covered up, and yield layers. The information layer contains various hubs that are plucky by methods for the informational index. Each hub incorporates related loads to the whole hubs in the following layer and too one disposition identified with the same hubs of the following layer. Inclination hubs envelop a yield of one hub and they are identified with the whole hubs of their layer. The loads on the relationship from inclination hubs are known as predisposition loads. The whole loads are evaluated to give

the theoretical of this hub, and a short time later the foundation task of this hub is determined. There are various classes of the foundation task like a stage task, a signed assignment and a sigmoid undertaking. There are numerous classes of the foundation task like a stage task, a signed assignment and a sigmoid errand. The customary foundation task is a sigmoid assignment which is appeared in condition as follows.

$$f(x) = \frac{1}{1 + e^{-x}}$$

The input data are specified by the equation  $x$ .

The number of information sources and the number of yields that can be reliably derived from a dataset are what determine the records that make up hubs in both the information and yield layers. The number of hubs that are contained within a hidden layer can be expressed as follows, in accordance with the Kolmogorov hypothesis:

$$\text{Hidden nodes} = 2 * \text{Input} + 1$$

A fake neuron is the basic preparing part and its inside modifiable confinements are recognized as association loads. Fake neurons weight, total and limit approaching signs are utilized to create yield. Data is assembled in the intensity of the interconnections or loads and the edges. The most critical goal of ANN is to decide a gathering of association loads that reduce the shortcoming task. The system is an open couple of yield information and the issue for the time of learning. The procedure depends on the FA. The calculation is gotten from the qualities of the fitter species. It contains successful rummaging strategy like remain alive and scattered in the improvement chain.

In the following section of this article, an in-depth analysis of the ANN is presented for your perusal. One of the neural network architectures that is used today in the most

common applications is the multi-layer feedforward network with the back-propagation learning algorithm. This architecture is used quite frequently. The architecture of a neural network typically consists of the standard components of an input layer, an output layer, and a hidden layer. Figure 3.4 presents an illustration of the training structure for ANNs. Back propagation is the name of the algorithm that is used during the training process for the neural networks.

**Figure 3.4** Training Structure of ANN using Proposed Adaptive

As can be seen, the weights for both the input and the output layers have been assigned in this illustration.  $W_{111}$  and  $W_{11n}$  are the weights that go from the input layer to the hidden layer.  $W_{211}$  and  $W_{212}$  are the weights that go from the hidden layer to the output layers, and  $W_{221}$  and  $W_{222}$  are the weights that go in the opposite direction. The outputs of the node are denoted by the letters  $Y_1$ ,  $Y_2$ , and  $Y_3$ . After that, an algorithm known as back propagation is applied to the training of the neural network. The following is an outline of the steps that make up the training algorithm.

**3.4.5 Proposed Cascaded H-bridge 5-Level multilevel Inverter**

The proposed method is utilized by multilevel inverters known as cascaded H-bridges (CHB) (5-level). Figure 3.5 is a schematic representation of an H-bridge multilevel inverter with cascaded H-bridge

input DC sources. There are a total of nine possible output stages when using  $V_{dc}$  and  $V_{dc} / 3$ , including  $4V_{dc}$ ,  $3V_{dc}$ ,  $2V_{dc}$ , and  $V_{dc}$ .

**Figure 3.5** Five Level Cascaded H – Bridge Multilevel Inverter

**3.4.6 Control Strategy**

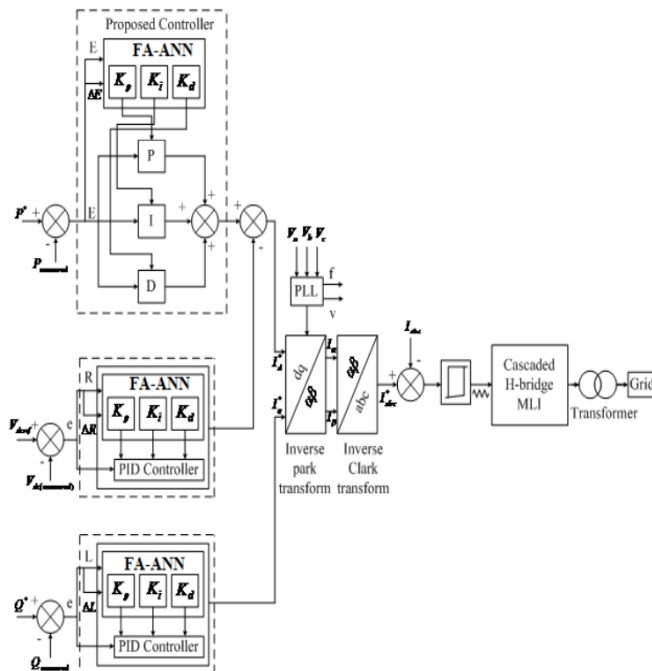

The control strategy for a grid-connected WECS is first deconstructed into its dynamic properties, which are then used to describe the control strategy. Studying the flow of electricity through the grid can be done with the help of the WECS. To put it another way, utilising WECS is a choice that results in significant cost savings. The power that is generated by the WECS is sent to the grid through the DBR. It was necessary to use a rectifier in order to change the alternating current into direct current (DC). When you already have access to the DC power, using a boost converter will enable you to extract the maximum amount of useful energy from the DC power. The maximum amount of power that can be drawn from the cascaded H-

bridge MLI is then used to draw from nine different levels of power. Improving the controller components is one way to increase the likelihood that the project will be successful. The performance of the cascaded H-bridge MLI has undergone further enhancements, and the generation of optimal pulses has been completed. The analysis takes into account not only the real power

but also the reactive power, the regulation of the voltage, and the total harmonic distortion. In this way, a proposed controller is utilised in order to conduct an analysis of the control system's power regulation and voltage regulation blocks. Figure 3.7 illustrates the control structure that is utilised by this method.

**Figure 3.6** Output voltage waveform of five-level cascaded H-bridge multilevel inverter

**Figure 3.7** FA – ANN with PID Controller

### 3.4.7 Power and Voltage Control loops

Because each control strategy is a separate and independent undertaking, it possesses its own one-of-a-kind set of parameters. In a power control strategy, the real power, denoted by  $P_m$ , is computed using the PLL method, and the result is compared to the reference power, denoted by  $P^*$ . After this has been accomplished, the error values are computed and recorded alongside the factor (E). Using the FA-ANN technique, the gain parameters of the controller are optimized for optimal performance. We are able to calculate the system's true output power by utilizing a PID controller. At first, the PID controller takes the error value of the power as its input, and then it tunes the gain parameters to their optimum levels. The FA-ANN method is utilized in order to achieve optimal results with the process. Input for the gain parameters  $k_p$  ( $K_p$ ),  $K_i$  ( $K_i$ ), and  $K_d$  ( $K_d$ ) are taken from the error values ( $K_d$ ). After that, the gain parameters and inputs that work best are figured out. As an input, the PID controller takes into consideration the optimized values for the gain parameters. After this step, PID controllers are able to be fine-tuned, which ultimately results in an output that is more accurate and efficient. In the same way, we are working on the other blocks, and their performances are being evaluated. Using these three blocks, it is possible to generate cascaded H-bridge MLI control pulses and investigate their dynamic properties. The pulses of a cascaded H-bridge MLI that has been optimized for connection to the WECS grid are being studied. The d-axis and q-axis current components of the inverter are responsible for controlling the instantaneous reactive and active power exchange that occurs between the DC link voltage and the grid. Inverters are responsible for producing square waves

with a high frequency. The synchronized reference frame for the direct current quantities of the control variables is depicted in figure 3.4. Grid-side converters can now be easily filtered and controlled thanks to a new method that has been developed. In addition to this, the PID regulator is superior to others in its ability to control DC variables. The phase lock loop (PLL) is then used to obtain the grid angle for the transformation.

A phase-locked loop is utilized in order to accomplish grid synchronization as well as coordinate transformation (PLL). Internal control loops of this strategy ensure a rapid response to any transients and a high static performance. It is possible to separate the d-axis grid current from the q-axis grid current, which enables independent control of the system's active power and reactive power. By utilizing this method of control, one is able to realize both a high power factor and sinusoidal grid currents. In the process of converting wind energy into usable forms, equations are utilized to ascertain the total amount of active and reactive power that is produced.

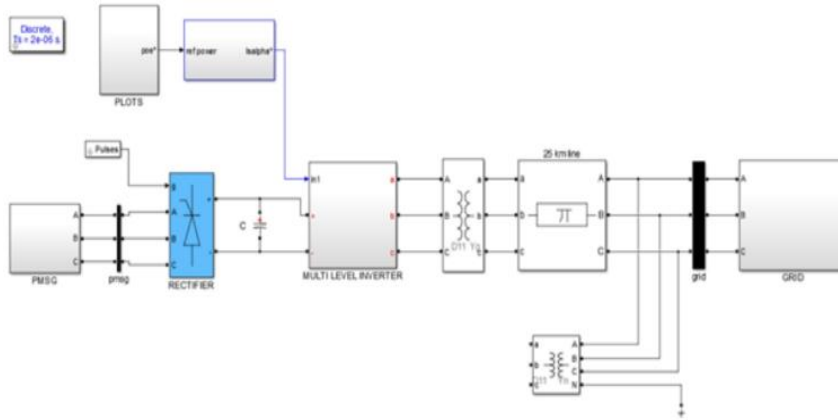

$$P = \frac{3}{2}(E^d \cdot i^d + e^q \cdot i^q) + (R^d \cdot i^d + R^q \cdot i^q) + (L^d \cdot i^d + L^q i^q)$$

$$Q = \frac{3}{2}(E^d \cdot i^d - e^q \cdot i^q) + (R^d \cdot i^d - R^q \cdot i^q) + (L^d \cdot i^d - L^q i^q)$$

## 4. Analysis of grid integrated wecs using fire fly optimization algorithm results

Figure 4.1 shows MATLAB/SIMULINK model of the FA-ANN method with cascaded H-bridge multilevel inverter, and Table 4.1 shows implementation parameters of the PMSG using FA-ANN method.

**Figure 4.1** MATLAB/SIMULINK model of the FA-ANN method with cascaded H-bridge multilevel inverter

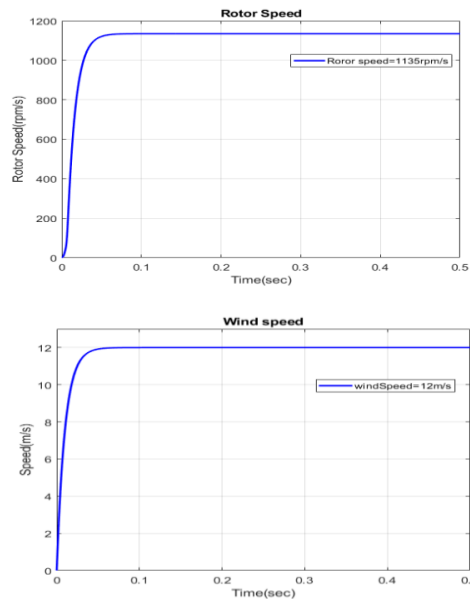

**Table 4.1** Implementation parameters of the PMSG using FA-ANN method

Description of parameters	Values
Rated wind speed	12(m/s)
Base rotational speed	1.2 (p.u)
Nominal mechanical output power	605.142 (W)
Stator phase resistance	0.18 (ohm)
Armature inductance	0.0167 (H)
Pole pairs	4
Rotor type	Round
Flux linkage	0.0714 ( $v_s$ )
Torque constant	0.4286 ( $N_m$ )
Inertia	0.00062J( $kgm^{-2}$ )
Friction factor	0.00030 F(Nms)

#### 4.1 Analysis of normal wind speed

Figure 4.2, which depicts the device in normal operation and demonstrates how it works, includes an illustration of the rotor and the wind speeds. When the sails are raised to their full height, the wind speed may be measured at 12 m/s; when the sails are lowered, the wind speed may be measured at 24 m/s. If the strategy is put into action, it will be possible to exercise control over wind speeds that are either lower than or comparable to the rated speed. The pitch

angle control will help to smooth out the output power whenever the wind speed is greater than the cut-in speed of the PMSG.

**Figure 4.2** Rotor speed and wind speed in normal wind speed condition using FA-ANN

**Figure 4.3** Active power and reactive power in the PMSG under normal wind speed condition using FA-ANN

**Figure 4.4** Dc-link voltage in normal wind speed condition using FAANN

**Figure 4.5** Three-phase voltage and current of grid in normal wind speed condition using FA-ANN

Figure 4.3 depicts the PMSG's active and reactive powers. At normal wind speeds, the PMSG's electrical speed is controlled by the optimum rational speed. At 0.5 seconds, the

PMSG's active and reactive powers settle. As shown in Figure 4.4, the DC-link voltage output in a steady state is perfectly normal under these circumstances. The settling time of 0.55 seconds and the corresponding voltage of 248V were used to determine the DC voltage. Figure 4.5 depicts the grid's three-phase voltage and current performance at normal conditions.

**Figure 4.6 (a).** Inverter voltage power in normal wind speed condition using FA-ANN

**Figure 4.6 (b)** Grid real and reactive power in normal wind speed condition using FA-ANN

Figures 4.6 (a) and (b) depict various analyses, including those of the inverter voltage as well as the real and reactive power of the grid (b). By referring to this diagram, one can observe that the voltage that is present on the grid is kept at a stable

level. As a result of its implementation, it has been demonstrated that the FA-ANN control technique is not only straightforward and reliable, but also enables greater adaptability and lessens the strain that is imposed on the blades of wind turbines. The vast majority of power fluctuations can be brought under control by utilising the FA-ANN method.

### 4.2 Analysis of variable wind speed

In this experiment, the voltages are analysed with the help of a motor that has a variable speed. Utilizing the proposed controller-based cascaded H-bridge MLI, we investigate the active power, reactive power, DC-link voltage, and harmonic compensation performance. The results of conducting tests on the proposed model in relation to different gust strengths are depicted in Figure 3.10. The amount of power and voltage that is output by the wind generator is proportional to the speed of the wind. Because of the large fluctuations in output power that are brought on by the relatively minor shifts in wind speed, the required voltage fluctuation to ensure compliance with grid standards is increased.

**Figure 4.7** Rotor speed and wind speed in variable wind speed condition using FA-ANN

**Figure 4.8** Active power and reactive power in the PMSG under variable wind speed condition using FA-ANN

### 4.3 Simulation Results

The following is the technical specification that the PMSG has developed for the FA-

ANN method: The simulation is run in MATLAB with the help of the Implementation parameters, and the results are displayed here with the assistance of the

Implementation parameters. Based on the Implementation parameters, the simulation is run in MATLAB, and the results are displayed here with the assistance of the Implementation parameters. Figure 3.11 illustrates the PMSG's real and reactive power performance, which was accomplished with the help of the suggested method. Voltages in the FA-DC-link ANN have been the subject of some research and analysis. It is clear that the time required for this DC-rise link is 0.001 seconds, the time required for its top-overshoot is 0.05" seconds, and the time required for it to reach steady state is 0.56" seconds (i.e., 200V settles in 0.56" seconds).

Figure 4.9 DC-link voltage in variable wind speed condition using FAANN

Figure 4.10 voltage THD% analysis of FA-ANN method

The findings of a THD investigation into the suggested procedure are depicted in Figure 3.10. The total harmonic distortion (THD) of the output of the grid-integrated power system control technique that has been proposed is 11.47 % a description of the factors at play Values Maximum wind speed of 12 meters per second speed of rotation at the point where it is slowest 1.2 (p.u) Power from the electrical source 605.142 watts (W) Both the phase resistance of the stator, which is 0.18 ohm, and its inductance, which is 0.0167 H, are very low. Two poles to a pair Rigid-Rotary 4-Rotor The following equation describes the relationship that exists between the torque constant and the flux linkage: Its friction coefficient is 0.00030 F.N.ms, and its moment of inertia is 0.00062 J kgm.

Table 4.2 Comparison of voltage %THD of FA-ANN Proposed Method

	FA-ANN
THD%	11.81
Grid Voltage(V)	14200
Grid Current(A)	10
DC link Voltage(V)	247

## 5. Conclusion

The FA-ANN optimization method is simulated in the MATLAB/SIMULINK environment, and the output waveforms for a variety of conditions are analyzed. The control strategy of the WECS integrated grid is implemented in order to enhance the transient response of the power system. An adaptive FA-ANN technique is used to track real and reactive power in order to reduce the fluctuation in a steady state. This technique is based on the various speeds at which the wind is blowing. The PID controller organizer of the WECS integrated grid is responsible for managing the cascaded H-bridge multi-level inverters. This organizer also incorporates FA and ANN algorithms. A look was taken at the voltage

of the system's DC link. It is clear that the time required for this DC-rise link is 0.001 seconds, the time required for its top-overshoot is 0.05" seconds, and the time required for it to reach steady state is 0.56"

seconds (i.e., 200V settles in 0.56" seconds). The FA-ANN control technique used by the grid-integrated power system has a total harmonic distortion of 11.47 %.

## GAME DEVELOPMENT TOOLS AND AI BASED ALGORITHMS FOR CREATION OF GAMEWORLD

**Abstract:** *Game development is a complex and time-consuming process that requires the use of specialized tools and technologies to create immersive and engaging game worlds. In recent years, the use of AI-based algorithms has become increasingly popular in game development, as they offer the ability to generate dynamic and varied game worlds that adapt to the player's actions.*

**Keywords:** *game development, game world, AI-based algorithms, procedural content generation, game engines, level design, conversational AI, game AI*

### 1. Introduction

Game world design theory involves creating a virtual environment that is immersive, engaging, and meaningful for players. The game world design is a critical component of a game, as it sets the tone, atmosphere, and overall experience for the player.

Creating the game world requires multiple process which should be interconnected.

One of the main principles of game world design theory is consistency. A game world should be consistent in its design, with elements that are logically and thematically connected. This helps create a sense of believability and immersion for players. By creating a world that is internally consistent, designers can help players become fully immersed in the game world.

Another important principle of game world design theory is exploration. The game world should be designed in a way that encourages exploration and discovery. This can include hidden areas, secrets, and rewards that player can discover as they navigate the game world. By creating a sense of discovery, designers can help players feel

more engaged and invested in the game world.

Interactivity is another key principle of game world design theory. The game world should be interactive, with elements that can be manipulated or interacted with by the player. This can include objects that can be picked up, doors that can be opened, or enemies that can be defeated. By creating a world that is interactive, designers can help players feel more engaged and invested in the game world.

In addition, game world design theory emphasizes the importance of challenge. The game world should provide challenges and obstacles for the player to overcome. These challenges should be designed in a way that is fair and balanced, but also challenging enough to keep the player engaged. By providing challenges, designers can create a sense of achievement and satisfaction for players.

Another important principle of game world design theory is storytelling. The game world should tell a story through its design and elements. This can include environmental storytelling, where the game world itself tells a story through its design

---

Corresponding author: Hrvoje Puškarić  
Email: [hpuskari@asss.edu.rs](mailto:hpuskari@asss.edu.rs)

and placement of objects. By using storytelling techniques, designers can create a world that is more engaging and meaningful for players.

Finally, game world design theory emphasizes the importance of player agency. The game world should provide the player with a sense of agency and control over their experience. This can include multiple paths or options for completing objectives, or the ability to make choices that affect the game world and its outcome. By giving players a sense of control, designers can help create a more engaging and immersive game world.

Overall, game world design theory is about creating a virtual environment that is engaging, immersive, and meaningful for players. By following these key principles, game designers can create game worlds that are memorable and enjoyable for players.

## 2. Game Engines for World Creation

Game world creation engines are software tools that game developers use to create and design game worlds. These engines provide a wide range of features and tools that help developers create immersive and engaging game worlds more efficiently.

### 2.1. Unity engine

Unity is a powerful game engine that is used by game developers around the world to create a wide variety of games and interactive experiences (figure 1). It offers a range of features and tools for game development, including 3D modeling and animation tools, physics simulations, and real-time rendering capabilities (De Macedo & Formico Rodrigues, 2011; Jitendra et al., 2021).

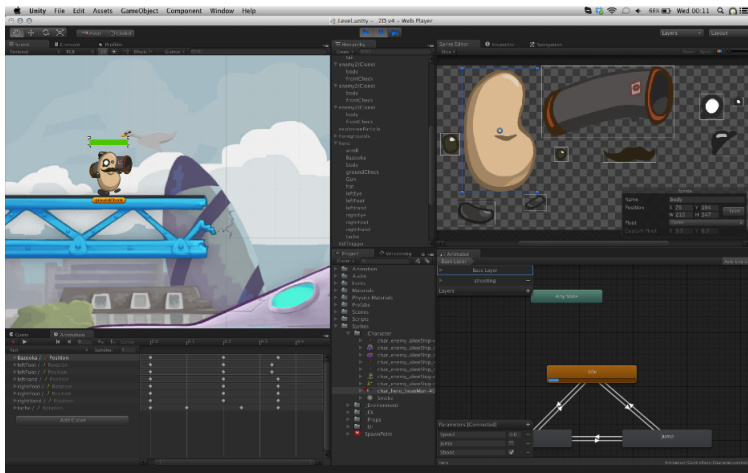

Figure 1. Unity engine interface (source <https://techcrunch.com/2013/08/28/unity-game-engine-to-get-official-2d-game-support-and-a-built-in-ad-service/>)

One of the key features of Unity is its cross-platform support. Games developed in Unity can be easily deployed to a wide range of platforms, including mobile devices, PCs, consoles, and even virtual and augmented reality devices. This makes it a popular

choice for developers who want to reach a large audience with their games.

Unity also includes a visual editor that allows developers to create and design game worlds without having to write code. This

editor includes a range of tools for creating terrain, adding objects to the world, and configuring lighting and effects. It also includes a powerful scripting system that allows developers to create custom behaviors for their game objects using C# or UnityScript (a variant of JavaScript).

In addition to its core features, Unity also offers a range of add-ons and extensions that can be used to extend its functionality. These include tools for creating user interfaces, networking and multiplayer support, and AI and machine learning integration.

Another key advantage of Unity is its active and supportive community. There are a wide range of resources available for Unity developers, including tutorials, documentation, and forums where developers can ask questions and share their

knowledge.

Overall, Unity is a versatile and powerful game engine that offers a range of features and tools for game development. Its cross-platform support, visual editor, and scripting system make it a popular choice for both beginner and experienced game developers.

## 2.2. Unreal engine

Unreal Engine is a popular game engine developed by Epic Games that is used by game developers to create high-quality, AAA games for a range of platforms, including consoles, PCs, and mobile devices (Lee, 2016; Satheesh, 2016). The engine is known for its advanced graphics capabilities, powerful tools, and flexibility (figure 2).

**Figure 1.** Unity engine interface (source <https://techcrunch.com/2013/08/28/unity-game-engine-to-get-official-2d-game-support-and-a-built-in-ad-service/>)

One of the key features of Unreal Engine is its advanced rendering capabilities. The engine uses a real-time rendering system that allows developers to create highly detailed and realistic environments, characters, and effects. It also includes a range of tools for creating advanced lighting and materials, as well as support for high dynamic range (HDR) rendering, which allows for a wider

range of colors and brightness levels.

Unreal Engine also includes a powerful visual editor that allows developers to create and edit game worlds in real-time. This editor includes a range of tools for creating terrain, adding objects to the world, and configuring lighting and effects. It also includes a Blueprint visual scripting system that allows developers to create custom

behaviors for their game objects without having to write code.

In addition to its core features, Unreal Engine also offers a range of add-ons and extensions that can be used to extend its functionality. These include tools for creating user interfaces, networking and multiplayer support, and physics simulations.

One of the key advantages of Unreal Engine is its active and supportive community. There are a wide range of resources available for Unreal Engine developers, including tutorials, documentation, and forums where developers can ask questions and share their knowledge.

Overall, Unreal Engine is a powerful and flexible game engine that offers a range of advanced features and tools for game development. Its advanced graphics capabilities, powerful tools, and active community make it a popular choice for AAA game development.

### 3. Artificial intelligence in game development

Artificial intelligence (AI) is used extensively in gaming development to enhance the gaming experience and provide more realistic and immersive gameplay (Carpenter, 2023; ChatGPT successor creates entire video games in minutes). Here are some ways AI is used in gaming development:

Non-Player Characters (NPCs): AI is used to create intelligent NPCs that can act and react realistically in the game world. NPCs can have various behaviors and personalities, such as aggressive, defensive, passive, or social, and they can learn from the player's actions and adapt to different situations.

- 1) **Enemy AI:** AI is used to create intelligent enemies that can challenge the player and provide a more realistic gaming experience.

Enemies can have different abilities and behaviors, and they can learn from the player's actions and adapt to different situations.

- 2) **Procedural Content Generation (PCG):** AI is used to generate game content, such as levels, environments, and items. PCG can create unique and dynamic content that adapts to the player's actions and provides a more engaging gaming experience.
- 3) **Pathfinding:** AI is used to help characters navigate the game world by finding the best path to reach their destination. Pathfinding algorithms can calculate the shortest or safest route, avoid obstacles, and adjust to changing terrain.
- 4) **Natural Language Processing (NLP):** AI is used to understand and interpret player input, such as voice commands or text messages. NLP can provide more immersive and interactive gameplay by allowing players to communicate with NPCs or control the game using natural language.
- 5) **Machine Learning (ML):** AI is used to analyze player data and behavior to improve the game's performance and provide a more personalized gaming experience. ML can learn from player actions and adjust the game's difficulty, pacing, or content to match the player's skill level and preferences.

### 4. Example of Algorithms in Game Development

An AI chat bot can be used in Unreal Engine to generate a game world by using natural language processing techniques to understand the user's preferences and then using procedural content generation

algorithms to generate the game world. The process can be broken down into several steps.

First, the inputs need to be defined. This involves defining the types of inputs that the chat bot will receive, such as the user's preferences for terrain type, object density, quest types, and NPC personalities. These inputs will be used by the procedural content generation algorithms to generate the game world.

Next, the natural language processing (NLP) algorithms need to be trained. This involves providing the chat bot with a large dataset of text input and corresponding outputs. The chat bot will use this dataset to learn how to recognize and interpret natural language input from the user.

Once the NLP algorithms are trained, the chat bot can be integrated into the Unreal Engine game development environment. The chat bot will be programmed to listen for user input and respond with generated game world data based on the input received.

The generated game world data can then be used to create the game world in Unreal Engine. For example, the terrain generation algorithm might use the user's preference for mountainous terrain to generate a hilly landscape with large rock formations. Similarly, the object placement algorithm might use the user's preference for a dense object population to generate a forest with lots of trees and wildlife.

In summary, the process of using an AI chat bot in Unreal Engine involves defining the inputs, training the NLP algorithms, integrating the chat bot into the game development environment, generating game world data based on user input, and using the generated data to create the game world.

#### 4.1. Use of Natural Language

In essential AI chat bot could be used to help create a game world in Unreal Engine.

User inputs a command such as "Generate a new game world".

The AI chat bot (ChatGPT successor creates entire video games in minutes) responds with a series of questions to help determine the parameters of the game world (e.g. size, terrain type, number of biomes, etc.).

The user responds to each question, providing the necessary information.

The AI chat bot then generates a game world using the parameters provided by the user, using a variety of algorithms and techniques such as Perlin noise, Voronoi diagrams, and L-Systems.

The user can then explore the generated game world in Unreal Engine and make adjustments as necessary.

Here is an example conversation between a user and an AI chat bot:

User: "Generate a new game world."

AI chat bot: "Sure! What size should the game world be? (e.g. 10x10, 20x20, etc.)"

User: "20x20."

AI chat bot: "What type of terrain do you want? (e.g. mountains, forests, etc.)"

User: "Mountains and forests."

AI chat bot: "Okay. How many biomes do you want to include? (e.g. one, two, three, etc.)"

User: "Two."

AI chat bot: "Great. Using the parameters you provided, I will now generate a new game world. This may take a few minutes, so please be patient."

The AI chat bot would then use the parameters provided by the user to generate a new game world in Unreal Engine, using a

variety of algorithms and techniques such as Perlin noise, Voronoi diagrams, and L-Systems. Once the game world has been generated, the user can then explore it in Unreal Engine and make adjustments as necessary (Artificial intelligence. (n.d.).).

## 4.2. In Code Ai Algorithms in Unreal Engine

AI chat bots could be used to create a game

```
// Prompt the user to specify the type of terrain they want
string terrainType = chatbot.promptUser("What type of terrain do you want?");

// Prompt the user to specify the size of the game world
int worldSize = chatbot.promptUser("What is the size of the game world?");

// Use Perlin noise to generate the terrain
for (int x = 0; x < worldSize; x++) {
    for (int y = 0; y < worldSize; y++) {
        float noiseValue = PerlinNoise(x, y);
        float terrainHeight = noiseValue * MAX_TERRAIN_HEIGHT;
        terrain.setVertexHeight(x, y, terrainHeight);
    }
}
```

**Object Placement:** An AI chat bot could ask the user to specify the type of objects they want to place in the game world (e.g. trees, rocks, buildings, etc.), the density of the objects, and any other relevant

world in Unreal Engine:

**Terrain Generation:** An AI chat bot could ask the user to specify the type of terrain they want (e.g. mountains, plains, forests, etc.), the size of the game world, and any other relevant parameters. Based on the user's input, the AI chat bot could use algorithms such as Perlin noise, Voronoi diagrams, and fractal terrain generation to generate a unique and realistic game world.

parameters. Based on the user's input, the AI chat bot could use algorithms such as Poisson disk sampling and random walks to intelligently and realistically place objects in the game world.

```
// Prompt the user to specify the type of objects they want to place
string objectType = chatbot.promptUser("What type of objects do you want to place?");

// Prompt the user to specify the density of the objects
float objectDensity = chatbot.promptUser("What is the density of the objects?");

// Use Poisson disk sampling to place objects
for (int x = 0; x < worldSize; x++) {
    for (int y = 0; y < worldSize; y++) {
        if (PoissonDiskSampling(x, y, objectDensity)) {
            Object* newObj = ObjectFactory::createObject(objectType);
            newObj->setPosition(x, y);
            gameWorld.addObject(newObj);
        }
    }
}
```

**Quest Generation:** An AI chat bot could ask the user to specify the type of quests they want to include in the game world (e.g. fetch quests, kill quests, puzzle quests, etc.), the difficulty level, and any other relevant

parameters. Based on the user's input, the AI chat bot could use techniques such as procedural content generation and natural language processing to generate unique and engaging quests for the player to complete.

```
// Prompt the user to specify the type of quests they want to include
string questType = chatbot.promptUser("What type of quests do you want to include?");

// Prompt the user to specify the difficulty level
int difficultyLevel = chatbot.promptUser("What is the difficulty level?");

// Use procedural content generation to generate quests
Quest* newQuest = ProceduralContentGenerator::generateQuest(questType,
difficultyLevel);
gameWorld.addQuest(newQuest);
```

**NPC Generation:** An AI chat bot could ask the user to specify the type of non-playable characters (NPCs) they want to include in the game world (e.g. merchants, warriors, mages, etc.), the personality traits of the NPCs, and any other relevant parameters.

Based on the user's input, the AI chat bot could use techniques such as decision trees and Markov chains to generate realistic and dynamic NPCs that interact with the player in unique and interesting ways.

```
// Prompt the user to specify the type of NPCs they want to include
string npcType = chatbot.promptUser("What type of NPCs do you want to include?");

// Prompt the user to specify the personality traits of the NPCs
string personalityTraits = chatbot.promptUser("What are the personality traits of the NPCs?");

// Use decision trees to generate NPCs
NPC* newNPC = DecisionTreeGenerator::generateNPC(npcType, personalityTraits);
gameWorld.addNPC(newNPC);
```

Overall, AI chat bots have the potential to revolutionize game world creation in Unreal Engine by providing an intelligent and user-friendly interface for generating unique and engaging game worlds.

## 5. Conclusion

In conclusion, AI algorithms have greatly

influenced the creation of game worlds in the gaming industry. The use of AI algorithms in game development has enabled game developers to create immersive and dynamic game worlds that can adapt to the player's preferences and behavior. With the use of AI algorithms such as machine learning, natural language processing, and procedural content generation, game developers can generate

game worlds with minimal human input, saving time and resources.

The Unreal Engine and Unity Engine are two of the most popular game design tools that game developers use to create game worlds. These game engines come equipped with various AI tools and features that enable game developers to incorporate AI algorithms into their game development process.

AI chat bots can be used in Unreal Engine to generate game worlds by using natural language processing techniques to understand the user's preferences and generating game world data based on the

input received. Additionally, AI algorithms can be used in Unreal Engine to generate game world data for terrain, object placement, and NPC behavior, among other things.

In summary, the use of AI algorithms in game development has revolutionized the way game worlds are created, making them more immersive, interactive, and adaptable to player preferences. As AI technology continues to advance, we can expect to see even more innovative and creative use of AI in game development, leading to more engaging and immersive game worlds for players to enjoy.

## SPECIFICITY OF THE PROCESS OF INTRODUCING ERP SYSTEMS IN COMPANIES

**Abstract:** *Introducing a new ERP system in companies is a demanding and long-term process, which is associated with high costs. Projects of this type are exposed to risks such as delays, additional unexpected costs or even interruption of the project that we want to avoid. In the relevant literature, the importance of applying established procedures in IT project management is recognized by many researchers when identifying key success factors (CSFs-Critical Success Factors) of ERP implementation. This work is based on the research of critical success factors related to the use of business intelligence, which can be seen as a guide for a system dealing with resource planning in large companies (ERP-Enterprise Resource Planning). This research, based on data on how different businesses are integrating these different technologies, also provides evidence of the critical success factors that drive this integration. An exploratory approach to the analysis of this problem uses detailed analysis as well as interviews to answer many questions. This research resulted in the development of a conceptual framework that identifies the critical success factors of business intelligence and the contexts that influence them, also the study investigates the critical success factors of business intelligence when implemented as a continuation of an ERP system. The research results confirm the relevance of various critical success factors in the application of business intelligence in the stages of its implementation.*

**Keywords:** *information systems, ERP systems, project management*

### 1. Introduction

In the conditions of the world economic crisis, business systems, in the desire to create a competitive advantage, are moving towards improvements in business processes that are most often found in the application of information technology. The introduction of ERP has become necessary if you want the business system to be competitive in

terms of reducing costs, integrating departments, integrating activities, improving business processes and increasing efficiency and competitiveness (Vlachos, 2006, p. 378), but the implementation itself requires significant resources. It is a complex, long-term process, with high risks, and the percentage of successful introductions is small. Also, the same author emphasizes that the business systems that were the subject of research in 2010 and

---

Corresponding author: Zoran Nešić

tasted the bitterness of failed attempts to introduce ERP solutions, were very cautious in 2012 when they tried again. However, based on the review of relevant literature and experience in practice, some authors emphasize that technology alone does not automatically create a competitive advantage, only with the reengineering, revision and improvement of business processes, it is possible to improve the vision and implement the planned strategy (Botta-Genoulaz, Millet, & Grabot 2005, page 515). Today, business systems use comprehensive software solutions (hereinafter referred to as ERP systems) not only for data collection, but also for supporting the execution of business processes and decision-making, as well as the effective setting of company goals. (Denić N 2016) In the literature, it is stated that ERP (eng. Enterprise resource planning) - the term enterprise resource planning was introduced by Gartner Group Stamford (Jacobs & Weston Jr., 2007) in the early nineties of the XX century. The ERP abbreviation could literally mean advanced management and planning of all resources in one business system. Research in practice shows that the process of selecting and implementing an ERP solution is one of the most important projects of business systems. (Denić N 2020) ERP systems functionally affect the business system, organization, processes, people and technology. In this research work, the intention is to ensure and provide professional instructions and guidelines for the implementation of ERP to people who intend to introduce or deal with implementation projects of these systems. The ERP systems we encounter today have evolved from the previous systems that were used to plan material requirements in production (eng. material requirements planning, hereinafter: MRP) and from MRP II (eng. manufacturing resources planning), which had purchasing, sales and marketing functions

## 2. Theoretical background of the ERP system

ERP systems are very flexible and cover the needs of users in all business sectors. The literature states that there are several types of these systems, one of them being generic forms of ERP systems that are set up for different markets, but must be properly set up before they can be implemented. (Denić N 2022) The advantage of generic ERP systems is that they can be changed and set according to the needs of business systems. The well-known author Keller (1995) states that ERP systems are characterized by the following characteristics:

- The ERP system represents an integrated set of financial distribution, software for the production of an expanded and modified functional model of production resource planning (MRP II).
- It is also a flexible set that can work with the technology that supports it.
- The system is proactive and combines business rules and software. He adapts to the rules of business.

In addition to the above, other ERP systems are encountered in practice, which represent packages that already contain processes and functionality. According to some authors, these systems are aimed at specific markets, such as the automotive industry or retail (Klaus et al., 2000, p. 142). Experiences in practice indicate that these systems are more difficult to change, but even when this is the case, it causes a rather high cost. A successful and functional ERP system helps reduce operating costs, create more accurate demand plans, speed up production, and improve service, all of which lead to better business in the long run (Umble, Haft, & Umble, 2003, p. 244). The Table 1 presents some of the characteristic features of ERP systems according to their nature.

**Table 1.** Typical characteristics of ERP systems according to their nature (Source: S.Uwizeyemungu & L.Raymond, Essential characteristics of an ERP system: conceptualization and operationalization, 2005, str.71.)

Characteristic type	Characteristic	Explanation
Organizational	Integration	Linking functions and hierarchical levels. Connecting different processes.
	Wholeness	A wide range of functionality. Suitable for different types of businesses. Relationship with external factors.
	Uniqueness	Unique reference data. Uniqueness of the interface. Integration of systems management.
	Process orientation	The systems are adapted according to the business processes that achieve the goals.
	Best business practice	The system includes the best business practices of various fields.
Technical	Adaptability	Ability to follow rules and changes in the organization
	Openness	Functional modules (modularity). Portability of functionality.
Informational	In real time	Data available in real time.
	Prediction	A business process can be predicted or simulated.

As presented in the Table 1, the organizational characteristics are those related to the use of the ERP system in the business system, those on which the ERP system has the greatest impact, both on the structure of business systems and on business practice. The technical characteristics of the ERP system are directly related to the ERP system, such as the degree of flexibility and modularity. Information refers to the quality and usability of the data recorded in the ERP system (Uwizeyemungu & Raymond, 2005, pp. 71-72). The most important features of the ERP system are integration, flexibility and process orientation. Uwizeyemungu & Raymond (2005, p. 74) argue that these characteristics are the minimum requirements to define a particular program as an ERP system. However, Botta - Genoulaz and Millet (2006) point out that apart from ERP being focused on the enterprise and resources, it goes beyond the planning function and also includes other tasks such as financial control, operations management, analysis and reporting, and routine decision support.

In the relevant literature, the definition of an ERP system has been given by different authors, but they all have a very similar explanation. For example, Morton and Hu (2008, p. 391) state that ERP systems have become the backbone of the information infrastructure in most medium and large business systems around the world and that they are the basic software packages that connect the flow of information throughout the company's operations. Dotle Ngai et al. (2008, p. 548) define that ERP is a generic term for a large set of activities, supported by applications that contain functional modules and enable the organization to manage its resources.

Like all computer programs, ERP systems also have their advantages and disadvantages. Strengths can be divided into operational, management, strategic, technical

and organizational, while weaknesses are mainly business and technical. According to some authors, operational advantages refer to the benefits obtained from the introduction of ERP systems to operational processes, such as ordering, inventory management and customer service (Zhu et al., 2010, p. 266). The same authors point out that strategic advantages bring competitive advantages and enable the company to grow, and technical advantages increase the capacity of the information system (Zhu et al., 2010, p. 267). Other authors emphasize that organizational advantages are related to the possibility of learning and personal advancement of employees, and they are (Saaticioglu, 2009, pp. 695-697):

- supporting organizational changes,
- determining the company's unique vision and goals,
- transformation into a process organization.

### **3. Characteristics of the ERP system selection process**

Key success factors can be considered as events that happened in a situation and help us to push the boundaries of ERP system implementation process improvement (Somers & Nelson, 2001, p. 2). Decisions on the choice of ERP solutions are extremely important because they have a long-term impact on the success of business systems. Most of the leading companies in the world nowadays do not have a dilemma, whether ERP is needed or not, that is, what kind of ERP solutions are necessary (Chen, 2001, p. 378).

In the professional literature, Lavrence (2008, p. 1) presented the theory of three factors that lead to the selection of an adequate ERP solution. These factors are cost, risk and technology and together they represent the ERP solution selection triangle:

- costs or low price, this is the factor that dictates the choice of ERP solution at the lowest possible price,
- stability is a factor that implies the probability that the ERP solution remains in step with time and represents the level of risk,
- technology is a factor that shows how modern the ERP solution is as a tool based on a technological point of view.

Each of the three factors represents for most business systems one of the main driving forces in deciding on the choice of an ERP solution, and the combination of the two factors represents the classification of the ERP solution.

The results of the research of certain authors indicate that a successfully introduced ERP system brings many strategic, organizational, managerial and technological advantages (Zhu, Li, & Wang, 2010, pp. 266-267), but at the same time weaknesses that are mainly technical and business (Saaticioglu, 2009, p. - 697). By business processes, we primarily mean inventory management and planning, recording their costs, monitoring production, procurement, delivery and payments. Based on the benefits that ERP systems bring to companies, it is easy to conclude that ERP implementation brings numerous advantages. Also, research in practice shows that the best way to choose ERP is that it is an ERP system in accordance with the business processes of specific companies, as it saves investments in changing programs and potential program errors, while business processes in a specific company do not change. According to well-known authors, experience shows that this is not always possible in practice, and that it is almost always necessary to change business processes when introducing a new ERP system (Ngai, Law, & Wat, 2008, p. 551).

The ERP System software market continues its growth trend year after year and research shows that it will continue in the future. It is

obvious that today's market is saturated with different ERP system offerings. It often happens in practice that a company that wants to introduce a new ERP system simply does not know which one to choose.

**Table 2.** Decision criteria for choosing an ERP solution (Source: Government RC College Commerce & Management Bangalore, ERP impact on organizations, 2014, p. 7).

Before the first run	Before the second run	Decision criterion
8	1	The level of support provided by the supplier and the local partner.
10	2	Supplier references.
7	3	Ability to adapt to business processes.
4	4	Upgradeability.
1	5	The price.
9	6	Document quality.
5	7	Functionality.
3	8	Ease of use.
2	9	Ease of implementation.
6	10	Compatibility with existing hardware.

That is why it is best in such cases to contact local providers and check the compatibility of the offered ERP systems with the specifics of the companies themselves. Spending in the world, but also in Serbia, on business intelligence projects is constantly growing. Users are looking for software that can bring them more efficient business and competitive advantage. Whether one chooses SAP, Oracle or Microsoft, as one of the largest producers of this software, business improvement is guaranteed if the system is properly implemented and people who know how to use the system in the right way are engaged. Available data shows that the global market for ERP systems grew by 3.8% in 2013 alone, which means that the

total revenue from sales of ERP systems increased from \$24.4 billion in 2012 to \$25.4 billion in 2013. (Forbes, 2014).

On the global market, SAP with a 24% market share is by far the strongest provider of ERP solutions. The top five ERP solution providers collectively controlled 48% of the ERP market.

#### 4. Key success factors of ERP system implementation

Several studies, surveys and literature reviews have already been conducted to identify factors influencing the success or failure of ERP system implementation (eg Esteves-Sousa & Pastor-Collado 2000, Finney & Corbett 2007). However, no study shows the failure rate and evolution of success over recent years. Despite the fact that ERP solutions have been on the market for two decades, the success of ERP implementation projects is relatively low. Yu (2005) points out that earlier researches have mostly resulted in very different failure rates due to the fact that implementation success is defined quite differently by different researchers. Therefore, the purpose of this research is to study the specific introduction of ERP solutions in order to investigate how and which key success factors the introduction of ERP solutions affected the success of these projects and draw attention to possible shortcomings and key moments of the specific project. Introducing a new ERP system into a business system is a demanding and long-term process, which also involves high costs. Esteves & Bohorquez (2007) indicate that critical success factors (hereafter referred to as CSFs) have been studied quite a lot. Over fifty researches related to critical success factors in ERP implementation are listed in the bibliography from 2001 to 2005. The possible reason is that the researches were not used in practice. Some authors emphasize that these projects are constantly

exposed to risks such as delays, additional unexpected costs or even project termination, which should definitely be avoided (Ngai et al., 2008, p. 548). In this sense, Deloitte research (b.1.) states that 55% to 75% of all ERP projects end unsuccessfully. Therefore, before the introduction of an ERP system, a good project plan must be developed and aligned with the key factors that lead to a successful project and are known in the literature as key success factors.

Well-known authors state that business systems must be aware of the critical success factors (Sternad & Bobek, 2006). The high failure rate is a motivation for further study of critical success factors (Xue et al., 2005). This explains the fact that the study of critical factors of ERP implementation is still a current topic (Lin & Rohm, 2009; Francoise, Bourgault & Pellerin, 2009; Snider, Silveira & Balakrishnan, 2009). In general, the key success factors were one of the first and very actively studied research topics. They can be defined in a limited number of areas, and if they are taken into account and adhered to, they will ensure the success of the project. The professional literature offers fairly similar and general CSFs that are generally grouped into the following factors: top management support, project management, project sponsor, communication and collaboration within the organization, and end-user training. The results stated by Chung (2007, p. 3) in his doctoral dissertation are characteristic that the literature from the last decades showed that the success of ERP ERP solutions is 25%, and the inefficiency is also 25%, while the other 50% of such projects are partially successful and partially unsuccessful. Practice shows that in the world only 9 to 17% of ERP solution implementation projects are successful, it has also been shown that the best ERP solutions in practice cover up to 70% of information needs. Based on a review of the relevant literature, Dezdar

and Sulaiman (2009, p. 1044) elaborated 95 newspaper articles on this topic, published between 1999 and 2008, and developed a systematic compilation of CSFs consisting of 17 categories.

**Table 3.** Critical success factors of ERP projects (Source: S. Dezdar & A. Sulaiman, Successful enterprise resource planning implementation: taxonomy of critical factors. Industrial Management & Data Systems, 2009, p. 1044)

Critical success factors	
Support and commitment of top management	Vendor support
Project management and evaluation	Software analysis, testing and troubleshooting
Business process reengineering and minimal customization	Project management
ERP team composition, ERP software competence and compensation	Careful selection of ERP software
Change management program	Use of consultants
User training and education	Appropriate IT and legacy systems
Business plan and vision	Quality system
Open communication and cooperation in the company	User involvement
Organizational culture	

Well-known authors Esteves & Bohorquez (2007) further indicate that there was a need to create an approach that will be used in practice and which will link critical success factors with implementation methodologies. In this sense, business systems decide to renew the ERP system, and thus to reengineer business processes. The introduction of an ERP system is a demanding and long-term project, which is associated with high costs. Every unsuccessful project brings a big loss to the business system. Statistics show that from 55 to 75% of ERP system implementation

projects are doomed to fail (Deloitte, b.l.). The well-known author Vlahos states in his research that 70% of business systems in the introduction of ERP solutions went beyond the planned financial framework, 40% of companies exceeded the planned deadlines, and only 23% of companies implemented the implementation within the planned time and cost plans.

On the other hand, a successful project can bring many benefits. In their research, Davenport et al. (2003), state that 47% of respondents have adapted their ERP systems to the needs of their business processes. However, the limitation of ERP system modification has been identified as one of the critical success factors of the ERP system, as well as the business success of the company. A high percentage of ERP implementation failures was also observed in earlier research, and often other authors cited this data based on other research that emphasized risk in the implementation project. (Liang, Saraf, Hu & Xue, 2007; Ma & Loeh, 2007; Martin & Huq, 2007; Parthasarathy & Ramachandran, 2008). In research conducted by Ngai et al. (2008, p.551), "A clear and defined project plan" was one of the most cited CSFs in the 10 regions where the research was conducted. According to these authors, it should contain objectives, strategies, scope and schedule. Ngai et al. (2008, pp. 551-560) listed 18 core CSFs and divided them into three main groups, as shown in Table 4.

Well-known authors emphasize that the renewal of business processes is almost always necessary when introducing a new "ERP" system (Ngai, Law, & Wat, 2008, p. 551). A further breakdown of the ERP solution implementation approach is divided into a step-by-step and a Big Bang approach (Andersson, 2008, p. 12). The Big Break approach means abandoning the use of old software solutions at one point and switching to an ERP solution at all locations. Al-Mashari (2003, p. 42) defines the aspects

that need to be balanced when introducing an ERA solution: • Strategic aspect : • Business process renewal aspect: • Technological aspects: • Project management aspect: • Change management aspect.

**Table 4.** Key success factors divided into three groups (Source: E.W.T. Ngai, C. C.H. Lawin F. K.T. Wat, Examining the critical success factors in the adoption of enterprise resource planning, 2008, p.560.)

Group	Key success factors
Factors on the side of the ERP system implementer or supplier	Choosing the right ERP system implementer
Client-side factors or of an organization introducing a new ERP system	Top management support
	Project management
	Goal, purpose and strategy of the project
	Project supervision and evaluation
	Project sponsor
	Communication
	Project team
	Change of business processes
	User training
	Consideration of existing systems
	Data management and analysis
	Strategy and methodology for the introduction of the ERP system
	Company characteristics
The choice of ERP system	
Development, testing and solving real problems	
Factors at the state level	Local legislation
	Local business practice

It is stated in the literature that ERP solutions bring many advantages to the company's operations, but their disadvantages must always be kept in mind. Len, Chou and Chang (2002, p. 341) state

the following:

- The cost of purchasing ERP solutions is extremely high, which limits the application of ERP solutions in smaller companies,
- the problem of data protection, because companies generally do not have precisely defined rules, which have access rights system, and who can change the information in the system itself,
- The introduction of an ERP solution is difficult and long-term (depending on the size of the company from 10 months to 5 years) and represents a large project that can affect the slowdown of daily work in the company,
- Adaptation of the ERP solution to the desired needs of the company is long-term and the costs are high.

In addition to the mentioned authors, others also studied this topic, so Kim, Lee & Gosain (2005) identified 47 obstacles in different stages of ERP implementation and took them as guidelines for solving problems. Then Wong et al. (2005) studied and defined fourteen critical failure factors and emphasized that the roles of consultants, effective project control and monitoring, as well as reconstruction of business processes to match ERP functions, are extremely important for ERP implementation.

The results of the literature review indicate that business systems must deal with the introduction of a new ERP system in a careful and systematic way. The system can be fully implemented in one step or can be distributed according to modules. Regardless of the chosen method of introduction, it is important that the introduction is based on a methodology that is a standardized process and defined on the basis of experience. In introducing a new ERP system, the business system must also consider key success factors (Ngai et al., 2008, p. 548). Key success factors are areas where things need to be done correctly if we want the project to be successful (Trkman, 2010, p. 126). If they are not taken into account, the probability of failure or interruption of the project increases. A successfully introduced "ERP"

system brings many strategic, organizational, management and technological advantages (Zhu, Li & Wang, 2010, p. 266-267), but also disadvantages, which are mainly technical and business (Saatcioglu 2009, p. 695 - 697).

In relation to the functionalities that the ERP solution must provide, it is necessary to analyze the existing software solutions and determine the complexity of the business processes implemented by the business system (Lav & Ngai, 2007, p. 420). The same authors emphasize that research in various parts of the world confirmed that top management's support for success in the introduction of ERP solutions is not negligible, and its weight in the success of ERP solution implementation is quite high (Ngai, Love, Vat, 2008, p. 14). Also, that inadequate team composition can in some cases lead to an inadequate solution (Ngai et al., 2008, p. 8). The ERP solution should be implemented in accordance with the chosen methodology for the introduction of the ERP solution. The ability to effectively manage the project in relation to the chosen methodology is one of the main factors in the introduction. Rigelhof (2003, p. 14) in his presentation presents the adaptation of ERP solutions. This means that productivity varies over time during the implementation of an ERP solution.

An ERP implementation project is a failure if the ERP solution implementation project exceeds the planned implementation timing and financial framework (Somers & Nelson, 2004; Mol & Loukis, 2005). Even if the ERP implementation project is not implemented on time, within the estimated cost, or does not reach the set specifications, the implementation can still be successful (Zhang, Li, Huang, Zhang, Huang, 2005, p. 60).

## 5. Discussion

Based on the research of the prices of ERP solutions, and the value evaluation of the functions that a certain package provides in the system of small and medium-sized companies, one of the better ERP system solutions for them is Oracle Warehouse Management Systems. Based on practical experience, Microsoft Dynamics AX Lifecycle may not be the most adequate solution for these needs for several reasons. Bearing in mind that Microsoft requires all equipment and operating systems to be their products, which initially increases the cost and makes the previous computer equipment unusable. In addition, it is evident that Microsoft initially offers the cheapest price of the Cloud, however, the other components of the ERP system have a rather higher price than other systems. Research indicates that SAP's Business One system has the highest cost of implementation and maintenance, which on an annual level greatly affects the company's operations. Based on the list of users of Microsoft and Sap ERP systems, it is easy to see that they are leaders in business and that their prices are largely increased because of that leadership. They are followed by Oracle in the third place in the world, it has business intelligence systems with high level performance, the largest database with the cheapest expansion licenses and the lowest maintenance cost, and has the ability to implement on the existing platform. In the ERP implementation project management procedures, the positive experiences of previous projects are very important, which can certainly help in increasing the success of future ERP solutions.

Based on the examination of ERP system prices, as well as on the basis of the ranking list of the evaluation of medium-sized companies, one of the more suitable ERP system solutions would be SAP-HANA. Also, based on experience in the practice of

project management in medium-sized companies, it is not recommended to decide on the SAS ERP system, as well as the IBM ERP system for several practical reasons. SAP is the market leader in the region and in the world with the largest user base, which, when the two companies cooperate, has a positive effect on business. Scalability is great with large databases. The SAP system has the highest cost of implementation and maintenance, but also the largest list of evaluations, which on an annual level greatly affects the company's operations, but the positive side and value of the business system when implementing one of SAP's tools is much more useful.

Mistakes that can be repeated in the following ERP implementation projects are the following: underestimation of the necessary work for the implementation of the analysis phase, wrong assessment of the complexity of the development, misconception about the unity of business processes by the business units of the company, too much adaptation to the wishes of the users, recognizing the active participation of the company's management and limited withdrawal delay. The results of the literature review indicate that science is aware that it is more important to include the management of business systems in the projects of introducing ERP solutions.

IBM's solution for large companies is very effective on the market, as shown by the rating list, with a rich base and quality software, along with partner services with other companies, it provides a very good part of the overall pie in the environment. The good side of the IBM ERP system is that the company is narrowly specialized in those segments where the competition is weak and provides its services to other companies that deal with ERP systems.

Microsoft is the world's second-largest company that, along with its ERP services, provides fully licensed enterprise software, which reflects very well on the value and

quality of the enterprise. Microsoft provides the cheapest Cloud services, which is a very important thing for large companies because of the connection of the company as a whole if the company also has foreign branches.

In the opinion of many authors, SAP is the ideal solution for large business systems, the proof of this is the well-argued rating list. SAP is the leader in the world with constant growth of shares on the world stock market, and therefore the value of the business system that implemented it comes to the fore. SAP has a large user base in the world and here in Serbia, which enables large companies to cooperate with each other. It is the market leader. Its price varies depending on the size and shape of the company.

Positive experiences, that is, those that should be focused on the following projects, are also not negligible. During the implementation of projects in evolved business systems, the following occurred: a partnership relationship between the client and the supplier, an appropriate way of charging for services, the joint use of a software solution specialized in project management, education is limited only to key users, capable IT staff facilitates the work of the supplier, the presence of the supplier at all subscriber locations at the time of transition to production, following the Sure Step methodology, adding automation even after transition to production AND development through pilot solutions.

## **6. Conclusion**

The ERP system provides role-based access, where the level of access assigned to each user of the system is based on their information needs. ERP represents business process management software that allows an organization to use an integrated system of applications or their parts, and in order to manage all jobs, plan their use, collect data and automate a lot of auxiliary jobs on their input. Considering the theoretical basis of

the key success factors in the introduction of ERP systems, it can be concluded that in the evolved cases the key success factors were really important in the ERP project implementation project. In the selected case, 6 of the 18 key success factors in Ngai et al. (2008, pp. 551-560) were shown to be the reason for the termination of the ERP project implementation project.

The statistics of successful implementation of ERP systems in the business environment record a large number of failed projects. The background for the unsuccessful introduction can be found in excessive expectations of interest groups, theoretical planning due to lack of experience, and conflict between key actors, which soon led to a decline in team development and enthusiasm among others. The complexity of the ERP system implementation process is further enhanced by increasingly complex technology. In this research paper, it was shown that for the successful introduction of the ERP system, it is necessary to prioritize, ensure and then maintain the harmony and consequently the commitment of the actors to establish a user trustee who will direct the users to a professional authority, and will also assume the role of a continuous participant in the research, environment and new needs.

The research results indicate that business systems that are capable of changing their organization to a process-oriented one have the opportunity to inform their business processes with the help of ERP solutions. Enterprise ERP implementation projects represent an important milestone for businesses. They can drastically help them in further development, but they can also lead to collapse. The ERP system is a key element of the infrastructure that brings added value to the company's operations. ERP enables a unique view of the company's operations, usually in real time, all with the aim of ensuring that all important information about the business is accurate and available in the shortest period of time,

so that the company's management can act quickly and efficiently on the market. The key success factors of ERP implementation are factors that have a fatal impact on the success and efficiency of ERP project implementation projects. Based on a review of the relevant literature, different authors list different key success factors, but a comprehensive review of the literature shows that there is a significant degree of agreement on the factors with the highest weight.

The importance of key success factors in ERP project implementation projects is great, so it is believed that they can be further examined and analyzed during the implementation of each project. By taking into account the facts about the key success factors of previous projects, the possibilities for success in the implementation of an ERP

solution can be increased. The results show that it is possible to avoid mistakes made on past projects, even though they may have been made by other teams. The expected contribution and results of this research can be upgraded in the future by research on the project's performance from a cost perspective. It is possible to investigate the actual costs of introducing an ERP solution for a certain economic branch or type of activity, the costs of additional software solutions and the costs of rewarding employees for additional work.

## THE RESEARCH OF CULTURAL ASPECTS INHERENT IN MARITIME COMPANIES, APPLYING MULTI – CRITERIA MODEL OF EMOTIONAL AND SOCIAL INTELLIGENCE FUNCTIONING

**Abstract:** Commencing from the already obtained results of the maritime market research, this work aims at defining and development of the innovative model. The research work will clarify a new approach of understanding the context of maritime companies through the processes that influence the purpose, goals and sustainability of port facilities. By using modern scientific methods and approaches, a new multi-criteria model was developed in the work, which was tested in real conditions and with real data, with solutions for ranking the strategic elements created within the general sub-strategy for each port service. The defined new approach is the starting point for managing the maritime system of transport and for the development of the IMS strategy of the sea port, in the field of communication strategy, on a strategic level.

**Keywords:** Organizational context, emotional and social intelligence, key performance indicators, business performance management, communication goals.

### 1. Introduction

Modern study of common and special problems of the maritime market, realistic (and/or abstract) of the world, requires consideration, acceptance, development and use of modern practical and scientific achievements based on the research of special strategies in the functioning of both social and emotional intelligence. The research of cultural aspects at the level of strategic management in maritime companies is not given sufficient scientific and professional attention. Among the significant reasons for this situation is insufficiently good theory analysis and minimal application of advanced system approaches, lack of interpersonal

connections in teamwork, indifference as a consequence of not accepting comprehensive quality management. As a result of such a situation in maritime ports in countries in transition, we have decentralization and shortening of interpersonal interaction of "homogeneous groups" which, due to non-constructed moral values, in their own way "create" elements of efficiency based on satisfaction, productivity and savings (Popović & Vujović, 2022).

Based on that, this research as a scientific achievement has multiple goals, and provides the possibility of a more detailed and efficient study not only of its individual parts, but of the entire maritime market as a unique system of a special kind.

---

Corresponding author: pavle Popović  
Email [pavle.popovic@portofkotor.co.me](mailto:pavle.popovic@portofkotor.co.me)

From this it follows that the creation of strategic elements is reduced to making relatively short-term decisions with long-term implications, without an upgraded communication strategy (Tauzović, 2001).

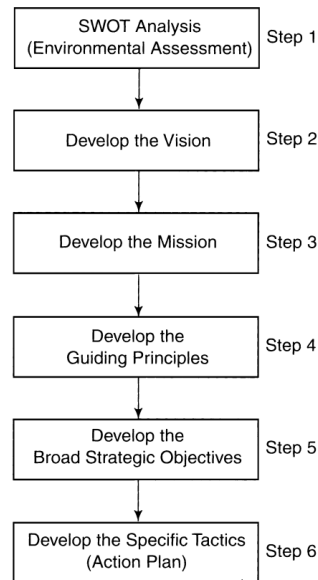

As every, even strategic, management of maritime companies is based on scientific research and practically accepted procedures for solving its problems, a modern systemic approach was taken for initial research, which includes an unformed strategy as a balance of power between the "deserved authority of the leader" and a manager who takes on the responsibilities that should be managed by a lower organizational level.

## 2. The process of strategic planning as a leadership concept for choosing strategic goals

The strategic management process must be viewed as a continuous, iterative process that includes: environmental analysis, directing the institution (mission and goals), formulating strategy, implementing strategy and strategic control (Goetsch & Davis, 1997). (Figure 1) shows the quality approach, integrated with the business strategy in the strategic planning phase, which according to (Goetsch & Davis, 1997 pp.75) constitutes the strategic planning process. The process is shown in six steps.

### 2.1. External analysis

The aim of the external analysis in the scientific work is to look at all relevant aspects of the impact of the external environment on the selected maritime companies and their performance. The analysis of the external environment is carried out due to the collection of information from the environment, the analysis of factors of the external environment, the identification of opportunities and threats and the formation of a strategy (Milošević, 2012).

**Figure 1.** -The strategic planning process (Popovic, 2018) (Adapted and modified from Goetsch, D, 2002)

#### 2.1.1 Technical tools for analysis and data collection from arcs in the environment

In modern maritime companies, numerous quality tools and techniques are used for the analysis and collection of data from the surroundings. In maritime practice, questionnaires, BREST analysis, BCG matrix, McKinsey/GE matrix, business model analyses, critical success factors and SWOT analysis are most often used (Popovic, 2018).

#### 2.1.2 Diagnosing the condition

In practice, according to research (Popović et. all, 2016), in the analytical approach of the SWOT analysis, we have selected four areas that should be considered (Figure 3). In this scientific research, we chose a SWOT analysis to diagnose the state of the port system in the surroundings that implied it:

- *Identification of the strengths* of the Port of Kotor and the Port of Dubrovnik in

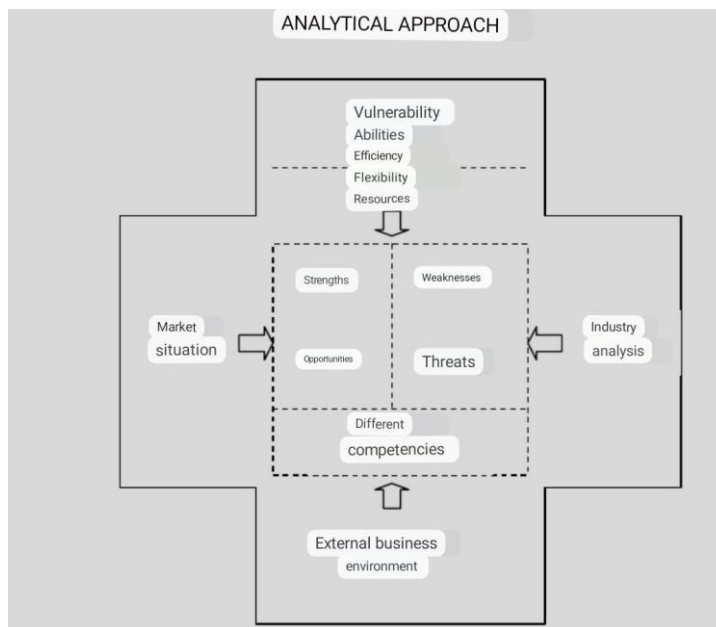

- relation to good reputation on the maritime market, strategic approach to business, high quality of port services, strong management team and others;
- *Identification of weaknesses* in relation to outdated port infrastructure, outdated operational processes, weak management team and others;
  - *Identification of external opportunities* in relation to the availability of new users of port services, the expansion of the maritime market, new technologies and
  - *The identification of external dangers* in relation to the appearance of competitors with lower costs, the appearance of competitors with a higher level of quality of port services, the introduction of new international regulations and state local laws that increase the cost of port operations and

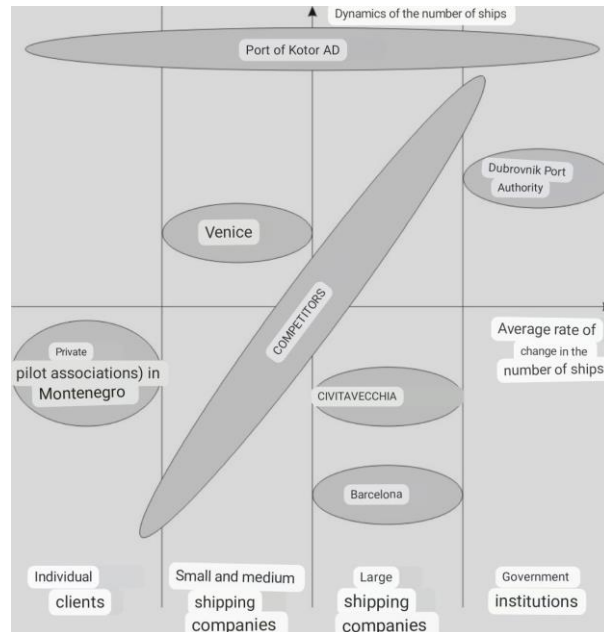

*the emphasis on the weak relations of the port management with stakeholders, i.e. users of port services.*

### 2.1.3 SWOT analysis of the Port of Kotor and the Port of Dubrovnik

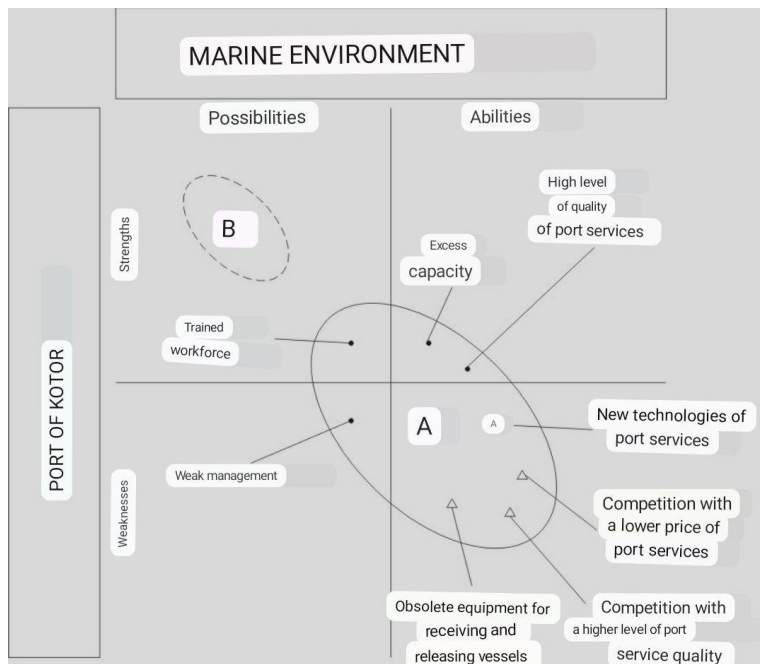

According to the analytical approach (Figure 2), a detailed strategic examination of each part of the Company was carried out in the Port of Kotor (Popovic, 2018). The real capabilities of the Port of Kotor company, the areas of vulnerability caused by the COVID-19 pandemic (eg: the dependence of the Port of Kotor on the users of port services), the effectiveness and the degree of flexibility that the company has in "facing" sudden changes in the maritime market, i.e., in the passenger transport market, were established.

**Figure 2 - SWOT analysis (Popovic, 2018)**  
(Adapted and modified from Popović et al, 2016)

**Figure 3.** SWOT matrix based on the example of the Port of Kotor (Popović et. all, 2016)

**Figure 4.** - Analysis of the competition comparing the rate of the number of ships (Popović et. all, 2016)

The SWOT matrix related to the Port of Kotor and the developed ports of the Mediterranean is shown in (Figure 3). For the analysis and forecast of the dynamics of the number of passengers from cruise ships, comparisons were made between the Port of Kotor and characteristic ports in the Mediterranean (Figure 4). According to the author's research (Popović et. all, 2016)

, financial and strategic goals were defined, according to the examination of functional systems, the examined competences and capabilities of processes and technologies in the Port of Kotor and the developed ports of the Mediterranean. The transition from area A to area B requires increasing competitiveness, permanent training of port staff, improved quality of port services and innovation of port infrastructure. (Figure 5) shows the SWOT matrix and analysis of the

Port of Kotor and port in Croatia. The research serves to understand the current situation in the Port of Kotor and Croatian ports while defining the strategy that should be applied in order to achieve the desired outcome and achieve business goals (Popović et. all, 2016)

In this thesis, SWOT analysis helped us in studying, forecasting and researching the maritime market in the surroundings, i.e. in the study of marine forecasting. In order to avoid confusion with such research, a general and clear distinction should be made between maritime market forecasting and maritime market research. The prediction of the maritime market is related to the prediction of its future events as a whole, or as its tightly interconnected parts - (passenger transport), our research case (Tauzović, 2001).

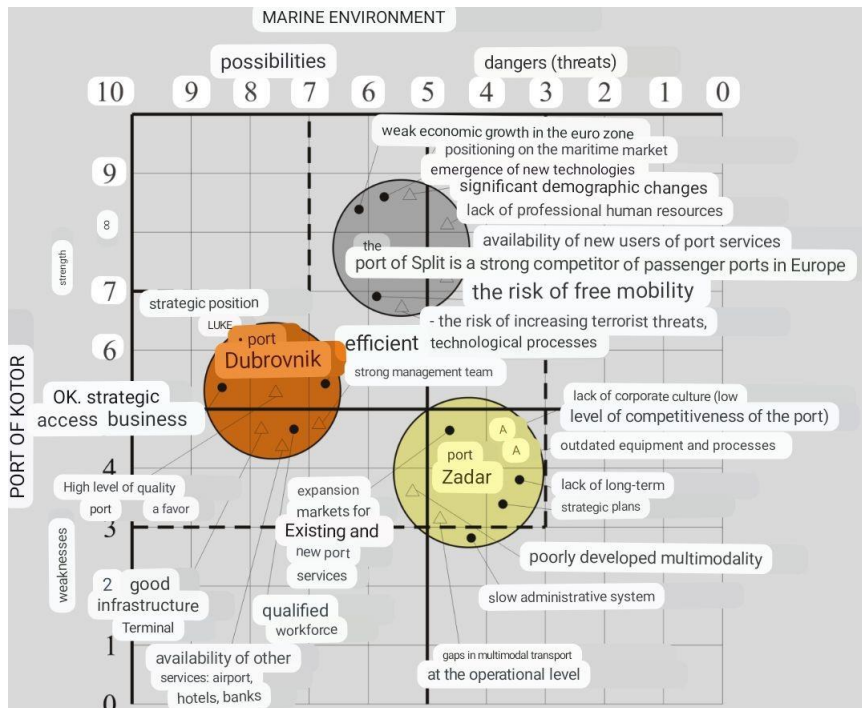

Figure 5 - SWOT matrix on the example of maritime ports in Croatia – research (Popović et. all, 2016)

**2.1.4 Analysis of the competition of the Port of Kotor from the aspect of comparing the average rate of change in the number of ships and passengers**

Research in the paper included:

1. *The collection of data on the needs and expectations of interested parties* was achieved through the media (articles, brochures) and on the basis of information obtained from surveys distributed to users of port services (other sources of information, such as publications, flyers, etc.).
2. *Identifying, analyzing, diagnosing and predicting the development of the situation in the maritime environment.*
- c) *Monitoring, analysis and interpretation of external indicators.*

External indicators were monitored through official data sources, such as the website of the Port of Kotor, websites of other professional maritime companies, websites of stakeholders from the surrounding area, media, etc. Sources or input data were extracted into indicator values. The analysis and interpretation of the indicators was carried out by the quality service of the Port of Kotor through the system management of the process "Review of the Company's IMS"

**Port of Kotor - Port of Dubrovnik**

We chose the Port of Dubrovnik, the tenth world port and the third Mediterranean port in terms of the number of passengers on one-day cruises (Form – Lko 12).

The analysis of the dynamics of the number of vessels in the port of Dubrovnik is presented in (Figure 6). A slight constant decrease in the number of ships in the Port of Dubrovnik compared to the Port of Kotor for the year 2022 is noticeable. In 2022, the presence of a greater number of larger ships will arrive.

An analysis of the dynamics of the number of passengers in the port of Dubrovnik is presented (figure 7), which shows a slight constant decrease compared to the port of Kotor for the year 2022.

**Port of Kotor - Port of Venice**

The analysis of the dynamics of the number of passengers in the port of Venice is presented in (table 1), which shows a slight constant decrease compared to the Port of Kotor (first quarter Jan-March - 12.59% for the year 2022) and (second quarter Jan-June - 59.98% for 2022).

**Figure 6** – Average annual rate of change in the number of ships Port of Kotor and Port of Dubrovnik for the period Jan. - Sep. 2022 (Form – Lko 12)

**Figure 7** – Average annual rate of change in the number of passengers Port of Kotor and Port of Dubrovnik for the period Jan. - Sep. 2022 (Form – Lko 12)

**Table 1** – Average quarterly annual rate of change in the number of passengers

	First quarter Q1 (Jan.-Mar.)	Second quarter Q2 (Jan.-Jun.)	Total:
Venecija	3464	77944	81408
Kotor	3900	124694	128594
Stopa promjene	12,59%	59,98%	

In the next phase, the research related to improving the work of strategic managers in maritime practice, whose work is usually opposed to operational managers. Operational management is basically short-term and detailed, taking place in the context of immediate or near future events. Strategic management includes ideas and actions, which are focused on the long-term future of all maritime companies, conducted in conditions of considerable uncertainty.

**Figure 8** – Average annual rate of change in the number of passengers Port of Kotor and Port of Venice by quarters Jan-June. 2022 (Form – Lko 12)

### 3. The influence of emotional and social intelligence in maritime practices

Digital transformation has brought numerous changes in the business world, one of the most important being the need to develop emotional intelligence in maritime companies employees.

Emotional and social intelligence (ESI competence) are connected with motivation, self-consciousness, managing oneself and the relations which make it possible to understand the interaction between one self and other people's emotions (Djurović, 2023).

#### 3.1. ESI as a fundament of successful leadership

The World Economic Forum has ranked emotional intelligence as one out of ten most important skills required for success in a workplace. It has recently been viewed as a key segment of successful leadership.

Social intelligence at work is about understanding and managing the relations with other people in business environment. That includes the ability to communicate, collaborate, solve problems, motivate others, understand differences and adapt oneself to a situation. Social intelligence helps the maritime companies' leaders to better understand and adapt to different styles of communication and work within a team,

which enables more effective collaboration and increases the agility and satisfaction of the employees, port services users and other stakeholders. All of these directly influence successful management, which is a key factor in modern maritime companies' productivity and income increasing.

#### 3.2. Formation of communication strategy in maritime ports

Strategic management represents a modern approach to maritime ports management, which implies a continuous process of constant adaptation of maritime companies to the changing environment, in which the environment exerts a permanent influence on maritime companies. Strategic management of maritime companies includes establishing and defining goals, determining the strategy, the process of implementing the defined strategy and control of realization and obtained results (Tuzović, 2001). The importance of skills is not equal at all management levels (Figure 9). Thus, technical skills that include knowledge of methods, techniques and tools characteristic for specific tasks (sales tasks, port service, procurement and others) are especially important at the lowest levels of the organization. Although other skills are important for managers at the lowest level of an organization, technical skill is not as valuable as other skills at the top of the hierarchy.

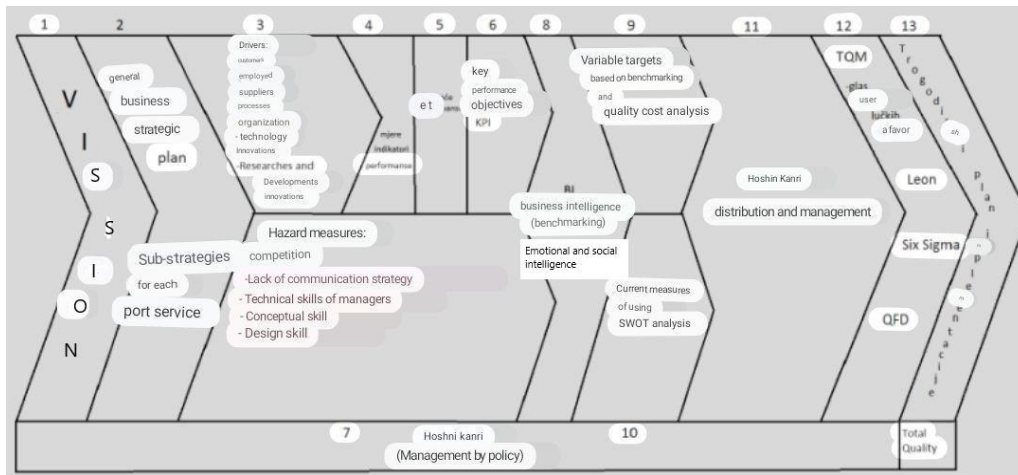

Figure 9 – Organizational hierarchy-skills and function of managers

## 4. Creation of vision-operational activity of improving the communication strategy

According to the author's research (Ansoff, 1995) Hoshin, management is connected with strategic planning and the BSC method

(Business Scorecards). This method is used for so-called policy management, which means that strategic elements (vision, mission, etc.) are transformed into tactical and operational quality improvement projects, which is shown in (Figure 10).

**Figure 10** – Organizational hierarchy-skills and function of managers

In Figure 10, all phases (from 1 to 13) are shown. (1- Strategy- 2-Vision) - it contains strategic elements within the general business strategic plan and separate sub-strategies for each port service. Phase (3 – Drivers, eng. drivers) as phases (4, 5, 6) were described in the previous thesis (Popović et. all, 2016).

In phase (7), the management of seaports is observed through the double function of research. The first phase of the research was related to management, which was observed through the management processes of certain port systems. The aim of the research was to achieve a more efficient degree of fulfillment of common goals under the influence of disloyal communication. The second phase of the research was related to management through a special group of people whose job it is to manage the execution of port operations and tasks

performed by other people. The aim of the research was related to the skills of managers, identifying, analyzing, diagnosing and predicting the development of the situation in the conditions of an undefined communication strategy at all levels of management.

Phase (8) refers to the application and recognizes the emotional and social intelligence of the leader as the basic link of effective leadership in the creation of strategic elements of improving the quality of the port system.

In phase (9), the new value of the objectives and the target costs are estimated. In the introduced phase (10), an operational risk analysis is performed, according to ISO 31000 recommendations, which refer to the responsibility of the process owner for each port service. Phase (11) is a key phase and approach in which the Hoshin policy is

strategically developed through its extension to port processes with the aim of later control and verification.

Phase (12) is described in detail in the previous paper (Popović et. all, 2016), while phase (13) refers to the application of project management methods based on project risk.

#### 4.1. A systematic approach to managing the quality of knowledge

The processes of globalization of pre - modern maritime companies in Montenegro essentially mean the defining of new requests and concepts of functioning with knowledge quality.

A systemic approach to strategic change management forms the basis for creating a quality strategy and makes a strategic response in real time through management. The superstructure of phase (7) of figure (10) forms the basis for the creation of a quality strategy. A recognized systemic approach constitutes a quality tool for internal analysis of corporate culture and organizational hierarchy-skills - functions of a maritime company manager (Popovic et al., 2022).

## 5. CONCLUSION

Modern overseas maritime companies create more and more opportunities for global partnership in port services, which increases the number and structure of participants and stakeholders. Maritime practices have had the examples of complicating the understanding processes , as well as those of defining the business goals and strategies.

The goal of this research is that managers in maritime companies must think strategically with the formulation of a clear plan that should define:

- effective achievement of business and strategic goals;
- the way and means of communication of managers, which

is reflected in simple and meaningful messages placed in an adequate context;

- realistically achievable and relevant goals for communication;
- the levels of ability to recognize, understand and manage their own emotions within the business environment .
- the management of relations with other people in the business environment.
- The mapping of knowledge as a tool for forming expert teams.

The management of knowledge quality is especially needed in the situations when neither the management theory with all its models, tools and techniques, nor the management practice with all its standards and instructions, can provide effective answers to the requests of the stakeholders (Popovic, 2018).

The system of management of knowledge quality depends on the engagement of competent personnel within the maritime companies and their understanding the standards. (ISO 10018). To effectively manage the quality within the maritime companies, we need a systematical approach of recognizing, understanding and managing our own emotions in the relations with stakeholders in the maritime business environment.

The permanent improvement implies the upgrade of convenience, adequacy and effectiveness of the quality management system. The analysis and evaluation results mentioned above, as well as the output elements of the review done by the management , should define the need for including and upgrading emotional and social intelligence in permanent improvement, explicitly identifying the opportunities for companies' performance improvement.

## THE ROLE OF DIGITAL PUBLIC RELATIONS IN IMPROVING THE QUALITY OF AIRLINES ORGANIZATIONS SERVICES

**Abstract:** *This research aimed to examine the relationship between digital public relation (DPR) towards improving the quality in the Aviation sector in Jordan. The researcher examined quality based on the variable of the study. A Descriptive and statistics analyses have been used for this research. The sample of the research included managers from digital public relation departments. The research hypotheses were tested using linear regression. The study concluded that there is a relationship exists between the (DPR) and quality in the airline organizations. As Reliability variable was found the most factor related towards DPR rather than the other response and accessibility. A number of recommendations were mentioned. Airlines organizations should pay attention to the importance if using DPR and to train their employees in order to achieve progress and prosperity.*

**Keywords:** *Digital PR, Reliability, response, accessibility, Quality*

### 1. Introduction

As a result of the technical and technological developments produced by the Internet in many different fields, public relations emerged, which was represented in the interactive communication processes between the sender and the receiver, as institutions of all kinds realized that it is difficult to achieve their goals and distinction if they did not approach their clients, or ignore the communication processes successful communication based on interactive communication skills, through the use of advanced technical methods, as the means of communication based on only one direction in providing information is no longer appropriate for the digital environment in which the person lives and the many challenges he faces (Mbama, 2018, p. 1). In line with these digital developments,

“digital public relations” term has appeared, as this term has been used in many studies in various fields, the most important of which is the airlines organizations, whose use lies in employing many digital media in all fields of public relations, in order to improve the quality of airlines organizations services, communicate with and follow-up with clients to reach its desired goals (Khajeheian & Mirahmadi, 2015, p. 86).

As digital public relations are an effective way to improve the quality of airlines organizations services, and work to enhance future visions in the era of digital revolution, and that social media and websites have a prominent role in improving digital public relations, especially its focus on interactive communication between public relations and clients by providing Internet, in order to follow up on clients through digital media, thus digital public relations have become

with enormous capabilities as the basis of human relations (Mbama, 2018, p.1).

The Airlines organizations are considered one of the sector that benefit most from digital and communication developments, because their services are based on communication processes permanently, dealing with clients and following them constantly, and they have the ability to apply all that is new to develop communication processes with high efficiency (Khajeheian & Mirahmadi, 2015, p.86).

Accordingly, this research was prepared in order to focus on the importance of shifting the concept of public relations to digital public relations in all airlines organizations in order to benefit from this shift in airlines organizations services.

## 2. Problem statement

In view of the digital developments brought about by the internet, which were represented by social media in a world full of digital communications, which became the basis for institutions achieving their goals and distinction, including airlines organizations, as they resorted to using these means to improve the quality of airlines organizations services and to communicate with clients through interaction and partnership in all information is on a wide field around the world, as this is due to the reliance of clients of all categories and ages in the current era on digital tools to receive airlines organizations services in a large way, which prompted airlines organizations to pay attention to advanced technologies and use digital public relations as a means to improve the quality of airlines organizations services (Mbama , 2018, p.1).

As the results of Khajeheian & Mirahmadi (2015) and Mbama et al., )2018( study confirmed that many airlines organizations still rely on traditional public relations, which weakened the quality of their airlines

organizations services. Therefore, they resorted to investing digital public relations in improving the quality of banking services through digital tools used by public relations, including social media that allows flexible banking services for clients.

Many conferences in Nigeria 2015 called for the need to rely on digital public relations to improve the quality of organizations services, and although there are many conferences that focused on the importance of digital transformation in public relations, there is a lack of studies and research that dealt with the subject of digital public relations in the airlines organizations, this confirms that there are no clear plans that show how to implement digital relationships in this sector. Also, there are no clear business plans that show how this shift and its implications for the quality of airlines organizations services (Mbama, 2018, p.250), hence the problem of the current study in measuring the role of using digital public relations tools in improving the quality of banking services. And thus, the main question of the study is: What is the role of digital public relations in improving the quality of airlines organizations services in its dimensions (reliability, responsiveness and accessibility).

The study comes its importance from its scientific topic as well as its practical application, where the importance of this study derives from the effort to supplement the studies and research conducted in the field of quality of airline organizations services and digital public relations which are a few, to a assured level, as a result of their sophistication and variety. The importance of this study also derives from the study and research of an important section of the public, which is the aviation sector. Therefore, it can be said that this study is considered one of the few studies, conducted on airlines organizations. The study also draws on the importance of its scientific subject, which can contribute to

illustrate the concepts of the quality of aviation services and digital public relations and clarifying the relationship between them in light of the providing suitable online services. It can also help airlines organizations to adapt and react to quick environmental changes to meet their customer satisfaction.

### 3. Literature review

#### 3.1. Digital Public Relations (NEED MORE INFO)

Public relations is considered one of the ancient activities, as humans started practicing it from the earliest times as a method for achieving reciprocal cooperation between members of society, and with the passage of time, organizations have realized the importance of influencing the public by convincing them of their opinions (Petrovici, 2014, p.81). This aspect was emerged in the United States of America in the early twentieth century, so was invented by (Ive Lee), (Mbama, 2018, p.1). Public relations allow the defining and constant, precise application of a communication or information policy, in the service of an enterprise, administration, collectivity or any other entity, related to its internal or external audience or interlocutors, also public relations are a vital tool of adjustment, interpretation, and integration between individuals, groups, and society. Public understanding and support is basic to existence in our competitive system, to know how to get along with the public is important for everyone (Petrovici, 2014, p.80). And because public relations are the link between the organization and the public, organizations may work at the present time to make all its efforts in order to build a good reputation for it among its audience and to gain their satisfaction, follow-up and cooperation with it, as it is the way to the internal and external masses of many

organizations with different goals and aspirations through Keeping up with recent technological changes and in line with digital developments (Mbama, 2018, p.2). In line with digital developments, the concept of “digital public relations” emerged, where the basic idea of digital public relations emerged about how to use digital means and modern technologies, such as the Internet, computers, and smart phones, to carry out their work efficiently, quickly and at a lower cost, especially in light of a world full of globalization, competition and research. Always on Excellence, in addition to its ability to use the news and media releases that it issues over the Internet, in order to provide its services, inform the public and follow it up with everything that is new and new in it in various organizations and institutions, as well as banking services (Petrovici, 2014, p.80). As digital public relations are an effective way to improve the quality of banking services, and work to enhance future visions in the era of digital revolution, and that social media and websites have a prominent role in improving digital public relations, especially its focus on interactive communication between public relations and clients by providing Internet, in order to follow up on clients through digital media, thus digital public relations have become with enormous capabilities as the basis of human relations (Mbama, 2018, p.1).

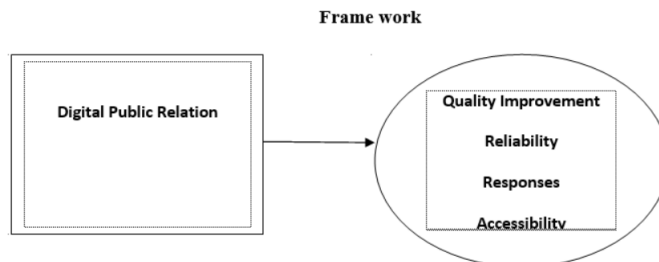

#### 3.2. Quality for Airlines organizations’ (NEED MORE STUDIES)

Organizations’ are keen to keep up-to-date of the quick changes so as to achieve an improved grade of services to meet the difficulties and the rapid changes they face particularly in light of the rising wants of customers. The quality of services is an advantage to be used to improve the organizations position in the market. The quick changes in the financial markets have

transformed the actuality of an organization environment more than what is predictable. Fast technological development and deregulation have led to progressively competitive pressures between financial and non-financial sectors. As a result it is the necessity focus on the quality of services to improve the performance. Since the beginning of the 21st century, the world has observed several technological changes that have a straight influence on dynamic and service projects. In light of these changes, several countries are facing the difficulties of steadfastness in the face of strong struggle, which shows the need to focus on the quality of banking services as one way to complete existence and continuity (Zulfadli et al, 2019, p.2; Al-Habil et al., 2017, p.200). There are ten elementary dimensions of quality that determine the quality of service according to the insight of the customers as

follows: (reliability, responsiveness, accessibility, efficiency and capacity of service providers, courtesy, communication, credibility, Security, Attention, care and upkeep, and tangible physical and human aspects), and the following is the concept of each dimension of the quality of banking services separately:

**Reliability:** is a degree of consistency in service performance and submission of the first time properly. **Response:** is the degree of the speed of response of service providers to the demands and customers wants. **Accessibility:** is the easy access to the service providers and interact with them when essential. In this research the researches aimed to study the variables which are (Reliability, Response, and Accessibility).

**Figure 1.** Quality framework

**4. Methodology**

The researches aimed to examine this study on the airlines organizations in Jordan. Recently, for the last ten years in Jordan all the Aviation business aspects witnessed very fast expansion including passenger and cargo transport. As a result, this progress in the airline sector has led to an increase in the demand for other aviation services, and thus, it was needed to support these changes or the expansion to operate successfully. One of these essential services that are required is the digital service .By that the researchers

will distribute a questionnaire included questions about the study on the study sample which is a purposive sample including Managers who are working in the digital public relation department. And they were (60) public relation managers in the airlines organizations.

**5. Results**

**5.1. Descriptive Analyses**

Demographic variables for the study sample. It appears from the table above that the "male" category in the gender variable got

the largest number of answers from the study sample, as it got "35" samples from the total sample of "60" samples with a percentage of "58%", while the "female" category got the lowest number Of the answers of the study sample, which got "25" samples, "42%".

Also it appears from the table above that the category "from 5 - less than 10 years" in the years of experience variable obtained the largest number of answers from the study sample as it obtained "28" samples from the total sample of "60" samples with a percentage of "47%" while The "less than 5 years" category came with the lowest number of responses from the study sample, which received "11" samples, at a rate of 18%.

It appears from the table above that the "Bachelor" category in the variable of academic qualification obtained the largest number of answers from the study sample, as it got "32" samples from the total sample of "60" samples with a percentage of "53%", while the "PhD" category came with the lowest A number of answers from the study sample, which got "5", a sample of "8%".

Cronbach Alpha ranged between (75-91.6), while the overall stability factor was (89.7), which are high values indicating that the study is acceptable for the purposes of scientific research.

- First question Descriptive analyses Result:

What is the role of digital public relations in improving airlines organizations reliability, The arithmetic mean of the field of the role of digital public relations in improving reliability in airline organizations was low, and tool areas were also low-grade, which got "2.18" and a standard deviation of "0.31". As for the items of the study, their arithmetic averages ranged between "2.20-2.16" and a standard deviation of "0.31 – 1.21" compared with the general arithmetic mean.

- Second question Descriptive analyses Result:

What is the role of digital public relations in improving response in the airlines organizations, that the arithmetic mean of the field of the role of digital public relations in improving the response in airlines organizations' was low (2.17), and tool areas were also low-grade, which got "2.17" and a standard deviation of "0.38", as for the items of the study, their arithmetic averages ranged between "2.15-2.19" and a deviation Standard "0.48 – 1.05" compared with the general moving average.

- Third question Descriptive analyses Result:

What is the role of digital public relations in improving accessibility in the airlines organizations, that the arithmetic mean of the field of the role of digital public relations in improving accessibility in airlines organizations was of a high degree, which got "2.16" and a standard deviation of "0.45", As for the study items, their arithmetic averages ranged between "2.14-2.18" and a standard deviation of "0.51 – 1.25" compared to the general arithmetic mean.

## 5.2. Study Hypothesis:

Are there statistically significant differences in the role of digital public relations in improving the quality of airlines organizations services due to the following variables: "gender, years of experience, educational qualification"?

To answer the hypothesis of the study, a t-test was performed for the variables that contain two levels, while one-way analysis of variance was performed for the variables containing three levels or more, as shown below.

First: gender variable Tests were performed to find the differences between the arithmetic means of the study sample answers to the variable of the place of residence, as shown in the table (1).

It is evident from the table (1) that there are no statistically significant differences in all fields of study according to the gender

variable, as the significance level value for all fields was higher than ( $\alpha = 0.5$ ).

**Table 1.** T-test to find the differences between the arithmetic means of the study sample answers to the variable of residence

Field	Variable classes	Average	standard deviation	Degree of freedom	T value	Significant level
the role of digital public relations in improving reliability in airlines organizations	Male	3.89	.31	59	0.221	0.832
	Female	3.86	.32			
the role of digital public relations in improving response in airlines organizations	Male	3.95	.38	59	2.051	0.085
	Female	3.64	.35			
the role of digital public relations in improving accessibility in airlines organizations	Male	4.79	.47	59	1.802	0.123
	Female	4.38	.53			

Second: years of experience variable One-way analysis of variance was performed to find the differences between the arithmetic

means of the study sample responses to the years of experience variable, as shown in Table (2).

**Table 2.** One-way analysis of variance to find the differences between the arithmetic means of the study sample responses to the years of experience variable

Field	Contrast source	Sum of squares	freedom Degree	Squares Average	F value	Significant level
the role of digital public relations in improving reliability in airlines organizations'	Between groups	.468	2	.234	2.756	.031
	Within groups	4.839	57	.0849		
	Total	5.307	59			
the role of digital public relations in improving response in airlines organizations'	Between groups	.206	2	.103	0.617	.610
	Within groups	9.518	57	0.167		
	Total	9.724	59			
the role of digital public relations in improving accessibility in airlines organizations'	Between groups	.425	2	.212	0.785	.525
	Within groups	15.416	57	.270		
	Total	15.840	59			

It is evident from the table (2) that there are no statistically significant differences in the second and third areas, as the value of the significance level for these two fields is higher than ( $\alpha = 0.5$ ), while there is a statistical indication in the first domain, "The role of

digital public relations in improving reliability in banks" Where the value of the significance level was less than ( $\alpha = 0.5$ ), and to find out in favor of whom those differences were, a Scheffe test was performed, as shown in the table below.

**Table 3.** Scheff'e Test for differences between averages

Field	Category		Less than 5 years old	From 5-10 years	More than 10 years
		Average	3.45	3.59	3.69
the role of digital public relations in improving reliability in banks	Less than 5 years old	3.45		0.311	*0.011
	From 5-10 years	3.59			0.189
	More than 10 years	3.69			

It is evident from the above table (3) that there are statistically significant differences between the "less than 5 years" category and the "more than 10 years" category due to the "role of digital public relations in improving reliability in banks" and with reference to the values of the arithmetic averages we find that the differences were in favor of the "more than 10 years" category, which got an arithmetic mean of "3.69", while the "less

than 5 years" category got an arithmetic mean of "3.45"

Third: educational qualification variable A one-way analysis of variance was performed to find the differences between the arithmetic averages of the study sample answers for the scientific qualification variable, as shown in the table (4).

**Table 4.** One-way analysis of variance to find the differences between the arithmetic means of the study sample responses to the educational qualification variable

Field	contrast source	Sum of squares	freedom Degree	squares Average	F value	significant level
the role of digital public relations in improving reliability in airlines organizations'	Between groups	2.249	2	.750	0.730	.526
	Within groups	58.573	57	1.028		
	Total	60.822	59			
the role of digital public relations in improving response in airlines organizations'	Between groups	2.092	2	.697	.889	.420
	Within groups	44.668	57	.784		
	Total	46.760	59			
the role of digital public relations in improving accessibility in airlines organizations'	Between groups	2.087	2	1.045	1.077	.109
	Within groups	55.303	57	.970		
	Total	58.590	59			

It is evident from the table (4) that there are no statistically significant differences in all fields of study depending on the educational qualification variable, as the significance level value for all fields was higher than (0.5 = &).

## 6. Discussion

This chapter deals with a discussion of the results that were reached, and the recommendations that emerged from those results, and the following is a review of that:

What is the role of digital public relations in improving airline organizations' reliability; The results of the study showed that the

mean of the field of the role of digital public relations in improving reliability in the airlines' organizations was low, and tool areas were also low-grade. This indicates a clear weakness in this aspect, and the researcher returns this result to that there is a weakness in the effectiveness of the level of digital public relations activities in achieving the reliability of the bank, as there may be a weakness in recruiting qualified personnel to practice digital public relations activities, and there may be a weakness in the administration department in following up and following the progress of digital public relations activities. Beside the researches explained this result based on the obtained mean (2.16) that the airlines organizations do not pay attention in updating their activities and information to meet their clients' needs. And thus, the result differed with Mahboub (2018) study, which concluded that the research indicated a positive significant impact of SMU on financial and non-financial performance in MENA countries in terms of profitability, growth and environmental performance. While This result is consistent with the Khajeheian & Mirahmadi (2015) study, which concluded that traditional media still play a dominant role in media consumption of public relations, while new Web2.0 media consist of Mobile communications and Social networks, have never ranked better than fifth from eight. Some reasons have been argued in conclusion.

Results related to the second question: What is the role of digital public relations in improving response in airlines organizations; The results of the study showed that the mean of the field of the role of digital public relations in improving the response in airline organizations was low. As the mean is 2.15 and tool areas were also low-grade. This indicates a clear weakness in this area, and the researcher returns this result to that there is a weakness in the effectiveness of the level of digital public relations activities in

achieving the response, as there may be weakness in the human resources management, as employees with competencies are not employed to practice digital public relations activities, and there may be a weakness in employing and following-up modern technologies within the airlines organizations by the airlines' administration department.

Results related to the third question: What is the role of digital public relations in improving accessibility in airlines organizations; The results of the study showed that the arithmetic mean of the field of the role of digital public relations in improving accessibility in banks was of a low 2.16, and tool areas were also low-grade. This indicates a clear weakness in this area, and the researcher returns this result to that there is a weakness in the effectiveness of the level of digital public relations activities in improving the accessibility of the airlines organizations', as there may be a weakness in recruiting employees who are able to deal with modern technologies, and there may be a weakness in the banking administration in terms of employing and managing modern technologies within the airlines organizations', and perhaps. The researchers explained this result due to the lack of financial resources available in providing these modern technologies, and it may also be due to the lack of awareness of the correct practices for digital public relations within the bank. As digital public relations provide a service that allow employees / users in the organizations to have easily access this also can provide a quick response.

Results related to the Study hypothesis:

1. Are there statistically significant differences in the role of digital public relations in improving the quality of airlines organizations' due to the following variables: "gender, years of experience, educational qualification"?

First: gender variable: The results of the study showed that there are no statistically significant differences in all fields of study according to the gender variable, and the researcher returns this result to that the study sample, regardless of their gender, have the same ideas regarding the role of digital public relations in improving the quality of airlines' services, so it was not found that there are differences in all areas attributable to the variable of gender

Second: years of experience variable  
The results of the study showed that there are no statistically significant differences in the second and third areas, while there is a statistical indication in the first domain, "The role of digital public relations in improving reliability in banks" in favor of the "more than 10 years" category, and the researcher returns this result to that the field of improving reliability in airlines organizations' may require that there be sufficient and long experience in the field of public relations compared with other fields, so it was found that there are differences attributed to years of experience in the field of the role of digital public relations in improving reliability in airlines organizations', in favor of those with years of experience. From 10 years "while the other areas, which are accessibility and responsiveness, did not have differences attributable to the years of experience variable.

Third: educational qualification variable  
The results of the study showed that there are no statistically significant differences in all fields of study depending on the educational qualification variable in airlines organizations', and the researchers returns this result to that the study sample, regardless of their academic qualifications, had the same ideas regarding the role of digital public relations in improving the

quality of airlines organizations' services. Therefore, it was not found that there are differences in all areas due to the variable of scientific qualification.

### Recommendations and proposals

Based on the results of the research, the researcher suggests a number of recommendations for applying digital public relations in airlines organizations', as follows:

1. The necessity of presenting and preparing workshops for the managers who are responsible for the digital public relations departments in airlines organizations', in order to prepare them to effectively practice digital public relations activities.
2. The necessity for airlines organizations's managers to enhance their organizations' services by employing modern technologies and managing them effectively.
3. Ensure that employees are trained on the necessary skills to effectively practice digital public relations activities.
4. The necessity of conducting more research and studies regarding the role of digital public relations in improving airlines organizations' services, in order to identify future proposals.
5. Obtaining the necessary skills to practice digital public relations in banks.
6. Increasing awareness of the importance and role of organizing events in public relations, its methods, objectives, functions and mechanisms to benefit from them in making a bright image for airlines organizations'.
7. Providing the participants with the necessary skills for bank marketing, and introducing the participants to the role of social media in making the airlines organizations' reputation.
8. Empowering employees with effective communication skills and competencies and building mental image through means Social Media.

## IMPROVING MONITORING OF EQUIPMENT IN THE LOGISTICS SYSTEM

**Abstract:** *In the fast-paced world of logistics, equipment management can be a costly and time-consuming setback. From transport vehicles to warehouse machinery, monitoring these crucial assets and their spare parts is essential for maintaining efficient operations. In this document, there will be presented the possibility of data processing automatization, through various classifications of arms and equipment and calculations, as well, which can improve the way of monitoring quantitative and qualitative parameters of items. This would increase the efficiency and effectiveness of the logistics system in one specific organization, the army. Throughout this article, there will be explored an innovative way to improve equipment monitoring in logistics systems and optimize supply chain management, according to the modern trends of automation and data exchange in manufacturing technologies, including cyber-physical systems, the Internet of Things, cloud computing, and cognitive computing, known as Industry 4.0. The most essential part of it, Quality 4.0, will help the integration of management tools into the quality and quantity control process. The main objective of this article is to show the new model of equipment management in quality products, and optimization processes using real-time data analytics, in order to reduce defects, provide greater responsiveness and reduce the strains on human resources.*

**Keywords:** *Industry 4.0; Monitoring; Logistics; Classification; Quality 4.0; Management.*

### 1. Introduction

Following the specifics of the missions and tasks performed by the forces of the Serbian Armed Forces, there are demands for accurate, timely, and expedient information, and with the development of technologies, requirements, and applications Quality 4.0. Having the right information at the right time is a good prerequisite for effective command and control in general, and especially in the area of logistical support, which is why there is a need to pay considerable attention to the

development of information systems. Due to the volume and complexity of data that appear in logistics processes, the main problem is the impossibility of functioning the modern army without appropriate information support provided by the latest information technology systems. Given that the logistics information system of the Serbian Army is in the initial stage of development and is not sufficiently developed, the main goal of this paper is to see the possible concept of development of the logistics information system, in order to

---

Corresponding author: Nikola Simić  
Email: [nikolasimicva@hotmail.com](mailto:nikolasimicva@hotmail.com)

create the most favorable conditions for monitoring the quantitative and qualitative state of assets. The development of information systems in the logistics support system would shorten the response time of the system to requests, and reduce the number of personnel and the volume of logistics resources (Jovanović, 2013). The primary task of this paper is the affirmation the importance of automated data processing and monitoring of the condition of weapons and military equipment through information technologies in the logistics system, the number of personnel and the volume of logistical resources would be reduced.

## 2. Informational Needs of Logistics Authorities

The logistics information system should process data and provide information to competent decision-makers about objects of logistics interest throughout the entire life cycle in which the defense system can be found (peace, crises, state of emergency, mobilization, war) (Milenkov, Andrejić, Stanković, Bukvić, 2010). The information system should provide information about the state of elements and subsystems and the system as a whole thing, in qualitative and quantitative forms. The object of monitoring must be well described to facilitate its quantitative and qualitative monitoring and thus better decision-making. Also, the system itself needs to learn how to recognize certain objects and their needs for them. Each object of interest of the system should be described with as many parameters and indicators as are important for making adequate management decisions, and therefore for various types of asset classification in accordance with the needs of competent decision-makers. Also, it is necessary to define the informational needs of each decision-making body and the way of presenting the necessary information: cyclograms, histograms, numerical data, a

form of prose description, etc. (Andrejić & Milenkov, 2012). The problem in the logistics support system is the lack of a single application for monitoring the qualitative and quantitative state of assets, non-updated management of assets in already existing information systems, i.e. lack of valid information on the current state of assets in the army caused by the human factor. Previous attempts to solve the problem of monitoring the state of assets in the army have not had much success. The applications "Information System UbS" and "IS VOZILA" have the greatest practical application, but due to the existence of certain shortcomings, they are not adapted for use by all logistics authorities. A proposal to solve the problem would be the introduction of automated information systems, based on Quality 4.0 and machine learning, where the rapid transfer of information would result in the creation of significantly lower inventory levels while increasing the degree of operative availability of funds. Therefore, in modern conditions, time becomes a critical factor due to more frequent requests for replenishment with critical material resources (Milenkov, Sokolović, Milovanović & Milić, 2020).

## 3. Informational System Model

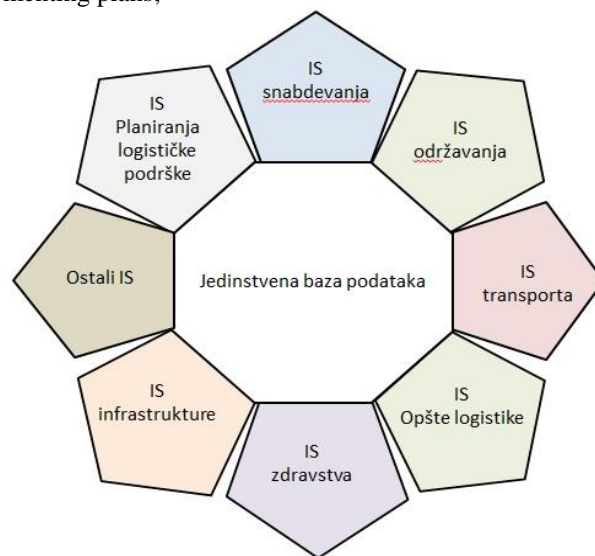

The information system of the logistics authority is intended for better coordination, information, operation, and speed of response of the logistics system. To comply with the requirements, it is necessary that, in addition to the efforts made for the development of the system, the logistics authorities continuously work on the automation of work and the development of the application, and with the development of modern artificial intelligence, they are also working on its application. The information system of the logistics authority should be based on the organizational and formational

structure of the Serbian Armed Forces, information processes in the command system, and the achievements of modern computer technology. The goal of the system is to provide logistics authorities with accurate data on resources, and tasks that they can perform with the available funds, as well as to provide automated calculations for replenishment planning. The information system of the logistics authority, as an integral part of the logistics support of the Serbian Armed Forces, should enable (Milenkov, Andrejić, Sokolović, Cakić, 2009):

- creation of conditions for effective planning and management of logistic support;
- automation of the process of data collection, storage, and processing;
- efficient work of logistics authorities in planning, organizing, and implementing plans;

- provision of accurate records of available funds;
- automation of calculations and provision of reliable information for decision-making;
- providing information to management bodies in real-time.

The basis of an informational system should be information systems of supply, maintenance, transport, general logistics, health, infrastructure, logistics support planning, and other IS (material bookkeeping, operational records, monitoring the realization of material and financial plans, monitoring data on resources in society, monitoring the state of logistics personnel, monitoring the state of resource protection, etc.) (Zlatnik & Mares, 2020). The concept of the information system is shown in Figure 1.

**Figure 1.** Functional structure of the information system of the logistics authority

The concept of such an informational system is very complex, and in itself represents a "mega project", which is divided into sub-projects according to logistic functions, to which specific resources are allocated and

the set tasks necessary to achieve the goals are implemented. The sub-project of the Information System of the Logistics Authority shown in the paper is intended for the implementation of supply tasks. The sub-

project presents small applications for solving specific tactical problems that do not violate the global concept of the information system of the logistics authorities and which can, when conditions are created, fit into the global concept of the development of integrated information systems. The application, presented in the paper, is a model of the information system of the logistics authority and is an integral part of logistics support in matters of supply. It was designed in the Microsoft Access program, and supported for application-oriented artificial intelligence towards Quality 4.0. The decision to project the IS model in this alliative program is the request of the logistics authority to automate data collection, and the program provides input in only one place, ie. it omits redundancy, which greatly increases the efficiency of the work of the logistics authorities. The application model consists of several separate databases that are mutually independent. The reason for this design is

the problems of modern technology, where viruses are primarily thought of. In case of an attack on one base, the application can be easily restored, and will not violate the global concept (Milenkov, Simić, Purković, 2015). The starting base is the central base that contains the necessary data for the realization of the requirements of the supply authorities (organizational-formation structure, classification of weapons and military equipment and echeloning of funds by units) and is the starting point for data entry. The central database contains data on the classification of assets, organizational and formational structures and distribution of assets by units, and other separate databases are linked to it, which represent the basis for later transfer and processing of data, preparation of calculations and provision of information in real time. Databases contain data on assets, and by linking to the central database, a connection is made with the classification, which is the basis for further upgrading of the application (Figure 2).

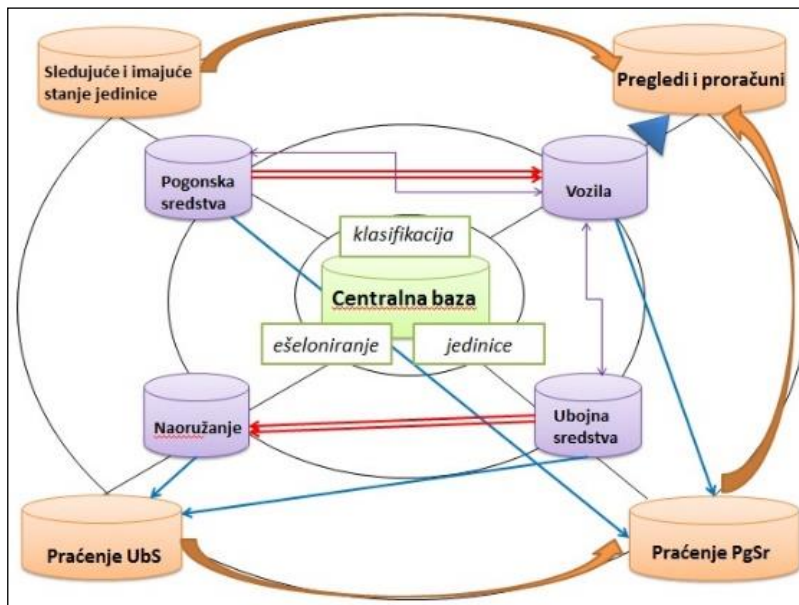

Figure 2. Connection of databases in the application

By creating quantitative monitoring of fixed assets (UbS (eng. ammunition) and PgS (eng. fuel)), the linking of assets and consumers into a single base is realized, and in this way, the condition for budgeting is realized ( ). By linking the database of the following and current state with the monitoring databases, a review and calculation database is formed. However, to obtain the final result, it is necessary to link funds with consumers ( ). For example: to calculate the amount of assets in the cargo box of the vehicle, it is necessary to connect the bases of assets (Sredstva) and the base of the vehicle (Vozila), and where previously it is necessary to enter the dimensions of the cargo box of the vehicle ( ). In the end, by tying all bases in the described way, a calculation is reached, one of the basic elements of which is the base of the vehicle (Vozila). ( ) Data are linked from one database to another and thus ensure constant updating of the complete application. The final outcome is the linking of all databases to the central database and the ultimate goal of the application is achieved, that is, overviews and calculations are displayed, which provide accurate records of the available funds, efficient work of the logistics authorities, and provide information

in real-time. Databases that form the basis of the application, are of relational type. Tables that contain data by binding enable the application itself to work. Each table is identified by a unique name that the database uses to find the table. All that is required is that the user knows the name of the table and the data he needs. Tables and their data are displayed using forms.

Starting the application is achieved through the input mask, where the possibility of direct access to the desired content is given. When accessing, the content is opened in the form of a form, where it is possible to view the status and update the data. The form is that part of the database application that allows entering data into tables instead of directly accessing the tables, then modifying the existing data and their sophisticated display. Creating forms is possible if the data is previously defined in the tables and if they are linked. This prerequisite is the basis. The form itself serves as a more beautiful display of the application, while all actions are performed in the background, that is, through tables and their interconnections. The form shown in Figure 3 is a combination of tables that contain data related to the consumer and the means used by the consumer.

СТРУКТУРА БОРБЕНОГ КОМПЛЕТА

Напомена	Пиштољ 9 мм ЦЗ 99 намењен је за уништавање живе силе на даљинама до 50м. Најуспешније дејство постиже се на даљинама до 30 м. Пиштољ је полуаутоматско оружје и опалјивање се врши појединачно. Пуни се оквиром од 15 метана.		

Figure 3. Form for displaying the structure of the combat kit

The form is structured from the main form and subform (Figure 3). On the main form, it is possible to select an asset, using the navigation buttons, where the image of the asset will be displayed in the documents field. The field includes legal and normative regulations that regulate the logistic support system, as well as technical documentation related to material resources. The form also shows a detailed description of the assets shown in the "note" field (Napomena).

The subform shows the structure of the combat kit for the selected tool, expressed through the number of bullets and mass (b/k). The "bullet code" field (Šifra metka) indicates the type of bullet intended for the

selected tool. The subform also contains a detailed description of the funds displayed in the "note" field.

For the full operation of an application of this type, it is useful to create queries, which shorten the working time of professional service bodies. The queries used in this application were related to the grouping of assets and the review of the amount and type of assets by unit, all to calculate combat kits and fill tanks, as well as placing assets on a motor vehicle.

The final output of the application is Reports. Reports are based on survey data and calculations for specific units. An example of the report is shown in Figure 4.

Извештај - прорачун п/р за батаљон				
пешадијски батаљон				
Назив средства и опис	Количина	Опис назива ПгС	Ознака ПгС	једно п/р

Figure 4. Tank filling calculation report

The report shown in Figure 4 offers data on the quantity and name of motor vehicles, a more detailed description of the propellants used by the motor vehicles, designations of the types of propellants, as well as the amount of fuel that represents one filling of the tank and the amount of lubricants and oils in kilograms that follow the observed motor vehicle. In the Name of Asset and Description column (Naziv/Opis), the exact names and detailed descriptions of motor

vehicles are given, based on the Directory of Assets. The next column, Quantity (Količina), shows the number of certain motor vehicles that the battalion has. Then, in the column Description of the name, fuels, oils, and lubricants are described in more detail, more precisely they are described according to the nomenclature name from the directory of motor vehicles, which is used by the motor vehicle that is the subject of our interest. Then, the following table of

PgS designations shows the designations of propellants, which most closely define the matter. The PgS mark (Oznaka) is the most important information for the user. And finally, in the column with the name one p/r (Jedno p/r), the total amount of propellant is shown, which represents one filling of the tank for a certain number of motor vehicles. Tank filling is calculated using the following formula.

$$1 \text{ p/r} = \sum_t Nv * q$$

Where:

p/r - the amount of fuel that follows the unit,  
Nv - the number of the same type of vehicle,  
q - the amount of PgS that fits into the tank.

Reports represent the everyday life of expert logistics authorities, and their automation reduces stress and time spent, above all, on a continuous collection of the same data.

The application also offers a visually processed report, through the realization of graphics (3-D Clustered column), which simplifies the insight into the situation and condition in the unit.

Figure 5. Graphic representation of filling.

The graphic representation in Figure 5 shows the relationship between the following and the current state of assets in the logistics line. The graphic is designed to show a certain percentage of the lack of funds in a certain color, so the amount missing in the range of 50 to 70% is shown in red, which signals to the user that the shortage is alarming and requires a certain action. Further development of the application tends towards the inclusion of machine learning and artificial intelligence to simplify data operations and facilitate the work of logistics

authorities.

## 4. Conclusion

For the sake of compatibility with other systems, it is necessary to provide a comprehensive logistics database designed for application in a wide range of logistics activities and a logistics reporting system that would ensure the timely provision of updated logistics information. Also, it is necessary to work on constant improvement of the application, and above all on:

- development of the system for operational planning;
- development of logistics support instruments that enable: an overview of asset history, exploitation, individual monitoring, and calculations required for planning at the tactical level;
- the development of communication interfaces, which enable the mutual exchange of logistic electronic data and electronic mail services in joint systems.

Designing a logistics information system on one hand develops a global concept and on the other a small application for solving tactical problems.

Contemporary trends in informatics, practice needs, and time constraints require the development of information systems, which can provide a solution for reducing the number of human resources and "reducing the volume of logistical resources". The basic information system of the logistics authority should be integrated into a unified command information system. Its subsystems must function properly, which is achieved by the permanent work of the logistics authorities on the formalization and automation of business operations and the

development of applications. The logistics authorities must work on the verification of empirical findings and their translation into theory.

The proposed model of the information system of the logistics authority can be a starting point for the creation of a unique information system that would enable data availability to all users at all levels of an organization, using machine learning and going towards Quality 4.0. This would facilitate the planning and monitoring of the implementation of logistics support plans, provide accurate records of the current state of funds, provide reliable information for decision-making through appropriate calculations, and provide information to the management authorities in real time and they could deal with more tasks, aimed at the organizational improvement of the existing system of logistical support and improvement of the operational capability of the units.

The final effects of applying the proposed model of the information system are gaining time, reducing the strain on the logistics authorities, increasing the quality of information, and efficient planning and management of logistics support.

## **FOOD PRODUCTS DEFILEMENT ANALYZER USING IOT**

***Abstract:** In order to make additional, quick profits, shopkeepers frequently adulterate food today. Foods are adulterated by adding things like ripening mangoes, chalk powder to turmeric, starch to curry powder, papaya seeds to black pepper, and other things. Adulteration is a common practise to increase profits, but it can have extremely harmful effects on people. The qualitative spectroscopic method offers a better way to identify the toxic components in milk and other things. The goal of this research is to develop a low-cost, portable, AI-based, non-destructive sensor system that can be used to detect the adulterant in real-time in order to solve this problem. The users can access a dedicated site with an Iot platform from anywhere to view the adulterant that has been found. In this study, the conductivity and pH meter methods were used to examine the food products in order to determine the degree of adulteration present*

***Keywords:** Back Propagation Algorithm, Neural Network*

### **1. Introduction**

Food adulteration is a common practise among shop owners to make quick extra money. Mangoes are ripened, turmeric is mixed with chalk powder, starch is added to curry powder, papaya seeds are mixed with black pepper, and other foods are adulterated in this way. In the long run, these adulterations have negative effects on people. In India, 77.68 million tons of liquid cow milk are consumed annually. Statistics from December 2019 indicated that India plays the best role in the consumption of cow milk. Milk improves human nutrition because it contains significant amounts of essential nutrients like lactose, fat, proteins, minerals, and vitamins. One of the most crucial tests to ensure the safety of people's health is the detection of adulterants in milk because people consume it daily. One approach that is frequently used to address the aforementioned issue is adulteration

detection based on pH and conductivity. The system for the measurement and creation that are created when electromagnetic radiation interacts with matter. The type of interaction between matter and radiation, such as diffraction, absorption, and emission, as well as molecules or atoms may affect the analysis methods used. The Beer-Lambert law explains how the absorption concentration and absorptivity of a substance whose chemical components are measured relate to one another.

$$A = \epsilon CL$$

Where A - absorption coefficient,  $\epsilon$  - molar absorption coefficient, C - concentration of substances, L - path length (cm) Absorption coefficient has no unit.

Spectroscopic methods for detecting adulteration are somewhat expensive, laboratory-based, and provide nondestructive methodology. In previous proposed systems, spectroscopy sensors are used which needs

spectrums for its full-fledged functioning, but in this system we have incorporated two different sensors which detect pH and conductivity of the samples. Moreover this methodology is a physical measurement and does not involve any other chemical substituents. As for adulteration, a few adulterants can be added to milk to fraudulently increase its quantity.

**Table 1.** Adulterants and its responsive wavelength

Adulterant	Responsive Wave Length (Nm)	Method
Honey	1200 -1450	Calorimetric Analysis
Milk	1100	Calorimetric Analysis

A survey is conducted to identify the responsive wavelength of our targeted adulteration in the milk and summarized in Table. 1 and yet to get results for other food ingredients

From the Table 1 the mechanism tests are carried out in a laboratory setting and do not support field testing, so these techniques are not appropriate for real-time analysis and take longer to produce results. Through created IoT applications, the results of the adulterant detection could be viewed from any location.

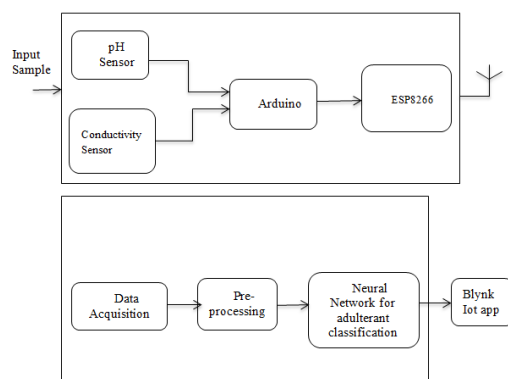

### 1.1 Proposed methodology

Milk is a dairy product that is incredibly nutrient-dense in its natural state. It includes minerals, proteins, amino acids, minerals, and carbohydrates.

- Designing and creating a portable, affordable sensor device that can support in-the-moment non-destructive testing is the focus of the proposed research work.
- To identify four different adulterants and pure milk, adulterant detection is approached as a classification problem and solved using Naive Bayes, Linear Discriminant Analysis, Decision Trees,

Support Vector Machines, and Neural Network Machine Learning Algorithms. The average accuracy for those models is 90%, 88.1%, 91.7%, 90%, and 92.7%, respectively.

- The neural network model's hyper parameter is adjusted to increase accuracy from 92.7% to 100% using a genetic algorithm to solve an optimization problem.
- The sensor system is designed as an Internet of Things (IoT) device to update the detected adulterant in the web server so that anyone can access the results.
- We have discussed about sample preparation, spectral data collection, processing, and the neural network algorithms used for analysis as well as the design of AI-enabled system.
- Here the proposed system detects the adulterant based on the pH level and conductivity which varies with pure and adulterated samples.
- The threshold level is set by comparing the above results with the calorimetric analysis outputs.
- The detected results from the multi-sensor system is then sent to BlynkIoT App, the user will be notified whether the sample is adulterated or not.

**Figure 1.** Design of ai-enabled multisensor system for adulterant detection

## 2. Materials and methods

The following sections covered sample preparation, spectral data collection, processing, and the neural network algorithms used for analysis as well as the design of AI-enabled system. The design of the sensor system developed with artificial intelligence methodology for the detection of adulterants is described in Section 2.1.

### 2.1 Design of a milk adulterant detection multi sensor system with ai

Figure. 1 depicts the designed AI-enabled sensor system's prototype. which includes an ESP8266 wireless module, an Arduino board, a PC used for data logging, and an implemented neural network AI software module, pH sensor, conductivity system. The AI-enabled multispectral sensor system is depicted in Figure. 1. Data from the sensor will be transmitted serially to the Arduino microcontroller and then wirelessly to a personal computer. The user can send the data they've collected to the PC using the Wi-Fi module. For pre-processing, the acquired data is stored. The non-linear neural network receives the pre-processed sample data for additional analysis. The neural network is trained, tested, and validated using these pre-processed data. One of the network outputs will classify or detect whether a substance is adulterated or not.

#### A) pH SENSOR :

- The H<sup>+</sup> ion concentration in the fluid is essentially measured by the PH sensor. The PH measurement sensor is composed of the measuring electrode, the reference electrode, and the temperature sensor. The millivolt signal at the electrode is amplified by a preamplifier to a specific amplitude. The measuring electrode is located at the positive terminal, and the reference electrode is located at the negative terminal. The voltage of the reference electrode is directly

proportional to the amount of hydrogen ions present in the solution, and it has a steady potential and is sensitive to hydrogen ions. When submerged in solution, the reference electrode makes contact with the measuring electrode through the junction.

- Chemistry uses pH to gauge the activity of solvated hydrogen ions. Due to its close relationship to the measurement of hydrogen ion concentration, PH, it is frequently spelt as Ph. At 25°C, pure water has a pH that is very close to 7. The term "acidic" refers to solutions with a pH of less than 7, while "basic" or "alkaline" refers to those with a pH of more than 7. A concentration cell with transference is used to measure the potential difference between a hydrogen electrode and a standard electrode, like the silver chloride electrode, to determine primary pH standard values. A glass electrode and a pH meter, or indicators, can be used to measure the pH of aqueous solutions. The Carlsberg Foundation asserts that pH stands for "power of hydrogen." The potential activity of the sample's hydrogen ions is measured by PH. Both total conductivity and electrical conductance had positive correlations with PH. It is used to determine whether the milk sample is neutral, basic, or acidic. Because its pH is 6.7, fresh milk is slightly acidic.)

- The hydrogen ion potential activity in a sample is measured by the pH scale. The relationship between pH and total conductivity and electrical conductance was positive. It is employed to determine whether the milk sample is basic, acidic, or neutral. (Fresh milk is slightly acidic due to its pH of 6.7.)

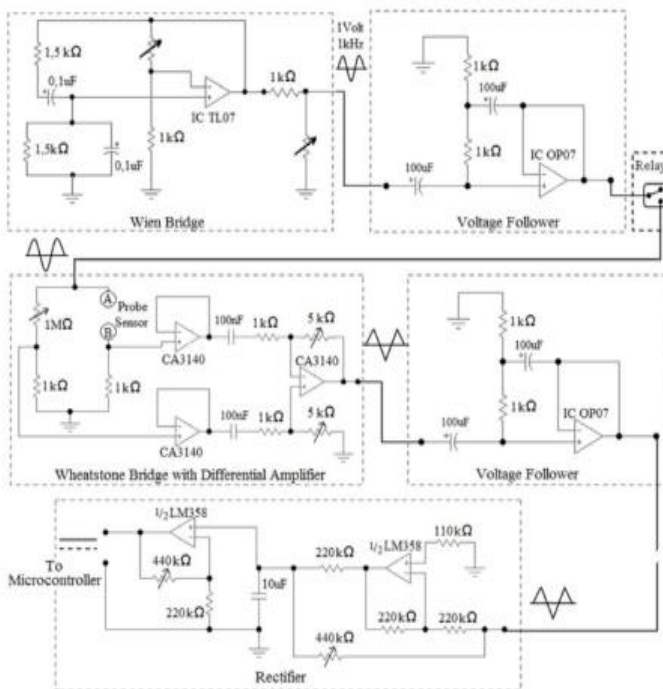

Figure 2. pH sensor

**B) CONDUCTIVITY SENSOR :**

The representative value of the limiting molar conductivity of milk was found to be 75 S cm<sup>2</sup> mol<sup>-1</sup>. The typical conductivity of tap water ranges from 1.2 to 1.6 mS. Even

still, the conductivity of 9% fat milk is between 2.3 and 2.5 mS. Therefore, if the milk conductivity is less than 2.2 mS, it is confirmed that the milk contains water.

**Figure 3.** Conductivity sensor diagram

**C) ARDUINO BLACKBOARD :**

The data from the sensors is gathered by the inexpensive Arduino blackboard and transmitted to the device for additional analysis. The 14 digital input/output pins on the Arduino blackboard are divided into six pulse width modulation pins, four analogue inputs, a universal asynchronous receiver and transmitter, and a serial peripheral interface (SPI). The gathered spectral data is once more sent to the WiFi module (ESP8266) single-chip pin.

**D) DATA ACQUISITION :**

The server PC receives the collected data from the ArduinoWiFi module. The WiFi

module is connected to a USB port, which is used to collect data using the Microsoft Excel data streamer software module. This section outlines the data collection process using an Excel sheet. Live data from a microcontroller is streamed into an excel sheet using a data streamer, which offers two-way data transfer.

**3. Conclusion**

One of the major concerns on the planet is adulteration. However, various spectroscopic approaches required for the detection of adulterants. The designed multi sensor model is used in the proposed model with

artificial intelligence to present the adulterant identifications. This created sensor model non-destructively extracts the data from the sample. The data is subjected to the application of several machine learning algorithms, including Naive Bayes, Linear Discriminant Analysis, Support Vector Machine, Decision Tree, and Neural Network Model, and accuracy of 90%, 88.1%, 90%, 91.7%, and 92.7% are obtained. The user or authorized individuals can access a dedicated webpage with an IoT application from anywhere to view the adulterant that has been found. Milk is tested for various concentrations of sugar, sodium chloride, and urea using a developed method. Within a reasonable amount of time, this system can detect the sugar, sodium chloride, and urea mixture in the milk sample. This system determines the milk's

PH level. To estimate the effects of external factors and increase the instrument's sensitivity, additional research in this area may be conducted. As a result, the sensor's performance can be affected less by changes in temperature, atmospheric pressure, and residual pressure caused by stray gases in the sample. This system keeps the quality of the milk good and prevents people from altering it.

**Table 2.** Summary of results in Honey

Adulterant	Ph	Conductivity (µs/M)
Honey – 25%	3.19	8.82
Honey – 50%	3.14	2.6

## DIGITAL COMMUNICATION IN AGRICULTURAL EXTENSION IN THE ERA OF THE INDUSTRIAL REVOLUTION 4.0

**Abstract:** *The research starting from the acceleration of digital diera technology in the industrial revolution 4.0 is undeniable and, especially for field agricultural extension workers is the spearhead of the success of agricultural development in the regions. The purpose of this study is to analyze how digital communication can be useful in agricultural extension in the era of revolution 4.0, the methodology used is descriptive qualitative, data collection through observation, interviews and documentation, primary data sources of 14 people and secondary data sources such as reference books, internet souching, and field studies. The results of the study that the extension system is a system of delivering innovations from technological sources to users (farmers) using various approaches and existing methods according to conditions, so that innovations can be utilized by users to increase income and welfare The agricultural extension system can use the approach of: (1) agro-ecosystem; (2) territory; (3) agribusiness; (4) institutional; and (5) welfare. The extension system approach is more directed at growing the regional economy (local economy) so that it can reach all life activities in the social system.*

**Keywords:** *digital communication, agricultural extension workers*

### 1. Introduction

The Ministry of Agriculture wants to foster the enthusiasm of young people to continue the relay of agricultural entrepreneurship in Indonesia, and also develop the use of internet technology to support the production of agricultural products to meet the growing market demand.

The Agricultural Human Resources Extension and Development Agency (BPPSUMBER DAYA MANUSAP) implements the millennial farmer program through an extension institution, namely the Rural and Independent Agriculture Training Center (P4S). It is an institution that

provides agricultural training in rural areas using the principles of democracy, self-help, business development, and integration. The existence of P4S spread across each region makes the farmer program millennials can be implemented equally. This can make the training, counseling and empowerment carried out will be effective because each region has its own character to be carried out by the Millennial Farmer program. Counseling is the right way to develop and improving human resources so that farmers can continue to develop. One of the areas that still makes agriculture the main livelihood is Nganjuk Regency although the demand continues to decline. The reason

for this decline in interest is that agriculture has not much yield. The existence of slashers who directly buy agricultural products at very low prices decreases the interest of farmers. The empowerment carried out by the local government is mostly in the form of providing capital in the form of materials and tool assistance. The development of communication patterns in agricultural extension in Indonesia written by Sadono (2009) explained although declining interest and declining economic output of farmers, the farmer sector is still a job for most of the population in Indonesia. In addition, it became a production granary in the country's foreign exchange earnings for non-oil and gas exports. Agriculture is also a bulwark for the national economy during the economic crisis. Entering the industrial revolution 4.0 that combines technology and the internet, becomes a challenge for the world of agriculture.

Farmers must continue to compete to produce agricultural products and be able to meet market demand. This challenge must be carried out by empowering farmers to become farmers who are able to compete in this era so that farmers must be able and able to process and produce their agricultural products by combining technology and the internet.

Through Ministerial Regulation Number 4 of 2019 concerning Guidelines for the Movement for The Development of Agricultural Human Resources Towards Food Barns 2045, it is explained that millennial farming is farmers aged 19-30 years and/or farmers who are adaptive to technology and innovation (Minister of Agriculture of the Republic of Indonesia, 2019). Millennial farmers don't just stick to age. Millennial farmers take precedence is what their mindset is. So, millennial farmers are not only intended to have human resources aged 19-30 years.

The interest of the Millennial Farmer program is to create smart and digital

farming (Utami, 2020). This is considered important because human resources are not eternal in the sense that there will be an expiration period. In the Millennial Farmer program, the millennial generation creates an agricultural system based on smart and digital farming which can later become a regeneration and also transmit an agricultural system that is more effective, environmentally friendly and also has good results in quality & quantity. Millennial Agriculture is a development effort carried out by the government to farmers. For this reason, in analyzing the existing communication patterns, this study uses development communication theory. Communication is very important in development so it is necessary to understand the elements of SMRCE communication (Source, Message, Receiver, Channel, and Effect) that must be applied in development. Communication patterns regarding agricultural extension have been carried out first, such as research conducted by Hariani (2017) from Halu Oleo University. This study looked at how the communication patterns carried out by PPL in conducting counseling to clove farmers in Wa ode Buri Village, North Buton. The communication pattern found is the application of one-way, two-way and multidirectional communication patterns (Hariani, 2017).

Nunung Nurhayati in his research on the Communication Patterns of the Indramayu Agricultural Extension Center in efforts to disseminate agricultural information concluded that the delivery of messages was carried out formally and informally.

In addition, the form of delivery from the Extension Center to farmers or vice versa is vertical. Instead, horizontal delivery is used for fellow farmers or fellow extension workers. Unclear dissemination of information, inadequate facilities and infrastructure, differences in perception and perspective make obstacles in the

dissemination of information.

In addition, this research also reviews the empowerment of farmers such as research conducted by Laili (2014) from Universitas Brawijaya. This study concluded that the empowerment carried out in Betet Village has been better to realize food security.

Farmers have more knowledge so that their agricultural output also increases. Support from the government with subsidies for aid and seeds. The obstacles that occur are the low quality of human resources and limited tools (Laili, 2014). This study was conducted to analyze the communication model carried out by P4S as an extension institution in conducting counseling for the Millennial Farmer program.

Development communication includes the function and role of communication in message exchange activities with reciprocity between the community and the government starting with the planning, implementation and evaluation of a development. In a narrow sense, development communication is a way of conveying ideas and skills of a development that arises from the initiative with the target of its builders, namely the community in order to understand, accept, and participate in development (Dilla, 2007), Goulet in Theresia (2014) explains the values of development. First, self-sufficiency, that is, having the ability to meet or meet basic needs. Second, the price, which is the freedom of oneself from oppression and not being taken advantage of by the other party. Third, freedom where a person is able to choose solutions to improve the quality of life so as to realize prosperity. Development will cause social changes so that communication has an important role.

This is because communication has a role in changing a person's way of thinking, attitudes, and actions in solving social problems. However, if communication is hampered, it will make the development process cause inequality. The facts of developed countries are like the difference

between villages and cities, the gap between poor and rich.

This will have an impact on how a person thinks, behaves, behaves, and opinions. For this reason, communication is very important in development so it is necessary to understand the elements of SMRCE communication (Source, Message, Receiver, Channel, and Effect) that must be applied in development. Agricultural communication is the activity of exchanging messages between people that have a relationship between agricultural activities, personally and between groups.

Usually, it has a common nature by using symbols in its delivery, and can generally be found in agricultural extension activities (Soekartawi, 1988). The two have a relationship that cannot be let go. Agricultural communication is a science that is not only needed by farmers so that non-farmer communities also need knowledge. In agricultural extension workers need to find and study agricultural communications to be conveyed to farmers (Soekartawi, 1988). Sukartawi also explained that agricultural communication carried out in counseling can be said to be successful if a communicator or extension worker and a communicant or audience (farmer) have similar perceptions in understanding agricultural science provided by extension workers. Therefore, it is mandatory for an extension worker to understand carefully about agricultural communication.

The basic functions of communication include 3 parts that are factors that cause why humans need to communicate, namely: 1) human desire to control their environment. Through communication, humans can know the opportunities that exist to be utilized, maintained, and avoided in things that threaten the surrounding nature, 2) human efforts to be able to adapt to their environment. The process of continuation of

a society actually depends on how the community can adapt to its environment, and 3) efforts to transform the socialization heritage (Cangara 2011).

In general, the consequences or results of communication according to Achmad (1990) can include 3 aspects, namely: 1) Cognitive, which concerns awareness and knowledge, 2) Affective, that is, it concerns attitudes or feelings and emotions, 3) Conative or psychomotor, that is, it concerns behavior or action. The assumptions used in the philosophy of agricultural extension are based on three things, namely: 1) counseling is an educational process that brings about the changes expected by a person or community, 2) counseling is a democratic process that is carried out by not forcing something to the farming community, and 3) counseling is a continuous process. Harun and Adrianto (2011) mentioned that communication is a process that connects one part with another in life.

Counseling activities are defined by various understandings, such as: dissemination of information, lighting or explanations, non-formal education, behavior change, social engineering, marketing innovations (technical and social), social change (behavior, individuals, values, relationships between individuals, institutions), community empowerment (community empowerment) and community strengthening, Mardikanto (2009).

The goal and objective of agricultural extension is the realization of farmers who have independence and freedom in using messages and information in the form of technology, as well as new things in improving their farming business so that it becomes more productive, efficient and profitable (better business) so that a better life will be achieved, and in the end the creation of conditions for people whose lives are prosperous (better community), Padmowihardjo (1999). The goal and objective of agricultural extension is the

realization of farmers who have independence and freedom in using messages and information in the form of technology, as well as new things in improving their farming business so that it becomes more productive, efficient and profitable (better business) so that a better life will be achieved, and in the end the creation of conditions for people whose lives are prosperous (better community).

## 2. Literature review

It is said to be minimal because communication activities are not only informative, namely so that others understand and know, but also persuasive, that is, so that others are willing to accept an understanding or belief, do an action or activity (Effendi, Onong Uchjana, 1995: 9).

In simple terms Ardianto, Elvinaro (2009; 51) explains that communication is the process of conveying understanding between individuals. Human society can exist, due to the human capacity to convey the intentions, desires, feelings, knowledge, and experiences of one person to another. In essence, communication is a behavior, where a source conveys a message to the recipient with the aim of influencing the behavior of the recipient.

According to Onong Uchjana Effeny (1981, 12) defines communication as, "The intended process is by which a person (communicator) conveys a stimulant (the basis of symbols in the form of words) to change the behavior of others (communicator). Meanwhile, the definition of communication media can simply be interpreted as a medium used to convey communication messages.

Then regarding the theoretical foundations used in the research, the author uses the theory of diffusion of innovations developed by Everett M. Rogers. According to Rogers (1983) defines diffusion as the process by

which an innovation is communicated through a certain channel within a certain period of time among the members of a social system. Diffusion is a special type of communication related to the dissemination of messages as new ideas. In the context of communication diffusion innovation is a special part that of the existing communication process because the information exchanged is innovation. The theory of diffusion of innovation is a model that describes the activity of new information exchange that takes place with the aim of the process of adopting innovation in the audience.

Conventionally, the role of counseling is only limited to the ability to convey innovations and influence the targets of counseling through certain methods or engineering techniques, until they adopt the innovations delivered. However, in its development, an extension worker must also be able to become a bridge between the government or the extension institutions he represents and the target community.

In connection with the role and responsibility of extension workers Kurt Levin (1943) introduced that there are 3 (three) roles of counseling consisting of activities such as, self-disbursement with the target community, encouraging the community to make changes, tabulating relations with the target community. The three kinds of designs, bridged into several more detailed roles, by Lippitt (1956): 1) Development of the need to make changes, 2) Encourage the community to make changes, 3) Tabulate the relationship between extension workers or government agencies and the target community. According to Mosher (1968) Relating to the role of extension workers, each extension worker (agriculture) must be able to carry out dual roles such as: 1) The teacher is someone who is able to be a reflection or role model, able to change the behavior, attitudes, knowledge and skills of the target

community. 2) The analyzer is to observe every situation (natural resources, community behavior, ability of funds and existing institutions) and be able to see problems and provide solutions for the target community. 3) Advisors choose the most appropriate alternative technically can be implemented, economically advantageous and acceptable to the social and cultural values of the local community. 4) Organizers are able to maintain good relations with the target community (especially the figures).

In the digital era, digital capabilities are the main prerequisites in order to compete in the long term, but various institutions and companies want to go digital who do not understand the best way to organize organizations in the automation process and develop the infrastructure and talents needed in managing digital information, both development, development, and maintenance of online services (Daub & Wiesinger, 2015). Ferrari, Editors, Punie, & Bre (2013) states that the field of digital competence is fivefold: 1. Information: identify, find, retrieve, store, organize and analyze digital information, assess its relevance and purpose. 2. Communication: communicating in a digital environment, sharing resources through online tools, connecting with others and collaborating through digital tools, interacting with and participating in communities and networks, cross-cultural awareness. 3. Content Creation: Create and edit new content (from word processors to images and videos); integrate and recombine previous knowledge and content; produce creative expression, media output, and programming; dealing with and applying intellectual property rights and licenses. 4. Safety: personal protection, data protection, digital identity protection, security measures, safe and continuous use. 5. Problem solving: identifying digital needs and resources, making informed decisions that are the most appropriate digital tools according to goals or needs, solving conceptual problems

through digital means, creatively using technology, solving technical problems, updating oneself and the competence of others.

Considering that this study is closely related to cybersecurity, the competencies discussed are related to security (Ferrari et al., 2013) including four competencies related to security, namely 1. Protecting devices, to protect devices themselves and understand risks and threats online and to know about safety and security measures, 2. Protecting personal data, to understand the general terms of service, active protection of personal data, understanding the privacy of others, protecting oneself from fraud and online and cyber threats, 3. Protecting health, to avoid the health risks associated with the use of technology in terms of threats to physical and psychological well-being, 4. Protecting the environment, to be aware of the impact of ICT on the environment.

In the global talks that 2020 enters the digital and automation era. Data obtained from the results of the 2025 HR survey (Letink, Garstang Caroline, & Ellimäki, 2020) states that every individual needs efforts to prepare themselves with abilities that cannot be easily replaced by machines and robots. The view of humans is irreplaceable by the rise of automation because robots or machines will run according to instructions or programs created by humans. According to a survey conducted (Dell Technologies, 2019) of global business leaders, the era of partnerships between humans and machines in 2030 as many as 54% of people will absorb and manage information in very different ways. For policymakers, business leaders, and individual workers around the world, the task is at hand to prepare for a more automated future by emphasizing new skills and improving training (Manyika et al., 2017).

The emergence of the definition of types of cybersecurity (Reid & Van Niekerk, 2014) is due to the fact that today all Internet and ICT

users are required to have a basic level of cybersecurity awareness and knowledge to carry out daily activities. This is a necessity in handling cybersecurity issues in the digital age. This condition requires coordination and cooperation nationally and internationally, in the government, community, and private sectors.

It is not enough to handle information security solutions only within the organization. Information security does not only apply to the use of information in personal contexts and the world has become increasingly more and more information-oriented (Reid & Van Niekerk, 2014). Cybersecurity is a collection of tools, policies, security concepts, security protection, guidelines, risk management approaches, actions, training, best practices, assurance, and technologies that can be used to protect the cyber environment and user asset organizations. The organization's assets include connected computing devices, personnel, infrastructure, applications, services, telecommunications systems, and the totality of information transmitted and/or stored in cyberspace. In general the purpose of cybersecurity is availability, integrity (which can include data authenticity and undeniability), and confidentiality (International Telecommunication Union, 2008). The research "Definition of Cybersecurity Gaps and overlaps in standardization" (ENISA, 2017) provides the important context necessary to understand the term cybersecurity and its use. Other cybersecurity domains are communication security, operations security, information security, physical security, public/national security. On the other hand in cybersecurity governance always consider these domains. Organizing information governance activities only from an information security perspective is not enough. The most common objectives of cyberattacks can be system scrambles, system destruction, data leaks, or attempting that the attacked system

cannot function (Ilhan, 2015).

Digital communication is the transmission of electronic information that has been digitally encoded, such as for storage and processing by a computer. In the development of digital communication technology, not only using computers in sending and receiving information but has developed in such a way using android, which also functions as a cellphone (Sumardjo, 2018). Realizing these conditions, it is now our duty for academics and national development stakeholders to build the concept of synergy of extension and development communication in realizing a dignified, just and prosperous community life. This paper discusses how synergies are built and how academic, political, strategic and technical implications in development.

In the current conditions, there are at least three reasons for the importance of synergy of Extension and Development Counseling, (1) Similarity of goals, (2) Complementary roles in development, and (3) The development of communication technology innovation in a society with diverse access to digital communication, has the potential to have an impact on inequality. First, there is a similarity of goals, counseling and communication both aim to occur behavioral changes, both cognitive, affective and psychomotor / conative, only different in their pressure, namely counseling in addition to these three aspects, especially on changes in conative aspects. Second, counseling is responsible in addition to changes in behavior of knowledge, attitudes and skills, but also on attitudes/actions (conative) and application (adoption) in life as a skilled/skilled (skills). Communication makes people smart and insightful, while counseling makes people smart and innovative in their lives. Smart means, in addition to being smart, they are also good at using their hearts so that they become more wise and wise in implementing new ideas, as well as technological innovations.

Third, the very rapid development in digital

technology innovation has turned out to cause a gap in human capacity in development. This is because access to information through digital technology is uneven, so there is a gap with individuals who are less able to access and or are less able to digest information from digital media with those who are better able to access digital communication. The word development in Development Counseling, binds the science of Communication and Extension Science in strengthening human capital (Individuality) and social capital (sociality) to realize the welfare of individuals, families and communities, as well as the environment through the process of human and social empowerment until independent. The synergy of Extension and Development Communication lies in the realization of independence.

Communication and Development Counseling is a combination of three domains of theories: (1) communication, (2) counseling and (3) development. The synergy of the three is the realization of harmony between people and society that is smart, independent, just and prosperous. The potential for social conflict is managed intelligently and optimally through conducive integration in resource and environmental management. The contribution of communication theories in development is "enlightening", that is, producing smart people with insight, expanding alternative life choices, expanding the mastery of innovative information, the importance of synergy of the role of communication technology development in development (digital communication and conventional communication), strengthening communication networks/cooperation, strengthening social capital and so on. The contribution of counseling theories in 3 developments is "educating", educating freedom of action ethically, changing behavior with a heart, strengthening attitudes to be increasingly innovative productive,

emphasizing wisdom and policies in acting, building human capital (individuality), leadership, social entrepreneurship attitudes and other positive attitudes. Both communication and counseling are tied up in the context of development.

An alternative term for counseling in Dutch, the word *voorlichting* is used which means to give light to help someone find their way. This term was used during the colonial period for the Dutch colonies, although counseling was actually needed by both parties. Indonesia, for example, follows the Dutch way by using the word counseling, while Malaysia, which is influenced by English, uses the word development. English and German respectively term it as giving advice or *Beratung* which means an expert can give clues, From various views there are still found some similarities in perception, according to Van den Ban & Hawkins, 2011: 25) one of them, namely that "counseling is the involvement of a person to communicate information consciously with the aim of helping others give opinions so that they can make the right decisions" Here it can be seen that there is a connection between communication and counseling. The source of communication is the party who sent the message or information. In agricultural extension, this source can be extension workers or reforming agents. In the context of development counseling education, competency competencies are needed related to the three synergy keywords "Communication, Counseling, and Development".

The vision of development extension education is related to "The production of competent development researchers, educators and communicators to create an independent, dignified (ethical) society that is prosperous and just". This is realized by developing synergy of communication and counseling systems in equitable development education. In Development, this "Human Development Education" should be a

prerequisite for the realization of an intelligent, dignified, just and prosperous society.

So the mission of development counseling education concerns at least three things, namely: (1) Realizing people and communities are smart, dignified, prosperous in justice. Education that produces Science and Technology for the development of human resources and graduates who are competent in participatory social engineering in human development (human capital) and social development (Social capital) in society; (2) Develop synergy of communication systems and extension systems in actual (appropriate) development. Producing graduates with the main competencies to synergize communication systems and development counseling systems that are adaptive to antisemitic to technological developments and changes in the actual strategic environment (appropriate). (3) Produce competent researchers, educators and development communicators. Producing competent graduates as researchers, extension workers / educators and development communicators in realizing a just prosperous society through the development of science and technology, socio-preneurs and participatory actions that educate people's lives.

The implications of such a vision and mission, several courses, with a level of depth in accordance with the level of competence (Indonesian National Work Competency Standard), are interesting to be discussed and considered in the three perspectives of Counseling, Communication and Development, namely: (1) Counseling, at least covering related theories: Philosophy and Theories of Development Counseling, Development Extension System, Philosophy and Adult Education, Leadership, Social Institutions and Group Management/Social Organizations, Training Management and Integrated Quality Management, Cyber Extension, Socio-preneur and Partnerships,

Preparation and Participatory Evaluation of Extension Programs, Counseling Methods and Techniques, Social Change and Development of Human Resources (Human Capital) and Social Capital (2) Communication, at least includes related theories: Philosophy and Theory of Development Communication, Development Communication Systems and Networks, Communication and Social Change, Cross-Cultural Communication and Management of Potential Social Conflicts, Innovation Communication, Digital and Conventional Communication, Group and Organizational Communication, (3) Development, at least includes theories: Development paradigm development, Local Economic Institutions and Local Wisdom, Fulfillment of Human Needs, Quality of Life Development and Development Indicators, and Sustainable Development.

In addition to these courses, it is necessary to strengthen local content in accordance with the advantages of each institution providing development counseling education.

### **Elements of Communication in Counseling.**

A communication process will be able to take place properly if there are elements that are one unit. There are at least 3 elements of communication, namely: 1). Source/communicator (source/sender) The source of communication is the party who sent the message or information. In agricultural extension, this source can be extension workers or reforming agents. 2). Message (message), Message is information addressed to the recipient. In agricultural counseling, this message can be in the form of counseling materials. The message used in agricultural extension is based on the targeted needs of men and women. 3). Recipient / communicant (receiver), The recipient is the party who receives messages or information, that is, the party who is

expected to change both his behavior and personality. In agricultural counseling, the recipients or targets are farmers (main actors) and business actors and their families. Because the agricultural extension process can be carried out using various methods, techniques and media, the element of communication increases. 4). Channel (channel), Channel is the path through which the message that the source conveys to the recipient. Channels include the use of methods and techniques as well as the use of media that are relevant to the purpose, objectives and nature of the message.

In general, the more senses that are stimulated through various media, the more effective the communication process in agricultural extension. The use of methods, techniques and media for agricultural extension in addition to increasing the understanding of the target to the message conveyed, to encourage the activity and creativity of the target as well as the growth of self-confidence. 5). Effect, the effect of communication is the recipient's response to the messages received and is feedback for the communicator / source of the messages conveyed.

The effect of communication is in the form of changes that are expected to occur in the target as a result of the communication process. The expected changes involve changes in behavior (knowledge, skills, and attitudes), as well as changes in the target personality (independence, toughness, ability to cooperate, self-confidence, the ability to put oneself in a strong bargaining position, etc.). The effects of communication are immediately known, for example changes in knowledge and skills, but some indirect means that it takes a long time such as changes in attitudes and personality. In two-way traffic communication, communicators can get feedback directly compared to unidirectional communication.

### **Development, Empowerment and Independence Counseling.**

Independence is the culmination of the poses of empowerment in the counseling process. Through Development Counseling, individuals or communities must experience strengthening empowerment in realizing the quality of life of themselves, their families, communities and the environment. The context of Indonesia is in line with the ideals of the nation and the national goals contained in the Preamble to the 1945 Constitution, namely realizing just and dignified prosperity. This is in line with Law No. 16 of 2006 concerning the Agricultural, Fisheries and Forestry Extension System and Law No. 13 of 2009 concerning The Protection and Empowerment of Farmers.

Independence is the culmination of one's empowerment. A person's independence is characterized by high filterability, competitiveness and sanding power in his life behavior (Sumardjo, 2014; Sumardjo, 2016). The development of this level of empowerment can occur even from the most helpless (dependent), to empowered (independent) and the peak to independent (interdependent). The individual or society's helplessness occurs when his life depends on the role of the other party, less able to adapt to changes in his strategic environment. Empowered individuals or societies are characterized by high filterability and competitiveness. A person's filtering power is getting higher in line with the breadth of insight and intelligence he has. While a person's competitiveness is characterized by the high ability to manage businesses or resources in his life effectively, efficiently and with quality.

A person's ability to partner, network synergistically with other parties in their lives. The essence of this sanding power is trust, mutual reliability, mutual strengthening, mutual trust and this is the basic material for building social capital in

their living environment. Development counseling is inseparable from efforts to realize welfare in a dignified manner. Law Number 11 of 2009 concerning Social Welfare mandates that the implementation of social welfare in Indonesia includes (1) Social rehabilitation, with the refunctionalization of the social functions of citizens, (2) Social security, namely guaranteed efforts to meet basic needs, (3) Social empowerment, so that the community is able to meet basic needs, and (4) Social protection, so that people avoid the risk of shocks and social vulnerabilities. All of these approaches are relevant to extension activities, especially the social empowerment approach. This approach is very relevant to the principles and philosophies of counseling.

The purpose of implementing social welfare (Law Number 11 of 2009 article 3) is to improve the level of welfare, achieve independence, increase social resilience, improve the ability, concern and social responsibility of the business world as well as the ability of the community's ability and concern institutionally. The principles of social welfare implementation are solidarity, justice, expediency, integration, partnership, openness, accountability, participation, professionalism, and sustainability (Law Number 11 of 2009 article 2). This is in line with the principle of counseling as stated in Law No. 16 of 2006 article 2 democracy, benefits, equality, integration, balance, openness, cooperation, participatory, partnership, sustainability, justice, equity and responsibility.

After going through studies related to counseling and community empowerment practices Sumardjo (2010; 2014; 2016) came to the understanding that in the context of community empowerment the philosophy of counseling is basically "to develop the empowerment of non-formal education participants in an adaptive, participatory, dialogical and synergistic manner to realize

human capital and social capital into an increasingly qualified, independent and dignified livelihood".

In empowerment, there is a meaning that the philosophy of counseling is a planned effort (Sumardjo, 2016):

1. Developing the empowerment of participants means liberating citizens of society from ingenuity of ignorance (cognitive), incompetence (psychomotor-conative) and unpreparedness (affective) adapting to actual life and or liberating from the domination of others.
2. Develop an adult education process (andragogy) for community members, namely meaningful non-formal education as an effort to improve the quality of behavior through learning outside formal schools.
3. Developing adaptive abilities to be increasingly anticipatory, actual, dynamic, with a dialogical communication approach so as to be able to develop a synthesis of various solutions and innovations, as well as participatory (voluntary change) and synergistic there is a convergence of interests with social partners.
4. Developing human capital to be competent and increasingly professional, as well as social capital, namely realizing an empowered and independent society (better community).
5. Improving the quality of life that is increasingly prosperous (to improve their level of living).
6. Realizing individual independence (interdependent) by strengthening filtering power (smart and moral), competitiveness (effective, efficient and quality), and sanding power (sovereign and synergistic in partnership).
7. Realizing a dignified human being and society (sovereign, prosperous, just and civilized).

This view is in line with the philosophy of counseling presented by Kelsey and Hearne (1955) in (Sumardjo, 2015; 2016) the following: "The Philosophy of extension is based on the importance of individual in the promotion of progress for rural people and for the nation". The philosophy of counseling is based on the interests of

individuals in order to develop progress for rural communities and the state. The philosophy is basically "To help people to help themselves through educational means to improve their level of living". Helping people in helping themselves with education as a means to improve their lives.

The value system that underlies (guides) counseling is basically client empowerment, the importance of future life (anticipatory), and trust (optimism) in the future. An important belief (belief) that exists in extension workers about the nature of reality is to have a systemic perspective (thinking systems that are holistic, not partial), rational and non deterministic. Extension workers should believe in knowledge and learn that knowledge is acquired and transmitted i.e. that learning is context-bound (philosophically idealistic, realistic and pragmatic) and that learning is an active, adaptive and actual process (Sumardjo, 2016).

An extension worker or every person involved in empowerment at least has an idealistic, realist and pragmatic philosophy, which is to have a clear picture of the future, based on the reality of life and has benefits for his life and future. Idealistic philosophy is the belief that truth exists in ideals, goals or logical conditions that can be realized, so that everyone needs to have a foresight of the ideal future that he believes can be realized.

Realistic philosophy is the belief that truth exists in the reality of life. Pragmatic philosophy is the belief that everyone believes the truth to exist in something that is considered beneficial to real life. Community empowerment is basically a process of developing the potential and abilities of individuals / communities so as to strengthen their capacity, to solve the problems they face so that they are able to meet the integrity of their lives.

Community empowerment is carried out through learning/ educational activities and

other efforts (for example helping the provision of certain facilities), aimed at improving their ability and willingness to act to overcome the problems and threats they face in everyday life. Learning activities are an active effort of a person aimed at developing insights, knowledge, skills and mental attitudes that have an impact on the growth of the ability to act intelligently in solving problems and meeting their needs.

### **3. Research methodology**

The research method used in this study is descriptive qualitative, namely research conducted on independent variables, namely without making comparisons or connecting with other variables. Moleong (2007:6) explains qualitative research is research that intends to understand the phenomenon of what the subject of research experiences 13 by means of descriptions in the form of words and language in a special natural context and by utilizing various natural methods. The way this description comes from interviews, observations, including quotations and summaries from documents.

Data Collection according to Arikunto (2010: 22), Primary Data is data in the form of verbal or verbally spoken words, gestures, or behaviors carried out by a trustworthy subject, in this case it is a research subject (informant) with regard to the variables studied. and secondary data is data obtained from graphic documents, photo photos, films, video recordings, objects, and others that can enrich the primary data. Secondary data collection through data obtained from library materials, among others, comes from documents or data regarding laws and regulations, Decrees (SK), journals, the internet, books, literature, and other sources.

Interviews Interviews were conducted at the Sibayak Lingga Farmer Group to get the problems experienced by the farmer group. Researchers visit the site in person whether

the counseling is carried out or not.

### **4. Research methodology**

Agricultural extension is defined as an out-of-school education system for farming families in rural areas, where they learn while doing to be willing, know and be able to solve the problems they face properly, profitably and satisfactorily (Wiriatmadja 1983). Or in other words, agricultural extension activities are an activity of conveying information to others, with the expectation that the person can change their behavior by willing to carry out the information conveyed.

Meanwhile, Law of the Republic of Indonesia Number 16 of 2006 concerning the Agricultural, Fisheries and Forestry Extension System (SP3K) states that the agricultural extension system is a whole series of developing the abilities, knowledge, skills and attitudes of the main actors (agricultural activity actors) and business actors through counseling. Therefore, the law states that Agricultural Extension is a learning process for the main actors (agricultural activity actors) and business actors so that they are willing and able to help and organize themselves in accessing market information, technology, capital, and other resources, as an effort to increase productivity, business efficiency, income, and welfare, as well as increase awareness in preserving environmental functions.

Because agricultural extension activities are learning activities, it cannot be separated from interaction and communication activities with each other between farmers and agricultural extension workers. Therefore, communication is an important factor that can support the achievement of counseling goals either in technology transfer or other efforts so that farmers can farm and live better.

### **Aspects of the Communication Process.**

Judging from the process, counseling is communication in the sense of the word there are two components, namely humans, one as a messenger or communicator and the other as a message recipient or communicant. In this process the agricultural extension officer acts as a communicator (messenger), while the farmer is a communicant (recipient of the message). The difference between communication and counseling lies in the purpose, where the purpose of communication is general, while the purpose of counseling is special, namely to improve the knowledge, attitudes and skills of farmers as the target. The goal will be achieved when there is an understandable and two-way communication.

But it could happen misunderstandings in communication, where the message cannot be understood by the recipient of the message well. This is due to the presence of factors inhibiting communication between the sender and recipient of the message. According to Purwanto (2009) there are factors that hinder communication that can be grouped into four main problems, namely: 1) problems in developing messages; 2) problems in the delivery of messages; 3) problems in receiving messages; 4) problems in interpreting messages.

Avoiding all of this, in agricultural counseling it is necessary to plan in advance, so that the agricultural extension process to help farmers achieve their goals can be carried out properly, by eliminating the inhibiting factors that are most likely to occur in communication. It seems that the role of communication is very large in extension activities, which will affect from planning to implementation and evaluation.

Extension workers as communicators are messengers, while the target in this case is called communicants very much that is influenced by their background, both individually and in groups. For the extension

workers themselves, are they ready to communicate from sharing aspects, whether the message they carry is in accordance with what the target wants as well as the channel or media they do is appropriate or is it appropriate for the method they use. However, the most important element in making this behavior change is the occurrence of good communication between the messenger, namely the extension officer, and the recipient of the message is the person who is expected to change his behavior.

### **Aspects of Communication Objectives.**

According to Slamet (1978), detailing the existence of three objectives in communication which in practice are often carried out together with different weights of emphasis on the three goals, namely: 1) Informative, providing news information, 2) Persuasive, coaxing and 3) Entertainment, providing entertainment. In the context of agricultural extension activities, it always contains these three kinds of goals even though the levels are not always the same. This is because the main purpose of counseling is to educate. That is, influencing others to be willing to accept / carry out the information they convey happily. Nonetheless the weight of "entertainment" must be kept from always being dominant, so that the information provided can be conveyed in larger portions so as to allow the target to obtain it quite completely and clearly.

We are currently in the digital era 4.0. An era where a lot of information is obtained by utilizing information and communication technology. Existing information can now be conveyed with the help of digital technology that is developing rapidly, information that used to be obtained through face-to-face and manually can now be disseminated through technology. With the digitalization of technology today, counseling will be more effective and efficient. Agricultural extension workers must be able to utilize

information technology to increase the enthusiasm of farmers in order to increase agricultural productivity. Extension workers must take advantage of technological innovations that have developed well.

Minister of Agriculture (Mentan) Syahrul Yasin Limpo (SYL) asked the millennial generation of agriculture to take advantage of the new paradigm of the digital world in developing farming. "Agriculture is no longer the same as agriculture in the past. In the digital era like now, the agricultural sector is also adapting to technology 4.0 to answer the challenges ahead. Dedi said agricultural extension workers must be able to utilize information technology to increase the enthusiasm of farmers in order to increase agricultural productivity. Extension workers must take advantage of technological innovations that have developed well. "The characteristic of successful extension workers is extension workers who can increase productivity in their respective target areas by utilizing cultivation innovations."

Meanwhile, Rizali Anshar, an agricultural extension worker from South Kalimantan Province, has utilized digital technology by conducting counseling media through video. In the MSPP activity, Rizali shared tips on how to make counseling videos so that they can be accepted and understood by farmers and stakeholders in agriculture. One of them is for the selection of material in the video based on events that are viral or are being hotly discussed. The type of video chosen should be consistent, if from the beginning you choose a video about ornamental plants then the video made should always be about ornamental plants.

Rizali explained that what affect video quality is voice quality and body language. With an excited voice, it will make people watching more excited. But even though you have used a good voice, you still have to use good body language too. "There is a special technique in making videos on Youtube so

that the videos made are more watched by the public in this case, especially farmers. There is such a thing as a youtube algorithm that can cause more viewers.", There are fatal errors in making videos including Misdirected content, Less interesting content, Focus on tools, Adsense, Inconsistent.

### **Security Education, Training, and Awareness (SETA) Program**

The Security Education, Training, and Awareness (SETA) Program can be defined as an education and training program designed to reduce the number of cybersecurity breaches that occur due to an individual's lack of awareness of cybersecurity. The SETA program can also be defined as a program that targets all users in an organization to help them become more aware of the principles of information security for their work. The SETA program also helps organizations deal with the risk of compromise due to employees' ignorance of how to perform secure IT-based tasks. This is important for every employee to understand cybersecurity because implementing the SETA program requires participation and motivation (Caballero, 2017).

The SETA program in its application consists of three stages which are a series of training, namely the level of awareness (awerness), the level of training (training), and the level of education (education). The implementation of the SETA Program begins with a basic level that is general to all users in this case all existing employees with the aim of building awareness so as to be able to create a culture of cybersecurity awareness throughout the organization and needs to be conveyed to all users focusing on individual accountability.

Ultimately, the higher the level of risk managed by individuals, the higher the level of awareness and training they should get.

The cybersecurity education level is usually implemented in a formal education built to teach all the basic concepts necessary to build a career in information security. Already many among universities and colleges have begun to create curricula that offer bachelor's and master's degrees on information security.

### **Training Needs Analysis**

Training needs analysis is an early stage in the training process and involves mechanisms to determine whether training will indeed be able to overcome previously identified problems (Bansal & Prakash Tripathi, 2017). Basically, the purpose of training can be defined if the analysis of training needs is carried out systematically related to development in the organization that is carried out professionally. Therefore, the analysis of training needs begins by defining the gap between what employees know and can do and what they and organizations expect to be able to do, which can be filled with training (Ludwikowska, 2018). Training activities are ensured from the analysis of training needs in order to get the relevance of the target participants and to improve the quality of their performance based on the skills or types of skills needed (Bansal & Prakash Tripathi, 2017).

According to (Khan & Masrek, 2017), each training activity requires an analysis of training needs to recognize what, where, how, as well as when it will be implemented. Success.

### **Extension Challenges in Disseminating Information Technology.**

Farmers in Indonesia are generally in the lower middle class, with socio-cultural conditions that are still firmly held, especially those who live in rural areas. The characteristics of farmers who are still strongly holding culture require a slower process of receiving innovation. This

remains a challenge for agricultural extension workers in delivering new technologies. Soekartawi (1988) stated that smallholder farmers generally have a risk averter nature, they are the ones who will bear the risk of what happens by implementing an innovation. Once they are sure of the results that will be obtained if the technology is adopted then the next step is the application of technology. The level of education of elderly farmers is currently relatively low, and most of them are still active in their farming business.

Narrow land ownership is a determining factor for consideration to face risks. The high number of smallholder farmers is a challenge that must be considered in disseminating a new technology. The Function of Extension Workers in Effective and Efficient Dissemination The principle of agricultural extension is to communicate properly, correctly and effectively. Working in the world of counseling must have good communication skills.

Communication is not only in verbal form, but non-verbally by means of codes or lambing. Communication in a language that is easy to understand so that the message or information conveyed can be easily understood. The gestures of the recipient of the information can be a clue as to whether an information is acceptable, for example, facial expression with a blank look or shaking your head or nodding indicates a lack of understanding with the information being heard. Information that is conveyed prolongedly with the expression of uncommon terms, causes the listener of the information to feel tired and become unfocused. They will chat on their own, no longer concentrating on listening.

Agricultural extension activities must be effectively able to organize counseling with methods that are in accordance with the target, time, place, object (material) and subject (participant). The material presented is in accordance with information needs, this

requires initial communication before carrying out counseling. Support counseling media such as posters, videos including using electronic social media that can support conveying information quickly.

Agricultural extension activities must be effectively able to organize counseling with methods that are in accordance with the target, time, place, object (material) and subject (participant). The material presented is in accordance with information needs, this requires initial communication before carrying out counseling. Support counseling media such as posters, videos including using electronic social media that can support conveying information quickly.

### **Institutional and Agricultural Extension Systems**

Sejak berlakunya otonomi daerah dengan Full authority in the district/city government to make changes to the extension institutions that are united with the Agriculture Office, resulting in the implementation of agricultural extension services stagnating. The extension system consists of methods, approaches and institutions or organizations. The macro extension system consists of two parts, namely the delivery system and the receiving/adoption system (Badan Litbang Pertanian, 2001).

Institutional counseling is an important factor in the extension system; without the institution of counseling, the implementation of counseling cannot run. The position and role of extension institutions is to organize extension programs by disseminating technology from technology sources to users (farmers) or clients in the social system. Therefore, extension institutions starting from the central, provincial, district/city, sub-district and village levels must establish a relationship of coordination, integration and synchronization of programs, both functionally and operationally in the implementation of agricultural extension

According to Axinn (1985), the agricultural extension system consists of two main categories, namely the delivery system and the acquisition system. The delivery system is the delivery of technological information to farmers based on the needs and goals of the organization. Meanwhile, the acquisition system in agricultural extension is very different. The main idea is that groups of farmers, can organize in any way, so that they can reach out outside their villages to obtain the necessary information.

These organizations are generally smaller, such as farmer associations, small farmer groups, or cooperation groups in the village. For the extension system to be successful, it must be controlled by the target group, by influencing the agricultural research agenda and the policies of the central government.

The development of today's agriculture, especially with regard to counseling clients, no longer distinguishes based on the specific category of farmer groups targeted, but must reach all layers of farmers; ranging from small farmers, farm workers/farmers who do not own land, peasant women and young peasants (Campbell and Baker in FAO, 1997). According to Swanson, Roling and Jiggins (1984) in FAO (1997), explained that there are four main factors that need to be considered in finding or providing an extension framework for the development of technology that suits the needs of the target group and clients. These factors are zone-agroecology, access to resources, gender, age of farmers and tribal groups.

Zne-agroecology is an important factor that needs to be identified such as bio-physical, land type, soil fertility, rainfall patterns, slope and altitude of the place will affect the development of location-specific technology. Such bio-physical factors can influence the adoption of technology. Therefore, in client system counseling, these indicators need to be considered in the delivery of information on technological innovations.

The access to resources factor is to explain the socioeconomic factors that distinguish the access of one farmer from another to other farmers to production factors such as land tenure status (area, owner, trapper, tenant, pawn), capital (source of capital, loan, credit, how to obtain credit, how to grow capital), labor (family labor, outside the family / wages, availability of costs, communal), inputs (availability of seeds, fertilizers and medicines), market (place, price, warehouse, transportation, distance), ability to use technology and information (availability of extension services, suitability of technology) (Swanson, et al, 1984, in FAO, 1997).

### **Human Resources of Agricultural Extension Workers Who Compete In The Digital Age**

Based on Law No.16 of 2006, extension workers are distinguished in 3 (three) categories, namely (1) Civil Servant Extension Officers; (2) Private extension workers ; (3) Self-help extension workers. In general, the three categories of extension workers have no different functions. As a delivery of information on innovative technology to assist farmers in technology escorts, so that it becomes an understanding of the application stages. Being an extension worker with a higher level of education than a farmer does not mean that he is greater than a farmer. The basic principle of agricultural extension is to learn together to solve problems in farming, our big role is to facilitate farmers to get technological information, as well as its application.

Access to information on social media in the modern era as it is now is more diverse and varied. The Internet is accessible to all walks of life, wide open to various information. Digital technology that continues to develop, provides the widest opportunities for us to be able to take advantage of both obtaining information and disseminating information

quickly in an unlimited space. This facility can be used for extension workers in carrying out the role and function of extension workers to become a learning medium and help solve problems. As an extension worker in charge of BPTP, he is required to always strive to increase capacity to face such rapid technological developments. In the digital era that has various conveniences.

The government continues to facilitate the improvement of the human resource capacity of Agricultural Extension Workers in order to carry out their duties properly. With the provision of knowledge, extension workers must also cultivate creativity and ideas that can provide solutions to agricultural problems in the field. The experience of extension workers in the field combined with the results of research or assessment will provide the right solution and have a positive impact. Digital Products That Can Be Utilized by Extension Workers The basic principle of counseling is efficient and effective communication, the use of communication media is very supportive in disseminating information technology in the digital era.

The use of digital products or the internet in conveying and disseminating technological information more effectively and efficiently by utilizing social media such as Twitter, Facebook, Instagram, Youtube, Google, Whatsapp, Telegram, LinkedIn, Line and various other types of social media. The creation of effective and efficient counseling media has been equipped with a variety that is easy to download either through an Android smartphone or on a laptop or notebook. The trend of counseling that follows the current current digital developments that are classic such as radio broadcasts can already use applications via the internet.

Video clips or films of short duration can be used as a form of media that has a wide spectrum, meaning that it can be easily

understood by viewers of various age and education levels. Making it is currently relatively easy because many menu menus are easy to operate because they already use symbols in the form of images. Recording a video clip does not have to use a special camera. Communication equipment such as smartphones have been equipped with photo camera features and video cameras. The editing process can be done easily just by using the application that can be downloaded.

The challenge for extension workers in this digital era is the ability to keep pace with technological developments, which have changed in a relatively short period of time. As an extension worker, you have to read a lot and study the changes that occur. Change is usually the cause of the emergence of new problems, because the existence of information systems that are no longer limited by time and space, can cause unexpected impacts. As an agricultural extension officer who carries out the task of disseminating agricultural technology, conveying new information to farmers. Creativity is needed to face problems for which there is no solution based on the results of research and studies. Of course, it needs to be supported by the knowledge of extension workers, experience in the field, level of education, hard work and discipline.

A communication process certainly needs to run effectively so that the content of the message is conveyed properly and the purpose of the process can be achieved. Likewise with the agricultural communication process, efforts need to be made so that the process runs effectively. The process of conveying messages in agricultural communication needs to pay attention to various aspects such as attitudes, thoughts, and feelings of the recipient of the message to be able to equalize meaning.

Basically, the process of agricultural communication (especially in agricultural extension) has several stages, namely: 1)

Creating awareness, that is, efforts made to attract attention and raise awareness of the recipients of the message (farmers) regarding the existence of something new. 2) Evocative of feelings, that is, an attempt to cause a feeling of opening up in the farmer of something new, which was already realized at the previous stage. So that the farmers have the willingness to know and learn more. 3) Arouse desire, that is, an effort to cultivate a desire in farmers to do new things that are conveyed in agricultural extension activities. 4) Convincing, that is, an attempt to convince the farmers to be sure, not to hesitate, and not to be afraid to do new things. 5) Mobilizing, that is, efforts made to encourage farmers to do new ways or things that are taught, and be able to practice them in a sustainable manner.

Setelah menjalani tahapan dalam Agricultural communication, it is necessary to pay further attention to how the approach is carried out so that the communication process runs effectively. Here are the approach methods that can be done to make agricultural communication run effectively: Group approach method, which is a method of providing agricultural counseling by grouping farmers based on the location of their residence, or paddy fields. (Also read: Philosophy of Communication) Mass approach method, which is a method of providing counseling that is carried out mass and can reach a wider target by using mass media such as television, newspapers, and so forth. (Also read: Gender Communication) The individual approach method, which is a method of approach by communicating directly to the target such as dialogue with farmers. That way, the information conveyed is more targeted and directed even though it cannot immediately reach many people.give importance that they really.

## 5. Conclusion

era digital is appropriate for agricultural farmers to be able to use digital media as a medium for the innovative dissemination of agriculture on social media. The extension system is a system of delivering innovations from technological sources to users (farmers) using various existing approaches and methods that are in accordance with client conditions and social systems, so that innovation can be utilized by users to increase income and welfare. The main components of the extension system consist of three sub-systems, namely the client sub-system, the change sub-system and the research sub-system. The research sub-system does not play a direct role in seeding technological innovations but as a supplier of technology (generating system).

The extension approach in the future is no longer designed as a partial concept but concerns all aspects of rural agribusiness activities, but must be able to be realized in operational activities carried out thoroughly, integrated and coordinated from all development actors.

Agricultural extension systems can use the approaches of: (1) agro-ecosystems; (2) territory; (3) agribusiness; (4) institutional; and (5) welfare. The extension system approach is more directed at the growth of the regional economy (local economy) so that it can reach all client life activities in the social system.

## 6. Recommendations

- Karakteristik petani yang masih kuat memegang budaya memerlukan proses yang lebih lamban dalam menerima inovasi. Ini masih menjadi tantangan bagi penyuluh pertanian dalam menyampaikan teknologi baru. Soekartawi (1988) menyatakan bahwa petani kecil umumnya mempunyai sifat menolak resiko (risk averter), merekalah yang akan menanggung resiko apa yang terjadi dengan menerapkan suatu inovasi menuju Menuju digitalisasi pertanian era revolusi industri 4.0,
- Penerapan teknologi. Tingkat pendidikan petani berusia lanjut saat ini relative rendahnya, dan sebagian besar masih aktif pada usahataniannya.
- Kepemilikan lahan yang sempit merupakan faktor penentu pertimbangan untuk menghadapi resiko. Masih tingginya jumlah petani gurem merupakan tantangan yang harus diperhatikan dalam mendiseminasikan suatu teknologi baru.

**Acknowledgment:** Our great confession to Allah Allah Subhanallah Taala who has given us mercy and blessings for all our activities. Thank you to the lecturers of the Islamic University of Kalimantan Muhamma Arsyad Al Banjari (Unniska MAB) Banjarmasin who have provided us with more knowledge and support to realize this journal. All this is with the support of the Head of the Binuang Agricultural Training Center, Tapin Regency, South Kalimantan Province, Indonesia.

## **PREDICTION OF CALORIFIC VALUES OF WHEAT STRAW FROM PROXIMATE & ULTIMATE VARIABLES**

**Abstract:** *Agro-crop residues for energy applications are paid impressive attention worldwide in the recent decades. As 850 kg of wheat straw generate per every tonne of wheat produced, globally 660.28 million tonnes of wheat straw was estimated for 2021-22. Wheat straw (WS) considered as a primary energy source despite of its utilization in soil enhancer, animal fodder supplement, frost prevention in horticulture, ingredient in mushroom production substrate and traditional building materials. Higher heating value (HHV) is considered as the energy indicator of fuel substances and thus this study mainly focused on construction of single and multivariate linear regression models to determine HHV of WS using proximate and ultimate parameters. 54 different WS data considered and stratified based on available attributes. WS samples found with the mean values of 67.95, 15.47 and 5.96 % of volatiles, fixed carbon and ash contents respectively besides the mean HHV of 16.86 MJ/kg. Further, one-way ANOVA study revealed that items considered for the study are highly significant. In addition, Pearson's correlations ensured that HHV has comparatively stronger linear relations with moisture and volatile matters apart from active relations with carbon and oxygen compositions. Moreover, multivariate linear models of HHV, expressed as function of proximate variables and a function of ultimate parameters along with ash content have proven to be more efficient predictions with the estimated  $R^2$  values of 0.777 and 0.8 respectively. Nevertheless, most of the developed models have demonstrated their coexistence with other reported models.*

**Keywords:** *Wheat Straw, Proximate and Ultimate Analysis, Statistical Measures, HHV Prediction, Single and Multivariate Linear Regression Model.*

### **1. Introduction**

Agro based biomass resources for energy application are paid impressive attention worldwide in the recent decades due to the fact that the replenishing of fossil fuels takes longer time. Despite the utilization of crop residues as fodder to animals, major portion

remains in the fields [Harmandeep et al 2013]. Crop residues have been applied as a biofuel feedstock and the significance of such sources rising in many countries because of increasing prices and depleting reserves of fossil fuels. In other words, CO<sub>2</sub> released from the burning of any biomass can be captured back by the plants while grow-up and thus it holds the carbon neutral

character, which ensure biomass as a renewable and sustainable energy resource.

Wheat is one of the major stable crops in the world and estimated the production of 776.8 million tonnes in 2021-22 [Food Outlook 2022]. Wheat is primarily grown in moderate and Mediterranean climates. The stalks remain following the removal of the grain during the grain harvesting process, often known as wheat straw. Main producers of wheat are located in Southern Asia, Eastern Europe, Northern America and Eastern and Central Asia. As 850 kg of wheat straw generate per every tonne of wheat produced [NL Agency 2013], globally 660.28 million tonnes of wheat straw was estimated for 2021-22. Wheat straw is a lignocellulosic biomass which relatively contains high amounts of inorganic components and ash. However, straw is considered as a major feedstock for the bio-based economy and combustion of straw remained the most common application so far [NL Agency 2013]. Current uses of straw include soil enhancer, animal fodder supplement, frost prevention in horticulture, ingredient in mushroom production substrate, traditional building materials and energy. In addition, wheat straw is co-fired in coal-fired power plants.

Fuel characteristics such as gross calorific value (GCV) or higher heating value (HHV) of a biomass is considered as a primary energy indicator and the effect of physicochemical compositions of biomass material on HHV studied experimentally or empirically by several researchers [Abdul et al 2013, Ayese Serdar 2016, Harmandeep et al 2013]. Heating value or calorific value of a fuel substance is defined as the energy liberated from the combustion under specific applied conditions. HHV is the total amount of heat energy available in the fuel including energy embodied in water vapour whereas lower heating value (LHV) accounts for only dry components. Heating values can be determined experimentally with the aid of a

Bomb calorimeter. Other words, LHV can be assessed from HHV using  $LHV = HHV - 24.42(AM + 8.94H)10^{-3}$  MJ/kg [Szymajda et al, 2021].

Abdul et al., have applied multiple linear regression models and simple linear models to predict GCV of lignocellulosic biomass materials using proximate variables. Experimental values of proximate parameters of any biomass can be easily obtained from a simple ordinary lab using an oven to measure moisture (M) content and a muffle furnace for measuring volatile (V) and ash (A) contents. And the fixed carbon (FC) can be determined by a simple relationship,  $FC = 100 - (M + V + A)$ . Determination of HHV in the range of 1.469 and 1.493 MJ/kg of biomass using proximate analysis with a statistical parameter  $R^2$  in the range of 0.812-0.837 reported by Ayese and Serdar. In another study by Harmandeep et al., ultimate and proximate variables considered to develop relevant equations for HHV prediction of biomass materials. In addition to many earlier studies focused on calorific value dependency on proximate and ultimate variable, Sunyong et al., have studied interdependency of proximate and ultimate variables [Sunyong et al 2022].

Integration of several varieties of biomass materials and predicting models in a more general way definitely causes to high uncertainty in the results as every type of biomass has shown random variations in their physicochemical compositions. Moreover, soil type and climatic conditions affects significantly the biomass compositions. Therefore, this study mainly focused on assessing the correlations among proximate and ultimate variables, and the development of models to predict higher heating value of wheat straw, a specific significant crop residue using simple linear relations and multivariate linear regression models.

## 2. Data Collection and Methods of Analysis

### 2.1. Data Collection and Stratification for the analysis

Proximate and ultimate analysis reports of 54 wheat straw (WS) samples in as received (ar) condition were acquired from PHYLLIS, Netherlands database in the month of March, 2023. Further, the data of WS samples provided with associated higher heating values (HHV). However, the data was stratified according to the available information such as proximate analysis (PA), ultimate analysis (UA), complete analysis(CA), and the data with HHV provision as shown in figure 1. Out of 54, total number of samples 20 samples has proximate reports (Table 1), 35 samples provided ultimate variables along with gross calorific values (HHV) as given in the table 2, and complete analysis (Table 3) for 14 samples which includes P<sub>2</sub>O<sub>5</sub> and K<sub>2</sub>O, and excluding proximate analysis that has provided in the Table 1 along with others.

### 2.2 Estimation of Statistical Measures [Kothari C.R 2004]

Measure of central tendency, also known as statistical average or mean tell us the point about which items have a tendency to cluster and it represent a figure for the entire sample data. In general, statistical mean of  $n$  items is given by,

$$\bar{X} = \frac{\sum X_i}{n} = \frac{X_1 + X_2 + X_3 \dots + X_n}{n}$$

Further, in order to measure the scatter behaviour of samples, statistical devices called measures of dispersion such as range, and deviation are calculated. Range is the difference between the extreme values of the items, whereas the standard deviation ( $\sigma$ ) is the square-root of the average of squares of deviations and it is given by,

$$\sigma = \sqrt{\frac{\sum(X_i - \bar{X})^2}{n}}$$

Thus mean, range and standard deviations of all proximate, ultimate and calorific values are determined for further understanding of their distributions.

### 2.2 ANOVA Performance and Determination of Pearson's Correlations [Kothari C.R 2004]

Analysis of variance (ANOVA) is essentially a procedure for testing the difference among different groups of data for homogeneity. In brief, ANOVA methods includes the estimation of population variances (PV) based on inter sample variance (SV) and intra sample variances and they are compared with  $F - test$  and given by,

$$F = \frac{\text{Estimate of PV based on Inter SV}}{\text{Estimate of PV based on Intra SV}}$$

Thus the value of  $F$  provides a qualitative mean of sample significance referred to a given  $F - limit$  for a specific degrees of freedom.

One-way (or single factor) ANOVA test performed in Microsoft EXCEL® for all data groups provided through Table1 to Table 3 to understand their deviations and significance of the samples.

There are several methods of determining the relationship between variables such as bivariate and multivariate correlations to understand their association or correlation and to determine the degree and direction. Karl Pearson has proposed a coefficient ( $r$ ), most widely used method of measuring the degree of relationship between two variables and is given by,

$$r = \frac{\sum(X_i - \bar{X})(Y_i - \bar{Y})}{\sqrt{\sum(X_i - \bar{X})^2} \sqrt{\sum(Y_i - \bar{Y})^2}}$$

Using a simple function, *PEARSON* (*y* variable, *x* variable) in EXCEL® correlation coefficients between the proximate, ultimate and HHV variables are established.

**2.3 Single and Multivariate Linear Model Constructions and Validations** [Kothari C.R 2004]

Simple linear regression models developed for the assessment of HHV values as a function of proximate and ultimate variables using single and multivariate linear regressions. Regression interpret what exist physically between independent variable (X) and dependent variable (HHV) and a single linear regression is given by,

$$HHV = a + bX$$

where X is an independent variable such as proximate or ultimate parameter and a, b are the regressions coefficients, which will give the best possible fit through original X and HHV and they are determined by simple least-square method as follows,

$$b = \frac{\sum x_i y_i}{\sum x_i^2} \text{ and } a = HHV - bX$$

and a multiple linear regression can be described by,

$$HHV = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \dots + \beta_k x_k + \varepsilon$$

where HHV is the dependent variable and  $X = \{x_1, x_2, \dots, x_k\}$  are the independent variables as describe above and  $\varepsilon$  is the corresponding residual error. If the expected error,  $\varepsilon$  assumed as zero, the set of arbitrary coefficients (b) can be described as,

$$b = \{\beta_0, \beta_1, \beta_2 \dots \beta_k\}$$

and it can be evaluated by the least square method as,

$$b = (X^T X)^{-1} X^T HHV$$

Regressions equations obtained from the above cited methods are evaluated based on coefficient of multiple determinations (R<sup>2</sup>), which is a comprehensive parameter to understand the precision of the relation usually dwells in the range of  $0 < R^2 < 1$  and it is given by [Abdul.R.S et al 2013],

$$R^2 = 1 - \frac{\sum_{i=1}^n (Y_i - \bar{Y})^2}{\sum_{i=1}^n (X_i - \bar{X})^2}$$

Thus the developed single and multivariate linear models using EXCEL® and POLYMATH® are compared with earlier reported models [Ayse et al 2019, Ivan et al

2022] for the determination HHV as a function of proximate and ultimate variables. Further the models developed for the evaluation of carbon and hydrogen using proximate parameters are validated with M. aliyu et al 2020.

### 3. Results and Discussion

#### 3.1 Significance and Variance of the WS Properties

Wheat straw has shown greater dispersion in terms of their proximate and ultimate variables as provided in Table 4. Moisture content and carbon compositions have noticed with higher variances than any other parameters. Nevertheless, the moisture content majorly depends on sample received conditions and the state of dryness of the samples analyzed. Further, volatile matter and oxygen compositions also recorded huge variances similar to the moisture and carbon contents. Volatiles refer to volatile carbon, combined water, net hydrogen, nitrogen and sulphur, which are first driven off during combustion and thus higher volatiles favors in rapid combustion. Wheat straw attributed with greater volatile contents ranging from 61.86-71.34 %, which is comparatively higher than many other biomass sources. Other words, of the proximate components, fixed carbon varied with less interval of 6.17 varied between 12.28 to 18.45 and a mean value of 15.47 % (weight) whereas rice straw ranging from 11.1 to 16.75% (Van Hung et al 2020). Additionally, higher fixed carbon content favors in higher char yields which can be burned as fuel. Ash content of the studied samples have varied between 3.05 to 10.83 and it has a mean value of 5.96%. The ash content of wheat straw analyzed found substantially lower than rice straw for which it is reported as 18% (NL agency report 2013). Sulphur and Nitrogen elemental compositions in wheat straw found very less magnitude and subsequently have shown least variance. In addition, wheat

straw samples possess higher compositions of carbon and oxygen and their associated variances. Higher heating values of wheat straw samples have shown comparatively less variances with a mean value of 16.86 MJ/kg which is remarkably higher against 14.59 MJ/kg for rice straw (Van Hung et al 2020).

One-way ANOVA results of wheat straw revealed that the samples considered for the analysis has potentially higher significance as their F-test values exceeds F-critical values as shown in tables 5 and 6. Thus the hypothesis test between dependent and independent variables will be more vital to establish. HHV of wheat straw has been considered as an objective variable to understand the corresponding functions in terms of proximate and ultimate parameters. Further the development of single and multivariate linear regression relations is simple, easy to construct and saves bountiful time with adequate results.

#### 3.2 Correlations among Ultimate, Proximate and HHV variables of WS

In general Pearson's coefficient alters between -1 and 1 to determine how closely two variables are related. Pearson's correlation coefficients are evaluated as shown in Table 7 between proximate, ultimate and HHV values of wheat straw. HHV has comparatively stronger linear relations with proximate variables of moisture and volatile contents besides the active relations with carbon and oxygen compositions. Nitrogen holds very weak affiliation with many other elements and HHV as well. Among the proximate variables, moisture adheres better with fixed carbon content while carbon bears the strongest linear alliance with volatiles and moisture components. In addition, in wheat straw samples analyzed, carbon also holds the strongest relation with hydrogen composition.

Eq. No	Model	R <sup>2</sup>	Variance
12	$C = 15.524 - 0.168M + 0.392V + 0.0327F$	0.805	0.653
13	$H = -1211.83 + 12.131M + 12.18V + 12.172F + 12.103A$	0.455	0.043

### 3.3 Prediction of HHV using Proximate Analysis

Many different models constructed to determine the HHV values in a more precised way using proximate and ultimate reports of wheat straw samples. In the primary approach, single and multivariate linear regressions established in terms of proximate variables and the best models are reported in the table 8. The most complex model that expressed as equation (7) has provided the highest statistical comprehensive variable (R<sup>2</sup>) of 0.777 along with the least variance. Further, the contribution of ash content in the HHV

modeling has witnessed with improved R<sup>2</sup> values when compared with equation (5), which excludes the ash content. The regression equations (2 and 3) for HHV developed as a function of moisture showed poor performance in terms of R<sup>2</sup> whereas the models (1 and 4) that excludes moisture and considers volatiles provided enhanced R<sup>2</sup>.

### 3.4 Prediction of HHV using Ultimate Analysis

The prediction of HHV as a function of elemental composition is crucial to provide a

**Table 11.** Verification of reported models

Eq. No	Model	R <sup>2</sup>	Variance	Reference
14	$HHV = 25.19 - 0.0503V - 0.044F$	0.755	0.217	Ayşe et al 2019
15	$HHV = 5.63 + 0.1679V$	0.622	0.317	Ayşe et al 2019
16	$HHV = -857.09 + 7.9M + 8.8V + 8.9F + 8.62A$	0.777	0.224	Ayşe et al 2019
17	$HHV = 13.6 - 0.655M + 0.171V - \left(\frac{61.1}{F}\right)$	0.767	0.219	Ayşe et al 2019
18	$HHV = -1.89 + 0.3357V + 0.055A - \left(\frac{94.12}{F}\right)$	0.768	0.218	Ayşe et al 2019
19	$HHV = 19.63 - 0.894M + 0.0538V$	0.739	0.231	Ayşe et al 2019
20	$HHV = 0.349C + 1.178H + 0.1005S - 0.1034O - 0.015N - 0.0211A$	0.762	0.256	Ivan M et al 2022
21	$HHV = 32.7934 + 0.0053C^2 - 0.5321C - 2.8769H + 0.0608CH - 0.2401N$	0.588	0.478	Ivan M et al 2022
22	$C(\%) = [(0.97FC) + 0.7(VM - 0.1) - M(0.6 - 0.01)]$	0.796	0.682	Aliyu et al 2020
23	$H(\%) = [(0.036 FC) + 0.086 (VM - 0.1 A) - (0.0035 M^2) (1 - 0.02 M)]$	0.572	0.038	Aliyu et al 2020

better model. Hence, the feasibility of constructing relevant models to gain high accuracy is verified and eventually attained four significant relations expressed in the table 9. Amongst the equations 8 to 11, the model (11) which incorporated with ash content beside all ultimate parameters has provide the R<sup>2</sup> value of 0.8 than any other models. Otherwise, in equation 10, HHV is described as a function of all ultimate variables (C,H,O,N,S) resulted with an R<sup>2</sup> value of 0.59, which is substantially poor when compared with equation 11 and thus it tells us the role of ash content is more prominent in HHV determination. Since the carbon found with best Pearson’s coefficient of 0.758 compared with other ultimate variables, a single variable linear regression between HHV and carbon established with an R<sup>2</sup> of 0.56

The generation of proximate analysis is quite simple than ultimate analysis as it doesn’t need any advanced experimental facilities and it could be easily accessible from any basic laboratory. Instead, ultimate analysis need sophisticated and advanced devices, thus the development of models that

facilitate the assessment of elemental composition based on proximate variable gaining more prominence in many developing countries. In context of that, this study accomplished two different models (12 and 13) for the evaluation of carbon and hydrogen, two imperative elements in terms of proximate parameters as provided in the table 10. Equation 12 displays the accuracy of carbon expressed as a function of M, V and F in terms of best R<sup>2</sup> value of 0.805 while equation 13 provide a model for hydrogen assessment with comparatively poor R<sup>2</sup> but with least variance.

### 3.5 Validation of the Models

Out of 13 different developed models, 10 models are validated with other reported models from the literature and their estimated statistical comprehensive parameter R<sup>2</sup> values along with variances are provided in the Table 11. Except the equations 21 and 23, all compared models are linear multivariate regressions in similar with the proposed models whereas predicted models 9 and 13 are validated with non-

linear multivariate models expressed by 21 and 23. However, all the predicted models are competitive and provides the substitution to the earlier reported models. Although Ayse et al. have proposed models to predict HHV values of 39 different biomass components based on their proximate reports excluding wheat straw, the models developed in this study for wheat straw coexist with their results. Further, Ivan et al has developed the models for the assessment of HHV of coal samples based on elemental analysis, therefore the current work has considered their models to compare the HHV prediction models that relate elemental compositions and proved that the proposed models are highly relevant.

## 4. Conclusion

Agro-crop residues contribute significantly in bio-waste generation worldwide, wheat straw in particular estimated at a rate of 776.8 million tonnes in 2021-22. Straw is considered as a major feedstock for the bio-based economy and combustion of straw remained the most common application so far. 54 different WS data considered and stratified based on available attributes. WS samples found with the mean values of 67.95, 15.47 and 5.96 % of volatiles, fixed

carbon and ash contents respectively besides the mean HHV of 16.86 MJ/kg. Further, Calorific value of fuels substances is considered as the key energy indicator and its determination in terms of fundamental analytical reports such as proximate and ultimate analysis aids to prevent the additional lab facilities. Additionally, one-way ANOVA study revealed that items considered for the study are highly significant. Else, Pearson's correlations ensured that HHV has comparatively stronger linear relations with moisture and volatile matters apart from active relations with carbon and oxygen compositions. Moreover, multivariate linear models of HHV, expressed as function of proximate variables and a function of ultimate parameters along with ash content have proven to be more efficient predictions with the estimated  $R^2$  values of 0.777 and 0.8 respectively. Validation of proposed models with formerly reported equations have proven their coexistence.

**Acknowledgment:** Authors convey their gratefulness to Dr. Sujana Ramesh for her consistent support in developing the concept. Authors extend their thankfulness to Ms. Helen Fanuel for her invaluable support throughout the complete project tenure.

## COMMODIFICATION OF FOOD CULTURE: A STUDY OF THE BODO COMMUNITY, WITH SPECIAL REFERENCE TO THE CHARIDUAR AREA OF THE SONITPUR DISTRICT

**Abstract:** Food, which is a basic requirement for a healthy life and survival, has broadened its scope. In a nutshell, it states that, aside from being a necessary component of survival, It has also evolved into a commodity for commerce and financial gain. The North-East of India, particularly Assam, is home to a diverse range of ethnic and other linguistic groups, each with its own distinct personality, resulting in a vibrant and colourful landscape. Every town has its own traditional foods, as well as a particular style of preparing, presenting, and exhibiting its cultural identity. This paper provides an outline of food commodification. Indigenous foods, which were previously primarily conserved and limited within the four walls of a community, are now being shared on global platforms and among other communities for economic gain, community representation, and man and woman empowerment to improve lifestyle and culture. The study area is comprised of six villages and sub-urban areas in Sonitpur District, Assam, India, primarily in the Chariduar area, where the majority of the population is from the Bodo community. The data and facts for the preparation and conservation of the Bodos' local traditional ethnic foods were gathered through discussions with families, commercial outlets such as ethnic restaurants, local markets, and other people involved in the process of preparing and selling the unique dishes on a commercial scale. The report also considers the chances for continued development of Assam's ethnic cuisine industry.

**Keywords:** Ethnic Food Commodification, Bodo community, Entrepreneurial Prospects, Chariduar area of Sonitpur District, Assam

### 1. Introduction

Simply put, commodification is the process of converting something into a commodity. When there is a mutual desire and trade understandings between members of a society and outsiders, a thing becomes a commodity. When these things are turned into commodities, they provide a source of

money for the community, allowing them to maintain their lifestyle and way of life. Commodification not only contributes to economic empowerment, but it also aids in the good depiction of the community at national and international levels, resulting in the creation of an identity as well as a food identifier or identification tag for that community. Culture is fluid and ever-

evolving. Food is such a vital part of any culture that it is easy to mould with minor variations. As a result, it is simpler for a group to acculturate its eating customs, and as a result, it has a wider reach and penetrates more easily into diverse cultures. As a result of this penetration, fusion food is created, and oicotypification begins. With time, food culture may accept certain changes, resulting in the emergence of variation in its aura while maintaining the core elements. As a result, it is not possible to claim that there is a loss of aura, but rather that there is a change in aura. Commodification is the transformation of an object into a commodity and market product, which is tied to capitalism. Food, like commodification, is a market product that goes through a mobilisation process in the global business era, resulting in new business opportunities. A lot of interest is currently being generated by research into the commodification, authenticity, and long-term survivability of cultural culinary legacies in the global market period. There is a significant debate in the global economic era over the monetization of traditional cuisine's legacy. Because it is tied to consumerism, commodification has become a prominent subject and a hot problem in today's global society. Every part of culture, whether tangible commodities like clothing or intangible ones like traditions and customs, has been transformed into a commodity in today's world for its monetary exchange value. On the other hand, the commercial side must not completely obscure the cultural components. As a result, a war between culture and commerce has erupted, with a dynamic relationship distinguished by interdependencies. On the one hand, the commercialization process should aid in the preservation of culture. The practise of trade, on the other hand, is only feasible because of the existence of culture.

Cuisine is an intangible cultural heritage that symbolises cultural identity and is passed

down from generation to generation, and its presence indicates a community's cultural diversity. This sacred cultural treasure has now become a commodity of trade as a result of commercialization throughout the global market age. The purpose of cuisine is to provide nourishment. Every aspect of people's life, as well as the range and complexity of their cultural arts, reveals their cultural ideals. Culinary heritage is seen as a global asset as well as a local resource that may be exploited to build a historical narrative based on social, environmental, economic, and political variables.

According to gastronomy, traditional cuisine is a culinary product that has not been modified and has been passed down from a previous age and is still in use now. Traditional food is regarded to have a relatively high inherent quality due to its historical relevance. It's a traditional cuisine that's known for eliciting intense emotions, sensuality, and sentiments.

Food preferences, according to researchers four decades ago, are a social interaction indicator, a representation of social caste, class, and hierarchy, and a metaphor for establishing a culture's ethnicity and identity. Food also functions as a marker of identification for individuals and groups of people because it can transmit classes, community, and ethnicity.

## **1.1 The Culinary Triangle, Claude- Levi Strauss**

Claude-Levi Strauss (1908-2009), a French anthropologist, examined the eating habits of North and South American tribes in the twentieth century. He deduced that all societies had a three-phase classification system for food, with raw, cooked, and rotten being the most common. Levi-Strauss noticed that, just as each culture has its own language, each culture cooks its food in a unique way. He came up with the concept of "The Culinary Triangle" as a result of this.

**Figure 1.** Triangle

Source: <https://www.thesmartset.com/article07181301/>

Raw, cooked, and rotting are the three points of the triangle. When looking at the triangle with "raw" at the top, the other two points can be seen as the results of several procedures. The following is Levi-Strauss' explanation for the triangle:

- Raw food straddles the line between cultural and natural forms. This implies that it should be free of human interference and degradation. True raw food, for example, would be carrots grown on a farm before being washed or peeled for human consumption; cooked food, on the other hand, is raw food that has been processed by culture. Potatoes, for example, can be boiled before being used in a meal.
- Finally, rotting food is raw food that has been altered by natural processes. Fruits that have been stored for a long time, for example, may turn rotten and begin to degrade. If the triangle is turned on its side and the word "cooked" is placed at the top, the other two points can be interpreted as distinct categories of inedibility (Davis 2013).
- Levi-Strauss developed the culinary triangle not only as a classification of foodstuffs, but also as a means of cultural difference. Cooking, he claims, is the

primary difference between other animals and humans since animals eat raw food, whereas all human societies heat food in some way. Once a newborn has been weaned from their mother's milk, societal norms determine what is and is not acceptable to consume. As a result, Levi-Strauss claimed that each society's cuisine is similar to an unconscious language that structures individuals' daily life. Each culture places a premium on eating at a specific time, which foods are appropriate for which social occasions, and which animals are socially acceptable to eat. Many wild animals, such as snails, bats, and songbirds, are offered in Chinese restaurants. The majority of the rest of the world frowns on such eating habits. Due to the implementation and strengthening of numerous laws on eating wild animals, the recent COVID-19 epidemic played a significant effect in modifying the food choices of many Chinese people. As a result, Levi-Strauss underlined the importance of gastronomy in determining the culture of a civilization and vice versa.

### 1.2 McDonalization of Society

Society Has Been McDonalized The McDonalization of Society, written by George Ritzer in 1993, was the first book to establish the concept of McDonalization. Since then, the notion has been increasingly important in the area of sociology, particularly in the field of globalisation sociology. McDonalization of society is a phenomena that occurs when society, its institutions, and its organisations adopt the same qualities as fast-food restaurants. Efficiency, calculability, predictability and uniformity, and control are among them. Ritzer's McDonalization theory is an update on Max Weber's famous sociological theory of how scientific reason spawned bureaucracy, which became the fundamental organising force of contemporary society for much of the twentieth century. The modern bureaucracy, according to Weber, was characterised by hierarchical roles, compartmentalised information and duties, a perceived merit-based system of hiring and development, and the rule of law's legal-rationality authority. These qualities could (and still may) be seen in a wide range of communities around the world. Changes in science, economy, and culture, according to Ritzer, have changed nations away from Weber's bureaucracy and toward a new social structure and order known as McDonalization. This new economic and social order is defined by four important features, as he discusses in his book of the same name. 1. Efficiency is defined as a managerial focus on reducing the time it takes to accomplish individual jobs as well as the time it takes to complete the entire production and distribution process. 2. Calculability is defined as an emphasis on objective that can be measured (counting things) rather than subjective aims (evaluation of quality). 3. Predictability and standardisation can be seen in repeated and routinized production or service delivery

processes, as well as in the consistent output of same or nearly equal products or experiences (predictability of the consumer experience). 4. Finally, management wields control throughout McDonalization to ensure that workers appear and perform the same from moment to moment and day to day. It also refers to the employment of robotics and technology to lessen or eliminate the need for human employees. These traits, according to Ritzer, are not only visible in production, work, and the customer experience, but that their defining presence in these sectors has rippling effects across society. Our beliefs, interests, objectives, and worldviews, as well as our identities and social interactions, are all influenced by McDonalization. Furthermore, sociologists acknowledge that McDonalization is a global phenomena fueled by Western businesses, economic power, and cultural supremacy, and that it leads to a global uniformity of economic and social life.

### 1.3 Globalization and its Impact on Bodo Food Culture

Globalization has increased the pace with which people, goods, and services, capital, technologies, and cultural traditions are moved and exchanged around the world. Human nature is responsible for the global phenomenon. Globalization, according to some, began around 60,000 years ago, at the dawn of human history. Different civilizations have created commercial trade routes and experienced cultural exchanges throughout history. It has occurred throughout history, but especially after the second half of the twentieth century, when world trade sped to such an extent and at such rates that the term 'globalisation' became widely used. Globalization began long before European explorers set sail across the huge Atlantic Ocean on voyages that would eventually expose the existence

of the Americans— and even before the term "globalisation" was invented. 1 Globalization, according to Nayan Chanda, is a process that has been going on for millennia without being given a name. 2 Globalization is defined by the Oxford dictionary as "the process of developing or operating on a global scale." As a result of globalisation, a community or culture adopts the values, beliefs, and clothing of other civilizations, losing its identity in favour of a single globalized supra-culture. Globalization has had an impact on every community in the globe, and the Bodo community is one of them. The Bodos, like other groups around the world, have consciously or unknowingly participated in the Globalization process. There have been many changes in their culture since the early nineteenth century, and they are still happening today, and the impact of Globalization will be felt in the future. Globalization has had an impact on many Indigenous communities throughout the world. Furthermore, the Bodo is a transnational Indigenous community that has been impacted by globalisation. For a long time, we have witnessed the development of globalisation in many political, economic, cultural, and religious contexts. This effect or impact is now felt in Bodos as well. As a result, there is no way to stop globalisation in any way. Many different types of changes have occurred in many cultural communities around the world as a result of globalisation or the impact of globalisation, such as in their way of life, thought process, clothing, eating habits, religion, festivals, belief system, and many other aspects of their culture. As a result, they are transitioning into an other cultural dimension, and their original cultural identities are being lost. Many Indian cultural communities, including the Bodo, are knowingly or unknowingly accepting, following, or influenced by westernised culture, and they are attempting to blend into their ideologies by going hand

in hand or following the influential westernised thoughts, methods of thinking, and trying to blend into their ideologies. It would not be inaccurate to state that they are mixing their overall culture with other civilizations and on their way to developing a new globalised culture in which cultural variety is diminishing. They are gradually losing their pure cultural qualities, originality, and originalities under this environment. Many cultural communities have abandoned traditional cultural aspects of their societies. Because of the phenomenon of globalisation, significant changes have been noticed in the Bodo people in every aspect of their culture. These changes or repercussions of globalisation have primarily been observed since the 19th century, and they are altering Bodo people's thoughts, living styles, livelihoods, and all other aspects of their lives. This has an impact on their ability to transition their culture to a new one. As a result, their religious activities, such as festivals, rites, and rituals, are changing, with old traditional practises and rituals being abandoned or lost. Again, nowadays, it is fashionable to discuss modernism in social science. Modernity, on the other hand, cannot be defined by a single concept. Modernity can be viewed from a variety of angles. Modernity is defined as a way of life and a manner of experiencing a new way of existence. New beliefs have produced new habits and actions, which are referred to as modernity. The term "modernity" refers to the ability to think rationally. Progress, science, optimism, and universality are valued in modernity. Modernity entails a transformation of ideals and institutional structures. Changes in conceptions of space and time, as well as the speed with which information is exchanged, are referred to as modernity. Traditional views of society are discouraged in modern culture. Modernity entails increased production mechanisation, a transition from agricultural to industry, and an increase in

urbanisation. Industrialization and capitalism are associated with modernity. Modernity brought about changes in people's minds, societies, and cultures. It alludes to a progressive mindset. Furthermore, modernity attempts to ruin what we have and puts an element of uncertainty, risk, and confusion into our lives. The desire for absolute knowledge in science and technology, society and politics, and the concept that attaining knowledge of the true self was the essential foundation for all other knowledge and rationality are all connected with modernity. Modernity has a profound influence on social structures and cultural institutions all across the world. Traditions have been steadily weakened as a result of modernity. Modernity dealt the first blow to religion and religious customs.

#### **1.4 Commodification and Bodo Food**

Traditional meals are part of the Bodo people's cultural inheritance. Traditional food is a cultural product of ancestral labour that needs to be preserved, developed, and incorporated into the philosophy it represents. Traditional cuisines are being maintained so that they can always be enjoyed and meet the cultural demands of modern society. Traditional cuisine, on the other hand, is more complicated than modern cookery. The practise of eating traditional meals is declining as a result of people's changing consumption patterns. People nowadays prefer to eat fast food or other modern forms of meals in order to save time on cooking and consumption. As a result, commercialisation of traditional food has been ingrained in Bodo society. Local values can inspire local culture, which is born out of living values and gives life meaning. Culture is typically commodified with the goal of generating cash from a certain cultural feature, such as art, cuisine, heritage and archaeology, tourism, and so on. The Ethnic Bodo Cuisine is categorically chosen as a

study area in this research work to interpret the commodification of the culinary element of the Bodo Culture and to reflect how commodification is helping to enhance the community's distinct identity factor in the face of a dynamic and globalised world. Currently, in the case of Bodo ethnic cuisine, the issue of commodification of traditional food leading to commercialization and modernization is being investigated from the perspective of socio-economic empowerment and community well-being, which will result in commodification of the community's food culture as an important facet of cultural representation.

Prospects for commodification of ethnic foods will result in new sources of income not only for producers but also for active bearers of each ethnic community, which will have a positive long-term impact on the community's socio-economic growth and establishment as an empowered community pursuing progressive growth and as a distinct ethnic identity for society in general and the world at large.

## **2. Objectives of the Study**

The study is an attempt to examine the Commodification aspect of the Bodo Ethnic Food of Assam with particular respect to the Chariduar area of Sonitpur District of Assam. The following are the objectives of the study:

1. To find out how commodification of ethnic food can impact the Bodo Community of Assam and thereby representing its cultural identity as a whole.
2. To examine whether the change of food servings of the foresaid community has created an impact in the lifestyle of the new generation.

### 2.1 Research Questions

Keeping consonance with the objectives, the following research queries have been developed. The above research objectives are expected to meet by answering the following questions.

1. Defining the Commodification of Ethnic Food. How can these sale of the ethnic foods contribute to the social upliftment of the community?
2. Is there any change in the lifestyle of the new generation as a result of food commodification?

## 3. Research Methodology

### 3.1 Type of Research

The present study is both qualitative and quantitative in nature as it consists of both numerical values as well as case study. It is exploratory and descriptive too. The researcher has used both the primary and secondary sources of data. For the intended study qualitative data will be collected using –Interview method and Case Study. Face to Face Interview and Controlled Observation method will be used for quantitative data collection. The data is collected using unstructured interviews, survey schedules and by taking field notes.

For Secondary Sources the researcher has gone through Census Data 2011, read articles and books and gone through various journals, research papers, Government Records and magazines to get a detailed understanding of the arena of work.

### 3.2 Sampling Unit

The respondents will consist of population both male and female who are involved in the Commodification of Bodo ethnic food cuisines from all the selected six villages,

where the maximum number of Bodo residence is found.

### 3.2 Sampling Method

A purposive, convenient and stratified sampling technique is applied to select a total of 316 respondents as a sample size for the study as the interviewee with relevant knowledge may not be found everywhere or might not be willing to share their views.

The respondents are stratified into the following categories consisting of-

- Sellers
- Producers
- Individuals who are both Sellers and Producers.

### 3.3 Sample Size

According to the Census of India record 2011, the total population of Chariduar 343749, out of which male 176589 and female 167160. The total number of people residing in Rural area is 94.6% and the urban population consists of 5.4%. The total number of schedule tribes in the entire area is 50,996 out of which 25,695 are male and 25301 are female i.e. 14.8% consists Schedule Tribe out of the entire population.

The villages selected for the study:

1. Bakola Gaon has a population of 2366 out of which 669 are Schedule Tribes.
2. Amloga 1 has a population of 813 out of which 314 are Schedule Tribes.
3. Amloga 2 has a population of 769 out of which 666 are Schedule Tribes.
4. Chengelimari has a population of 594 out of which 173 are Schedule Tribes.

5. Chapaguri has a population of 692 out of which 264 are Schedule Tribes.
6. Jogi Basti has population of 485 out of which 258 are Schedule Tribes.

The Total Population is 5719, out of which 2344 consists of the schedule tribe. Among the 2344 schedule tribes, the Bodo population is 1758. The sample size is taken to be 316 keeping the confidence level 95% and margin of error to be 5%. So, as per the data the sample size is determined at 316 respondents.

#### 4. Discussion and Analysis

The study has been conducted under selected six(6) villages of the Chariduar area of Sonitpur district of Assam where Bodo population is found to be in majority and were commodification of Ethnic Food has seen to be on a large scale.

Out of the total sample size of 50 respondents, in this six monthly progress from the field report conducted, following observations have been made.:

In the study there are 6 numbers of villages have been selected and randomly survey has been conducted to collect the primary data related to ethnic food among the Bodo tribes in Assam. There are all total 50 (fifty) numbers of people has been surveyed from the locality and accordingly data analyses have been made.

**Table 1. Sample Villages**

Sl. No	Sample Villages	Sample Size
1	Bakola Gaon	7
2	Amloga No.2	10
3	Amloga No.1	8
4	Chapaguri	12
5	Jogi Basti	5
6	Chengelimari	8
	<b>Total =</b>	<b>50</b>

From the above table, it could be determined that from Chapaguri village, 12 respondents were selected for survey who are directly or indirectly associated with the commodification process followed by Amloga No. 2 with 10 respondents, Amolga No. 1 with 8 respondents, Chengelimari with 8 respondents and finally Jogi Basti with 5 respondents.

**Table 2. Respondents' gender type**

Sl. No.	Gender	Numbers	% Of Total
1	Female	23	46%
2	Male	27	54%
	<b>Total</b>	<b>50</b>	<b>100.00%</b>

From the above table, it could be seen that out of 50 respondents selected under the area of study, Female stands to 23 and Male stands to 27 in number, when it comes to the engagement in the commodification of the Bodo Ethnic Food.

**Table 3. Respondents' Age Group**

Sl No	Age Group	Sample Size	% of Total
1	Below 20 Years	7	14%
2	20 to 40 Years	22	44%
3	40 to 60 Years	15	30%
4	Above 60 Years	6	12%
	<b>Total =</b>	<b>50</b>	<b>100%</b>

From the above table, it could be inferred that more than half of the respondents are from the age-group of 20-40 years who are mostly the producing generation engaged in commodification of Bodo Ethnic Food, whereas the next highest respondents are from the age-group of 40-60 years and respondents from below 20 years of age not at a vast difference from the previous age-group and the respondents from above 60 years are the least persons who are involved in the process of Bodo Food Commodification under the selected area of study.

**Table 4.** Respondents commodification rank on selective ethnic food

Rank /Food	RiceBeer	Pork	Silkworm	Mushroom	Tekeli Pitha	Total
<b>1st Rank</b>	6	35	3	2	4	50
<b>2nd Rank</b>	37	5	0	0	8	50
<b>3rd Rank</b>	5	4	3	36	2	50
<b>4th Rank</b>	6	7	30	3	4	50
<b>5th Rank</b>	0	3	3	2	42	50

From the above table, it can be analyzed that from the selected six villages under the area of study, pork has the highest rate of commodification because of the high demand for consumption within the villages and arising of new cuisines with pork as the primary food item and ingredients in the local dishes, because of which its demand has reached out even to the nearby town area daily markets. Followed by pork, the second rank is held by the most popular local beverage, rice beer (traditionally known as Zumai), because of its traditional heritage as a local drink to be consumed mostly on occasions and festivities as well as welcome drink for their guests. A perfect example of commodification of Rice Beer was noticed from the field, where villagers from the selected villages under the area of study sell the rice beer in packed bottles in the local markets and food festivals organized by the Govt. of Assam, which led to a wider prevalence about its specialty amongst the Non-Bodo population as well. Third Place in the preference rank of the respondents for the selected Ethnic Food items is occupied by Tekeli Pitha, where its commodification in the past two- three years has increased manifold in the cities and towns during Bihu, Baisagu, and in the ethnic food festivals. Self Help Groups of the Bodo community has established a supply- chain in the towns and hotels. From the field report, it was enunciated that Silk Worm occupies the fourth preference when it comes to commodification of ethnic food, where it is commodified as food items in the local markets and ethnic food festivals. In case of Mushroom, it still infamous as a

commodified food items but its cultivation and popularity has steadily increased amongst the Bodo Population.

**Table 5.** Respondents response to marketing facility of food products

Sl. No.	Responses	Numbers	% Of Total
1	Agree	27	54%
2	Disagree	12	24%
3	Cannot Determine	11	22%
<b>Total =</b>		<b>50</b>	<b>100.00%</b>

When asked about whether there is any proper marketing or supply-chain management with regard to the popular ethnic foods under the area of study, it was known that 27 number of respondents agreed to having marketing the food products they produce for commodification, whereas 12disagreed to the same when asked. And around 11 respondents were not sure regarding what was asked and its status.

**Table 6.** Respondents' Responses to Food Commodification Culture as a source of Livelihood

Sl. No.	Responses	Numbers	% Of Total
1	Agree	36	72%
2	Disagree	6	12%
3	Cannot Determine	8	16%
<b>Total =</b>		<b>50</b>	<b>100.00%</b>

The above table represents the responses of the respondents with respect to Commodification of Food Culture as a source

of livelihood of their commodified ethnic foods were it was seen that out of the total of 50 respondents under the selected villages for study, 36 agreed, 6 disagreed and 8 said they cannot determine a proper answer to the question being asked or they could not understand the concept of food commodification as a source of livelihood at all.

## **5. Results of the Study**

Some of the impact and effect of Commodification of Ethnic Bodo Food on the Surveyed Areas are discussed below:

1. Under the surveyed areas of this research paper, the aspect of commodification of Bodo Ethnic Foods has brought to light the various vegetarian and non vegetarian foods of the Bodo Community, which will be useful in representing this community in the world stage with their unique customs and traditions.
2. The commodification of Bodo ethnic cuisine has inundated their local market places, contributing to the community's socioeconomic development and instilling in the youths an entrepreneurial spirit that would help them become financially stable.
3. The commodification of Bodo ethnic cuisines has aided in the economic upliftment of both male and female producers and merchants, empowering them to a large extent.
4. The Bodos' traditional dishes have their own distinct and identical taste and cultural representation. In this scenario, commercialization has allowed ample opportunity to sample the flavour of Bodo meals in general.
5. The need for the government to preserve, patent, and grow the ethnic food industry on a large scale is urgent, and there is plenty of opportunity to do so with the expansion of food processing industries and

the provision of patenting rights to ethnic foods so that they can be marketed in the country in particular and globally in the Asian/South East Asian market in general to generate revenue for the government and community empowerment in particular. This will allow for cross-cultural contacts, as well as contribute to peace and brotherhood among neighbouring countries.

## **6. Conclusion and Suggestions**

The Bodos' rich traditional culinary habits depict the society's socio-cultural aspect as a whole. The rising demand for traditional ethnic foods of the Bodos in local communities' markets as a result of commodification of ethnic food culture, as well as in Bodo ethnic festivals like the 'Dwijing festival,' which represents the ethnic identity of the Bodos, and the growing up of retail and commercial outlets and ethnic Bodo restaurants (albeit few in number) is acting as a boon for the community to establish its ethnic identity. Although the scope of this study is limited to a few Bodo villages in the Chariduar area of the Sonitpur district of Assam, India, the evidence presented here shows that the trend of commodification of Bodo foods, which eventually leads to commercialization, is increasing day by day, even though within the local and nearby markets of the study's focus areas, it can be inferred that the rise in commodification of these foods is accelerating. The government should increase seed capital with a low rate of interest for Bodo youths interested in commercialization of these ethnic foods, and food processing research of Bodo foods should be enhanced to scientifically determine the aspects for patenting so that these foods can be sold not only in Assam and other states of India, but also in foreign countries. Food chains have sprouted up in practically every aspect of the world's

countries as a result of Globalization and McDonalidization. Punjabi food, Gujarati food, Bengali food, and other Indian popular food chains have practically occupied many food restaurants abroad as a result of

Globalization. This is also conceivable for Ethnic Bodo cuisines with good planning and measures by the government at the correct moment, which is a must.

## QUALITY ASSESSMENT OF ALID VOLCANIC ROCKS FOR THE POTENTIAL FERTILIZER APPLICATIONS

**Abstract:** Eritrea is one of the developing countries having a GDP that rely on agriculture. Though the agricultural industry is not well structured yet, the Ministry of Agriculture (MoA) assists farmers on a regular basis and provides them with all necessary utilities. Fertilizers are amongst them. However, the MoA is on the verge of prohibiting conventional fertilizers due to their adverse effects on soil, water and biological species. Nowadays, volcanic ashes have been applied as natural fertilizers in many parts of the world. Hence, on this study, the quality of Alid Volcanic Rocks (AVR) found in Eritrea were examined using an XRF study, and compared with earlier local baseline reports. Besides, a comparison with other international sites was also considered for the potential use of fertilizers. Statistical studies in association with simple linear and polynomial model of AVR compositions showed that P<sub>2</sub>O<sub>5</sub> serves as a useful means of evaluating other components of AVR samples with improved R<sup>2</sup> values. The study also revealed that AVR composed of higher Si/Al of 5.52 and Fe of 4.943% help in soil fertilizing and conditioning. Furthermore, the studied samples possess greater K/P values of 17 on average and thus serve as a potassium supplement to the plants. In addition, cations (K, Na, Ca, Mg) concentrations are higher than many of the other sites in the world and it is vital to note that the AVR serve as a good soil enhancer.

**Keywords:** Alid Volcanic Rocks, Volcanic Ash Fertilizer, Quality of Volcanic Rocks, Statistical Model Construction, Mineral Compositions of Volcanic Rocks

### 1. Introduction

The rise in world population has driven the improved food with increased rates of production in the recent decades and consequently posed the threat of infertile and degraded soil. Soils contribute significantly in life cycle of many essential nutrients that directly or indirectly support biological species on earth. Unfortunately, climate crisis in the form of global warming, loss of

biodiversity and improperly organized land use practices have put the soils into more risk. From the 18 essential plant nutrients 15 are supplied by a healthy soil. Nevertheless, one third of soils worldwide are already degraded and the loss of soil fertility resulted in the production cereals, vegetables and fruits with reduced content of vitamins and nutrients as they were 70 years ago. (FAO Report, 2022).

Eritrea is a country virtually bisected by a branch of the east African rift valley. It has a fertile land to the west, descending to desert in the east making it a semi desert land. The highlands of the country have a temperate climate throughout the year while the climate of most of the lowlands are; arid and semi-arid causing the distribution of rainfall and vegetation types of the country to vary markedly throughout the year (Wikipedia, 2022). Since Eritrea is a developing country the agricultural industry is not well structured yet. The country's agricultural input is mostly dependent on local farmers and seasonal rainfall. Ministry of agriculture (MOA) is responsible to provide the farmers with all the necessary utilities such as fertilizers, equipment and livestock. The Government of Eritrea considers the development of agriculture as one of the prospering projects in the country, this project focused on finding an effective fertilizer in terms of providing prominent nutrients necessary for the plant growth and economic viability for the ample supply.

Fertilizers hold vital role in countries where the economy depends on local agricultural products. Though the conventional chemical fertilizers proven to be more effective in terms of productivity, with time, these have noticed to be disadvantageous as they caused many different problems such as soil, water, air pollutions and biomagnification issues as well. On top of this, the microorganisms in the soil have vanished because of the chemicals present in the fertilizers. In response, Eritrean government has put efforts on facilitating farmers with necessary utilities to achieve potential growth in agricultural sector. As a part of that, the MOA has recently prohibited using conventional fertilizer and started to find an ecofriendly substitute for them.

Alid volcanic area center, Eritrea, lies along the axis of the Danakil Depression, the graben trace of a crustal spreading center that radiates north-northwest from a plate-

tectonic triple junction within a complexly rifted and faulted basaltic lowland called the Afar Triangle. Alid has long been recognized as a potential geothermal resource of electrical grade because it is the focus of geologically young rhyolitic volcanism within a background of spreading-related basaltic volcanism and it is the site of many fumaroles (Michael A. et al, 2005). The Danakil Depression is a subaerial segment of the spreading system that is opening to form the Red Sea. Crustal spreading along the axis of the Red Sea is transferred to spreading along the Danakil segment in a right-stepping echelon pattern. The Danakil segment shows increased opening southeastward to the Afar triple junction (Michael A. et al, 2005).

Rock minerals are essential for plant growth, but not all rocks are the same. Basalts; which are igneous rocks from volcanos, have the highest mineral content (Rosaria et al, 2022). This means that they provide the biggest benefit for a soil. Volcanic rock dust is a great organic supplement to prepare a super soil. Volcanic rocks tend to break down faster than other rocks and its higher quartz content makes it more accessible to plant, at a faster rate (Claudeta GR. et al, 2017). For this reason, it is no coincidence that civilizations have been setting near volcanoes for thousands of years. Some of the most fertile soil in all the world can be found at the base of active volcanoes. These igneous rocks are full of beneficial minerals. Coming from the center of the earth, the minerals work well for aiding plant growth.

Volcanic activities push igneous rocks out of the earth and onto the surface where they broke down by plant roots. Because these rocks have not been worn down or weathered on the surface before this point, their trace elements and micro-nutrients have not leached out. This means that powdered volcanic rock can be an ideal fertilizer. Once added to a soil, volcanic rock tends to break down faster than other forms of rock. With a

higher quartz content, it makes more of it accessible to plants more quickly.

Volcanic ash contains both magmatic and non-magmatic minerals and has two major effects on the human eco-system, one on soil and the other on climate [El-Desoky et al 2018]. Primary use of volcanic ash as a soil enricher have been studied by several researchers (Rosaria et al 2022, Lalita V. et al 2022, Damasus et al 2022, El-Desoky et al 2018, Nitisapto et al 2018, Claudette GR et al 2016, B. Langmann et al 2010, Marta et al 2006, Marta AV et al 2006, Sadao et al 1975). One research illustrates that volcanic ash is a multi-nutrient mineral fertilizer that replenishes the trace metals necessary to soil bacterial enzymes for the efficient biogeochemical cycling of key elements such as N, C, K, P and S, ensuring use of relatively small amounts to fertilize large soil surfaces. The experimental results showed that the seeds growing in the stimulated soil created with two different compositions of volcanic ash had higher germination rates, higher growth rates, and produced plants that were healthier in appearance than the soil made from peat mixed with quartz sand (Rosaria et al., 2022).

A field trail conducted in Cairo, Egypt suggested that cation exchange capacity of infertile soils may possibly be boosted by using volcanic ashes. In addition, volcanic rocks are considered as a source of soil fertility due to their moderately fast rate of releasing their contained nutrients (El-Doseky et al., 2018). Another study done in Indonesia which is a country susceptible to volcanic eruptions, observed the volcanic ash's feasibility to be used as vegetable planting media, especially for curly lettuce, based on the improvement of physical and chemical volcanic ash characteristics with charcoal husk (so as to reduce its hardening property when exposed to water) (Nitisapto et al., 2018). While a 1975 research on volcanic ash's chemical composition indicated the

presence of the important elements vital to plant growth (Sadao et al 1975), another one supported by a field experiment confirmed that the potato yield increased by 31-63% relative to the background, 47% on average.

Fulfilling the key principle of the emerging circular economy to reuse materials previously considered waste, the use of readily available and overabundant volcanic ash as agricultural fertilizer is a significant economic opportunity for both farmers and populations living nearby active volcanoes, affording also important environmental advantages. Providing a unified picture, this study will hopefully accelerate such progress.

## 2. Materials and Methods

### 2.1. Volcanic Rock Sample and their Preparation

A volcanic rock sample of 20 cm diameter, which has a weight of 3.75 kg collected from Alid volcanic area and brought to a construction laboratory, Mai-Nefhi College of Engineering and Technology (MCOETEC) for further size reduction. Part of the rock approximated to 100g separated by breaking, packed in a polyethylene bag and sent to Bisha Assay laboratory for elemental analysis. The remaining rock was crushed by an automatic compression strength device until an ash that is 75 $\mu$ m sieve size was obtained.

### 2.2. Characterization of Volcanic Rock

The CS230 Carbon/Sulfur Determinate is a microprocessor based, software driven instrument for measurement of carbon and sulfur content in metals, ores, ceramics, and other inorganic materials. The CS230 uses an induction furnace and measures carbon and sulfur by infrared absorption. Analysis begins by weighing out a sample (1 g

nominal) into a ceramic crucible on a balance. Accelerator material is added, the crucible is placed on the loading pedestal, and the analyze key is pressed. Furnace closure is performed automatically, and then the combustion chamber is purged with oxygen to drive off residual atmospheric gases. After purging, oxygen flow through the system is restored and the induction furnace is turned on. The inductive elements of the sample and accelerator couple with the high frequency field of the furnace. The pure oxygen environment and the heat generated by this coupling cause the sample to combust. During combustion, carbon bearing elements are reduced, releasing the carbon, which immediately binds with the oxygen to form CO and CO<sub>2</sub>, the majority being CO<sub>2</sub>. Also, sulfur-bearing elements are reduced, releasing sulfur, which binds with oxygen to form SO<sub>2</sub>. Sample gases are swept into the carrier stream. Sulfur is measured as sulfur dioxide in the first IR cell. A small amount of carbon monoxide is converted to carbon dioxide in the catalytic heater assembly; SO<sub>2</sub> is converted to SO<sub>3</sub>, while sulfur trioxide is removed from the system in a cellulose filter.

The detailed chemical elements including trace components were determined using an Inductively Coupled plasma- optical emission spectroscopy (ICP-OES). ICP-OES is an analytical technique that can be used to measure elements at trace level. Its principle relies on those excited atoms releasing light at specific wavelength as they transition to a lower energy level. Generally, each sample was a 0.25g weighed accurately using a 4-decimal-place analytical balance and placed in a 20ml digestive test tube. The samples were initially digested with concentrated HNO<sub>3</sub> (2mL) at 85 0 C water bath for around 15min. 7mL HCl was added to dissolve most of the base metals present in the samples and the mixture was heated at 85 0 C for 45min.

The mixture is allowed to cool to keep hygroscopic nature of elements might present in the mixture. The resulting mixture was diluted suitably with ultrapure deionized water to a total volume of 20mL. Samples are then shaken and transferred to ICP-OES for instrumental analysis.

### 2.3. Stastical Evaluation of Alid Volcanic Rock Composition

The variance among different sample locations were estimated using one-way ANOVA study performed on Microsoft EXCEL®. Statistical Mean values were also determined for the chemical compounds presented in the volcanic rock samples. Arithmetic mean or average were estimated by (Kothari C.R, 2004)

$$\bar{X} = \frac{\sum X_i}{n} = \frac{X_1 + X_2 + X_3 \dots + X_n}{n}$$

And standard deviation ( $\sigma$ ) or variance is given by;

$$\sigma = \sqrt{\frac{\sum(X_i - \bar{X})^2}{n}}$$

Karl Pearson's coefficient of correlations evaluated between the Alid volcanic rock compositions to understand the dependence of one on the other variables. The degree of correlation between two populations can be analyzed using the Pearson correlation coefficient, which is expressed in the following Equation [Sunyong et al., 2002).

$$r = \frac{\sum(X_i - \bar{X})(Y_i - \bar{Y})}{\sqrt{\sum(X_i - \bar{X})^2} \sqrt{\sum(Y_i - \bar{Y})^2}}$$

In addition, data regression analysis was carried out in POLYMATH® to assess the functional relations among the variables. Determination of relationship between two or more variables is known as regression. A simple regression applied to obtain potential linear equation such as  $Y = a + bX$  of all dependent variables ( $Y$ ) by considering a low variant component as an independent variable ( $X$ ). Regressions equations obtained from the analysis evaluated based on

coefficient of multiple determinations ( $R^2$ ), which is a comprehensive parameter to understand the precision of the relation usually dwells in the range of  $0 < R^2 < 1$  and it is given by [Abdul.R.S et al 2013]

$$R^2 = 1 - \frac{\sum_{i=1}^n (Y_i - \bar{Y})^2}{\sum_{i=1}^n (X_i - \bar{X})^2}$$

Further, linear polynomial fitting applied for the better predictions of some special cases.

### 3. Results and Discussion

#### 3.1. Volcanic Rock Composition and Their Correlations

Alid volcanic place is a 700 m tall mountain in Eritrea, and it is 7 km x 5 km structural dome and doming was assumed that due to the intrusion of relatively low density silicic magma into the upper crust. In addition to major chemical analysis of volcanic ash rocks performed in this study, a summarized report by Clynne et al. 2005 provide more detailed elemental analysis of approximately 40 different kind of volcanic rock samples in Alid region. Average values of different components of all tested samples are compared against many other reported samples from Alid area (Clynne et al., 2005) as shown in Tables 1 & 2, to understand the variations among the chemical compositions in addition to the petrography.

Statisticians usually adopt the following method for a better study, suggested by H.A. Sturges (Kothari C. R., 2004), determining the minimum size of the group ( $i$ ) in terms of range ( $R$ ) and number of samples ( $N$ ) for a better analysis.

$$i = \frac{R}{(1 + 3.3 \log N)}$$

The rounded values of minimum size of the component groups for SiO<sub>2</sub> (6), Al<sub>2</sub>O<sub>3</sub> (3), Fe (3), MgO (2), CaO (3), Na<sub>2</sub>O (1), K<sub>2</sub>O (1), TiO<sub>2</sub> (1) and P<sub>2</sub>O<sub>5</sub> (1) were determined as shown in Table 2, thus group size of 9 different components with a sample count of 10 in each case considered for better understanding of the statistical parameters such as their range, mean and variances, estimated using One-way ANOVA study as shown in Table 2. The sum of average values of 9 selected compounds is estimated as more than 96 % of the total rock composition, majorly dominated by SiO<sub>2</sub> and Al<sub>2</sub>O<sub>3</sub>. The P content in the form of P<sub>2</sub>O<sub>5</sub> is smaller than the other 8 components and it is also noticed that it has a low variance and thus it could be a better independent candidate for the comparative study between the group variables. Since the F values of the groups higher than the critical and P values are too smaller than 0.05 between the groups as shown in Table 3, the study considered as a significant statistical analysis.

**Table 1.** Elemental Composition of Alid Volcanic Rock Samples (Clynne et al. 2005)

Components (%)	This work	ES96-10	ES96-8	EC96-43	EC96-25	ED96-6	EC96-31	ED96-11

**3.2. Correlations of Chemical Compounds in Alid Volcanic Rock Samples**

Pearson’s coefficient of correlations among the group variables are evaluated as shown in Table 3. The range of coefficients is in between -1 and 1. Further, positive and negative values are considered as proportional or inverse relations between the parameters. The linearity of the relationship depends on closeness of the coefficients to -1 or 1. As the approaches to zero, they depart highly from the linearity. It is lucid from the Table 3, the SiO<sub>2</sub> an inverse relations with all parameters except with Na<sub>2</sub>O and K<sub>2</sub>O. In most of the cases, Al<sub>2</sub>O<sub>3</sub> and K<sub>2</sub>O components are poorly associated with each other and even with other populations. CaO and MgO possessed similar kind of relations with other components while P<sub>2</sub>O<sub>5</sub> holds better linearity with others than any other component in the group.

Different mathematical models as shown in Table 4. constructed in POLYMATH® for the better prediction of Alid volcanic rock compositions by treating P<sub>2</sub>O<sub>5</sub> as an independent component. P<sub>2</sub>O<sub>5</sub> has a positive linearity with SiO<sub>2</sub>, Fe, MgO, CaO, and

TiO<sub>2</sub> except Na<sub>2</sub>O with high R<sup>2</sup> values whereas Al<sub>2</sub>O<sub>3</sub> and K<sub>2</sub>O adjudged to a 3rd order polynomial equations. Further these models may help in determining the composition of volcanic rocks with relatively high precision if only P<sub>2</sub>O<sub>5</sub> composition is given.

Experimental values are compared with model predictions for all components as depicted by the Figures 1(a) to 1(h) and their relevance measured by R<sup>2</sup> values provided in the Table 5. Sadaoe et al has correlated SiO<sub>2</sub> with other volcanic rock compositions and confirmed that it has a very poor linearity with K<sub>2</sub>O, TiO<sub>2</sub> and MnO with R<sup>2</sup> values of 0.351, 0.546, and 0.571 respectively, whereas in the present study, all the predicted models possess higher R<sup>2</sup> values of minimum 0.644 and hence P<sub>2</sub>O<sub>5</sub> serves as a useful means of predicting all other components of Alid volcanic rock samples.

**3.3. Comparison of Alid Volcanic Rock with Other Reported Samples**

Volcanic rock contains many different minerals and they are varied greatly and in

general, silica and alumina represented the major components in all volcanic rock samples compared in the Table 6. Moreover, volcanic rocks are classified in to basaltic (45-53.5%), andesitic (53.5-62%), dacitic (62-70%) and rhyolitic (70-100%) based on the SiO<sub>2</sub> content and thus based on the average composition, most of the Alid samples belongs to deictic family. The composition of Alid samples also observed as more relevant with Shibecha site samples of Japan (Sadae et al, 2012) except K<sub>2</sub>O which found significantly higher in Alid

samples.

Despite of greater K/P values, Alid volcanic samples noted of higher silica and higher Si/Al ratio of 5.5 than other sites except Mount Kelud East Java of Indonesia. From another comparison with volcanic rock samples of Papandayan Mountain of Egypt (El-Desokey et al., 2018), K<sub>2</sub>O, TiO<sub>2</sub> and P<sub>2</sub>O<sub>5</sub> compositions are identified as very close to the Alid mountain samples of Eritrea.

**Table 4.** Results of Pearson Correlation Between Chemical Components of Alid Volcanic Rocks

	SiO <sub>2</sub>	Al <sub>2</sub> O <sub>3</sub>	Fe	MgO	CaO	Na <sub>2</sub> O	K <sub>2</sub> O	TiO <sub>2</sub>	P <sub>2</sub> O <sub>5</sub>

6	$Na_2O = 4.637936 - 5.013535P_2O_5$	0.8310	0.0987
7	$K_2O = 12.9333 - 239.0302P_2O_5 + 1033.459P_2O_5^2 - 1281.53 P_2O_5^3$	0.6440	0.3417
8	$TiO_2 = -0.0618609 + 4.7263 P_2O_5$	0.9644	0.0396

El-Doseky also pointed that high alumina content and low Si/Al ratio (less than 4) such as the sample cases of Kuchinash, Bibi and Hatano sites in Japan (Sadaoe et al., 2012) are considered as a hydrophilic soil conditioner. In the same study when they

compared volcanic ash with soil, cations (K, Na, Ca, Mg) concentrations were high and since the current study contain similar concentrations of rock it is vital to say that Alid volcanic rocks are good soil enhancers.

### 3.4. Potential of Alid Volcanic Rocks for Fertilizer Application

The results of this study on the availability of micronutrients and macronutrients showed a suitable potential for the application of volcanic rock as a natural fertilizer. These volcanic rock released several nutrients from the solid structure to the acidic solutions as shown in Table 6. It is relevant to emphasize on some of the components which imparts greater benefits to be used as potential natural fertilizer. For instance, though Si is not conventionally considered as an essential element, it has proven to have a positive influence in plant growth and yield, in particular under stressful environments and enhances plant

resistance to fungal and bacterial diseases and insect pest damage conditions (Rosaria et al., 2022; T. Balakhnina, A. Borkowska, 2013). Thus, the Si content from this study shows that the Eritrean volcanic rock sample has a great potential for fertilizing and conditioning damaged soil bodies.

A study by A.I. El-Desoky et al, in 2018 revealed the immediate relevance of essential elements like Ca, Mg and K which are found in CaO, MgO, and K<sub>2</sub>O respectively to agriculture by using Indonesia's Papandayan volcano to fertilize potato tuber. In line with this study, the considerable amount of these compounds in Eritrean volcanic rock sample would make it a potential substitution for conventional

fertilizer. Fe which is a micronutrient plants constitutes 4.943% of the volcanic rock sample is an average if we compare it with a different study (S. Hardinata et al. 2015; El-Desokey et al., 2018; Sadaoe et al. 2012). However, it is sufficient enough to aid a plant to synthesize chlorophyll and accepting and donate electrons as part of the electron transport chains of photosynthesis and respiration. However, the Na in the form of Na<sub>2</sub>O causes sodicity (excess salinity of soils), detrimentally affect plants (MAFRD, 2022). On the other hand, the low concentrations of potentially toxic elements such as As (< 100 ppm), Pb (< 0.02 %), Cd (< 10 ppm), and Li (18 ppm), among others, do not represent environmental risk to soil bodies or the ambient environment itself.

The results of analysis by LECO method (CSA06V), and ICP-OES demonstrates that the volcanic rock sample was characterized by a series of macronutrients and micronutrients described in this study. These facts have proved that this volcanic rock powder will be a promising natural organic fertilizer for application in agriculture.

#### 4. Conclusion

Volcanic ashes in the world have been applied as potential fertilizer in many parts of the world. In the context of that volcanic rock samples from Alid area of Eritrea are examined using an XRF study. One-way ANOVA study performed among nine (SiO<sub>2</sub>, Al<sub>2</sub>O<sub>3</sub>, Fe, MaO, CaO, Na<sub>2</sub>O, K<sub>2</sub>O, TiO<sub>2</sub> and P<sub>2</sub>O<sub>5</sub>) significant components of samples tested. Range, Mean and Variances were compared and P<sub>2</sub>O<sub>5</sub> compositions recognized with a less variance of 0.0212 while SiO<sub>2</sub> possess highest deviation of 111.43. In addition, mineral compositions of

samples correlated using Pearson's coefficients and found P<sub>2</sub>O<sub>5</sub> positively hold a linear relationship with most of the components except Al<sub>2</sub>O<sub>3</sub> and K<sub>2</sub>O. Therefore, composition of P<sub>2</sub>O<sub>5</sub> considered as an independent variable and model equations developed for the prediction of other variables using linear and polynomial regressions. Statistical comprehensive parameter R<sup>2</sup> estimated for all models is better than the earlier proposed model (Sadaoe et al., 2012) and thus P<sub>2</sub>O<sub>5</sub> serves as a useful means of predicting all other components of Alid volcanic rock samples than SiO<sub>2</sub>. Despite of greater K/P values, Alid volcanic samples noted of higher silica and higher Si/Al ratio of 5.5. Though Si is not conventionally considered as an essential element, it has proven to have a positive influence in plant growth and yield, in particular under stressful environments and enhances plant resistance to fungal and bacterial diseases and insect pest damage conditions. Cations (K, Na, Ca, Mg) concentrations are higher than many other sites in the world and it is vital to note that the Alid volcanic rocks are good soil enhancers. In response to the adverse effects of using chemical fertilizers, MoA of Eritrea is trying to prohibit them and in search of finding a better substitute to boost agriculture in the country. Hence the present study could make the relevant researchers or local officials to understand the quality of local volcanic sources and potential of using Alid volcanic rocks as a natural fertilizer.

## **SIMULATION AND PARAMETRIC STUDY OF ETHANOL DISTILLATION PLANT FOR ASMARA BREWERY**

**Abstract:** Globally ethanol has a key role in food and beverage industry with a substantial contribution of 17% of its total production. As the young nation Eritrea started to grow, the demand of alcoholic drinks such as AREQI, GINN, COGNAC etc., and the need of change in terms of production scale besides the purity of ethanol have become inevitable in the Asmara Brewery company. Consequently, a preliminary study performed on the development of a new ethanol distillation plant with a capacity 6500 lit/day to replace the currently existing and inefficient bubble cap column of 2000 lit/day. Atmospheric (ADS) and multi pressure distillation system (MPDS) for ethanol separation of 96.4 % (volume) purity using locally available fermented wine must of 7 % (volume) alcohol are evaluated in Aspen HYSYS®, an industrial plant simulation tool. The effect of changing feed location, number of stages, and minimum reflux ratio for ADS and MPDS studied primarily by adopting shortcut column models. However, a three column-ADS recorded with 30% excess energy consumption than MPDS that permits first column to operate at 10 kPa and the other two columns at atmospheric conditions. Further, a facility adopted in MPDS to recover 68% of energy from the condensers has reduced the specific energy consumption to a currently competitive levels of 2.4 kWh per liter of ethanol from 7.01 kWh/lit without any energy recovery.

**Keywords:** Ethanol Rectification, Multi-Pressure Distillation System, Beverage Alcohol, Process Simulation, Aspen HYSYS®

### **1. Introduction**

Ethanol is a simple liquid alcohol that formed from the fermentation of sugars in their natural occurrences or by the conversion of starch and lignocellulosic substances. Ethanol used as disinfectant, an organic solvent, a chemical feedstock, transportation fuel and a beverage (Hoang and Nghiem 2021). Ethanol production has

grown about 33% globally, over the last 10 years due to its significant role as renewable fuel to mitigate the climate change issues levitated from the combustion of fossil fuels. The unprecedented spread of COVID-19 has triggered the demand of ethanol to the lower bounds for fuel applications while increasing consumption in beverages to the peak, disinfectant and personal care and the trend expected to continue for 2 to 3 years. Ethanol beverages earlier considered a

---

Corresponding author: Ramesh Babu Aremanda  
Email: [ramesh.nitrkl@gmail.com](mailto:ramesh.nitrkl@gmail.com)

premium offering and now slowly turned into an essential product found in the majority of the households globally despite of the fact that the alcohol consumption causes the damage of liver, an important organ that helps in removal of toxins from the human body. In 2019, the sales of premium alcoholic beverages grew at a rate of 5 to 6%. However, fuel ethanol has driven down the global ethanol market size from 110 billion liters to 98.6 billion liters in 2020 due to the pandemic (Hoang and Nghiem, 2021) but it was anticipated to register a compound annual growth rate (CAGR) of 4.8% from 2020 to 2027 (Market Report, 2022).

Alcoholic beverages classified into beers, wines and spirits, which are distilled beverages such as whisky, rum, gin, vodka etc. Distilled alcoholic beverages contains 40-60 % (vol) of ethanol and produced using distilled ethanol from the fermentation of grains, fruits and vegetables. During the fermentation process, the yeast *S. cerevisiae* produces the enzyme invertase and uses it to convert sucrose to glucose and fructose and subsequently converted to ethanol and carbon dioxide. The maximum theoretical yield of ethanol is 0.511g per 1g of glucose; however, the actual yield is always lower as entire glucose cannot be converted to ethanol (Hoang and Nghiem, 2021). Many other investigators have studied on the production of ethanol using various raw materials (Pramanik and Rao, 2005). Singh and Jain (1995) studied on the production of ethanol by batch fermentation of cane molasses. Green and Shelef (1989) used municipal solid waste in ethanol production while agricultural waste was tried by Schugerl (1994). The fruit wastes like papaya (Akin-Osanaiye et al., 2008), mangoes (Reddy and Reddy, 2007), banana peels (Joshi et al., 2001), pineapple and grapes (Pramanik and Rao, 2005; Asli, 2010) were used in the production of ethanol. Depending upon the various attributes such as cultivar, stage of

ripening of fruits, chemical composition of juice, use of additives to the must, vinification techniques and ageing of wine, the alcohol and sugar content, the wines are classified as natural wines (9-14 % alcohol) and dessert and appetizer wines (15-21 % alcohol).

Distillation column is one of the prominent devices in the process industry, it uses difference in relative volatility to separate two or more components. Today, the distillation columns widely used in chemical industries are tray towers and packed towers (Tarikh Azis et al.2019). Ethanol has the most outstanding role in the liquor industries as it is the main component. In connection, there are different types of distillation systems like atmospheric and multi-pressure distillations practiced for optimization of energy consumption. In multi-pressure distillation system (MPDS) the energy requirement is less when compared to atmospheric distillation (ADS) whereas the water required for cooling is higher in ADS than in MPDS. (Nilesh PP, Vilas S.P,2016).

Advanced System for Process Engineering (ASPEN) is one of the virtual simulation software used to simulate the chemical processes. A generalized computer procedure for individual trays and complex tray columns yields the optimum design for the tray parameters, has a desirable degree of operating flexibility, and allows accurate estimation of performance. In this study Aspen HYSYS® is used in particular to develop a model and simulate the atmospheric as well as the multi pressure distillation columns. Design of distillation columns is always challenging because of their high energy inputs, which must be optimized through finding the best operating variables such as feed composition, feed stage location, number of stages in the column and actual reflux ratio. Therefore, it is necessary to study and determine the various parameters that can affect the distillation column for the optimal ethanol

production, with high purity and less energy consumptions while protecting environment. For this study, the case of Asmara Breweries has been considered as it plans to expand its existing capacity of alcohol production unit. It started way above half a century ago in Asmara Brewery (originally known as MELOTTI Beer Factory), the production of ethanol has started as one of the main products and since then it has been filling the demand in liquor production as its main objective to produce AREQI, GINN, and COGNAC. However, now a day the distillation has been facing many problems such as low capacity and less efficiencies. In the context of that, the requirement for better efficiency and higher capacity are in greater demand as ever (personal communication). The existing bubble cap column has a capacity of 2000 lit.day at Asmara Brewery company, but the demand is discovered to be much higher in the survey done recently by the company and it was estimated about 5000lit/day.

## 2. Methodology

### 2.1. Feedstock selection and its composition

Currently Asmara Brewery doesn't have any specific feed in their plan. As the country produces wine from locally cultivated grapes in Anseba region of Eritrea for this study, a wine based fermented broth is proposed as the feed for the ethanol rectification process. Based on the information provided by the Hagaz Wine Factory, Eritrea, the fermented broth presumed as a binary solution of 7%(vol) ethanol and 93% of water.

### 2.2. Process Development

The grapes are first collected from the vineyard and washed before sent to the juice extractor. The sugar contained in the pulp of grape comprised of fructose & glucose.

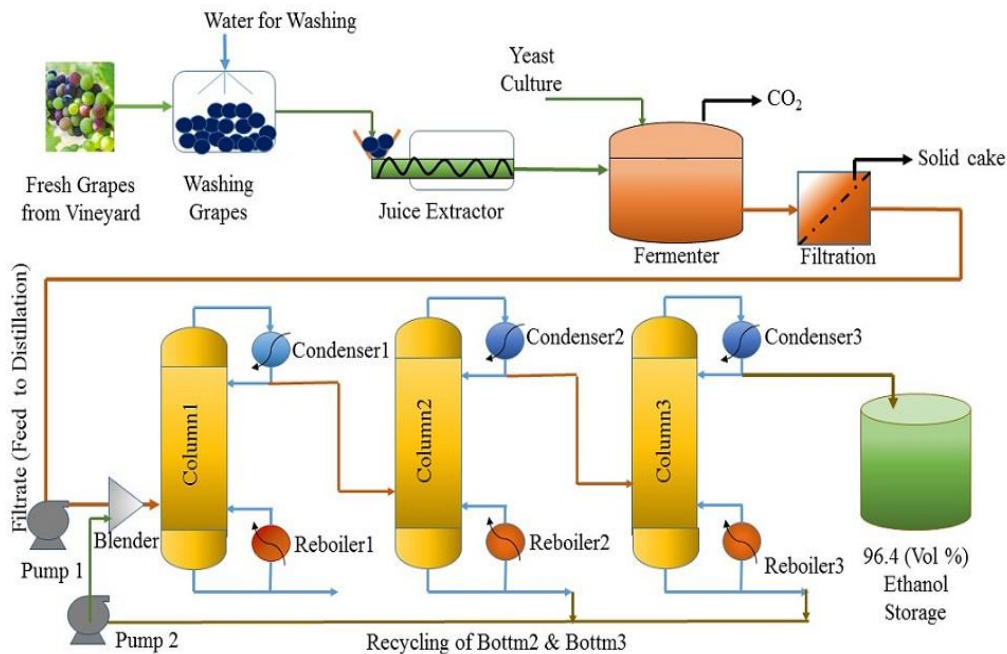

During fermentation, enzymes from yeast convert the sugars into ethyl alcohol and carbon dioxide. The fermentation temperature begins about 20°C, but temperature may rise to 30°C to 32°C. Yeast ceases to work if the temperature rises above approximately 35°C. From fermentation tank, a fermented broth that contains 7% of alcohol is filtered and centrifuged before it is fed to the distillation column. After a series of three consecutive distillation columns, 6500 liters of 96.45% beverage grade alcohol can be obtained from the 3<sup>rd</sup> column as showed in figure 1. The bottoms of the 2<sup>nd</sup> and 3<sup>rd</sup> columns contain appreciable amounts of alcohol which must be recycled through a blender along with fresh feed to the first column.

### 2.3. HYSYS® Simulation of Ethanol Rectification Plant

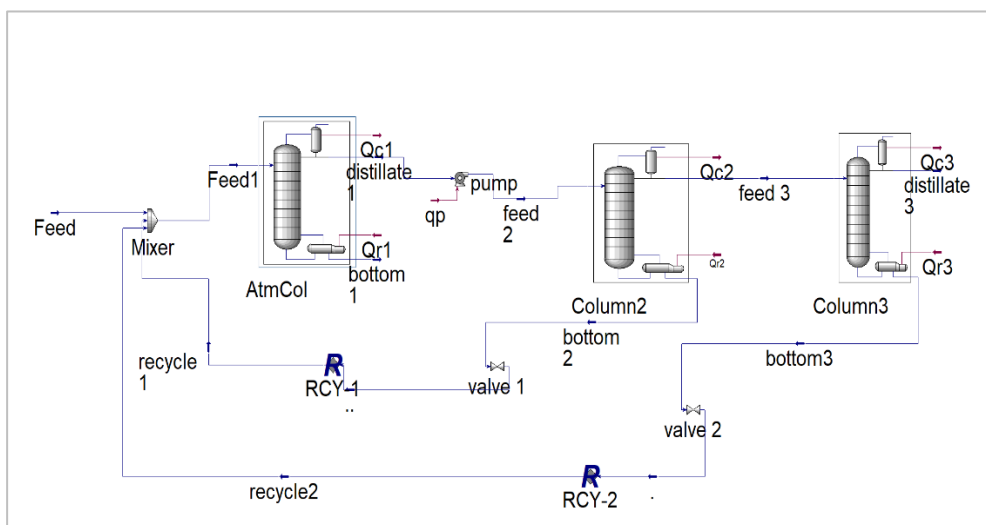

Aspen HYSYS® (or simply HYSYS) is a chemical process simulator currently maintained by Aspen Technology, Inc., USA, used to model chemical processes, from unit operations to complete chemical plants and refineries. HYSYS is able to perform many of the core calculations of chemical engineering, including those concerned with mass balance, energy balance, vapor-liquid equilibrium, heat transfer, mass transfer, chemical kinetics, fractionation, and pressure drop. HYSYS, V8.8 is used extensively in industry and academia for steady-state and dynamic simulation, process design, performance modelling, and optimization. As a primary step in a new case, Ethanol (C<sub>2</sub>H<sub>5</sub>OH) and Water (H<sub>2</sub>O) added as Conventional Components. The choice of appropriate thermodynamic model and the accuracy of parameters are crucial for the reliability of design. The Non-random Two-Liquid (NRTL) model equation of state for thermophysical properties has been selected as fluid package (base method) in Aspen HYSYS®

steady-state simulation. NRTL model is generally suggested for highly non-ideal chemical systems and can be used for both

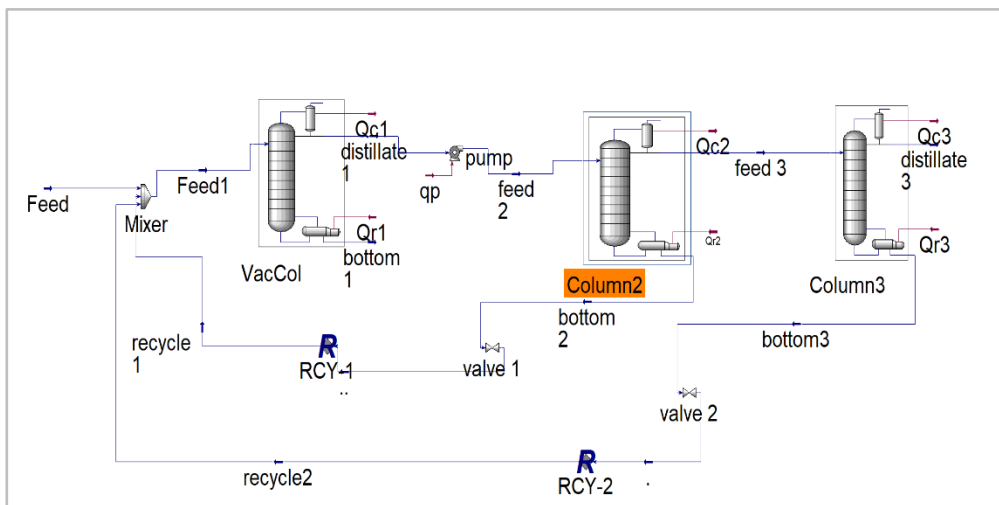

VLE and LLE applications (Syed AT et al) 2016).

**Table 1.** HYSYS models used in simulation.

Unit	HYSYS® model	Purpose
VAC COL or ATM COL	Rigorous Distillation Column	Separation of Ethanol from Water
Column2	Rigorous Distillation Column	Separation of Ethanol from Water
Column3	Rigorous Distillation Column	Separation of Ethanol from Water
Pump	Pump	To elevate the pressure of the feed to Column2
Mixer	Mixer	To blend the recycle streams with fresh feed
Valve1, Valve2	Control Valve	To reduce the pressure of the recycle streams
Distillation column	Short cut Distillation	To evaluate minimum reflux ratio and minimum number of trays

**Table 2.** Operating Conditions Distillation Columns

Units	Number of stages	Feed stage	Molar composition of Distillate	Top pressure (kPa)	Bottom pressure (kPa)
Atm Col	11	7	0.78	101.3	106.4
Vac Col	11	7	0.78	5	10
Column 2	12	8	0.85	101.3	106.4
Column 3	15	11	0.8945	101.3	106.4

As ethanol-water, system forms azeotropes at atmospheric pressure, vapor-liquid equilibria (VLE) study of a binary system of ethanol-water studied at different column operating pressures to identify their

azeotropic compositions prior to proceed for further steady state simulation. Later, a steady state simulation of ethanol rectification developed for an atmospheric column or a vacuum column coupled with

two more additional atmospheric columns using the models mentioned in the Table 1 at different operating conditions as shown in Figure 2 and Figure 3 according to the specifications provided in Table 2. In addition, a pump and two valves included in the process to compensate the stream pressures to the specific column conditions.

Simulation studies performed on model to minimize the specific energy demand for the desired product composition through univariate approach. A shortcut column design approach utilized to decide number of stages and minimum reflux ratio required for the specific product composition in each column model applied in the study. Later effective variables such as feed composition in terms of alcohol content ranging from 5 to 10 % (by volume), feed stage location varied in between 6<sup>th</sup> to 12<sup>th</sup> stages and a range of operating reflux ratios 1.1 to 1.5R<sub>min</sub> have been applied to optimize the minimum energy requirement per liter of 96.4%(vol) ethanol.

### 3. Results and Discussion

#### 3.1. Equilibrium study of Ethanol-Water System

The separation of ethanol-water, a binary system studied in terms of its equilibrium conditions. For the phases to be in equilibrium, essential criteria are their temperature, pressure and fugacities of all the components in both the phases must be same. The T-x-y diagram of the binary solution of ethanol and water at atmospheric pressure of 101.3kPa has showed an azeotropic composition of 88.34 % (mol) at a minimum boiling point of 77.88°C as displayed in figure 4, whereas the minimum boiling point of azeotropic composition for a vacuum pressure of 10 kPa has upgraded to 90.16% (mol) while lowering the temperature to 29.42°C as depicted by figure 5. In other words, under atmospheric

pressure ethanol-water system forms an azeotrope at 89.4% (mol) of ethanol at 78.4°C provided by the previous reports (K.V Narayanan,2009), which was slightly deviated from the current study as it depends on selected thermodynamic property method. VLE study of ethanol-water system has revealed that the vacuum operation at 10 kPa facilitate the desired composition of beverage grade alcohol with 89.45% (mol) of ethanol.

Figure 5. VLE diagram at 10 kPa

#### 3.2. Atmospheric Distillation versus Multi-Pressure Distillation

The optimum conditions such as feed location, number of stages, and minimum reflux ratio for atmospheric distillation

systems to achieve the desired composition of ethanol as shown in table 3 studied by using a shortcut column in HYSYS® prior to

the development of atmospheric separation model.

**Table 3.** Atmospheric distillation operating conditions

Column	$R_{min}$	$R_{actual}$	Number of stages	Feed location	Heat required by Reboilers (kW)	Heat removed in Condensers (kW)
Atm Col	2.231	2.97	11	7	1766	1768
Column 2	1.937	2.63	12	8	518.6	515.2
Column 3	4.794	6.7	16	13	414.4	401.2

**Table 4.** Multi pressure distillation operating conditions

$1.2R_{min}$	0.7898	0.8568	0.8936
$1.3R_{min}$	0.793	0.8587	0.8943
$1.4R_{min}$	0.793	0.8594	0.8945
$1.5R_{min}$	0.793	0.8594	0.8945

Atmospheric distillation model applied for the production of ethanol from fermented wash in a distillery. In this process all the columns set to operate at atmospheric pressures. Reboilers of each column supplied with saturated steam of 1 atm pressure to meet its heat requirement. The vapor coming out from the top of each column get condensed in a condenser facilitated with cooling water supply. Since the current study not focused on heat integration, the energy consumption in the process noticed as quite high. In this study three consecutive columns used to operate at atmospheric pressure as shown in figure 4 to achieve the desired composition of distillate. The first

atmospheric column set to recover 78% (mol) ethanol from a fresh must of 7% alcohol, which has noticed with an energy consumption of 1312 kW per 207.2 kmol/h of feed at 25°C of operating temperature. Actual reflux ratios of all columns fixed at  $1.38R_{min}$  which is within the acceptable limits of reflux ratio ranging from 1.1 to 1.5  $R_{min}$  for the commercial operations (Coulson and Richardson, 2004).

Multi-pressure distillation is a latest technique employed in the ethanol production. The energy consumption in this process is quite low compared to that of atmospheric distillation process (Patil et al 2016). In this study three columns applied

with the first one operating at vacuum pressures of 10 kPa and 5kPa at the top and bottoms respectively while the others set at atmospheric conditions. In addition, all three

columns are specified at the operating reflux ratios of 1.38 $R_{min}$ .

**Table 6.** Effect of feed composition on distillate

Feed composition (volume %)	Distillate Composition (mole fraction)		
	Column 1	Column 2	Column 3
5%	0.76	0.85	0.892
6%	0.76	0.85	0.8924
7%	0.78	0.856	0.8935
8%	0.78	0.855	0.8935
9%	0.78	0.855	0.8935
10%	0.79	0.858	0.894

**Table 7.** Effect of feed stage on Ethanol composition

Feed Location	Column 1	Column 2	Column 3
6	0.791	0.8558	0.8912
7	0.793	0.8593	0.8923
8	0.793	0.8594	0.8932
9	0.793	0.8594	0.8941
10	0.793	0.8594	0.8943
11	0.793	0.8594	0.8945
12	0.793	0.8594	0.8945

To achieve a distillate composition similar to that obtained from ADS, MPDS utilized about 40.93% less energy. Further, the effect of change in reflux ratio on distillate compositions in each column has noted as shown in table 5. The corresponding distillate compositions have altered in each separation column while actual reflux varied between 1.1 $R_{min}$  to 1.4 $R_{min}$  and remained static thereafter.

### 3.3. Effect of feed composition on distillate

The intention of this sensitivity analysis is to analyze the performance of the distillation column at different feed composition. Since the fermentation may yield different amount of concentration ranging from (5%-10%), the distillation should perform with consistency. And the required amount of yield using different concentration is about

96.4 (v/v) % because the potable alcohol should be up to the maximum possible purity and beyond that ethanol and water shows azeotropic property. And at the expense of extensive energy the desired amount of composition can be achieved. As per the required purity of the alcohol by the Asmara Brewery company, this work focused on achieving the result of above 6000 lit/day at 7% feed composition. However, the change in feed composition from 7 to 9% of alcohol hasn't shown any effective variation in the products from all three columns. Further, a minute alteration noted corresponding to a feed composition that contains 10% of alcohol.

### 3.4. Feed location and its impact on product composition

The feed tray position of the distillation

column was varied from 6 to 8 for the first column, from 7 to 9 for the second, from 10 to 12 for the last column, by keeping all other parameters constant. As shown in table 7, when the feeding of the column was altered from 6 to 7 stages, an increasing of recovery of ethanol of 0.20 % (mol) was obtained for the first column while the feed stage of the column 2 altered from 6 to 8 stages shown an increase of recovery of 0.42% (mol) ethanol. Further, the feeding of column 3 was altered from 6<sup>th</sup> to 11<sup>th</sup> stages resulting an increase of 0.33 % (mol) ethanol recovery.

### 3.5. Specific Energy Consumption and The effect of Energy Recovery in MPDS

The production of ethanol of 96.4% (vol) purity at a rate of 4.779 kmol/hr subjecting 38 stages comprising of all three columns in MPDS system measured with a specific energy consumption of 7.017 kWh/litre for a feed flow rate of 207.2 kmol/hr that contains 7 % (mol) of alcohol. Further, distillation process is always energy intensive which makes it more challenging for commercial adaption. However, implementation of innovative technologies to recover partially the energy spent on distillation will support the system in commercial way. Diverting Process water to condensers as cooling media prior to its conversion into steam in the reboilers will decrease the energy demand by the boilers.

In other words, the selection of suitable design for better heat transfer in condensers and in reboilers will improve the heat transfer area and helps in dissipation of energy in a better way. Applications of advanced thermodynamic cycles such as ORC (Organic Rankine cycle) for the conversion of waste heat recovery into electricity would support the system for economical operation. As it is depicted by the figure 6, energy savings and reduction in

specific energy consumptions assessed at various energy recovery schemes. If the plant is assumed at least 50% recovery of energy from the condensers, the specific energy reduces to 3.6 kWh per liter of ethanol. In other words, if the plant is designed to recover about 68%, it will achieve an energy consumption of 2.4kWh per liter.

**Figure 6.** Specific energy consumption versus percent recovery of energy

## 4. Conclusion

Ethanol production has grown about 33% globally, over the last 10 years due to its significant role as renewable fuel to mitigate the climate change issues levitated from the combustion of fossil fuels. In Asmara Brewery company the existing bubble cup column with a capacity of 2000lit/day is not meeting the demand discovered by the recent market study organized by the company and it was estimated about 5000lit/day to produce alcoholic beverages such as AREQI, GINN, COGNAC etc., Therefore, in this work, an ethanol separation plant with a capacity of 4.779 kmol/hr of 96.4% (vol) purity developed in Aspen HYSYS® simulation tool. An Atmospheric distillation system and a multi-pressure distillation system were compared and found that MPDS has saved the specific energy of 40.93%. Minimum reflux ratios of 1.596,

1.947 and 4.912 were determined for first, second and third distillation columns of totally 38 stages in MPDS system. An actual reflux ratio of 1.38R<sub>min</sub> found that as an optimum operating conditions in all three columns to achieve the desired distillate composition. Further, suggested that if the MPDS provided with 68 % of waste heat energy recovery from the condenser, it could meet a globally competitive specific

electricity requirement of 2.4 kWh per liter of ethanol production.

**Acknowledgment:** Authors convey their gratefulness to Dr. Sujana Ramesh for her consistent support in developing the concept. Authors extend their thankfulness to Mr. Bahreselam Sielu, HOD, Chemical Engineering Department, MOCETEC, and Mr. Abraham Yohannes, founder and Chairman of EChE, Asmara, Eritrea.

## QUALITATIVE AND QUANTITATIVE EVALUATION ON PERFORMANCE OF LOCAL HOPS (GESHO) IN BEER PRODUCTION

**Abstract:** *Rhamnus prinoides* (Gesho) is a medicinal plant practiced as a bittering agent in the preparation of local alcoholic beverage known as 'Suwa' in Eritrea. Due to lack of scientific analysis application of Gesho constrained to limited areas and no earlier reports available on quantity of bittering agents, essential oils, and antioxidants of this plant. Therefore, the objective of this research is set to assess the Gesho plant and determine the bitterness, essential oils, and antioxidants. Leaves and stems of the Gesho plant were taken separately for the experimental study. Results revealed that leaves of local hops contains 16.54% total resins, 10.615% soft resins, 5.925% hard resins. Further, 3.37mg/l of alpha acids, 2.26 mg/l iso-alpha acids, 3.93 mg/l beta acids, 7.74% (weight) essential oils, 24% (weight) flavonoids, and 2.3 mg/l polyphenols were measured in the leaves. Stems of local Hops have shown relatively poor results and approximately a 10% drop observed in all contents compared to leaves. Leaves of *R. prinoides* are found as a good source of bittering agents, essential oils, antioxidants and meeting the requirements on comparing with contents of currently used imported Hops in Beer Production. Moreover, *R. prinoides* is economically favorable substitute for commercial hops used in the breweries, and Gesho leaves acts as a bittering agent, source of aroma and flavor, and also antioxidant for beer and other alcoholic beverages.

**Keywords:** *Rhamnus prinoides* (Gesho), Local Hops, Titrimetry of Gesho, Beer production, Qualitative analysis of Gesho

### 1. Introduction

Beer is the most consumed alcoholic beverage in the world, and is the most popular beverage behind water and tea (Nelson, 2005). Most often beer is produced from malted barley, hops, yeast, and water, yet simple changes in the formulation has created 25,000 to 35,000 varieties of beer worldwide. It is produced by the brewing and fermentation of starches, mainly derived from cereal grains—most commonly from malted barley, though wheat, maize (corn),

rice, and oats are also used. During the brewing process, fermentation of the starch sugars in the wort produces ethanol and carbonation in the resulting beer (Wikipedia). Beer is measured and assessed by bitterness, by strength and by colour. The perceived bitterness is measured by the International Bitterness Units scale (IBU), defined in co-operation between the American Society of Brewing Chemists and the European Brewery Convention.

Hops are known to be one of the most essential and characteristic ingredients in

beer production as they make several contributions to the final product. Hop plant has been in a continuous use for centuries or even a millennium mostly as an ingredient of beer, although some of its medicinal properties have been known as well. Hops are used in beer brewing to impart both its distinct aroma and bitter taste (Kovačević and Kač, 2002). It is also used as bacteriostatic activity to inhibit the growth of most microorganisms (Simpson and Smith, 1992). Beer that is made from hops or hop products of certain breeding varieties, varies considerably in the nature of bitterness, taste and aroma. This is due to the peculiarity of the biochemical composition of bitter substances, polyphenolic compounds and essential oil of hop of aromatic and bitter varieties (Lidia Protsenko 2017). There are currently many varieties of hops, but they can be divided into bittering hops [that is, those with high bitter acids, humulone, cohumulone, lupulone, and colupulone (Ting and Goldstein, 1996)] and finishing or aroma-giving hops (Hornsey, 1999). Finishing hops are generally added to the wort at the end of the boiling process (last 1-2 min) to provide volatile aroma components to the beer (Papazian, 2003). Most modern beer is brewed with hops, which add bitterness and other flavours and act as a natural preservative and stabilizing agent. Other flavouring agents such as gruit, herbs, or fruits may be included or used instead of hops (Wikipedia). After the introduction of hops into England from Flanders in the 15th century, "ale" referred to an unhopped fermented drink, "beer" being used to describe a brew with an infusion of hops. Thus, there are different types of drinks worldwide today, such as real ale, pale ale, stout, mild ale and wheat beer. The strength of beer is usually around 4 to 6% alcohol by volume (Ebneht and Theuvesn, 2005).

There are two fundamental limits to any history of beer brewing. First, the unambiguous definition of its object, namely

beer. A consideration of hopped beer only would be too selective, and would ignore the fundamental roots of brewing technology and beer culture. The dissemination of European/American beer culture all over the world and the recent trend towards globalization generates new variants of beer-like beverages that follow regional and traditions preferences. A second difficulty arises from the availability and reliability of resources. In the world there are five top hop producing countries in. Although Eritrea is not one of the top growing countries in the world, but because it can be grown within most places the imported hops can be easily replaced with our own local hop.

Nowadays, beer is produced in Eritrea with imported hop as bittering agent. Since it is imported, it creates a pressure on its foreign currency. *Rhamnusprinoïdes* (Gesho) is a cultivated indigenous shrub which is also known to occur far west as Cameroon and as far south as South Africa, Eritrea and Ethiopia. It has a potential use as a commercial hopping agent in the beer industry. The leaves and stems of this plant are essential ingredients in the traditional fermented Ethiopian beverages, local beer. In Eritrea, the plant parts are used to impart the characteristic bitter flavor for the traditional beverage and it was estimated that over 5 million people consume these beverages every day. However, the role of this plant in the fermentation process of beer or beer production is not clearly established. Gesho is a new potential substitute for imported hops which can be used as an alternative substrate and also raise economic benefits through import substitution. With the continued increase in Eritrea and western African population great emphasis has been placed throughout the region on increasing the production of beer, improving their nutritional qualities. Thus, this project mainly focused on scientific analysis of Gesho plant leaves and stems for understanding its aptness to substitute

imported hops in local beer production industries and in other traditional beverages.

## 1.1. Gesho (*Rhamnusprinoides*) Plant

*Rhamnusprinoides*, the shiny-leaf buckthorn, is an African shrub or small tree in the family *Rhamnaceae*. Commonly referred to as "gesho". It was first scientifically described by French botanist Charles Louis L'Héritier de Brutelle in 1789. *Rhamnusprinoides* occur from Eritrea to South Africa at medium to high altitudes. They grow near streams or along forest margins. The small edible fruits are shiny red and berry-like. It is commonly known as dark blinkblaar, dogwood, and shiny leaf. *R. prinoides* is a dense shrub or small tree which grows up to 6 meters tall. It is one of the two species that represent the genus *Rhamnus* and a widespread plant species in Africa. *R. prinoides* occurs in regions with altitudinal range of 1,400-3,200 m and annual rainfall of 750-2,000 mm. The plant is native to Ethiopia, Eritrea, Botswana, Namibia, Lesotho, Swaziland, South Africa, and Uganda and also exotic to Kenya. It also occurs in Cameroon, Sudan, Angola, and Arabia (Abebe WN et al 2021).

## 2. Materials and Methods

### 2.1. Sample Collection, Preparation and Extraction

The sample used in this study is *Rhamnusprinoides* which was collected from Asmara. The other samples like Barley malts, yeast and water used for brewing which were already produced as wort liquor, collected from the brewing house of the Asmara Brewery factory [ABF]. The fresh plant leaves and stems were harvested from a small garden (vegetation) area and scattered in a wide open area for drying. Drying was done in two phases, initially the moisture of

freshly harvested sample of Gesho leaves measured of 75 -80%. In the first phase, the gesho was left for drying under direct sun light for 2-3 days covered with cambric in order to free the gesho from dusts and other particulate matter. In the second phase, drying performed in an open air protected system for the direct exposure to sunlight for five days to attain a moisture content of 10.4%. The dried materials are ground using a portable coffee grinder. Later, gesho plant samples powdered into a size of 0.75 mm and subjected to extraction (Abebe WN et al 2021).

As methanol dissolves a broader range of hop components and represents a suitable solvent for the extraction of polyphenols, compounds with structural phenolic features, which can be associated with different organic acids and carbohydrates, 90% methanol used to obtain gesho leaf and stem extracts for further analysis. 5% [w/v] of dried gesho stem sample measured as 5g of sample mixed in 100ml of 90% ethanol solution, was taken in extracting funnel and extraction carried out by vigorous shaking for 5hrs and then filtered. The filtrates [extract] show in in the figure 1 were concentrated in a rotary evaporator and the dried crude extracts analyzed further for the presence of phytochemicals following the tests provided in table 1 (Abebe WN et al 2021).

**Figure 1.** Gesho stem(left) and leaf(right) extracts

## **2.2. Qualitative Analysis of Phytochemicals of Rhamnusprinoide's leaves and stems**

Leaves and stems of the Gesho plant containing phytochemicals, which are chemical substances or nutrients derived from plant sources such as alkaloids, saponins, tannins, sterols & triterpenes, phenols, flavonoids & flavones and resins and their functions are explained as follows, Saponins are also referred to selectively as triterpene glycosides, are bitter-tasting that have foamy nature when agitated in water whereas tannins are a class of mild astringent, polyphenolic biomolecules that bind to and precipitate proteins and various other organic compounds including amino acids and alkaloids. In addition to the alpha acids extracted from hops to provide bitterness in beer, condensed tannins are also present. These originate both from malt and hops. In addition, phenols are carboxylic acid is an aromatic organic compound, polyphenols are a large family of naturally occurring organic compounds characterized by multiples of phenol units. Further, alkaloids are a class of basic, naturally occurring organic compounds that contain at least one nitrogen atom. This group also includes some related compounds with neutral and even weakly acidic properties. Additionally, resin is a solid or highly viscous substance of plant or synthetic origin that is typically convertible into polymers. Most plant resins are composed of terpenes, particularly specific components such as alpha-pinene, beta-pinene. Flavonoids and Flavones are a class of polyphenolic secondary metabolites found in plants, and thus commonly consumed in diets. Moreover, the presence of phytochemical components in Gesho stems and leave extracts determined using qualitative tests as shown in table 1.

## **2.3. Detection of bittering agent in Rhamnus Prinoide's samples by Quantitative Analysis**

Extraction of well vented and dried samples of Gesho was performed by soaking in 97% ethanol or methanol as an extracting agent and the aqueous extract prepared as follows. 40g of powdered sample was soaked in aqueous solution of 70 ml methanol and 100 ml water (70 % v/v) then filled in a funnel extractor. The extract was macerated for three days with continual shaking and then filtered using whatman No. 1 filter paper. Filtered extract dried in a water bath evaporator until constant dryness achieved and stored in refrigerator for further analysis following the methods provided in the table 2.

In general, Alpha acids ( $\alpha$  acids) are a class of chemical compounds primarily of importance to the production of beer. They are found in the resin glands of the flowers of the hop plant and are the source of hop bitterness. The alpha acid "rating" on hops indicates the amount of alpha acid as a percentage of total weight of the hop. Hops with a higher alpha acid content will contribute more bitterness than a lower alpha acid hop when using the same amount of hops. High alpha acid varieties of hops are more efficient for producing highly bitter beers. Further, Iso-alpha acids are isomerization form of alpha acid. Iso-alpha acids (iso- $\alpha$ -acids) are typically produced in beer from the addition of hops to the boiling wort. The degree of isomerization and the amount of bitter flavor produced by the addition of hops is highly dependent on the length of time the hops are boiled. Longer boil times will result in isomerization of more alpha acids and thus increased bitterness. But, in case of our local hop (Gesho plant) these iso-alpha acids can be present naturally before isomerization reaction occurs.

**Table 1.** Qualitative testing methods for the detection of phytochemicals in Gesho stem and leaf extracts

Phytochemical Component	Detection Test	Reference
Saponins	0.5g of the sample extract was dissolved in 5ml of distilled water and the mixture was poured in a beaker and shaken for five minutes. If stable frothing occurs on the top of the solution, it is proved that saponins are present	Teklit GA 2015
Tannins	0.5 g of the sample extract was dissolved in 2 ml of distilled water and the solution was filtered using a whatman no-1 filter paper. Ferric chloride was added 2 drops to the filtrate. Finally, if a blue-black precipitate occurs, it indicates the presence of tannins in the plant extract	Teklit GA 2015
Phenols	1mg of sample was taken in a test tube and was added to 2ml of distilled water and then few drops of 10% aqueous ferric chloride. Finally, formation of blue or green colour indicate the presence of phenols	Abebe WN et al 2021
Resins	2mg of plant extract was dissolved in 5 to 10 ml of acetic anhydride by gentle heating. After cooling, 0.5 ml of sulfuric acid was added. Bright purple colour produced indicated the presence of resins	Teklit GA 2015
Alkaloids	0.5g of plant extract was weighed and stirred in 2 ml of 1% aqueous hydrochloric acid and heated in a boiling water bath for 10 minutes. The mixture was filtered while hot and treated with Dragendorff's reagent. Turbidity or precipitation indicate the presence of alkaloids.	Teklit GA 2015
Flavonoids and Flavones	200mg of the extract was dissolved in 4 ml of 50% methanol. The solution was warmed and metal magnesium added. Five drops of concentrated sulfuric acid were then added. Development of a red color indicated the presence of flavonoids and afterwards orange color showed presence of flavones	Teklit GA 2015

**Table 2.** Quantitative methods for the determination of bittering agents of *R. prinoides*

Phytochemical Component	Quantitative Test	Reference
Total Resin	20g of the leaves sample of <i>R. prinoides</i> was dissolved in a 100 ml of cold methanol in a conical bottom flask and agitated vigorously. The mixture was filtered using the whatman No. 1 filter paper. The filtrate containing the resin was dried until constant weight over a water bath. The final weight was calculated as a percentage of the original weight of the sample dissolved in methanol.	Adama K.K et al 2011
Soft and Hard Resin	20g of the sample was dissolved in a 20 ml of n-hexane in a conical bottom flask and agitated. The mixture was filtered using the Whatman No. 1 filter paper. The filtrate containing the soft resin was dried until constant weight over a water bath. The final weight of the soft resins was calculated as a	Okoro and Aina 2007

	percentage of the original weight of the sample dissolved in n-hexane. Hard resin was calculated by subtracting soft resin from total resin.	
$\alpha$ and $\beta$ acids	0.15g of the sample plant (leaf) extract was dropped into 100 ml of cold methanol filled in a flask shaker, then filled in centrifuge tubes. The mixture was centrifuged at 2500 rpm for 20 min. The supernatant of the mixture was decanted from the test tubes and acidified with 0.002N HCl. Finally, using UV-vis spectrophotometer the alpha and beta acid content can be calculated its absorbance at a wavelength of 355,325 and 275 nm.	Abebe WN et al 2021
Iso- $\alpha$ -acid	15g of sample of R. prinoides was dissolved in a 100 ml of distilled water 0.15% (w/v) and boiled for 90 min and cooled, then filtered using whatman No-1 filter paper. 15 ml sample of extract was acidified using 0.5 ml of 6N HCl and then mixed with 15 ml of pure isooctane in a flask shaker. Finally 10 ml of the isooctane extract was washed with 10 ml of a mixture of methanol and 4 N HCl (68: 32, v/v). 5 ml of the washed isooctane layer was diluted with 5 ml of alkaline methanol (60: 40, v/v methanol: 0.5 N NaOH). Finally, using a UV-Vis spectrophotometer the iso-alpha acid content can be calculated as absorbance at wave length of 255 nm.	Abebe WN et al 2021

**Table 3.** Testing methods for the determination of essential oils and antioxidants.

Compounds	Testing Procedure	Reference
Essential Oils	20g of sample is placed inside a thimble & inserted into the inner-tube of the soxhlet extractor. The apparatus is fitted to a round-bottom flask, which contains 200 ml of n-hexane. Reflux condenser was set on the top of the apparatus and extraction time of 120 min at 60°C (boiling point of n-hexane). The mass of the extracted oil was recorded and calculated as a percentage from the original sample.	Adama K.K et al 2011
Flavonoids	10g of the leaves sample of R. prinoides was mixed with 100 ml of 80% aqueous methanol at room temperature. The whole solution was filtered with whatman No. 1 filter paper and the filtrate was transferred into a crucible and then evaporated to a dryness over a water bath. Finally, the evaporated filtrate was weighed to a constant weight.	Edeoga H.O et al 2005
Phenols	5g of leave sample of R. prinoides was boiled with 50 ml of petroleum ether for the extraction of phenolic component for 15 min. 5 ml of the extract was poured into a 50 ml flask then add 10 ml of distilled water. 2 ml of ammonium hydroxide solution and 5 ml of di nitro salicylic acid solution (1%: aqueous solution) was added. The sample was made up to the mark and left for 30 minutes for color development. Finally, using a UV-Vis spectrophotometer the polyphenols content can be calculated as absorbance at wave length of 505 nm.	Damilola O et al 2015

## 2.4. Determination of essential oils and anti-oxidants

Essential oils are volatile oils that present in a hop plant. Especially in the aroma hops (hops which gives flavor & aroma to the finally produced beer). Since these oils are highly volatile, they are inserted to the wort kettle during the end of the boiling. For the extraction of oils, the raw material containing the compound placed inside the thimble. Later, the thimble loaded into the main chamber of the Soxhlet extractor. The extraction solvent to be used placed in a distillation flask. Then the flask placed on the heating mantle. The Soxhlet extractor placed on top of the flask and a reflux condenser attached at top of the extractor. Further, the quantitative details of the sample, solvent and operating conditions are set as shown in Table 3.

Antioxidants such as flavonoids and phenols are the compounds that inhibit oxidation. They are mainly used as food additives to guard against food deterioration. Therefore, these compounds have a great role in beer preservation by means of providing a long-lasting expiry to the beer. The presence of antioxidants in the hops applied exist in the form of flavonoids and polyphenols. So, the content of antioxidants measured according to the methods given in the Table 3.

## 2.5. Beer Brewing using imported Hops and Gesho

Imported hops used in ABF for the beer production are collected and wort liquor prepared using ABF facilities under the similar conditions that are practiced by ABF for the beer production to compare the effect of local hops from the imported ones. After the raw material milling process in ABF, mashing was done in a large mash-tun where 30,000 tons of malted barley and 176 hectoliter of water were boiled for 120 min at 74°C to achieve saccharification, which is the total conversion of starch in to glucose and the completion of saccharification determined by an iodine test. On completion of mashing, HOPS are added and allowed to wort boiling in wort kettle.

Further, the mash was collected from ABF and used to produce beer using Gesho (local HOPS). Followed the methodology adapted by ABF to produce beer with the replacement of imported HOPS by Gesho local HOPS. The collected mash liquor [ of about 5 liters] was added with 12.7g HOPS as the same proportion used in ABF and boiled to 95°C for 90 min to obtain the Wort liquor as shown in figure 2. And finally, after one and half hour, boiling was stopped and allowed the wort to attain 10-12 °C which is favorable temperature for the yeast inoculation for further fermentation process.

**Figure 2.** Wort boiling (a) and Inserting Gesho plant in wort (b)

**Figure 3.** Fermentation process(a) and fermented beer (b)

Moreover, yeast was inoculated into the five-liter jar containing the wort liquor and it was first acclimatized to 10 °C for 6 days and thereafter the temperature increased to 15 °C in order to reduce vicinal di ketones (VDK) which is a metabolic product secreted by the yeasts. After two days, the fermentation was finished when almost 80% of sugar converted into CO<sub>2</sub> and ethanol. Then these wort samples were precipitated for almost 8 days by decanting, with proper pH monitoring and was kept at 12°C in the refrigerator. Later the temperature was dropped to 3 °C for 7 days and then the beer product was characterized.

## 2.6. Characetrization of the beer brewed

Beer analysis from Gesho leaf and stem samples were performed at ABF lab using facilities such as determination of extract, alcohol meter, pH meter, turbidity, color meter, density, specific gravity and characteristic studies such as determination of bittering units, polyphenol and vdk using the methods provided by Getaw and Berhanu, 2022.

Bitterness of the beer determined using adegassed sample without loss of foam by adding 2-4 drops of octanol into the bottle and pouring 5-20 times from one beaker to another or use magnetic stirrer at least of five minutes. If Yeast contained in beer must

be clarified by centrifuging 15minutes at 3000rpm. Further, 10ml of degassed test sample was pipetted into conical flask which was acidified with 1ml of 3N HCl and was filled with 20ml of isooctane (2,2,4-trimethylpentane). Flask was stoppered tightly and placed it in mechanical shaker, shaken vigorously for 15min at room temperature and then decanted for 10 minutes until the supernatant organic phase forms. Absorbance of isooctane at 275nm in cuvette was measured using Isooctane from the batch as the blank. The optical density is expressed in terms of European brewing convention bitterness units as follows.

Bitterness[IBU] = 50 x Absorbance at 275nm  
 Calculation of International Bittering Units

$$IBU = [AAU \times U \times 10] / V$$

Where AAU is Alpha Acid Units and V is the Volume of the boil in liter

$$Utilization [U] = F[G] \times F[T]$$

Where  $F[G] = 1.65 \times 0.000125[G_b - 1]$ , in which G<sub>b</sub>=boil gravity

$$F[T] = [1 - \exp(-0.04X_t)] / 4.15$$

The constant 10 was accounted for the unit conversion and IBU was measured in mg/L.

Polyphenol amount in beer determined using 10ml of degassed test sample was pipetted into volumetric flask (25ml) with glass stopper which was basified with 0.5ml of 25% ammonium solution and 0.5% ferric

reagent and 8ml of CMC/EDTA were added to the solution the blank was run in the parallel except 0.5% ferric reagent to determine polyphenol amount in the beer. The reaction was allowed for 10min. Absorbance was measured at 600nm. The optical density is expressed in terms of European brewing convention bitterness units as follows.

Polyphenol [pphl] = 120 x ABS at 600nm

VDK estimated in 25ml distilled beer, 10ml of the distillate was taken into 50ml flask with glass stopper, 0.5ml % O-phenyldiamine (reagent) was added and kept in the darkness. After adding 2ml 4N HCl (reagent) into the sample, the absorbance was measured at 275nm and expressed in terms of European brewing convention ppm.

VDK[ppm]=2.7 x ABS at 335nm.

### 3. Results and Discussion

#### 3.1. Qualitative Analysis for the presence of phyto-chemical in Rhamnusprinoides

**Saponins:** It was proved that the foam formed after continuous shaking of the sample for five minute and the stable foam persisted for 26 min. This presence of saponins also indicates the protein content in the Gesho plant (RP). Saponins which were present have been used as antioxidant, anticancer, anti-inflammatory. They are also known to have anti-fungal properties and have been implicated as bioactive antibacterial agents of plants.

**Tannins:** The presence of tannin was proved that the formation of blue-black color precipitate by the ferric chloride test. Tannins are also known to possess general antimicrobial and antioxidant activities.

**Phenols:** As per the standard procedure of ferric chloride test, the appearance of green-black color showing the presence of phenol in the Gesho plant. Phenolic phytochemicals

were present and have been reported to have antioxidative, antidiabetic, anticarcinogenic, antimicrobial, antimutagenic and anti-inflammatory activity. Such activities would qualify the plant for use as a medicinal remedy.

**Resins:** The presence of resins was detected by appearance of bright purple color for the leaf sample very well compared to stem. They are secreted by plants as secondary plant metabolites. A variety of trees produce them and each variety has a slight difference in the resins they secrete. Because of their anti-inflammatory properties' resins have been used in treatment of arthritis as well as in aroma therapy to release stress and anxiety in Africa.

**Figure 4.** Tannin test for leaf(left) and Tanin test for stem(stem)

**Figure 5.** Sample extract of leaf and stem

**Figure 6.** Phenol test for leaf (a) and Phenol test for stem (b)

### 3.2. Quantification of Bittering Agents present in *R. prinoides*

The quantitative values of total resins, soft resins, hard resins,  $\alpha$ -acid, iso- $\alpha$ -acid, and  $\beta$ -acid of *R. prinoides* leaves and stem collected from the small vegetation garden area were determined. In general, the total resins represent the sum of all bitter resins and can be further divided into hard and soft resins. Hard resins are insoluble in hexane, and soft resins are soluble in hexane. In this investigation, the amount of total resin content of *R. prinoides* leaves and stems collected from our garden.

Total resin of the leaf sample estimated as 16.54% on average based on the data obtained from the journal (L.Herit) reported from Amhara Region, Ethiopia. The results of total resins were comparable comparing with the total resin, they ranged from  $16.03 \pm 0.03$  to  $17.05 \pm 0.04$  %. And the amount of soft resins measured for both leaf and stem as an average of 10.615% based on the same journal mentioned above the outcomes of our soft resin were satisfactory and favored the range between  $(10.00 \pm 0.08$  to  $11.23 \pm 0.07)$ %. Further, the hard resin content of *R. prinoides* leaves and stems collected from the small garden area was calculated by the difference of the total resin to soft resin as shown in Table 4.

### 3.3. Determination of alpha, beta, iso-acids and essential oils.

Alpha acid: The mean compositions of  $\alpha$ -acid obtained from the leaves and stem of *R. prinoides* collected from our area were developed in a plot as shown in figure 7. Then with the provided wave length ( $\lambda$  max= 355nm), found the absorbance using the spectrophotometer and based on that absorbance calculated the concentration of the alpha acid through the standard plot.

- Alpha acid absorbance of leaf: 50.8
- Alpha acid absorbance of stem: 43
- Alpha acid concentration of leaf sample: 3.37 mg/L
- Alpha acid concentration of stem sample: 2.9 mg/L

**Figure 7.** Alpha acid test for *R. prinoides* leaf sample absorbance

**Table 4.** Resin Content of the *R. prinoides* leaf and stems

Sample type	Total resin	Soft resin	Hard resin
Leaf sample	16.54%	10.615	5.925
Stem sample	Trace amount	Trace amount	Trace amount

**Beta acid:** The mean values of  $\beta$ -acid obtained from the leaves and stem of *R. prinoides* collected from our area were drawn in a plot as shown in figure 8. Then with the provided wave length ( $\lambda$  max= 323 nm), we found the absorbance using the spectrophotometer and based on that absorbance we calculated the concentration of the beta acid through the standard plot.

- Beta acid absorbance of leaf sample: 47.3
- Beta acid absorbance of stem sample: 38.7
- Beta acid concentration of leaf sample: 3.93 mg/L
- Beta acid concentration of leaf sample: 3.27 mg/L

**Figure 8.** Beta acid test for *R. prinoides* leaf sample absorbance

So the values of  $\beta$ -acid of leaves of *R. prinoides* from our sample sites was found to be within the range of  $(2.62 \pm 0.04$  to  $4.29 \pm 0.08$  mg/l) of  $\beta$ -acid values of commercial hops reported in references.

**Iso-alpha acid:** Based on standard method and uv-spectrophotometer absorbance at 345nm it was found that the content of iso-alpha acid was  $2.26 \pm 0.15$  mg/l up to  $4.15 \pm 0.10$  mg/l.

**Essential oils:** Essential oils are the key contributor to aroma and flavor during beer production. Using the standard procedure mentioned in our report, it was found that the content of the essential oil obtained in *R. prinoides* leaves was in the range of  $7.74 \pm 0.11$ – $12.47 \pm 0.13\%$ . It was also proved by our steam distillation experimental results. Therefore, significant amount of essential oils was obtained in this study, indicates that the leaves and stems of our *R. prinoides* can be serving as a good source of aroma and flavor in the production of alcoholic beverages in ABF.

### 3.4. Determination of Antioxidants of *R. prinoides*

Flavonoids of the leaf and stem samples of *R. prinoides* determined as 24.0332 % and 22.8631 % respectively. And the polyphenol content of the *R. prinoides* leaves and stem were reported using the standard plot of uv-spectrophotometer as shown in figure 9.

**Figure 9.** Polyphenol test for *R. prinoides* leaf sample absorbance

Polyphenol absorbance of leaf sample: 45.1  
 Polyphenol absorbance of stem: 42.3  
 Polyphenol content of leaf sample: 2.3 mg/l  
 Polyphenol content of stem sample: 2.13 mg/l

**Figure 10.** Polyphenol test for (a) leaf and for (b) stem

**Table 5.** Comparison of local hops with imported hops in terms of bittering agents, essential oils and antioxidants

Content		Local hop(leaf)	Local hop(stem)	Imported hop	Typical acceptable Range
Bittering Agents	Total Resin	16.54%	Trace	16.675%	10-20%
	Soft Resin	10.615%	Trace	10 - 18%	8-15%
	Hard Resin	5.925%	Trace	2-4%	1-6.2%
	Iso $\alpha$ -acid	3.205 mg/l	3.21 mg/l	8.52 mg/l	3-9 ppm
	$\alpha$ -acid	3.37 mg/l	2.9 mg/l	9.27 mg/l	3-10 ppm
	$\beta$ -acid	3.93 mg/l	3.27 mg/l	7.64 mg/l	3-8 ppm
Essential oils		2.9%	Trace	1.2%	0.25-3%
Antioxidants	Flavonoids	24.0332%	22.8631%	24.42 $\pm$	20 – 25%
	Polyphenols	2.3 mg/l	2.13 mg/l	0.13% 2-5 mg/l	2 -5 ppm

The result obtained in this study suggests that the *R. prinoides* leaves are a good source of polyphenols, and it may serve as an antioxidant for commercial alcoholic beverages brewing. Further comparisons of bittering agents, essential oils and antioxidants developed in the table 5.

### 3.5. Comparison of Gesho beer with beer produced from imported hops

The sample of beer was prepared by filtering the gesho beer to its final stage with filtration process that includes whatman filter paper and filtration aids. A comparison made between the beer produced from local

hops and imported hops, in terms of color, turbidity and alcohol contents as shown in table 6. The alcohol content was determined by the gas chromatography as 7.57 % (volume), higher than conventional beer that use imported hops. In other words, gesho beer found in golden yellow color and turbidity measured as higher in gesho beer due to lack of effective filtration, the turbidity is slightly higher than ASF beer. Interms of taste and odor, not found any appreciable difference between Gesho beer and ASF beer, except the Gesho beer was showing slightly less sourness than ASF beer due to less presence of alpha, beta and iso-alpha acids.

**Figure 11.** Gesho beer (A) and beer of Asmara brewery factory (B)

**Table 6.** Comparison of the beer produced from local hops and imported hops.

S.No	Parameters	Beer with imported hops	Beer with local hops
1	pH	4.37	4.64
2	Color	9.75 EBC	15 EBC
3	Specific gravity	1.008	1.0096
4	Density	1.008 g/cc	1.0096 g/cc
5	Extract	3.5 g/100ml	3.36 g/100ml
6	Alcohol content	5 % v	7.57 % v
7	Turbidity	0.29 EBC	5.92 EBC
8	Toxicity (VDK)	Not present	Not present

## 4. Conclusions

From the experiments performed, it was observed that the bitter taste and antioxidant activities of Gesho hops are suitable for application in brewing. Resin contents and antioxidants of local Gesho hops were closely approaching imported hops. Essential oils found in local hops are medically valuable compounds are higher than in the imported hops, but the alpha, beta and iso alpha acids are relatively lower than the imported hops. Similar taste and quality was observed except the sourness of beer was

slightly lower [within acceptable range] than the imported hops due to lower alpha, beta and iso-alpha acids. The Gesho beer was found to have a pH of 4.64, alcohol content of 7.5%, and colour of 15EBC are in acceptable range.

The processing methodology of beer [local Gesho hops added] was followed closely with the ASF beer [imported hops containing beer]. Since the taste of the beer was slightly less sour and all other requirements were closely approaching the ASF beer, the local Gesho hops are recommended to ASF. The fermentation efficiency was also showing the

similarities on both the beer. Therefore, incorporating Gesho as a bittering agent gives an advantage to the breweries and the country as well an economic advantage by:

- Increasing profit margin of the brewery
- Reducing import of hop with increasing agricultural inputs to industries
- Creating job opportunities

**Acknowledgment:** Authors convey their thankfulness to the administration of Mai-Nefhi College of Engineering and Technology (MCoET) and Asmara Beer Factory (ABF), Eritrea for their cooperation and consistent support. Authors would like to express their heartfelt gratitude to the Department of Chemical Engineering [MCOETEC], for providing necessary laboratory facilities and chemicals during experimental works

## APPLYING ARTIFICIAL INTELLIGENCE TO DETECT RETINAL DISEASES

**Abstract:** Vision and eye health are one of the most crucial things in human life, it needs to be preserved to maintain the life of the individuals. Eye diseases such as CNV, DRUSEN, AMD, DME are mainly caused due to the damages of the retina, and since the retina is damaged and discovered at late stages, there is almost no chance to reverse vision and cure it, which means that the patient will lose the power of vision partially and maybe entirely. Optical Coherence Tomography is an advanced scanning device that can perform non-invasive cross-sectional imaging of internal structures in biological tissues by measuring their optical reflections. which will help the ophthalmologists to take a clear look on the back of the eye and determine at early stages the damage caused to the retina, macula, and optic nerve. The aim of this study is to propose a novel classification model based on deep learning and transfer learning to automatically classify the different retinal diseases using retinal images obtained from Optical Coherence Tomography (OCT) device. We propose a deep CNN architecture and compared the obtained results with pretrained models such as Inception V3 and VGG-16, our proposed CNN architecture gave an accuracy of 98.96% and Inception V3 model gave an accuracy up to 99.27% on the test set.

**Keywords:** Convolutional neural networks, Optical coherence Tomography, Transfer learning, medical imaging, image classification

### 1. Introduction

OCT stands for Optical Coherence Tomography is an advanced scanning device that can perform non-invasive cross-sectional imaging of internal structures in biological tissues by measuring their optical reflections. [1], which will help the ophthalmologists to take a clear look on the back of the eye and determine at early stages the damage caused to the retina, macula, and optic nerve. Diagnosing or predicting these pathologies at early stages can increase the chance of curing the patients and restore vision ability, it has been also proved that eye diseases don't just affect the retina and

the patient's vision, but it has also a relation between heart diseases and hypertension, which means that predicting and diagnosing eye diseases at early stages can also save the health of the patient's heart.

Four main types of eye diseases are treated in this study:

- DME Diabetic Macular Edema is a type of eye disease due to the damage of blood vessels in the retina. When left untreated, DME will cause the build-up of liquid in the macula further leading to a swollen area on the retinal layer and

consequently irreversible eye blindness.

- **AMD** Age-related Macular Degeneration is a damage affects the macula (small area at the center of the retina), leads to center-blind, and it's a blinding disease with no cure at present. This disease doesn't just affect the vision of the patient, but it can also cause heart diseases and hypertension, according to [5]. The number of people living with macular degeneration is expected to reach 196 million worldwide by 2020 and increase to 288 million by 2040 [6]
- **DRUSEN** One of the first signs of AMD pathology are called DRUSEN. Drusen are yellow deposits under the retina, they are not symptoms of eye diseases, but the appearance of large number of them can lead to AMD and vision loss. [16] Ophthalmologists these days use OCT imaging scanning to detect DRUSEN and define their types if they are serious and can lead to AMD, or if they can disappear [9], which gives them the opportunity to make prior decisions.
- **CNV** Choroidal neovascularization is a very common vision-threatening disease that leads to vision loss. involves the growth of new blood vessels that originate from the choroid through a break in the Bruch membrane into the subretinal pigment epithelium or subretinal space. [7] [15] any damage to the Bruch membrane can be complicated by CNV.

## 2. Related works

Machine learning is nowadays used in different fields of medical imaging, computer-aided diagnosis [19], image

segmentation [18] and image-guided therapy, this means that there are multiple areas in medicine, where machine learning methods can be applied to improve patients' health care. Different studies have been proposed to classify OCT images. Md Akter Hussain et al. [31] proposed a classification model based on random forest classifier, with 15-fold cross-validation tests, to detect (AMD) or Diabetic Macular Edema (DME) using retinal features from Spectral

Domain Optical Coherence Tomography (SD-OCT) images. the dataset contained 251 (59 normal, 177 AMD and 15 DME) images, and obtained the accuracy of 95 % while testing and 96 % in train set.

Venhuizen et al. [42] proposed an architecture to detect AMD diseases using Random Forest with a maximum of 100 trees is used for the classifier. The method achieved an AUC of 0.984 with a dataset of 384 (269 AMD, 115 control) OCT volumes. Shenghua He et al. [36] have proposed a very deep CNN network architecture contained 9 CONV blocks and 2 FC layers. 2 max-pooling layers were placed after the 3rd and the 6th CONV blocks, respectively. 1 global pooling layer was placed after the 9th CONV block. The spatial support of the filter in each of the CONV layers was set as 3 x 3 pixels. The number of the filters in the first three Conv layers was set to 32. In order to compensate for the information loss caused by max pooling, the number of filters in 2nd three CONV layers and 3rd three CONV layers were set to 64 and 128, respectively. Two FC layers followed the global pooling layer. The first FC layer included 512 neurons and the second one included 5 neurons. One dropout was set between these two FC layers with a dropout ratio of 0.5 to further avoid overfitting. A softmax layer was placed at the end of the classifier.

The experiments on 269 OCT images showed that the average prediction accuracy of the CNN-based method was 0.866. The

test set accuracy wasn't mentioned in their paper, we believe that such very deep architecture on a few data (269 images) can lead to overfitting. one trick could have been done is to use data augmentation [35] to get more data for training. Muhammad Awais et al. [30] have worked on the classification of SD-OCT images using VGG-16 pretrained model, to detect DME diseases on a dataset consisting of 32 OCT volumes (16 DME and 16 normal cases). Each volume contains 128 Bscans with resolution of 1,024px 512px. They did many experiments on the dataset combining CNN with other classifiers (KNN and Decision trees). the best configuration was obtained 93.5 %. One of their configurations gave 100% accuracy, by setting the  $k = 1$  in KNN classifier, and 2 FCL1, hence this leads also to overfitting cause of the bad choice of parameters. Cecilia S. Lee et al. [33] published a paper on classifying AMD diseases using a modified version of the VGG16 convolutional neural network on a total of 80,839 images (41,074 from AMD, 39,765 from normal) were used for training and 20,163 images (11,616 from AMD, 8,547 from normal) were used for validation. The training was then performed using multiple iterations each with a batch size of 100 images with a starting learning rate of 0.001 with stochastic gradient descent optimization. At each iteration, the loss of the model was recorded, and at every 500 iterations, the performance of the neural network was assessed using cross-validation with

the validation set. The training was stopped when the loss of the model decreased and the accuracy of the validation set decreased. Accuracy in the area under the ROC curve (AUROC) was 92.77 %.

This is a very interesting paper indeed, due to the use of pretrained model and regularization techniques to speed the learning phase and avoid overfitting.

Another paper on classifying OCT images

using deep learning methods by Parmita M. et al. [34] for multilabel multiclass classification for OCT retinal images to diagnose patients who may exhibit multiple pathologies, the dataset consists of 36,150 images, applied data augmentation [35] and modified version of Inception Resnet V2 pre-trained model by removing the output activation layer softmax and replaced it with sigmoid. The goal of their study was to compare transfer learning with CNN from scratch the resulted work is accurate and exact match for transfer learning was 74.5% and 30.14% compared to 85.23% and 64.3% for direct learning. A paper was published recently that used the dataset that we are using in this study published by Kuntoro Adi Nugroho [32] comparison of Handcrafted and Deep Neural Network Feature Extraction for Classifying Optical Coherence Tomography (OCT) Images the deep neural network-based methods outperformed the handcrafted feature with 88% and 89% accuracy for DenseNet and ResNet compared to 50% and 42% for HOG and LBP respectively. The issue with this study is that they have split the dataset into 50% for training and 50% for validation. In this study, we are proposing different split of the data and different approaches

### 3. Proposed approaches

Machine learning approaches: We have trained three classic machine learning classification algorithms, and we compared the results obtained of each algorithm based on the accuracy and training time.

-Decision trees classifier:

Decision trees classifier is one of the most popular machine learning algorithms used all along, we used sklearn python library to fit decision tree classifier, after 38 minutes of training using google colabs GPU we obtained these results:

**Table 1.** Decision trees classifier results

Accuracy	Precision	Recall	F1-score
33,50%	33,25%	33,50%	32,87%

-XGBOOST classifier :

After splitting our dataset and resized the images to have a shape of (224 by 224 ) pixels and converting the images to matrix data, we used sklearn library to fit XGBOOST classifier to our the training data. After 40 minutes of training we obtained the following results :

**Table 2.** XGBOOST classifier results

Accuracy	Precision	Recall	F1-score
52,06%	51,91%	52,06%	51,12%

-SVM classifier:

We used the sklearn library to adapt the SVM classifier to the training data. After 13 minutes of training, the following results were obtained:

**Table 3.** SVM Classifier Results

Accuracy	Precision	Recall	F1-score
40,20%	44,31%	40,20%	40,29%

-Random Forest Classifier :

We used the sklearn library to adapt the Random Forest classifier to the training data. After 15 minutes of training, the following results were obtained:

**Table 4.** Random Forest Classifier Results

Accuracy	Precision	Recall	F1-score
60,30%	62,66%	60,30%	59,47%

Deep learning approaches: In this section we will demonstrate how we applied deep learning to classify and identify the retinal diseases, we focused on the use of

convolution neural networks because they shows a good performance when dealing with images, we done many experiments, we changed the hyperparameters and evaluated the obtained results. We also establish the use of some pretrained models by tuning them to fit our dataset outputs.

- First CNN architecture:

the first CNN experiment architecture is composed of 3 Convolution layers and 3 Max pooling layers and one Dense layer.

We obtained from this experiment an accuracy of 96,97% in validation set and 97,52% when testing on our test set data.

- Second CNN Architecture:

We added to the first CNN architecture one dropout layer and one Batch normalization layers.

We obtained from this experiment an accuracy of 97,20% in validation set and 98,96% when testing on our test set data.

Architecture interpretation: The model is sequential which allows us to create the model layer-by-layer. The architecture consists of convolutional layers, max-pooling layers, dropout layers, and fully connected layers.

The first layer is a convolutional layer with 32 filters each of size 3 x 3. We are also required to specify the input shape in the first layer, which is 224 x 224 x 3 in our case.

We will be using the Rectified linear unit (ReLU) activation function for all the layers except the final output layer. ReLU is the most common choice for activation function in the hidden layers and has shown to work pretty well.

The second layer is a pooling layer. The pooling layers are used to reduce the dimension. Max Pooling with a 4x4 window only considers the maximum value in the 4x4 window. A dropout layer with dropout

[39] rate of 0.1 means 10% of the neurons will be turned off randomly.

This helps prevent overfitting by making all the neurons learn something about the data and not rely on just a few neurons. Randomly dropping neurons during training means other neurons will have to do the work of the turned-off neurons, thus generalizing better and prevent overfitting. The third layer is again a convolutional layer of 512 filters each of size 3 x 3 followed by another max-pooling layer of 3x3 window. Usually, the number of filters in the convolutional layer grows after each layer. The first layers with a lower number of filters learn simple features of the images

whereas the deeper layers learn more complex features. The next layers are again convolutional layers with 32 filter size. followed by a Batch normalization layer. We need to flatten the 3D feature map output from the convolutional layer to 1D feature vectors before adding in the fully connected layers. This is where the flattening layer comes in. The following dense layer (fully connected layer) has 128 neurons. The final output layer is another dense layer that has a number of neurons equal to the number of classes. The activation function is softmax because it is a multi-class classification problem.

Figure 1. Our proposed CNN architecture

- Inception V3 Model We used Inception V3 pre-trained weights to classify our images, we removed the first three top layers and changing the output layer to have four neurons corresponding to our number of classes.
- VGG-16 Model We used VGG-16 [44] pre-trained weights to classify our images same as we did with Inception V3 model, we removed the first three top layers and changing the output layer to have four neurons corresponding to our number of classes.
- ResNET50 Model We used ResNET50 pre-trained weights to classify our images same as we did with InceptionV3 and VGG16

models, we removed the first three top layers and changing the output layer to have four neurons corresponding to our number of classes.

### Compiling and training the models

All the models are compiled with categorical cross-entropy loss function and the Adam as an optimization algorithm, except the InceptionV3 model where we tried both Adam and rmsprop, the last one gave better results. The accuracy metric is used to evaluate the model. Training the model using a GPU speed up the training process, We set the number of epochs to 15 and use a regularization method Early Stopping [38], In our case, we tell EarlyStopping to monitor

validation-accuracy and if it does not improve for 10 epochs continuously, stop the training process. The model checkpoint is used to save the model.

The monitor parameter allows us to set a metric that we want to keep an eye on. In our

case, we only save the model when the validation accuracy is the max. We save the best model to be used later to make predictions and thus evaluate the models' performance.

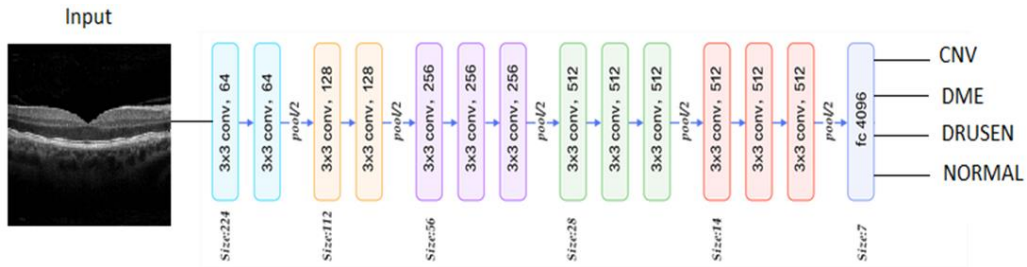

Figure 2. Adapted version of the VGG-16 architecture to match our data

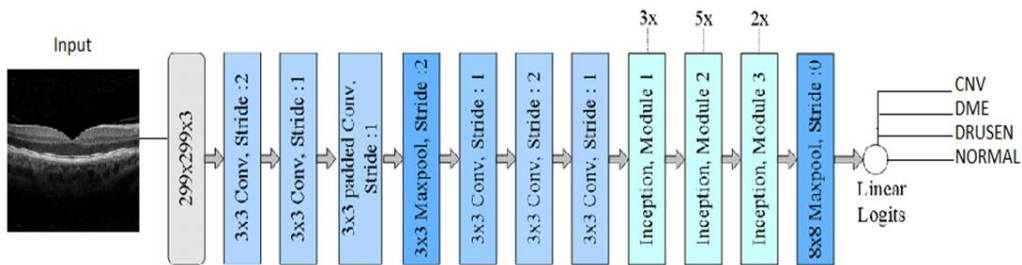

Figure 3. Adapted version of InceptionV3 to match our data

Figure 4. Adapted version of the ResNET50 architecture to match our data

#### Dataset overview and preprocessing

We have used the OCT images dataset from [27], the dataset is organized into 3 folders (train, test, val) and contains subfolders for

each image category (NORMAL, CNV, DME, DRUSEN). There are 84,495 images (JPEG) and 4 categories (NORMAL, CNV, DME, DRUSEN).

Our dataset was taken from different research labs, what makes the sizes of the images varies (496, 768, 3), (496, 1024, 3), (496, 512, 3), (496, 1536, 3), (512, 512, 3) the first two values refers to the width and height of the image, and the third one refers to the image channels, meaning in this case that the images are in RGB.

**Table 5.** Dataset original split

	Training	Testing	Validation	
CNV	37205	242	8	<b>37455</b>
DME	11348	242	8	<b>11598</b>
DRUSEN	8616	242	8	<b>8866</b>
NORMAL	26315	242	8	<b>26565</b>
	<b>83484</b>	<b>968</b>	<b>32</b>	<b>84484</b>

**Table 6.** Dataset distribution after resampling

	Trainin g	Testin g	Validatio n	
CNV	33,03 9	242	4,174	<b>3745 5</b>
DME	7,182	242	4,174	<b>1159 8</b>
DRUSEN	4,450	242	4,174	<b>8866</b>
NORMA L	22,14 9	242	4,174	<b>2656 5</b>
	<b>66,78 8</b>	<b>968</b>	<b>16,696</b>	<b>8448 4</b>

Data Rescaling: Importing the images with the original sizes will lead to use big part of hardware resources and the time of processing the images will highly increase, we reduced the image sizes to 224 X 224 pixels, same as Imagenet [41] dataset images sizes because we aim to do experiment on pretrained models.

Data Resampling: The dataset is splitted into 3 folders as explained in the previous section, with only 8 images per class for validation and 242 images for test and the rest for training. as detailed in table This split is not efficient and can lead to extream overfitting. We made another split of 80% for training , 20% for validation (table 2) and after constructing our model we tested our

model on 968images.

## 4. Results and discussions

After compiling our first CNN architecture we obtained an accuracy of 96,97% in validation set and 97,52% when testing on our test set data.

After the second experiment of our CNN architecture ( after adding the regularization terms )we obtained an accuracy up to 97,29% and accuracy of 98,96% while testing. meaning when we added the two regularization terms the accuracy did enhance for both validation and testing.

Our experiment on the VGG16 model, the training time was 16 minutes per epoch, we obtained an accuracy of 94,75% on validation and in testing the model. the accuracy in the validation part didn't improve the 10 first epochs until early stopping algorithm stopped the training process.

Our experiment on the ResNET50 model, the training time was 20 minutes per epoch, we obtained an accuracy of 95.57% on validation and in testing the model.

The results of our experiment on the InceptionV3 model were exciting, after 15 epochs of training and validation, we obtained an accuracy up to 99.03% in training and 100% in the validation part, and accuracy of 99.27% in 986 testing images. This experiment outperformed all the other results.

Predictive labels on the X-axes and true labels on the Y-axes, we have used 968 images to test our model, the blue cells shows the correct predicted images meaning the predicted labels matches the actual labels of the images, in this case the model correctly predicted 958 images out of 968 images where the DME images were 100% correctly predicted. and the wight cells show the incorrectly predicted labels which 10 in this case.

CNN architecture - accuracy ON TEST SET : 0.9896694421768188

31/31 [=====] - 1s 19ms/step

	precision	recall	f1-score	support
Normal	0.98	0.99	0.99	242
CNV	0.98	0.98	0.98	242
DME	1.00	1.00	1.00	242
DRUSEN	1.00	0.99	0.99	242
accuracy			0.99	968
macro avg	0.99	0.99	0.99	968
weighted avg	0.99	0.99	0.99	968

**Figure 5.** Matrix showing the precision and recall for each classed obtained by second CNN architecture

**Figure 6.** Confusion matrix obtained by the second CNN architecture

Inception V3- Rmsprop optimizer - accuracy ON TEST SET : 0.9927685950413223

	precision	recall	f1-score	support
Normal	1.00	0.98	0.99	242
CNV	0.98	1.00	0.99	242
DME	1.00	1.00	1.00	242
DRUSEN	1.00	0.99	0.99	242

**Figure 7.** Model's accuracy obtained by the Inception model while testing

The performance on the test data is consistent with the performance on the training data. DME , DRUSEN and Normal images have a great precision value of 100%, in all the evaluation metrics. CNV have lower precision value compared to other classes.

**Figure 8.** Confusion matrix obtained by InceptionV3 model

This model was able to correctly predict 961 out of 968 images, meaning only 7 images were incorrectly classified, this shows better results compared to the previous confusion matrix where the 2nd CNN models miss-classified 13 images. The CNV category is better classed here compared to the previous confusion matrix of the 2nd CNN architecture, and the test accuracy improved as well, all the instances of CNV class were correctly classified.

**Figure 9.** Comparisons between the results obtained by our experiments

Convolutional neural nets give better results in term of accuracy and efficiency compared to artificial neural nets and classical Machine learning algorithms. CNN gives good results and inceptions V3 outperforms all the results, 2nd CNN is better than the first one where we added regularization terms.

Comparative study with the diagnosis of OCT experts in order to evaluate our models and see if they give good results compared to OCT radiologists experts, we obtained diagnosis of 7 OCT radiologist, by asking them to label 10 images corresponding to the category.

The experts were given the enough time to make their own decision on the images, from all doctors, only one of them accurately classified the 10 images. another thing to notice is that all the doctors have correctly classified the DME and NORMAL images, and some of them struggle to diagnose images that contains CNV.

**Figure 10.** Comparisons between experts and our model

Our model outperformed the diagnosis of 6 out of 7 OCT experts in term of accuracy. It took the model only 3 seconds to predict the 10 images.

Then we tested 50 images on our model, our model successfully classed all the images correctly as illustrated in figure 11.

**Figure 11.** Predictions on 50 randomly chosen images

## 5. Conclusion

This work represents case study and aims to develop and propose a new novel classification model based on deep learning to automatically detect and diagnose retinal images better than the diagnosis of experts in OCT radiology and also previous published papers.

To achieve research objectives we conducted many experiments using classic machine learning classification algorithms and deep convolutional neural nets methods.

As turned out, our proposed CNN model outperformed all other classifiers and approaches, as well as the diagnosis of OCT experts. The results has shown that the use of Convolutional neural networks can give very interesting results in image classification and can be used to asses doctors in medical diagnose and opens up to a new, simple and effective method for early CNV, DME and DRUSEN detection. We have also seen that the use of some pretrained models can enhance the results in time and model effectiveness.

Our approaches shows good results in term of classification performance, yet we didn't trained our models for long epochs due to the hardware limitations, and we haven't test our models in different OCT dataset to see if they can perform as well as they did in this data.

For future , we would study further many related problems and test our models in different datasets to diagnose more retinal diseases. We also aim to integrate our model directly into an OCT scanning device to asses the ophthalmologists in making decisions.

## HOW TO MAINTAIN A QUALITY ENVIRONMENT IN HOSPITALS

**Abstract:** *The main focus of this paper is on maintaining a high quality environment in hospitals, which is essential for the safety and well-being of patients, staff, and visitors, and to some extent even promotes healing. We have divided the paper into three main sections: Physical Environment, Healing by Design - Comfortable and even Positive Environment, and Socio-emotional Environment.*

**Keywords:** *quality environment, hospital, patients, safety, well-being, Patient-centered*

### 1. Introduction

Maintaining a quality hospital environment is critical to the safety and well-being of patients, staff, and visitors, and to some extent may even aid in the healing process. To promote this quality hospital environment, we must focus our attention on the physical environment, the ability to create a comfortable environment, and the patient's socio-emotional environment. By physical environment we mean: cleanliness, adequate ventilation, sufficient space, waste disposal, hand hygiene. By pleasant environment we mean: Natural light, colors and textures, art and nature, privacy and personalization, comfortable furnishings, clear pathways. And we use the term socio-emotional environment to help patients, staff and visitors have a positive experience, even under difficult circumstances: Empathy, compassion and communication.

### 2. Physical environment

In the Physical Environment section, we listed several factors that contribute to maintaining a quality environment in hospitals, such as cleanliness, adequate ventilation, sufficient space, waste

management, and hand hygiene.

Cleanliness means that regular cleaning and disinfection of all surfaces, equipment and patient rooms is critical to prevent the spread of infection. Ensure cleaning protocols are followed correctly and staff are trained to maintain hygiene standards (Peters et al., 2018).

Adequate ventilation means that good ventilation can help reduce the risk of airborne infections. Ventilation systems in hospitals should be inspected regularly and air filters replaced as needed (Elsaid et al., 2021).

Adequate space means that adequate space for patients and staff can help prevent the spread of infections. Staff must ensure that patient rooms, waiting areas, and other public spaces have adequate space to maintain social distance (CEP et al., 1996; Kader, 2023).

The importance of waste management is that proper waste disposal is essential to maintaining a clean and safe environment. Personnel must ensure that all waste is disposed of properly and that hazardous waste is disposed of in accordance with local regulations (WHO, 2017).

It is important that staff, patients, and visitors practice good hand hygiene. Provide hand sanitizers and hand washing stations throughout the hospital and ensure that staff are trained in proper hand hygiene (Gaubé, Fischer, & Lermer, 2021).

### **3. Healing by Design - Comfortable and even Positive Environments**

In Healing by Design - Comfortable and even Positive Environments, we explain how incorporating natural elements such as natural light, plants, and views of nature into hospital design can have a positive impact on health and well-being. We also mention how the use of colors and textures, art and nature, privacy and personalization, comfortable furniture, and clear wayfinding can help create a warm and welcoming environment for patients. The meaning of Comfortable Environment is that patients should feel as comfortable as possible during their stay in the hospital. This can be achieved by providing comfortable beds, adequate lighting and temperature control, and amenities such as TV, books, or games.

From the perspective of biophilic design theory, we can assume that humans have an innate connection to nature and that incorporating natural elements into design can have a positive impact on health and well-being. This may include the use of natural light, plants, and views of nature in hospital spaces (Wilson, 2000; Heerwagen, 2009; Kellert, 2018).

By the term natural light, we mean a positive effect on mood and well-being. Wherever possible, hospital rooms should be designed to maximize natural light and views to the outdoors (Tekin, Corcoran, & Gutiérrez, 2023).

By the term color and texture, we mean the use of color and texture in hospital spaces that can help create a warm and inviting environment. Use warm colors and natural

materials such as wood or stone to create a calming and comfortable atmosphere (Dalay, 2020).

By art and nature, we mean that incorporating art and nature into hospital spaces can help create a sense of calm and relieve stress. This may include displaying artwork or photographs, creating green spaces or gardens, or providing views of nature (Samir, 2021).

By privacy and personalization, we mean the fact that hospital spaces should be designed to provide privacy and allow patients to personalize their environment. This may include providing private rooms with en-suite bathrooms, allowing patients to bring personal items such as photos or blankets, and providing space for visitors to spend time with patients (Fuchs, 2001; Xiong et al., 2019).

By comfortable furnishings, we mean comfortable and supportive furniture that can provide a sense of comfort and well-being. Provide comfortable chairs, sofas, and beds, as well as pillows and blankets for patients (Olausson et al., 2021).

By clear wayfinding, we mean clear and easy-to-understand wayfinding that can help reduce stress and confusion for patients and visitors. This includes clear signage, maps and directions, and color-coded floors or areas to help patients find their way around the hospital (Chen, Ko, & Hsieh, 2021).

### **4. Socio-emotional environment**

In the section on the socio-emotional environment, we emphasize the importance of empathy and compassion, as well as clear and effective communication in the hospital. We also mention the need to provide patients with a spiritual or cultural space and support. The importance of empathy and compassion is that patients and their families are often in distress and need emotional support. Hospital staff should be trained to show empathy and compassion toward patients

and their families, to listen to them, and to respond to their needs (Su et al., 2020).

Communication means that clear and effective communication is essential in a hospital. Patients and their families should be informed about their care and treatment, and staff should communicate effectively to ensure that patients' needs are met (Hapsari et al., 2022).

Nonetheless, offering spiritual or cultural space and support is part of the process (Saad & de Medeiros, 2016; Kader, 2023).

### 5. Staff support, training and regular inspections

Hospital staff should be supported to provide quality care. This includes access to training and development opportunities, ensuring adequate staffing levels, and promoting staff well-being (Boamah, Read, & Spence-Laschinger, 2017).

We see that at the heart of everything we do to promote a quality hospital environment is not just the physical environment, but also education and training. This means that education and training are critical to maintaining a high-quality hospital environment (Peters et al., 2018). Ensure that staff are trained in infection prevention and control and that patients and visitors are educated on the importance of maintaining a clean and safe environment.

However, we believe that education is not enough and that something always needs to be done. Regular inspections and audits can help identify areas for improvement. This

includes gathering feedback from patients and their families, as well as staff, and using that feedback to identify areas for improvement. Ensure that inspections are conducted regularly and that any issues identified are addressed promptly.

### 6. Conclusion

Positive psychology is a field that focuses on promoting positive emotions, behaviors, and attitudes and has been applied to healthcare (Seligman & Csikszentmihalyi, 2000). Hospital spaces can be designed to promote positive emotions such as serenity and comfort and reduce negative emotions such as stress and anxiety (Ulrich, 2000).

Person-centered design theory is an approach that focuses on the needs and experiences of individuals and seeks to create spaces that are tailored to their needs. This may include designing hospital spaces that are comfortable, private, and allow for personalization (Boissy, 2020).

So, if we are willing to understand that the hospital environment should be customized so much to have a quality environment, we can claim that the key factor is the patient-centered methodology. This means that the care is tailored to the individual needs and preferences of each patient.

And furthermore, there are even heaps of evidence that environment design even improves medical outcomes (Ulrich, 2000; Schweitzer, Gilpin, & Frampton, 2004; Sternberg, 2009, DuBose et al., 2018).

## METHODICAL ASPECTS OF SIMULATION MODELING OF EMERGENCY INTERACTION OF LIFE SUPPORT FACILITIES

**Abstract:** An important component of the sustainable functioning of urbanized territories are life support systems that provide the main indicators of the quality of life of the population both in normal conditions and in emergency situations of man-made and natural character. Such systems primarily include power supply systems, gas supply, heat supply, water supply, transport, etc. Accidents in life support systems lead to large-scale and long-term negative social, material, financial and environmental consequences. Especially severe consequences are associated with intersystem accidents, when the termination or restriction in functioning affects two or more life support systems. The report discusses methodological issues of simulation of emergency interaction of life support systems, an algorithm and a general scheme for resilient assessing are proposed..

**Keywords:** life support system, accidents, intersystem interaction, negative consequences, general algorithm

### 1. Introduction

An important component of the stable functioning of urbanized territories are life support facilities, which provide the main indicators of the quality of life of the population both in normal conditions and in emergency situations of man-made and natural character. Such facilities include, first of all, power, gas, heat, water, transport and other facilities. Accidents in life support facilities lead to large-scale and long-term negative social, material, financial and ecological consequences. Particularly severe consequences are associated with intersystem accidents (ISA), when the termination or limitation of functioning affects two or more life support facilities (LSF).

The study of intersystem accidents within the framework of risk theory and the concept of adaptive resilience considers the development of such methods and models

that allow to assess not only the risks of intersystem accidents, but also to assess the duration and costs of restoration of life support facilities and territory. The development of mathematical models of emergency interaction of life support facilities is an urgent research area for a number of years. Taking into consideration the difficulties of formal description of the interaction of heterogeneous life support facilities, the focus has been on modeling the emergency behavior of electric power facilities (Dobson et al, 2005; Reducing..., 2011), modeling the interaction of two facilities, for example, electric power and gas supply facilities (Lesnykh et al, 2016), electric power and water supply (Jin-Zhu & Hiba, 2019). There is a number of problems that make it difficult to model the emergency interaction of two or more life support facilities. First of all, it is different dynamics of emergency disturbance propagation in the facilities: in the electric

power facilities the propagation is almost instantaneous, in the gas supply facilities it can reach several hours, and in the heat supply facilities - several days. Another difficulty is related to the formalization of the disturbance transfer function between the facilities. If for the energy facilities the energy equivalent (Lesnykh et al, 2016) can be used, for other facilities the description of such a function requires additional research.

## 2. Modeling the emergency interaction of life support facilities

The main purpose of modeling the emergency interaction of life support facilities is to assess the level of adaptive resilience of LSF to intersystem accidents. The total negative consequences (direct and indirect social, material, financial and environmental damage), the duration and costs of the restoration of LSF to the normal level of functioning can act as criteria of adaptive resilience.

ISA modeling is conducted for the selected territory, to which the structure and categories of consumers, the specified composition and structure of life support facilities correspond. Life support facilities are attached to the main groups of consumers (public utilities, industry, services, etc.).

The most effective method that allows to realize a model of such processes, taking into account the influence of a large number of random factors is simulation modeling. Let us consider sequentially all the main elements of the ISA simulation modeling algorithm. The proposed algorithm is a development of the conceptual model of interaction of life support facilities during intersystem accidents (Lesnykh & Timofeeva, 2021).

**Step 1.** For the given initial data, the modeling of emergency processes begins with the selection of the initiating life support facility. Analysis of statistical data also showed that the most frequent initiating event of intersystem accidents are accidents in electric power facilities, the histogram of the frequency distribution of ISA initiating of life support facilities is shown in Fig. 1. This diagram is converted into a distribution histogram and can be used in the first step of ISA modeling to generate the type of initiating accident facility.

To select the initiating system of intersystem accidents, you can use statistical data for a particular territory and a particular composition of life support facilities. Analysis of the operation of life support facilities revealed the following main causes of accidents (Causes..., 2007):

- dilapidation, poor preparation of engineering infrastructure for the heating season (36%);
- failure to comply with the rules of technical operation of equipment, unskilled actions of maintenance personnel (32%);
- natural factors and natural disasters (21%);
- unauthorized power cuts, gas explosions, fires, etc. (11%)

Statistics on 80,000 accidents and incidents during the year show that 47% occur in water supply facilities and 16% - in heat supply facilities. According to the data collected, repairs last on average 8.5 hours (Over..., 2021).

**Step 2.** After determining the initiating ISA facility it is necessary to determine the cause of the accident and identify the emergency element of the life support facility (for example, LSF-1). Determination of the emergency element of the LSF-1 facility is carried out for a given configuration of the facility (composition and number of main elements, types of relationship between the elements) is carried out with Monte Carlo method based on statistical data on the causes and frequency of accidents at LSF-1

objects.

**Step 3.** The next stage of ISA modeling is the selection of the accident development scenario in LSF-1. Complexities of formation of emergency scenarios, especially for a large-scale space distributed life support facility with a large number of equipment elements, lead to the need to form a typical set of scenarios based on a preliminary analysis of statistical data.

**Step 4.** For the chosen scenario of the emergency situation a number of indicators

are assessed: the number of elements of LSF-1 involved, material, social, financial and environmental consequences of the scenario, the duration of elimination of consequences and restoration of normal functioning of LSF-1. The assessment of consequences and duration of restoration is performed both on the basis of data obtained from regulatory documents, and on the basis of probability distributions or expert assessment to generate values of random parameters of the model.

**Figure 1.** Histogram of ISA distribution by triggering event location

The assessment of damage to consumers and the life support facility should be carried out with the possibility of redundancy, such as the use of a second source of electricity or reserve water supplies, which can reduce the amount of possible damage to consumers.

To assess total damage, direct and indirect damage must be determined on the basis of regulatory documents or using statistical data, including the distribution of damage as a random value.

The value of indirect losses in relation to direct losses is not constant, but varies depending on the type of production facility, type of products, scale of production, etc. According to the data (Arkhipets, 2005), this ratio for the main industrial sectors for industrial safety events (accidents, incidents) can vary from 30 to 300%. In this work,

based on the analysis of a number of studies, it was found that between the damage from the failure of industrial equipment and the total losses of the enterprise associated with the restoration of production, downtime and other economic losses, there may be a larger scale ratio of 1:14 to 1:23. That is, indirect damage can exceed direct damage by an order of magnitude or more.

The assessment ratio between direct and indirect damage for labor safety events (fatalities, severe and minor injuries) is also a problem in its own right. This value varies within a fairly wide range. A ratio of 1:6 can be used for preliminary assessments (Timofeev, 2009).

**Step 5.** This element of the algorithm is key in the ISA modeling, because it is associated with the identification of elements of LSF-1,

which may lead to the transfer of emergency perturbations to the interconnected life support facilities.

A formal representation of the interrelations between systems when an ISA occurs is a multidimensional matrix of interactions. This matrix should contain the following information: type of initiating system, number of the considered node; type of "receiving" system, number of the considered node; probability of influence; duration of expected outage; scale of expected consequences. The basic form of the interaction matrix must contain the values of conditional probabilities of transfer

of emergency perturbation from the element of one facility to the element(s) of the other facility(ies).

Table 1 shows an example of an interaction matrix of two life support facilities. Each element of the  $P_{ij}$  matrix represents the conditional probability that an accident that occurred in the  $i$ -th element of the first facility will lead to an accident in the  $j$ -th element of the second facility. The values of the matrix elements are obtained as a result of the analysis of statistical data, or on the basis of expert assessment.

**Table 1.** . Example of an interaction matrix between two life support facilities

Objects of Facility	1	2	3	...	$i$	...	$N$
1	$P_{11}$	$P_{12}$	$P_{13}$	...	$P_{1i}$	...	$P_{1N}$
2	$P_{21}$	$P_{22}$	$P_{23}$	...	$P_{2i}$	...	$P_{2N}$
3	$P_{31}$	$P_{32}$	$P_{33}$	...	$P_{3i}$	...	$P_{3N}$
...	...	...	...	...		...	...
$j$	$P_{j1}$	$P_{j2}$	$P_{j3}$	...	$P_{ji}$	...	$P_{jN}$
...	...	...	...	...		...	
$M$	$P_{M1}$	$P_{M2}$	$P_{M3}$	..	$P_{Mi}$	...	$P_{MN}$

Simulation of occurrence of emergency processes in the interconnected facility takes place in accordance with the values of conditional probability in the interaction matrix. If the modeling shows the possibility of perturbation transfer from LSF-1, for example, to LSF-2, then the type of perturbation function, type and characteristic of interrupted communication (energy or material equivalent), the duration of interruption and other characteristics are determined.

Random processes and quantities which values are random and for the calculation of which Monte Carlo-based statistical testing procedures are used include the following:

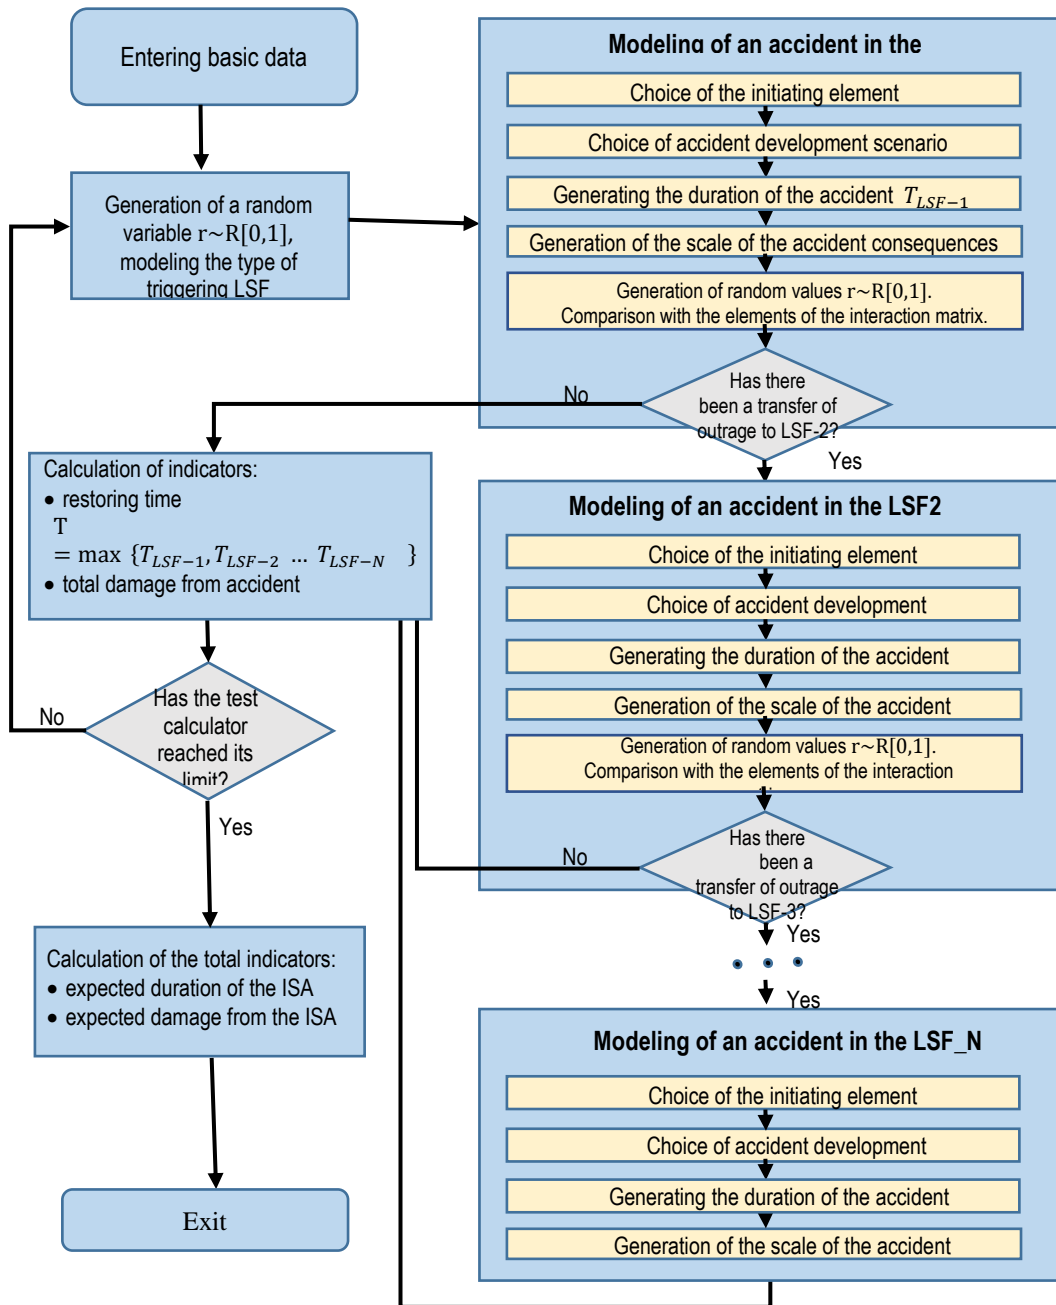

- the cause of the accident;
- emergency element;

- scenario of the development of the emergency process;
- the duration of the elimination of the accident;
- the value of direct and indirect damage;
- the possibility of transferring perturbation to interconnected facilities, etc.

The general scheme of the simulation ISA modeling algorithm is shown in Fig. 2.

The implementation of the above simulation scheme will make it possible to assess the level of adaptive resilience of life support facilities, as well as to identify elements of these facilities that can initiate the intersystem development of emergency situations ("bottlenecks").

**Figure 2.** General scheme of the simulation ISA modeling algorithm

### 3. Conclusion

The work defines a methodical approach to the modeling of emergency interaction of life support facilities, develops the basic provisions and an algorithm for the simulation model describing this process. The ways for further research are outlined.

The most time-consuming task of future research is to develop and implement a system of ISA simulation models. It is advisable to begin this task with small cities or isolated territories, that will allow us to consider interconnected life support facilities in the limited area, as well as a limited

number of possible ISA scenarios. In the future, this experience can be transferred to larger-scale infrastructure-complicated territories.

The main task of future research will focus on finding "bottlenecks" in the interconnected life support facilities that can initiate the intersystem development of emergency situations. Solving this problem with the help of simulation models will make it possible to assess the current level of adaptive resilience of life support facilities and, if necessary, justify the appropriate measures to reduce the risk of ISA.

## **THE USE OF THE EXCELLENCE EFQM MODEL IN THE HEALTHCARE SECTOR**

***Abstract:** As the healthcare sector is under growing pressure to enhance patient outcomes and reduce costs, quality management systems are becoming increasingly essential to ensure high-quality care and efficient operations. The EFQM (European Foundation for Quality Management) model serves as a framework for assessing an organization's quality management system. This paper provides an overview of the implementation of EFQM in the healthcare sector based on the literature analysis. Findings revealed that the EFQM model is unsuitable for the hospital sector and needs to be customized before it can be used for practical application. In addition, the EFQM model can also be integrated into local, national, or international country-specific models. However, regarding the model's application sector, the EFQM model can be applied to any specialty (emergencies, medical services, primary care services, intensive care services, and so on). To the best of our knowledge, the proposed study is the first that sheds light on the importance of the integration and customization of the EFQM model when it is used in the healthcare sector by various case studies in the literature.*

***Keywords:** Literature review, organizational business excellence, quality management systems, EFQM, healthcare sector*

### **1. Introduction**

The healthcare sector is a critical sector that has a significant impact on individuals and communities worldwide (Burlea-Schiopoiu & Ferhati, 2020). As the demand for healthcare services continues to increase, there is a need for healthcare organizations to implement effective quality management systems (QMS) to enhance patient care outcomes, ensure patient safety, and improve operational efficiency. A robust QMS enables healthcare providers to identify and address potential risks and opportunities for improvement proactively (Rawshdeh et al., 2022). Furthermore, implementing a QMS can help healthcare organizations comply

with regulatory requirements and achieve accreditation or certification, which can enhance their reputation and attract more patients. In addition to implementing QMS, healthcare organizations can benefit from adopting business excellence models, such as the Baldrige Performance Excellence Framework (Garvin D., 1991), the Deming Model (Anderson, Rungtusanatham, & Schroeder, 1994) and the European Foundation for Quality Management (EFQM) Model (Calvo-Mora, Navarro-García, & Periañez-Cristobal, 2015). They have been utilized worldwide to improve the quality of patient care and assess the performance of healthcare organizations (Antunes, Hadi-Vencheh, Jamshidi, Tan, &

Wanke, 2023; Noronha et al., 2023).

The Baldrige Criteria for Excellence in Performance, or the American Model of Total Quality Management (TQM), was developed in response to a crisis in American competitiveness during the information age. Established by the United States Congress in 1987, the model has seven categories that provide strategic direction for the whole system. These categories include leadership, strategic planning, customer and market focus, information and analysis, focus on human resources, management of business processes, and results. Over 60 national and regional awards use the Baldrige criteria as their framework (Garvin D., 1991). Second, the Deming Model (also known as the Japanese Model of TQM), has been in place since 1951, with the Japanese Union of Scientists and Engineers establishing the Deming Award to acknowledge contributions to quality and product. Rather than providing a structured framework for organizing and ranking criteria, the award assesses 10 criteria that carry equal weight. (Anderson et al., 1994). Finally, the EFQM Excellence Model, or the European model of TQM, is utilized as a foundation for good management practices and long-term sustainability. Although each organization is unique, the model offers a generic, non-prescriptive

framework consisting of nine criteria that can be applied to any organization. While there are differences among these models of excellence, most of their objectives and criteria overlap (Heras-Saizarbitoria, Casadesús, & Marimón, 2011; Hosseini Ezzabadi, Dehghani Saryazdi, & Mostafaeipour, 2015).

Several studies have compared these models, highlighting differences in their application category, criterion, scope of assessment, value, and concept (Bohoris, 1995; Doulatabadi & Yusof, 2018; L.J. Porter & S.J. Tanner, 2004; Vaxevanidis, Krivokapic,

Stefanatos, Dasic, & Petropoulos, 2006). Overall, different countries and regions have developed their own national models of excellence or have adopted established models of Total Quality Management (TQM), including the American, Japanese, and European models. A study conducted by Mohammad (2010) provides a summary of the situation regarding the Business Excellence Award and associated models in various regions and countries worldwide. Analysis of the data reveals that European countries tend to prefer the EFQM excellence model or models developed from it, while American countries lean toward the Baldrige criteria as their primary model for excellence, with many models being based on these criteria (Mohammad, M, 2010).

The EFQM model offers a holistic approach to evaluating healthcare organizational performance and management, including assessing the QMS (Bocoya-Maline, Rey-Moreno, & Calvo-Mora, 2023). The EFQM model allows healthcare organizations to have a deeper understanding of their own progress through self-assessment (Bou-Llusar, Escrig-Tena, Roca-Puig, & Beltrán-Martín, 2009). This enables organizations to determine where they stand in their journey toward excellence and plan their next steps (Bocoya-Maline et al., 2023; Nicolaou & George Kentas, 2017; Oubrahim, Sefiani, & Happonen, 2022). EFQM has developed several tools to assist organizations in completing this process, ranging from a simple questionnaire to simulating an EFQM award evaluation. This approach prioritizes a customer-focused approach, continuous improvement, and stakeholder engagement. Selecting an appropriate model or benchmark allows healthcare organizations to improve their business excellence, enhance patient care outcomes, and ensure patient safety. By prioritizing these objectives and choosing an appropriate model or benchmark, healthcare organizations can improve their overall

performance and contribute to the advancement of the healthcare industry. This model also gives a guideline for organizations to establish an appropriate management system regardless of the sector, size, structure or maturity (Ahidar, Sarsri, & Sefiani, 2018). It is a complete model that can be used either at the private sector or the public sector (Josep Davins Miralles, 2007). Based on the reasons cited above, the EFQM model was selected as the preferred model for the healthcare sector assessment.

In light of the ongoing COVID-19 pandemic, research efforts have increasingly focused on the healthcare sector. As such, the use of an excellence model such as EFQM in the healthcare sector has been chosen to be researched. The purpose of the paper is to provide an overview of how the EFQM model is used within the healthcare sector, as well as to examine feedback from those who have implemented the model in their own practices.

The remainder of this paper is structured as follows. Section 2 goes into the methodology employed to conduct the study. Section 3 includes the literature review. The findings and discussions are presented in Section 4. Finally, the summarized conclusion is discussed in Section 5.

## 2. Research methodology

Given the critical nature of the healthcare sector, which strives to provide quality care that directly or indirectly impacts human lives, and the abundance of quality and excellence models, frameworks, and awards, the objective of this study is to investigate the utilization and advantages of the EFQM excellence model in healthcare. Specifically, the study aims to address the following research questions:

RQ1. How do decision-makers operating in the healthcare sector utilize the EFQM model?

RQ2. What are the benefits associated with the adoption of the EFQM model in the healthcare sector?

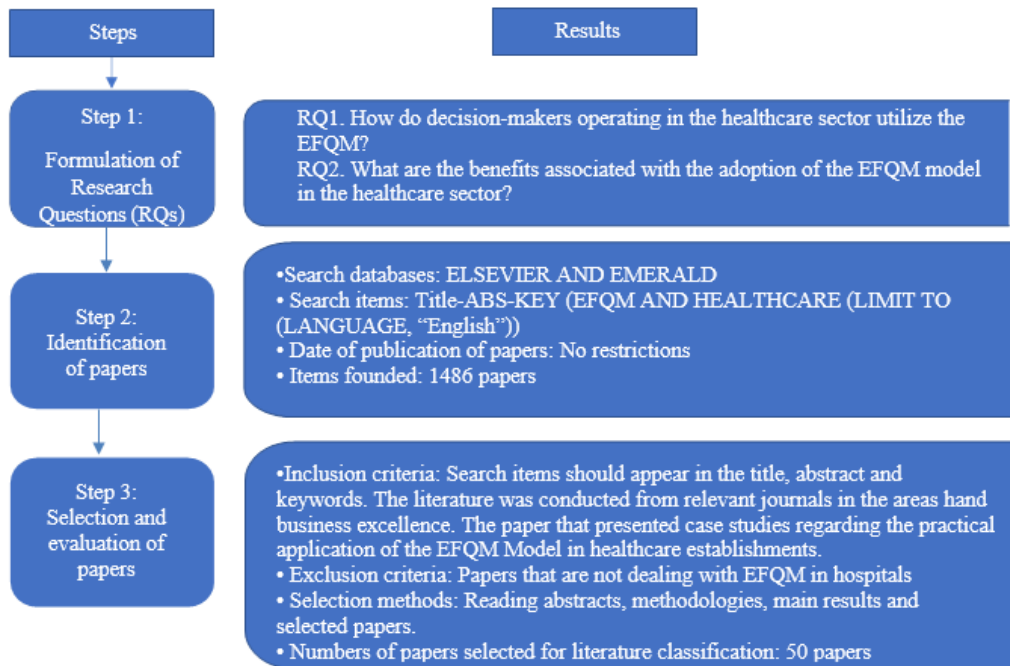

The present study focuses on articles published in the widely recognized academic databases, Elsevier and Emerald, which are widely used search tools in academia. While there are several databases available, these two were chosen due to their extensive coverage. However, it should be noted that this study is not quantitative in nature, and the objective is not to conduct an exhaustive analysis of all articles. The aim is qualitative, with the purpose of identifying key characteristics related to the application and use of the EFQM model in the healthcare sector. Only peer-reviewed journal articles were included in the study, and conference papers and unpublished works were excluded. The search terms "EFQM" and "HEALTH" were used in all texts, summaries, keywords, and titles. Review papers and case studies were considered in the study, without any specific time frame. The search ended in April 2023, resulting in 864 articles in Emerald and 622 articles in Elsevier. After initial screening, a total of 140 articles were identified, which were then rigorously analyzed for practical application and use of the EFQM model. Finally, 50 articles were selected and analyzed using Excel to group the data by job description, place of application, country, methodology, and any integrated models. The steps of the study are summarized in Figure 1.

## 3. Literature review

EFQM model and reported their strengths and weaknesses. They integrated the model with different tools and created "modules for excellences" based on the strengths and weaknesses. Others strengths and weaknesses were also identified in studies by (Naylor, 1999), (Arcelay et al., 1999) and (Nabitz & Klazinga, 1999) (Hayes, 2007) (Ferrándiz-Santos et al., 2010), and several

actions were proposed for implementation. PARETO has been used by authors such as (Martínez, 2012) for prioritizing the essential key points, and (M. P. del Ríoa, et al., 2006) use the score achieved as an internal reference to monitor changes in the quality of service. (Holland & Fennell, 2000a) have concluded that the assessment tool generated useful discussion within hospitals and provided an opportunity for the teams to explore current issues relating to their services. Factors that managers take into consideration during the implementation process to let the EFQM model be an ideal tool for supporting the delivery of clinical governance are discussed in (Jackson, 2000) (Escrig & de Menezes, 2016). The EFQM model has been used for both internal and external assessment by authors such as (Nabitz & Walburg, 2000) and (Moracho et al., 2001) (Ugalde, Sierra, & Pardo, 2001) (Rodríguez-González et al., 2019). The assessment must be aligned with continuous improvement and repeated as necessary to follow the scores of the different criteria. (Favaretti et al., 2015), applied the model over ten years and demonstrated improvement in evaluation results. Barriers and difficulties encountered in the process of EFQM implementation are discussed in (Moeller & Sonntag, 2001) and (Jackson & Bircher, 2002) (Güven-Uslu, 2005) (Ignacio et al., 2001). (Stahr, 2001), mentions improvement of performance indicators such as the reduction of average length of stay for a dedicated hernia service. (Simón, Guix, Nualart, M. Surroca, & Carbonell, 2001) suggest that the EFQM vocabulary is not suitable for healthcare and should be integrated with the Joint Commission. However, (Fernando Palacioa, Ignacio Pascualb, & Jordi Danielc, 2002), has

translated it into clinical terms to make it understandable and easy for users, and (Moreno-Rodríguez, Cabrerizo, Pérez, & Martínez, 2013), has proposed a consensus support model based on linguistic information to conduct the self-assessment. Several authors highlight the importance of not neglecting the link between strategic and operational levels in the application of the models and the implication of several levels of managers, including (Sánchez et al., 2004) and (Rodríguez-Balo & Ferrándiz-Santos, 2004) (Vakani, Fatmi, & Naqvi, 2011) (Vernero, Nabitz, Bragonzi, Rebelli, & Molinari, 2007). (Robles-García et al., 2005), used some factors of the EFQM relative to “people” to assess the satisfaction of hospital workers, and van (van Harten, Casparie, & Fisscher, 2002), underlined the positive effects both in the EFQM-score and the staff’s work satisfaction. The EFQM model has been applied, adapted and integrated by several authors in various contexts, including (Martínez-Rodríguez, Urdaneta Pignalosa, Rosales Bordes, & Villavicencio Mavrich, 2008) (Ayuso-Murillo, de Andrés-Gimeno, Noriega-Matanza, López-Suárez, & Herrera-Peco, 2017) (Ahidar, Sarsri, & Sefiani, 2019; Mishra, Samuel, & Sharma, 2018) (Palani Natha Raja, Deshmukh, & Wadhwa, 2007) (Emilio Pariente, 2003) (Oliver, 2005) (Harr, 2001). (J. Davins Miralles, 2011) has tested the model before applying it to validate it. (Manzanera et al., 2014) used the model to evaluate previous approaches in literature. (Bartolomé-Benito et al., 2016) proposed the use of the balanced scorecard as a dashboard to display all the indicators based on the EFQM. (Jackson & Morgan, 2007) used the RADAR approach for the application of the EFQM.

**Figure 1.** Research methodology

Regarding the strengths of the EFQM model, (Stewart, 2003) found that the "customers" result showed a high level of customer awareness, customer satisfaction, and generic training. (Saz Moreno et al., 2007) found strengths in processes and people. (Fariñas-Álvarez et al., 2008) used the EFQM model to benchmark different hospitals, identifying good practices in hospitals within the national health system.

Moreover, some authors have used the EFQM model for specific activities or objectives. For instance, (Mateo, de la Fuente, & Borrego, 2009) used the EFQM for the unit security plan, while (Mingo-Gómez, Navas-Cámara, Bayona-Marzo, Pérez-Gallardo, & Fernández-Pérez, 2012) and (Hashemy, Yousefi, Soodi, & Omid, 2016) used the model for measuring the satisfaction of personnel and human

empowerment. Additionally, and (de la Fuente Rodríguez et al., 2013) and (Saura et al., 2014) used the model to measure patient safety.

#### 4. Findings and discussions

According to the analysis, the EFQM model has been employed across various sectors, particularly in healthcare. The way in which this model is utilized varies depending on the requirements of managers. On one hand, some healthcare organizations integrate the EFQM model with other standards or models, while on the other hand, some prefer to use it independently but adjusted to suit their operations. Findings revealed that there is a little difference between the numbers of papers per publisher (Fig 2).

**Figure 2.** Number of papers per publisher

Furthermore, the results showed that the first articles that deal with the application of the model appeared in 1998/ 1999, this can be explained by the fact that the EFQM model was developed in 1992 and began to be applied in the late nineties (Figure 3). Indeed, in 1999, the EFQM launched the

revision of the model and created the network of partners. The year 2001 saw a high number of publications; this is explained by the launch of the levels of excellence in 2001 by the European Foundation for Quality Management.

**Figure 3.** Number of papers per year

The EFQM model is more widespread in Europe. For the 50 papers filtered, the EFQM was applied in different countries (Figure 4) such as: Spain, Germany, UK,

Netherlands ...The most of the papers are located in Spain (56 %).

**Figure 4.** Percentage of papers per country

Institutions prefer to integrate the EFQM model with other models or to apply it on its own (Figure 5). 28 studies were applied without integration into other models, 22 studies were integrated into different models in particular sectoral and national models specific to the countries where the model was applied. Only 2 studies have integrated the EFQM model with ISO family, this is explained by the fact that hospitals do not have the obligation to be ISO certified unlike the automotive sector where customers require certification IATF 16949 (before ISO TS 16949).

45 studies have adapted the model to the activity before applying it because terminology is important and make the self-assessment easy to understand. The authors find that the EFQM model is not suitable for the hospital sector and must be personalized

before the use in order to be effective.

The healthcare sector has some unique characteristics that distinguish it from other industries. Healthcare organizations have to deal with complex patient needs, high levels of risk and uncertainty, and a range of stakeholders with competing interests.

Therefore, to effectively apply the EFQM model to the healthcare sector, it needs to be adapted to address the specific challenges and requirements of healthcare organizations. For instance, the EFQM model should incorporate the values of patient-centered care and the importance of involving patients and their families in decision-making processes.

Additionally, healthcare organizations need to take into account the regulatory requirements and standards that govern the

industry, such as those related to patient safety, privacy, and confidentiality. Therefore, the EFQM model needs to be aligned with these regulations and standards to ensure compliance and enhance the overall quality of care.

In conclusion, the EFQM model can be a valuable tool for healthcare organizations to

improve their performance and enhance the quality of care they provide. However, to be effective in this sector, the model needs to be adapted to address the unique characteristics and requirements of healthcare organizations.

**Figure 5.** The manner of the EFQM's use

Regarding the sector of application of the model, the model has been applied to different specialties:

- Emergencies (Moreno-Rodríguez et al., 2013)
  - Internal medicine(Martínez, 2012)
- Primary care services(Emilio Pariente, 2003)
- Intensive care services(Saura et al., 2014)
- Dental practice (Vakani et al., 2011)
- Pharmacy (Rodríguez-González et al., 2019)
- Acute care (Möller & Sonntag, 1998)
- Service unit Rehabilitation (Möller & Sonntag, 1998)
- Mental health (Holland & Fennell, 2000b)
- Learning disability (Holland & Fennell, 2000b)
- Forensics(Holland & Fennell, 2000b)
- Anti addiction center (Nabitz & Walburg, 2000)
- Maternity (Ignacio et al., 2001)
- Oncology (M. P. del Río, et al., 2006)
- Coronary heart disease services (Jackson & Morgan, 2007)
- Hospitalization zone(Saura et al., 2014)
- Surgical area (Saura et al., 2014)
- Intensive medicine service(Saura et al., 2014)

- Diabetic service (Mishra et al., 2018) .... And others

All the experiences (100%) show positive feedback on using the EFQM model on healthcare sector, because it a suitable tool that shows the strengths and weaknesses of any organization (hospital, primary care...) and specialties.

The studies that have been adapted the model suggest that the EFQM is more effective when it is adapted and integrated with others standards.

The EFQM was integrated to different tools, models or standards. Sometimes it is integrated or combined with one other standard, two or more depending on the need

and the objective of the establishment. The different techniques, methods or tools that were used with the model EFQM can be classified in two categories: local and national or international (Table 1).

The table 1 shows that the model EFQM can be integrated with various models, techniques local, national and international.

The scorecard is the most used tool in our case (three studies), because of the common points that exist between EFQM and BSC. In fact, the axis of the BSC: financial, customer process, education and growth are included in the EFQM which will make the integration easier.

### 5. Conclusion

The proposed study has demonstrated that the EFQM model is highly recommended for the hospital sector, as it provides managers with insights into the strengths and weaknesses of their organization. However, for an effective implementation, it is advisable to adapt or integrate the model with other relevant techniques, standards or methodologies that managers consider useful. Our research has reviewed various models that have been successfully integrated with the EFQM in literature, which can serve as a source of inspiration for professionals and researchers.

To ensure a successful implementation, it is important to prepare an adapted or integrated EFQM model that is well-structured and based on validated methodologies or approaches published in literature. This will enable an easy, efficient and optimal implementation process.

Nonetheless, the implementation of an integrated EFQM model must also take into account the potential obstacles and challenges that have been highlighted in the literature. For instance, there is a risk of neglecting the importance of a critical variable, as well as a lack of communication and competent resources. Therefore, these potential issues should be addressed in the

planning phase to ensure the success of the integrated system.

Furthermore, it is important to note that the implementation of an integrated EFQM model should be viewed as an ongoing process rather than a one-time event. Managers must continuously monitor and evaluate the system to identify areas that require improvement and make necessary adjustments. This ensures that the system remains relevant and effective in the constantly evolving healthcare landscape.

In addition, involving all stakeholders in the implementation process is crucial (Oubrahim & Sefiani, 2022; Oubrahim, Sefiani, & Happonen, 2023; Oubrahim, Sefiani, Happonen, & Savastano, 2022; Oubrahim, Sefiani, Quattrociocchi, & Savastano, 2022). This includes not only managers but also staff, patients, and other external stakeholders such as regulatory bodies. Their feedback and insights can provide valuable perspectives that can be incorporated into the integrated EFQM model.

Finally, it is essential to ensure that the implementation of an integrated EFQM model is aligned with the organization's overall goals and objectives. This will ensure that the system is integrated seamlessly into the existing structure and processes, and contributes towards achieving the desired outcomes.

## IMPROVING ACTIVE DISTURBANCE REJECTION DRC CONTROL FOR ROBOTICS HOME-BASED TO LOWER EXTREMITY REHABILITATION CARE

**Abstract:** *This study is intended to be used as a fundamental guideline for developing locally established restoration frameworks for exoskeletons (Robotics), particularly in the event of the COVID-19 pandemic. This work describes a one-degree-of-freedom exoskeleton-leg dynamic demonstration and control recreation (automated knee joined with sitting level). The linear active disturbance rejection control (LADRC) and the corresponding proportional-derivative-integral (PID) controller for position and speed control are the two regulators that make up the control structure. The findings of the MATLAB reconstruction reveal that the proposed regulator (LADRC) has a respectable potential for providing scheduled recovery treatment to reduce appendages, particularly for direction following error. The results of the proposed controller (LADRC) demonstrate quicker reactions with settling time and steady-state error are very small.*

**Keywords:** *Exoskeleton system, ADRC controller, PID controller, Robustness, Tracking performance*

### 1. Introduction

In the last 20 years, an increasing number of neurological conditions such as hemorrhage, spinal cord damage, and Disease were reported for people of all ages. The World Health Organization (WHO) identified "brain hemorrhage" as the third leading cause of weakening worldwide and one of the main causes of over 5 million casualties between 2000 and 2016 (World Health Organization [WHO], 2016) due to the development of certain illnesses. The demand for recovery administrations is rising globally. Controlled lower extremity orthotic devices, often known as motorized skeletons, and frequently regarded as aids in rehabilitation and the improvement of human gait. These devices have undergone

extensive development and presentation work, and there are still numerous problems that need to be studied due to the inherent demands of flexibility and safe interaction with the user and the environment. The control of these devices is conceivably one of the major approaches for working on their exhibition (Young & Ferris, 2017).

The analysts have been addressing existing provokes and prerequisites to configuration, control and develop recovery robots appropriate for home treatment. Subsequently, many at-home recovery gadgets have been planned inside the exploration domain (Aylar et al., 2021). Additionally, the present state of the global crisis increases interest in robot-assisted restoration frameworks in order to reduce the risk of contamination for both patients and

medical care provider organizations (Kimmig et al.,2020). Robot-helped recovery practice for useful variation of knee joint broadens an extraordinary chance for post-stroke patients. Likewise could be an extraordinary apparatus to gauge utilitarian enhancements of muscles and joint movements.

An robotic leg's instrumentation setup is capable of performing accurate location and power estimations as well as being prepared to collaborate with humans (Huang et al.,2019). More critically, electro-mechanical actuators of the framework can play out an undertaking more than once inside the ideal work area of a joint. The test in this field is to discover suitable control systems for these gadgets, which can be adjusted to the useful abilities of the clients, for a consistent intellectual and physical interaction. Hence, users and exoskeleton should cooperate during restoration, in an instinctive and synergistic way, to permit more normal developments, and work with their contribution for an improvement at their neural versatility. For this reason, diverse control approaches dependent on movement aim have been accounted for to work on the exhibition of the exoskeleton to execute activities that are both fitting for the restoration errand and compares to the client's assumptions (Tucker et al.,2015). Due to the dubious components and the inadvertent subject's reactions during walk recovery, the design of an exact control system for a low appendage skeleton framework does not present many challenges. For more than a decade, lower appendage exoskeletons and orthoses have been controlled by typical automated stages.

The purpose of the exoskeleton control is to aid the wearer in partially or completely reestablishing engine function. The majority of these recent publications emphasize the use of conventional PD or PID control techniques. It is well recognized that these regulators are weak to model errors and

disturbances (Akhtaruzzaman et al.,2020). For (Rifai et al.,2011), a bounded control force was applied gradually while employing the EICOSI orthosis to regulate a lower appendage orthosis placed to the knee joint for restorative items. Observations revealed a good match between patient joint development and the expected path in a respectable amount of time. It is suggested in (Mefoued et al.,2011) to employ a controlled knee-joint orthosis to restore human lower appendage growth, particularly the knee extension of the lower leg.

The control method relied on the Higher Ordering Sliding Mode Control (HOSMC) process. To assess the suitable control law's robustness, testing using conventional PID regulators was conducted. HOSMC's display tends to be more well-liked. To comprehend the regular gait, however, very few scientists have looked at the best control, in particular the linear quadratic controller. Additionally, by approximating the linear time-changing structure and substantially limiting the computational complexity linked to a few nonlinear regulators, LQR as a linear control plan may be utilized for nonlinear framework components (Knee joint model). However, the LQR is the best control strategy and should be used to identify ambiguous exoskeleton components (Castro & Zhong,2018). However, chattering due to erroneous exchanging is a problem for the sliding mode control (SMC) technique, which can limit against vulnerabilities and boundary vacillations [Wei & Aiguo,2020; Li et al.,2014]. Before the concept of active disturbance rejection control (ADRC) recently emerged, there was some work to be done managing the plant's uncertainties, including the affects of disturbances and its obscure components.

Numerous designing tools use it (Parvathy and Asha,2013; Huang and Xue,2014) to overcome these control issues at hand. The basic motion of the human knee, as according to biological traits, is flexion-

expansion in the frontal plane. In this approach, the plan of the device knee always has a single absolutely turning DOF (Li et al.,2019). The advantages of this approach include a reduction in weight and an increase in the complexity of the exoskeleton and control frameworks.

This work introduces the design and control reproduction of a 1-DoF automated limb for knee practice in order to reduce weight. An exceptional seat is attached to the limb so that a disabled person can be seated on it and perform treatments for their knee joints. In this work, an input regulator, which makes up for the absolute unsettling influences by simple linear active disturbance rejection control (ADRC) is intended to balance out knee movement joint controller framework. The paper's contribution of this study can be highlighted by the following points:

- An improved ADRC built by modified the ESO for traditional ADRC depending on desired trajectory response with a one design parameter related to closed-loop poles location.
- The proposed controller satisfied the stability criterion by using pole-placement technique.
- Study the validity of modified ESO for estimation and cancellation by a proper controller law

## 2. Methodology

In this section, we introduce the basic concepts behind the knee-joint mathematical model, as well as the ADRC control elements, and develop the suggested controller.

### 2.1 Knee-joint mathematical model

As shown in Figure 1, which depicts the skeleton is controlled through a controller that transmits power to the lower leg, the relatively lower extremity framework in this article consists of a person wearing an

activated orthosis chair that swings in around lower leg. Throughout this framework, the strap synchronizes movement between the two portions and links the exoskeleton to the human leg. The considered dynamic orthosis's mechanics design outline shows that is the exact position of the involved knee joint, in which  $\theta = 0$  rad refers to complete leg extension,  $\theta = \pi/2$  rad is the resting condition, and  $\theta = 3\pi/4$  rad is the maximal leg flexion.

The top and bottom halves of the motorized exoskeleton each have (1DoF). An active segment of a DC brushless motor drives the top portion. Typically, the person leg and the incorporated motorized exoskeleton constitute up the system. The exoskeleton is a piece of machinery that is fixed to the participant's knee using straps and fits properly on that leg. The corresponding models for the shank and orthosis will be derived similarly. It is based on the kinematic concept of materials in rotational:-

$$J\ddot{\theta} = \sum \tau_i \quad (1)$$

$J$  represents the overall inertia, and  $\tau$  represents the torques applied to every joint's leg orthosis. The lower leg joint orthosis model can be expressed as follows using the Lagrangian formulas (Han ,2009; Hala et al.;2012; Kashif et al.,2019):

$$J\ddot{\theta} = -\tau_g \cos\theta - A \operatorname{sgn}\dot{\theta} - B\dot{\theta} + \tau_h + \tau_e \quad (2)$$

Where  $\dot{\theta}$  and  $\ddot{\theta}$  are, respectively, the lower leg angular velocity and acceleration, and  $\theta$  is the knee joint angle between the exact place of the shank and the fully adjustable location, while  $\tau_e$  is the desired exoskeleton torque. The solid friction factor, viscosity friction coefficient, gravity torque, and person disturbance torque are denoted by the letters  $A$ ,  $B$ ,  $\tau_g$ , and  $\tau_h$ . The measurements of the adult limb are listed in Table 1 (Hala et al.,2012; Kashif et al.,2019).

Figure 1. An exoskeleton around the knee

## 2.2 ADRC design

In the remainder of this work, an ADRC is intended to manage the following issue for the knee joint 1-DoF controller framework presented in the section 2.1. The outline of the planned control framework is displayed in Figure 2.

Figure 2. ADRC structure

To prevent overflow and enhance control performance, divide the reference input signal into two parts. The first portion should represent the desired trajectory, and the second should be its derivative. Consider the powerful framework in equation (2) that can be represented by the development of a second order nonlinear conceptual framework:

$$\ddot{\theta} = f(t, \theta, \dot{\theta}, w) + b\tau \quad (3)$$

$b$  is a boundary that is an established one. The abbreviation " $f$ " refers to the combined effect of internal and external influences. In actual situations, it is usually difficult to get an exact mathematical representation of  $f$ . ADRC offers a really important solution to this problem. The key idea is that, if  $f$  can be evaluated gradually in some fashion, it will typically be dropped using the control action,

turning equation (3) into a second integration process. In other words, a time - variant unidentified system of equation 2 is roughly decreased to a continuous - time basic system that may be successfully regulated using, for example, a PD regulator. This ingenious idea is what changes a control problem into an estimating problem. The following is how the suggested layout is presented:-

### A- Extended-state observer (ESO)

The structure in equation (2) can be expressed using the state space form shown as :(Han, 2009;Wammeedh et al.,2020; Amjad,2018)

$$\begin{aligned} \dot{x}_1 &= x_2 \\ \dot{x}_2 &= x_3 + b_o \tau \end{aligned} \quad (4)$$

$$\begin{aligned} \dot{x}_3 &= \hat{f} \\ y &= x_1 \end{aligned}$$

When equation (4) expressed in state-space matrix notation:-

$$\begin{aligned} \dot{x} &= Ax + B\tau + Eh \\ y &= cx \end{aligned} \quad (5)$$

Where

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 0 & 0 & 0 \end{bmatrix}, B = \begin{bmatrix} 0 \\ b \\ 0 \end{bmatrix}, E = \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}, c = \begin{bmatrix} 1 & 0 & 0 \end{bmatrix} \quad (6)$$

The observer of equation (5), in this case takes the form of the most widely used linear Luenberger-like estimator, which is:-

$$\begin{aligned} \dot{\hat{x}} &= A \hat{x} + \hat{b} \tau_c + L (y - \hat{x}_1) \\ \hat{y} &= C \hat{x} \end{aligned} \quad (7)$$

Where,  $\hat{x} = [\hat{x}_1 \ \hat{x}_2 \ \hat{x}_3]^T$  is the respective vectors representing estimates for  $y$ ,  $\dot{y}$ , and  $f$ . Since the state vector in equation 4 is expanded to include  $f$  and this observer is made to offer an estimate of that, it is known as the ESO. When properly planned and executed, the observer equation (7) will track the plant in equation (5). The pole-placement approach, for instance, can be used to

determine the variable vector  $L$  (Mefoued,2014). Let the characteristics equation for the ESO design be as follows for simplicity:-

$$Q(s) = |SI - (A - LC)| = (S + w_o)^3 \quad (8)$$

And the observer gains can be calculated as:-

$$L = [3 w_o \quad 3 w_o^2 \quad w_o^3] \quad (9)$$

There are just two borders in the ESO:  $b_o$  and  $w_o$ . Engineers are familiar with the former, and it can also be obtained by open-loop system response or ( $b \approx b_o$ ). The final stage is an adjusting parameter that increases the observer's bandwidth. Productivity and noise sensitivity can indeed be significantly compromised by tuning  $W_o$ .

The state space equation (4) can be expressed as (Wameedh et al., 2021) to modify ESO for increasing the ADRC performance.

$$\begin{aligned} \dot{x}_1 &= x_2 \\ \dot{x}_2 &= -w_c^2 x_1 - 2w_c x_2 + x_3 + b_o \tau \quad (10) \\ \dot{x}_3 &= \dot{f} \\ y &= x_1 \end{aligned}$$

Where  $w_c$  controller bandwidth. The desired closed-loop transfer function given by:-

$$\frac{Y(s)}{R(s)} = \frac{w_c^2}{s^2 + 2w_c s + w_c^2} \quad (11)$$

The modified ESO for equation (10) and related to equation (7) is:-

$$\begin{aligned} \dot{z}_1 &= z_2 + \alpha_1 (y - \hat{y}) \\ \dot{z}_2 &= -w_c^2 z_1 - 2w_c z_2 + z_3 + b_o \tau + \alpha_2 (y - \hat{y}) \\ \dot{z}_3 &= \alpha_3 (y - \hat{y}) \\ \hat{y} &= z_1 \end{aligned}$$

The modified observer gains are calculated as:-

$$\begin{aligned} \alpha_1 &= 3w_o - 2w_c \\ \alpha_2 &= 3w_o^2 - w_c^2 - 2w_c \alpha_1 \\ \alpha_3 &= w_o^3 \end{aligned} \quad (12)$$

As seen from the equation (12), the first parts of it is the same as equation (9).

### B- Controller design

Where estimate of  $x_3 \approx f$ , it can be get the control strategy :- (Han,2009; Mefoued,2014)

$$u = \tau = \frac{(w_c^2 r - f)}{b_o} \quad (13)$$

So that reduce equation (3) to simple second order:

$$\begin{aligned} \ddot{y} &= \ddot{\theta} = -2w_c \dot{y} - w_c^2 y + f + \\ b_o \left( \frac{-z_3 + w_c^2 r}{b_o} \right) &\approx -2w_c \dot{y} - w_c^2 y + w_c^2 r \end{aligned} \quad (14)$$

Equation (14) is identical to equation (11), when represent as transfer function. To calculate  $w_c$  and  $w_o$ , these related to design specifications, specially the settling time  $T_s$ , so that (Chen ,2011; Gao,2003):-

$$w_c = \frac{10}{T_s} \quad (15)$$

In this study, if select  $T_s=0.4$ sec, then  $w_c = 24.5$ rad/sec and the value of observer bandwidth  $w_o$  is calculated as  $w_o = 4w_c$  (Gao, 2003). Figure 3 show modified ADRC for any order.

**Figure 3.** ADRC with modified configuration

### 3. Simulation result and discussion

This part considers a numerical simulation to show the performance of the proposed control method. The following conditions are selected for equation (2):- (Hala et al.,2012; Kashif et al.,2019)

$$\begin{aligned} J &= 0.4 \text{ kg. m}^2, A = 0.6 \text{ N. m, } B = \\ &1 \text{ N. m. sec. rad}^{-1} \text{ and } \tau_g = 5 \text{ N. m.} \end{aligned}$$

**3.1 Without effect of disturbance**

The proposed ADRC and comparing with PID controller were tested by carrying out the simulation in MATLAB(2020b) MathWorks. In this work the desired trajectory of the knee joint is taken as predefined by the doctor is (sinusoidal input) with magnitude (0.5) and frequency (2rad/s) and for general test signal(step input). In this case the performance of the proposed ADRC is compared with classical controller (PID) without external disturbance. The PID controller settings ( $K_p = 150$ ,  $K_i = 80, K_d = 15$ ) are calculated by trial and error and some tuning. The observer gains of equation 12 are ( $\alpha_1 = 239, \alpha_2 = 16501, \alpha_3 = 941192$ ). Figure 4 show the trajectory tracking performance of mentioned controllers for the knee joints for step input and Figure 5 for sin input.

**Figure 4.** Trajectory tracking comparison between ADRC and PID controller without disturbance for step input

As seen from Figure 4 the maximum overshoot  $M_p=0.005\%$  for ADRC and  $M_p=14.4\%$  for PID controller, while the transient response speed for ADRC is very high, when compared with PID to reach the steady-state. The root mean square error (R.M.S.E) for ADRC is(0.0024rad), while for PID is(0.982rad). The trajectory tracked by ADRC has best reference tracking than PID controller. For sin wave input as shown in Figure 5,

also it is clear that the differences in transient trajectory and appear the improvement of ADRC.

**Figure 5.** Trajectory tracking comparison between ADRC and PID controller without disturbance for sine input

**3.2 With effect of disturbance**

We also assess the ADRC and PID control's ability to reject perturbations only with introduction of a permanent disruption. They are all set to produce the very same closed loop response. After attaining steady state, a unit step perturbation of magnitude (5N.m) is introduced to every control loop for a one-second duration. From Figure 6, it is clear that ADRC corrects the disturbance much more quickly, ensuring that its impact on the control variable stays minimal. Though PID controller could also be compensated with high overshoot and take more time to reach the steady state. This state also can be conclude for sine input signal as shown in Figure 7.

**Figure 6.** Trajectory tracking comparison between ADRC and PID controller with constant disturbance for step input

**Figure 7.** Trajectory tracking comparison between ADRC and PID controller with constant disturbance for sine input

### 3.3 Validity of ESO

The way to the success of the ADRC is the ESO, which empowers the regulator to effectively make up for the progressions in the dynamics (inertia) or the unsettling influences. To see the adequacy of the ESO, we plot the estimation state ( $Z_3$ ), against its objective (total disturbances), and complete unsettling influences, which is the subordinate of  $f(\cdot)$ . In Figure 8, it is shown that  $Z_3$  tracks, the complete aggravations  $f(\cdot)$  intently and R.M.S.E value is (0.07058rad). This permits the control law  $u(t)$  to move the plant in Equation 3 to a roughly double integrator, which can be effortlessly controlled with the PD controller. Figure 9 shows the transient trajectory error at force aggravation (sin wave) with magnitude (1) and frequency (0.5rad/s) with R.M.S.E value is (0.004262rad).

**Figure 8.** Total disturbance and its estimation

**Figure 9.** ADRC position tracking error

## 4. Conclusion

This study proposes a dynamic representation and reproduction of an exoskeleton-assisted knee joint exercise recovery system. This paper shows a control scheme for a 1-DoF exoskeleton leg's trajectory tracking. By reproducing for various input kinds, the suggested control engineering's reasonability is evaluated (step, sine). The main goal is to exercise the knee joint with the aid of an exoskeleton, ensuring a consistent and steady movement design. This type of scheduled restoration framework is desired for medical helpful practice in the COVID-19 situation to ensure the separation relationship while providing the types of support to the patients. The fundamental goal of this work is to draw out the advantage of arranging control techniques towards hearty methodology for human help and restoration cycles to make up for changes in the human-orthosis elements. Two different control laws (PID, ADRC) were tested in different operational scenarios. The results reveal that, when compared to the PID controller, the ADRC controller exhibits the least error and the smallest overshoot. When such perturbations are present, the modified ADRC controller performs as desired in respect of position error. Although the estimation error tends to reduce as observer bandwidth rises, this has the opposite effect on control action, which rises as observer bandwidth increases, particularly with step input. For showing the effectiveness of ESO, it is clear that the extra

estimated state variable ( $z_3$ ) can be cancelled the total disturbances (external torque and uncertainties) with R.M.S.E is (0.07058rad) and the error between the reference input ( $r$ ) and the position trajectory output ( $y$  or  $\theta$ ) is almost equal zero, with R.M.S.E is(0.004262rad). This research can be expanded in the future by including new observation techniques or

designing additional control systems, either to improve the ADRC or to compare performance (Humaidi et al.,2018a; Aljuboury et al.,2022; Humaidi et al.,2018b; Nasir et al.,2022; Alawad et al., 2022; Shaymaa et al., 2022). The suggested controller for 2-DOF of motion, which is used with the Knee-Hip Exoskeleton system, may be expanded in future study.

## CARDIOVASCULAR DISEASE RISK PREDICTION USING DEEP LEARNING

**Abstract:** An unhealthy lifestyle is a direct result of today's hectic schedule, which contributes to anxiety and depression. There is a tendency to resort to excessive drug use in order to overcome these conditions. Numerous dangerous diseases, including cancer, cardiovascular disease, are brought on by all of these factors. The World Health Organization (WHO) says that Cardio Vascular Diseases (CVDs) cause the most deaths worldwide. They have become extremely common over time and are now putting much strain on nations' healthcare systems. Rapid, precise, and prompt clinical evaluation of disease severity is essential at this stage. An efficient data prediction based on deep learning was proposed in this work to assist in healthcare systems' decision-making and logistical planning. The Long Short Term Memory (LSTM) classifier's efficacy can be demonstrated by employing our method on the MIMIC-II database, which is freely accessible. Our proposed method improves prediction accuracy, as demonstrated by experiments.

**Keywords:** Long-Short Term Memory (LSTM), Artificial Neural Networks (ANN), Recurrent Neural Network (RNN)

### 1. Introduction

The healthcare industry is producing an enormous amount of data at a rapid rate. A machine learning dataset typically consist of multiple instances or examples, each of which has a set of features or attributes that describe it. The data in a data set can take many forms, including numerical values, images, text and more. The digitization of healthcare data, including biomedical images, clinical text, genomic data, Electronic Health Records (EHRs), sensing data, biomedical signals, and social media, has led to the rise of data [1,2]. The healthcare industry generates a large amount of primary and secondary data [1,2]. By 2025, the total amount of data produced around the world is expected to reach 175

zetabytes, representing an increased annual growth rate of 61 percent [3]. Only 22% of all data, according to the 2012 Digital Universe Study by International Data Corporation (IDC), could be analyzed. By 2020, the proportion of beneficial data would rise to 37% [4]. This has sparked a lot of interest in using access to healthcare data to improve patient quality and cut costs. Automated tools and novel techniques that can assist in the intelligent transformation of vast amounts of data into useful information and knowledge have become urgently required as a result of the explosive increase in stored or transient data [5]. Today, the healthcare industry generates a lot of intricate data about a patient's disease and diagnosis. Data resources from hospitals and medical devices are difficult to process

---

Email: [msv@vcet.ac.in](mailto:msv@vcet.ac.in)

manually, and loading them into a conventional relational database for analysis takes time and money [6].

The most prominent fields of study that aid the empowered individual in uncovering buried data for efficient decision-making are statistics and data mining. Quantification and evaluation of outcomes are facilitated by a solid foundation in statistics. However, before they can be used in data mining, statistics-based algorithms must be adjusted and scaled [7]. One of the most useful methods for obtaining useful information from large data sets is data mining [8]. Cardiovascular diseases (CVDs) are the most prevalent and widespread diseases in India and the world [11]. The World Health Organization (WHO) estimates that heart disease-related deaths account for more than 12 million deaths annually [12]. 17.9 million CVD deaths were estimated, and that number would rise to 24.2 million by 2030 [13, 15]. Heart disease and cardiovascular disease, which encompasses a wide range of conditions that affect the heart and blood vessels, are frequently used interchangeably [14]. Ischemic heart disease, rheumatoid arthritis, congenital heart disease, cardiomyopathy, valvular heart disease, aortic valve stenosis, and atherosclerosis are all examples of cardiovascular diseases [15]. Echocardiography records are the sole focus of this work's statistical and data mining tools and methods for cardiovascular disease. As a result, the significance of echocardiography data for CVD prediction will be discussed in the following section.

### **1.1 Recent literature review**

Nikam, A. et al proposed machine learning techniques to predict cardiovascular disease using features. BMI is one of the highlighting features we used for prediction. BMI is important in predicting cardiovascular disease.

The main focus of the article is the effect of BMI on the prediction of cardiovascular disease. The model has proposed with different features as well as regression and classification techniques. Conclude that BMI is a significant factor while predicting cardiovascular disease.

Mostafa, N et al analyzed some common physiological attributes to identify a pattern among the people having a cardiovascular disease which, in further, has been used to distinguish whether a person has a risk of developing cardiovascular disease or not.

Ema, R. R et al proposed a new hybrid model based on Fuzzy C-means and Artificial Neural Networks (ANNs) with Principle Component Analysis that is capable to predict heart disease. The Principal Component Analysis is used to select the important features from the dataset. Then Fuzzy C-Means Clustering is used to cluster the extracted data from PCA and finally, Artificial Neural Network is used to predict Cardiovascular Disease.

## **2. Proposed system**

Using these structured data and deep learning models to predict cardiovascular disease, which is global concern. A proposed model of the Long-Short Term Memory (LSTM) model based on the attention mechanism was presented in this chapter to address the issue of the LSTM model's low accuracy in CVD prediction. From the long sequence of CVD data at the moment, the proposed model can learn the importance of each past value to the current value, allowing for the elimination of more valuable features. Developed a dataset for experiments with the CVD data from Wuhan's core, and compared the improved model's performance to that of the original LSTM model.

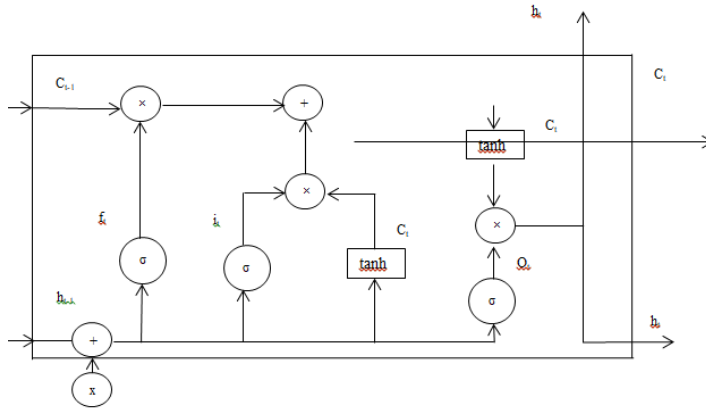

### 2.1 Construction of the attention-LSTM model

The LSTM model's fundamentals will be briefly discussed. As depicted in Figure 1., LSTM is a type of recurrent neural network.

However, compared with the conventional RNN, the structure of this repeated module A of LSTM is more complicated, as shown in Figure 2

**Figure 1.** Recurrent neural network (RNN)

**Figure 2.** The structure of LSTM cell

The forgotten gate, the input gate, and the output gate are the three components that make up this module. The Sigmoid function returns a number between 0 and 1, indicating how much of each part can pass.

$$F_t = \sigma(W_f \cdot [h_{t-1}, x_t] + b_f) \quad (1)$$

$$i_t = \sigma(W_i \cdot [h_{t-1}, x_t] + b_i) \quad (2)$$

$$\bar{C}_t = \tanh(W_c \cdot [h_{t-1}, x_t] + b_c) \quad (3)$$

$$C_t = f_t \cdot C_{t-1} + i_t \cdot \bar{C}_t \quad (4)$$

$$o_t = \sigma(W_o \cdot [h_{t-1}, x_t] + b_o) \quad (5)$$

$$h_t = o_t \cdot \tanh(C_t) \quad (6)$$

One of them is  $f_t$ , which tells us how much information we want to throw away. It decides how much additional data we should include. It decides how much data we want to send out. At time  $t$ , the input is  $x_t$ ; the previous gate's output is  $h_t$ ; the weights are  $W_f$ ,  $W_i$ ,  $W_c$ , and  $W_o$ ; the bias is  $b_f$ ; the cell state is at the previous moment  $C_{t-1}$ ; and the

cell state at the current moment is  $C_t$ .

#### Attention-LSTM Model

Because it is difficult for the model to learn information from a distant past that may be crucial to the current value. We tried to add an attention layer to the LSTM network to fix the flaw. We can apply it to the LSTM model by referring to the steps in [9] for implementing attention. As depicted in Figure 3. The LSTM model now includes an attention layer.

Among them,  $X_i$ ,  $i \in (1, n)$  is the input,  $h_i$  is the intermediate output result of each cell,  $h_i$  are input into each attention model as  $H$ , and the elements of the next layer  $h_i$  are used as  $H$  to calculate the similarity and weight coefficient, and finally get the attention coefficient. The specific attention model is shown in below figure.

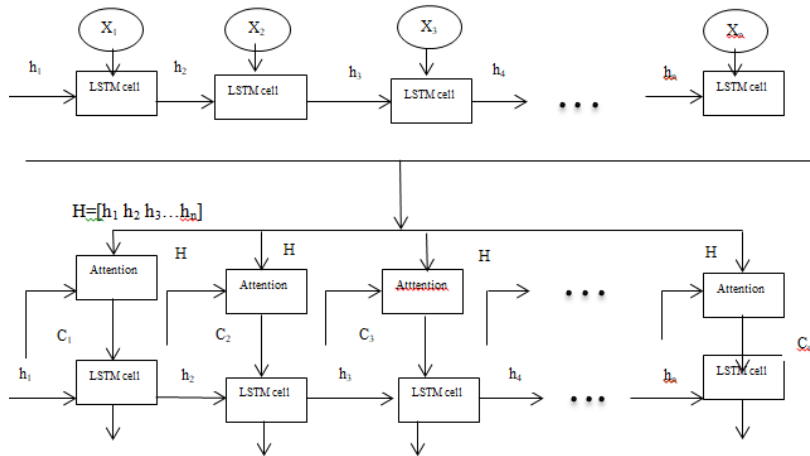

Figure 3. The process of adding an attention mechanism to the LSTM model

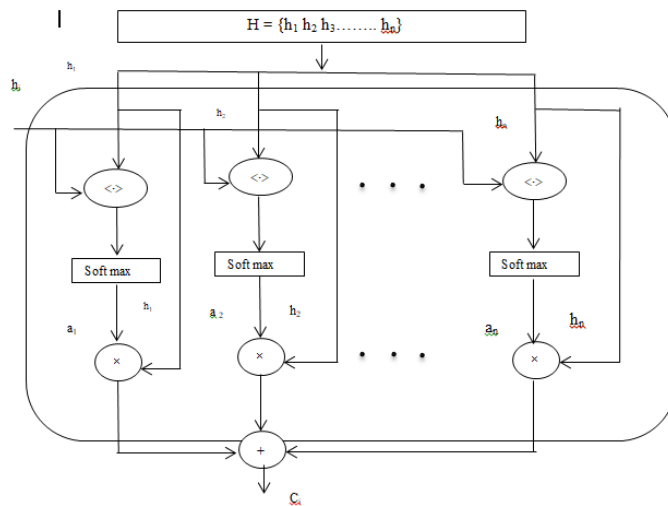

Figure 4.

Where, the similarity between the current element and the intermediate output result in the previous layer, and then normalized by the softmax function to obtain the corresponding weight coefficient  $a_i$ . Finally, a weighted summation operation is performed to obtain the Attention value  $C_i$ . The formula used in the attention layer is as follows:

$$H = [h_1 \ h_2 \ \dots \ h_n] \quad (7)$$

$$H' = [h'_1 \ h'_1 \ \dots \ h'_i] \quad (8)$$

$$\text{sim}_i = H'_i \cdot H^T \quad (9)$$

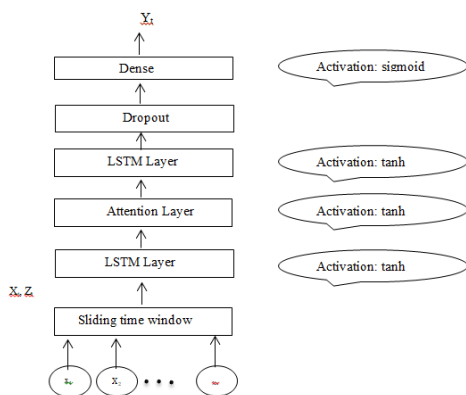

$$a_i = e^{\text{sim}_i} / \sum_{j=1}^{L_h} e^{\text{sim}_j} \quad (10)$$

$$C_i = \sum_{j=1}^{L_h} a_i \cdot h_j \quad (11)$$

In the above equations, uses vector  $H$  and  $H'$  to calculate similarity to obtain weights, uses the softmax function to normalize the weight, uses the normalized weight  $a_i$  and  $h_j$

weighted sum. The result of weighted summation is the attention weight value  $C_i$ . The implementation of the Attention layer is to retain the intermediate output results of the input sequence by the LSTM encoder, and then calculate the similarity amongst the intermediate output results of the previous layer and the current output to obtain the weight factor, and finally obtain the attention coefficient.

**Figure 5.** Attention-LSTM network architecture.

As shown in above Figure, we use the original traffic flow data to construct a feature matrix and label vector through a sliding time window method, and obtain the attention weights based on the correlation between the values in matrix  $X$  and the values in vector  $Z$  through the attention layer and generate the final prediction  $Y$ .

### Proposed algorithm 1

Input: CVD data

Output: A trained Attention-LSTM model.

1. Construct a dataset with a sliding time window, including  $X_t$  and  $Z_t$ .
2. Normalize the values  $X_t$  and  $Z_t$ .
3. Input features matrix  $X_t$  and current disease vector  $Z_t$  are given to A-LSTM network.
4. While training epoch does not reach the set value

5. Put  $(X_t, Z_t)$  into the Attention-LSTM network for forward propagation.
6. Calculate the attention weight corresponding to each element
7. Generate  $Y_t$
8. Calculate mean square error.
9. Use RMSProp update weights for A-LSTM network.
10. End the while loop
11. Return A trained Attention-LSTM model.

The performance of the LSTM model based on the attention mechanism is verified for long time series and large prediction lag time. All prediction models use the same data set and are built in the same way. In the LSTM model, we set 2 hidden layers, the number of hidden layer neurons is 64 and 64, and the learning rate is 0.05. The network optimizer is also RMSprop. The process of Attention-LSTM model training is shown in Algorithm 1.

### 3. Conclusion

An Attention-LSTM model is made by adding an attention layer to the existing LSTM model in this project. Experiments also demonstrate that long-sequence data prediction is reliable. The Attention-LSTM model's construction process was described, and its performance was evaluated with actual CVD data sets. Prediction accuracy is improved by our proposed scheme, as demonstrated by experiments. The application of the model with the attention layer to the time series was the sole focus of this study. We can use attention mechanisms to take into account the spatial correlation of traffic flow in subsequent research.

## CLASSIFICATION OF BRAIN TUMOR USING CONVOLUTIONAL NEURAL NETWORK

**Abstract:** *The brain is one of the vital organs of the human body and is made up of billions of cells. The abnormal, uncontrolled division of cells, also called brain tumors, puts tremendous pressure on various nerves and blood vessels and can cause irreversible damage to the body. Brain tumors can be benign (non-cancerous) and malignant(cancerous). One of the most common techniques for diagnosing brain tumors is magnetic resonance imaging (MRI), which provides detailed images of the brain. MRI images can be processed to segment brain tumors. These tumors can be segmented using various advanced machine learning algorithms and image segmentation techniques. In this paper, we propose the classification of brain tumors as glioma, meningioma, and pituitary tumor using a convolutional neural network framework. This demonstrates the efficiency of deep learning techniques to detect brain tumors using his MRI images of the brain. Performance is measured in terms of training accuracy and testing accuracy. This work was performed using an MRI image data set as input, and further preprocessing and segmentation were performed to enhance the images. The CNN ResNet50 framework ensures effective super-resolution of brain images, ensuring better tumor classification with high accuracy, especially for early cancer nodules.*

**Keywords:** *Brain Tumor; CNN Architecture; Deep Learning; Classification*

### 1. Introduction

Brain tumors are nodules that form as a result of inappropriate proliferation of brain cells and loss of brain regulatory mechanisms. There are over 130 types of brain and nervous system tumors. The World Health Organization (WHO) has classified brain tumors according to malignancy. These may be malignant (cancerous) or benign (noncancerous), and in either case brain tumors can be harmful or life threatening. Early diagnosis and treatment of brain tumors minimizes mortality. MRI is one of

the preferred scans for radiologists and doctors to diagnose brain tumors. It provides detailed 2D images of organs and tissues that can be used for both screening and staging various types of cancer. Observing the tumor growth pattern from a patient's MRI images reveals the type and grade of brain tumor. This brain tumor dataset includes 3064 T1-weighted contrast enhanced images from 233 patients with three types of brain tumors: meningioma (708 slices), glioma (1426 slices), and pituitary tumor (930 slices). Meningioma – Usually benign tumors that arise from the meninges, the membranes that

---

Email: [kk@vcet.ac.in](mailto:kk@vcet.ac.in)

line the brain and spinal cord. Glioma is a type of tumor that arises from glial cells in the brain or spine. Gliomas account for approximately 30% of all brain and central nervous system tumors and 80% of all malignant brain tumors. A pituitary tumor is an overgrowth of the pituitary gland. The pituitary gland is a small gland at the base of the brain. Regulates the balance of many hormones in the body. Most pituitary tumors are benign (benign). Various CNN-based methods have been proposed for classifying brain tumors. With such a procedure, 3 types of tumors. Meningioma, glioma, and

pituitary tumors were classified. In this article, we present a method to classify brain tumors into meningioma, glioma, and pituitary tumors using a deep neural network with Resnet 50 architecture.

## 2. Proposed methodology

Our proposed approach is based on deep learning applying convolutional neural network (CNN) algorithms. Figure 1 shows a block diagram representation of the proposed brain tumor classification system.

**Figure 1.** Block diagram representation of the proposed brain tumor classification system.

### 2.1 Image acquisition

Experiments are performed on MRI image datasets of brain tumors. This brain tumor dataset includes 3064 T1-weighted contrast enhanced images from 233 patients with three types of brain tumors: meningioma (708 slices), glioma (1426 slices), and pituitary tumor (930 slices).

**Table 1.** Type and number of Slices of Brain tumor images

TYPE OF TUMOR	NUMBER OF SLICES
Meningioma	708
Glioma	1426
Pituitary tumor	930

Split the dataset for training using a cross-validation method. There are 3064 T1-weighted contrast-enhanced images, of which 70% are for training, 15% are for validation, and 15% are for testing to assess the accuracy of the model. Out of the 3064 images available, the number of training samples is 21, the number of validation samples is 60, and the number of test samples is 60.

**Figure 2.** MRI dataset of different types of brain tumors

## 2.2 Image pre processing

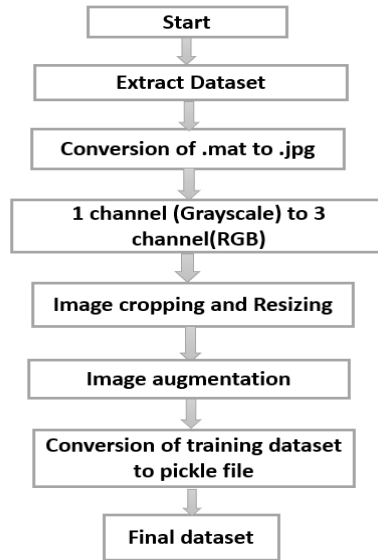

The preprocessing step improves the standard of brain tumor MR images and makes these images suitable for future processing by clinical experts or imaging modalities. It also helps in improving the parameters of MR images. Preprocessing can remove unwanted distortions and improve certain qualities that are essential for the application we are working on. These properties can be changed depending on the application. In order for the software to work properly and produce the desired results, the images must be preprocessed.

Data preprocessing consists of the following steps, which are described below.

Step 1: Convert data to image format.

Use matplotlib library to open MATLAB array file using h5py Python library and save image in his JPG format. This provides

an image dataset for training the Python library model. pydicom, which is used to read images in DICOM format. The NumPy library is used to process image arrays and the OpenCV library is used to save files in his JPEG image format. This provides an image data set for testing and validation.

**Figure 3.** Flowchart for Image Pre-processing

Step 2: Increase Image Channels

Open the image using the OpenCV library and convert the image from 1 channel (i.e. grayscale) to 3 channels (i.e. RGB channels).

Step 3: Crop and Resize Images:

OpenCV (Open Source Computer Vision Library) is an opensource computer vision and machine learning software library. Used to reduce the size of the image to 512 x 512 to make the image a generalized resolution. This is necessary because the input images of the deep learning model must be of the same resolution.

Step 4: Augment the Image:

Augmenting the image data refers to modifying an existing image by making

changes to the existing image and including the modified version in the neural network's training data set. Modifications can be as simple as rotating, cropping, zooming, flipping, etc. Image augmentation is used to generate a custom dataset class that augments each image to different angles (0,5, 90, 120, 180, 270, 300, 330 degrees). As a result, data can be loaded, augmented, and trained in real time, rather than caching all training samples in memory for augmentation. After image augmentation, the number of augmented training samples is 17152, the number of augmented validation samples is 3680, and the number of augmented test samples is 3680.

**Figure 4.** Data augmentation applied on a given dataset

### 2.3 Dataset labeling

Data labeling is a machine learning process that identifies raw data and adds one or more descriptive and informative labels to provide context. Pickle is a handy Python tool that helps us to share, commit, and reload pretrained machine learning models. Used to serialize and deserialize Python object structures. Pickling is a technique for converting Python objects (lists, dictionaries, etc.) into character streams. This character stream is supposed to provide all the data needed to recreate the object in another

Python function. Accurate data labeling improves quality assurance within machine learning algorithms and enables model training and delivery of expected outputs.

### 3. Architecture for brain tumor classification

Convolutional Neural Networks (CNNs or Convnets) are a subset of machine learning. In deep learning, a convolutional neural network (CNN) is a type of artificial neural network commonly used for image/object detection and classification. So deep learning uses his CNN to recognize objects in images. The convnet's job is to compress the image into a manageable format while preserving the important factors for good prediction. This is important for designing architectures that are scalable to large datasets yet still capable of feature learning. CNN output layers typically use neural networks for multiclass classification. CNNs use feature extractors in the training process instead of manual implementation. A CNN's feature extractor consists of a special type of neural network that determines the weights through the training process. Pooling in convolutional neural networks is a technique for generalizing features extracted by convolutional filters, allowing the network to recognize features regardless of their location in the image. There are several approaches to pooling. The most commonly used approaches are max pooling and average pooling.

**Figure 5.** Basic Architecture of Convolutional Neural Network

ResNet-50 is a 50-layer convolutional neural network (8 convolution layers, max pool layer, average pool layer). A residual neural network is a type of artificial neural network (ANN) that stacks residual blocks to form a network. A 50-layer ResNet uses a device bottleneck design. The bottleneck remainder block uses a  $1 \times 1$  convolution known as the "bottleneck". This reduces the number of parameter and matrix multiplications. This makes training for each shift much faster. Use a 3-layer stack instead of 2. A  $7 \times 7$  kernel convolution alongside 6 other kernels with strides of size 2. Max pooling layers in increments of 2.9 layers –  $3 \times 3.6$  kernel convolutions, another layer with  $1 \times 1.6$

kernel, third layer with  $1 \times 1.256$  kernel. Repeat this 3 layers 3 times. 12 more layers with  $1 \times 1,128$  cores,  $3 \times 3,128$  cores, and  $1 \times 1,512$  cores, iterations. Over 18 layers of  $1 \times 1.256$  core and 2 cores  $3 \times 3.256$  and  $1 \times 1.102$ , 6 iterations. Repeat 9 layers of  $1 \times 1.512$  cores,  $3 \times 3.512$  cores, and  $1 \times 1.208$  cores three more times. Average pooling followed by a fully connected layer of 1000 nodes using the softmax activation feature. Skip connections were introduced to solve different problems in different architectures. ResNets solved the degradation problem by skipping connections.

Figure 6. The proposed Resnet50 CNN architecture

## 4. Experimental setup and analysis

### 4.1 Confusion Matrix:

A machine learning confusion matrix (figure 7) is a matrix used to determine the performance of a classification model on a given test data set. It can only be determined if the true value of the test data is known. The matrix itself is easy to understand, but the associated terminology can be confusing. Also known as the error matrix because it shows the errors in the model's performance in the form of a matrix

### 4.2 Evaluation Parameters

Quantitative analysis is performed using the following metrics: Accuracy is defined as the proportion of correctly labeled subjects out of the total number of subjects. Precision is the ratio of true positive marked samples to all positive marked samples. The harmonic mean (average) of precision and recall is the F1 score.

$$\text{PRECISION} = \frac{tp}{(tp+fp)} \quad (1)$$

$$\text{RECALL} = \frac{tp}{(tp+fn)} \quad (2)$$

$$\text{ACCURACY} = \frac{(tp+tn)}{(tp+tn+fp+fn)} \quad (3)$$

where,

tp = Number of positive targeted cases which are positive,

tn = Number of negative targeted cases which are negative.

fp = Number of positive targeted cases which are negative.

fn = Number of negative targeted cases which are positive.

Figure 7. Confusion matrix

Figure 8. Training performance

**Table 2.** Performance Metrics:

Validation accuracy	98.88%
Test loss	0.0096
Test accuracy	99.32%
Recall	1.00
Precision	0.98
F1-score	0.99

From the table 2, we can see that using the ResNet-50 architecture yields the best accuracy of 99.32%, validation accuracy of 98.88%, test loss of 0.96%, and accuracy of 98%.

This skeleton is saved in .pt format using Torch Vision's built-in functionality. This file contains values for the trainable parameter. Another Python file downloads the Torch Vision framework and updates the stored weights. This framework is used for brain tumor classification of images stored in databases. To make the model available in real time, a web page is created containing pistons where MR images can be uploaded and tumors can be classified.

**Figure 9.** Screenshot of the home page

Click Upload Image and a check box will appear to select a brain MR image in JPG or

## 5. Conclusion

The main aim of this study is to classify brain tumors into three classes: meningiomas, gliomas and pituitary tumors. This paper presents an automated brain tumor classification method using DL- and ML-based techniques. MRI images are preprocessed, enhanced, and matched to a fine-tuned CNN model. B. ResNet-50, for tumor classification. After training the framework, the proposed model achieved the highest classification accuracy with minimal computational effort. Achieves a high accuracy of approximately 99.32%. Validation accuracy is excellent and loss is minimal. As a result, this study can be used in the medical field to easily identify types of brain tumors.

**RELATIONSHIP BETWEEN UPPER ARM  
CIRCUMSTANCES AND COMPLIANCE  
WITH FE TABLET CONSUMPTION WITH  
THE INCIDENCE OF ANEMIA IN  
PREGNANT WOMEN AT EDUCATIONAL  
HEALTH CENTER IN 2022**

**Abstract:** *Anemia of pregnancy is a condition where red blood cells are reduced so they are unable to carry oxygen to all tissues. Pregnant women are anemic with hemoglobin levels <11 g%. Based on the preliminary study of interviews with 10 pregnant women, there were 5 pregnant women with anemia (50%) and 5 people without anemia (50%), pregnant women who were anemic with bad lingkarlenganatas (LILA) but adherent to taking Fe tablets 2 people ( 20%), 2 people (20%) had bad anemia but did not comply with taking Fe tablets, 1 pregnant woman had bad anemia but adhered to consuming Fe tablets (10%), pregnant women with good LILA anemia but did not adhere to consumption of Fe tablets as many as 0 people (0%), and pregnant women with no severe LILA anemia but obediently consuming Fe tablets 3 people (30%),The analytical method and cross-sectional study design used accidental sampling technique, namely mothers who came for antenatal care at the East Anvil Ulin Health Center, totaling 36 respondents. Questionnaires on compliance with the Guttman scale, LILA measurements before administering the questionnaire and anemia data were obtained from the MCH handbook. Most pregnant women with Bad LILA and experienced anemia as many as 8 respondents (33.3%) with the results of the chi square statistical test,  $p \text{ value} = 0.001 \leq \alpha (0.05)$   $H_0$  is rejected, meaning there is a relationship between LILA and Anemia in pregnant women. Most of pregnant women in the category of high compliance and anemia totaling 9 respondents (81.8%) with the results of the chi square statistical test,  $p \text{ value} = 0.036 \leq \alpha (0.05)$   $H_0$  is rejected, so there is a relationship between the level of adherence to consumption of Fe Tablets and the incidence of anemia in pregnant women.*

**Keywords:** *Upper arm circumference, compliance with Fe tablet consumption, anemia*

## 1. Introduction

Pregnancy is a very important period of life. The health of the baby being born depends on the mother who is pregnant. One of the factors that affect maternal health is the state of maternal nutrition (Ministry of Health, 2019). Physiological changes during pregnancy, namely blood volume increases blood volume during pregnancy by 50% and red blood cell mass increases by 20-30% (Watika, 2019).

Anemia in pregnancy is a condition in which red blood cells in blood circulation or hemoglobin mass are reduced so that they are unable to fulfill their function as oxygen carriers throughout the tissues. Pregnant women are said to be anemic if their hemoglobin in the blood is less than 11 gr%. The danger of anemia in pregnant women does not only affect their own safety, but also that of the fetus they contain. (Ulfa, 2020).

During pregnancy, blood volume will circulate gradually and progressively from 6 weeks of gestation, it will continue to increase at 14-14 weeks of gestation. 27 weeks. At 32-34 weeks. This increase in blood volume becomes a blood supply to the uterus, breasts, kidneys, skin and a number of other organs, as well as facilitating the exchange of gases and nutrients in the mother and fetus (Mochtar, 2019.)

Blood plasma volume increases by about 40% greater than the increase in the number of erythrocytes 20%. This causes hemodilution (blood dilution) causing anemia in pregnancy. Decreasing Hb levels in pregnant women can be overcome by fulfilling the nutritional needs of pregnant women, one of which is by giving iron supplement tablets or foods such as beans, liver and green vegetables (Denata 2020).

World Health Organization data (WHO, 2019), stated that the highest prevalence of anemia in pregnant women

was in India, China, Pakistan, Nigeria and Indonesia. Anemia of pregnant women occurs mainly in developing countries by 35-37% and in developed countries 18%. Indonesia is a developing country with a high rate of anemia in pregnant women. World Health (WHO) reports that the prevalence of anemia in pregnant women is Anemia in pregnant women who are in Banjar Regency is (23.75%), Banjarbaru is (19.62%) and Banjarmasin is (12.62%). It can be stated that the city of Banjarbaru has the second highest incidence of anemia in pregnant women and around 35-75% and increases with increasing.

Department of Health Data South Kalimantan Province (2019) (33.71%). Several factors affect anemia in pregnancy, namely age of the mother, mostly parity, distance of the gestational age (Dinkes South Kalimantan, 2019). Based on research results Basic Health (Riskesdas) year 2018, the prevalence of anemia in pregnant women in Indonesia increased to 48.9% compared to the 2013 Riskesdas which was 37.1% (Ministry of Health RI, 2019). Most of the causes of anemia in pregnant women in Indonesia are iron deficiency. Needs increase during pregnancy, low iron intake is one of the factors causing iron deficiency anemia.

Banjarbaru Health Office data found pregnant women with anemia in 2021 (January - December) of (2.29%), and in 2022 (January-June) an increase of (4.43%) with Anemia (Banjarbaru Health Office, 2021-2022). From the data from the East Ulin Foundation Health Center for 2021 (January-December) it was found that pregnant women with anemia were pregnancy, education, frequency of antenatal care, adherence of mothers to take iron tablets, infection and disease, knowledge and chronic energy deficiency (KEK). Poor nutritional status is also at risk of anemia in pregnant women 6 times higher (Mochtar, 2019).

Indicators for assessing the nutritional status of pregnant women, especially for detecting the risk of CED, use upper arm circumference (LILA) as a screening tool for CED in pregnant women and body mass index (BMI) for assessing CED status to detect good or bad nutritional status of pre-pregnancy (Susilajati, 2018). According to researchKurdanti (2020) recommends the use of LILA as a nutritional status screening in pregnant women, apart from due more practical in its use when compared with other anthropometric.

It is expected that the application of standards for antenatal care according to standards can comply with the incidence of anemia in pregnant women. The special service standards in efforts to prevent anemia in pregnant women include administering iron supplementation tablets. There are still many obstacles in the implementation of iron supplements that are often experienced, one of which is the compliance of pregnant women taking iron tablets according to recommendations is still low. Adherence to consuming blood-boosting tablets is a behavior of pregnant women that leads to a mutually agreed therapeutic goal, compliance in industry 4.0 (Fadilurrahman et al., 2021).

Hartatik(2018) explained that the characteristics of the mother (age, education and work) affect the mother's adherence to taking Fe tablets. And based on research by Nurmasari&Sumarmi (2019) it shows that pregnant women who make complete ANC visits have a lower risk of anemia. This is because pregnant women will get an early anemia examination. The preliminary study was conducted by interviewing 10 pregnant women. pregnant women with anemia (50%) and 5 people without anemia (50%), pregnant women pregnancy at the Anvil Ulin Health Center East Year 2022.2 people (20%) had anemia with bad LILA but adherent to consuming Fe tablets, 2 people (20%) had bad anemia but did not adhere to

taking Fe tablets, pregnant women with bad LILA anemia but adhered to taking Fe tablets 1 person (10%), pregnant women with good LILA anemia but 0 people (0%) did not adhere to taking fe tablets, and pregnant women with not bad LILA anemia but adhered to taking Fe tablets 3 people (30%), pregnant women with not good LILA anemia but 2 people (20%) adhere to the consumption of Fe tablets.

From these data the authors are interested in conducting research on "Relationship of Upper Arm Circumference and Fe tablet consumption compliance with the incidence of Anemia in mothers.

The purpose of this study was to analyze the relationship between upper arm circumference (LILA) in the incidence of anemia in pregnant women and maternal adherence in consuming Fe tablets at the East Ulin Foundation Health Center in 2022.

## 2. Research Methods

This type of research is an analytical survey research, with a cross-sectional research design. This research was conducted at the East LandsanUlin Health Center in the City of Banjarbaru and was carried out in the period July - August 2022. The population in this study were pregnant women visiting the East Anvil Ulin Health Center.

Banjarbaru City. The sample in this study amounted to 36 respondents. The independent variables in this study were upper arm circumference and adherence to consumption of Fe tablets. The dependent variable was Anemia. Collecting data in this study using a questionnaire. The sampling technique in this study was accidental sampling, namely pregnant women who visited the East Ulin Foundation Health Center in Banjarbaru City.

Data processing was carried out using the SPSS application version 25 and analyzed using the Chi-square test to examine the

relationship between the independent variables (upper arm circumference and adherence to consumption of Fe tablets) and the dependent variable (Anemia).

East LandsanUlin Health Center in the City of Banjarbaru and was carried out in the period July - August 2022. The population in this study were pregnant women visiting the East Anvil Ulin Health Center.

### **3. Results and Discussion**

Based on research conducted by measuring the Upper Arm Circumference (LILA) to 36 pregnant women respondents, the Upper Arm Circumference (LILA) .

Based on the research conducted by measuring using a questionnaire to 36 respondents.

Based on table 4.3 above, it can be seen that the level of adherence to consumption of Fe tablets by mothers who answered with a low level of compliance was 11 respondents (30.6%), a moderate level of knowledge was 14 respondents (38.9%), and a high level of knowledge was 11 respondents ( 30.6 %).

### **4. Discussion**

Relationship of Upper Arm Circumference with Anemia Incidence in Pregnant Women  
The statistical test results obtained the value of  $p = 0.001$ , meaning  $p \leq 0.05$  so that  $H_0$  was rejected and  $H_a$  was accepted, it can be concluded which means there is a relationship between the measurement of upper arm circumference (LILA) and the incidence of anemia in pregnant women at the East Ulin Public Health Center, Banjarbaru City.

Researchers argue that there is a relationship between LILA and the incidence of anemia in pregnant women, meaning that the higher the nutritional status which can be seen from the measurement of the LILA, the lower the

chance of anemia in pregnancy, conversely if the nutritional status is low, the incidence of anemia in pregnancy increases. This is due to poor health behavior such as eating patterns which will affect nutrition, especially pregnant women, especially the working area of the East Ulin Foundation Health Center which is a former localization place so that the majority of people are still not aware of the importance of health.

Lack of self-will to behave healthily such as not smoking, not drinking alcoholic beverages, etc. and lack of self-awareness to receive information and apply it in daily life about health and habits that cannot be eliminated.

This is in accordance with research by Mutiarasari (2019). The results of this study using the chi square test showed that there was a relationship between nutritional status and the incidence of anemia with a p value ( $0.012 \leq 0.05$ ), which means that nutritional status contributes to influencing the occurrence of anemia. This is also in line with the research by Larasajeng et al (2020) based on the Chi Square test, which obtained a p value of 0.001 ( $< 0.05$ ), so it can be concluded that there is a significant relationship between nutritional status and the incidence of anemia in pregnant women at the Kotagede II Health Center, Yogyakarta. The nutritional status of pregnant women is influenced by the substances consumed during pregnancy. Pregnant women are a group that is vulnerable to nutritional problems, especially anemia. Fetal growth and development is strongly influenced by the nutritional status of the mother.

If a pregnant woman consumes Fe tablets during pregnancy, the greater the risk of anemia in pregnancy. In the working area of the East Runway Ulin Health Center the incidence of anemia is still high because the compliance of pregnant women in consuming Fe tablets is still lacking. complaints that occur due to side effects of

Fe tablets such as nausea and dizziness, as well as the impact if you don't take Fe tablets according to the rules. Lack of motivation from husbands and families to overcome the boredom that mothers feel when taking Fe tablets.

The results of this study are in line with the research of Gilang et al (2016) for several reasons pregnant women do not finish taking Fe tablets because they forget, are bored, feel nauseous, take vitamins from a doctor, feel themselves healthy and will only take Fe tablets if they feel weak. 21 people (39.6%) took Fe tablets until they were finished and 32 people (60.4%) did not take Fe tablets, some of the reasons why pregnant women did not consume Fe tablets regularly were 37.6% felt nauseous and vomiting, 28.12% often forget, 18.75% because of bad smell, 9.3% feel themselves healthy and 6.26% are worried that their baby will grow big if they regularly take Fe tablets.

This opinion is supported by the theory of Notoadmojo (2017) which states that good knowledge of pregnant women will affect the level of adherence in taking Fe tablets. Someone has behaved in accordance with the knowledge, awareness and attitude of the stimulus, so that pregnant women who have good knowledge will also have a higher willingness to consume Fe tablets.

The results of this study are not in accordance with the research of Yeni et al (2017) that it can be seen that even though pregnant women consume Fe tablets, pregnant women still experience anemia, due to a lack of knowledge on how to consume Fe tablets correctly to speed up the absorption process. Based on the research by Kamaruddin et al. (2019) also showed that the group that was given Fe tablets alone was not enough to increase hemoglobin levels. It was also necessary to be given foods that accelerated Fe absorption and reduced consumption of foods that inhibited Fe absorption.

This is also not supported by Wasiah's theory, (2020) that knowledge of how to consume Fe tablets, among other things, is not recommended together with drinking tea because it can inhibit Fe absorption in the body but iron absorption can be increased by consuming fruits that contain vitamin C. In addition consumption of Fe tablets, for Increasing Hb levels can be done by consuming foods that contain lots of iron such as beans, red meat, green leafy vegetables.

This is not in line with the results of the Ethiopian study (2019) which was conducted in Adis, Ababa, with the results of a different proportion test, namely the results of the chi square test obtained  $p = 0.003$ , it can be concluded that there is a significant relationship between education and the incidence of anemia. The OR value is 3.95, meaning that pregnant women with low education are at risk of developing anemia by 3.95 times higher than those with higher education. The results of the Ethiopian study (2019) in a different place, namely in Denbiya, also revealed that maternal education is a factor that influences compliance with iron supplement consumption, pregnant women who have upper secondary education 3.44 times have good adherence to iron supplement consumption compared those without higher education.

This is also not supported by the theory of Nasir et al., (2020) that the educational status of high school and tertiary graduates is at least 4 times more likely to have the ability to understand and receive input from information providers. Pregnant women with higher education can increase awareness about complying with consumption with the iron supplements compared to those who cannot read and write. In addition, educated pregnant women can understand information from health workers regarding the benefits of iron supplements and the impact of iron deficiency. (Tarekegn et al., 2019).

## 5. CONCLUSIONS AND RECOMMENDATIONS

### 5.1. A. Conclusion

Based on the results of the study entitled The Relationship between Upper Arm Circumference and Fe Tablet Consumption Compliance with the Incidence of Anemia in Pregnant Women at the East Ulin Public Health Center in Banjarbaru City in 2022 from July to September from 36 research respondents it can be concluded that:

- Based on the results of the study, 19 respondents (52.8%) had anemia and 17 respondents (47.2%) did not have anemia.
- Based on the measurement of Upper Arm Circumference (LILA), the results obtained for pregnant women with Bad Upper Arm Circumference (LILA) were 24 respondents (66.7%) and pregnant women with Good Upper Arm Circumference (12 respondents (33.3%),
- Based on the level of Compliance Consumption of Fe Tablets, it was found that the category of pregnant women with Low Compliance was 11 respondents (30.6%), Moderate Compliance was 14 (38.9%), High Compliance was 11 respondents (30.6%)
- There is a relationship between the circumference of the upper arm and the incidence of anemia in pregnant women where the Chi-square test was carried out and obtained  $p$  value = 0.001
- There is a relationship between Compliance with Consumption of Fe Tablets and the incidence of anemia in pregnant women where the Chi-square test was carried out

to obtain a  $p$  value = 0.036.

### 5.2. B. Suggestion

#### 1. For Respondents

Advise pregnant women to carry out routine pregnancy checks, as well as improve their nutritional intake patterns and adherence to consuming Fe tablets regularly with the aim of improving hemoglobin levels and improving fetal development.

#### 2. For Health Centers

For health workers, especially those dealing with the problem of anemia, to provide more education on nutritional patterns and regular patterns in consuming Fe tablets as well as conducting catin (bride-to-be) classes in the form of counseling on pregnancy preparation and administration of Fe tablets.

#### 3. For Educational Institutions

For educational institutions can provide input in the development of obstetrics, especially about anemia in pregnancy.

#### 4. For Researchers

For researchers, it can be used as experience in conducting research and as a means of developing knowledge gained during education by applying it to the realities in the workplace.

**Acknowledgements:** The researchers would like to thank the head of the East Ulin Foundation Health Center in Banjarbaru City and his staff for giving permission to conduct the research so that this research can be carried out.

## **THE ROLE OF HUMAN RESOURCE INFORMATION SYSTEMS WHEN FACING THE COVID-19 PANDEMIC CRISIS IN YOGYAKARTA STARTUP COMPANIES**

***Abstract:** The purpose of this study was to determine the role of using human resource information systems in dealing with the Covid-19 pandemic crisis faced by startup companies in Yogyakarta. This research was conducted by taking 100 samples from various startup companies in Yogyakarta at random. The calculation technique used in this study is the Multiple Linear Regression Analysis models. Based on the results of the analysis, shows that there is a significant influence between the use of the human resource information system from the teleworking usage system, recruitment system, benefits system, support system, and performance system in its role in facing the Covid-19 pandemic crisis, where almost all startup companies in Yogyakarta implementing work from home. The results of multiple linear regression analysis show that there is a positive and significant influence on the use of the teleworking system, recruitment system, benefits system, support system, and performance system and is able to make a significant contribution in increasing the work productivity of the HR department in dealing with the Covid-19 pandemic crisis.*

***Keywords:** Human Resource Information System, Covid 19 Pandemic Crisis*

### **1. Introduction**

In recent years, the environment tends to become more complex and dynamic: new technologies and globalization increase competition forcing organizations to prove themselves to be highly productive, sustainable, and cost-effective (Dessler, 2013). Because of this, organizations need to identify and implement approaches that encourage effective management of people within the organization and bridge the gap between employees and the organization's strategic objectives. Human Resource Management (HRM) is an organic part of every organization that plays an important role in the life cycle of an organization

contributing to its success. Information Systems also significantly influence Human Resource Management because they can support many HRM functions (Papalexandri & Bourantas, 2002). But all the time, with the latest example of the Covid-19 pandemic, organizations have been called upon to operate during times of crisis, forcing Human Resource Management to adapt to new realities, ensuring that the organization's strategic goals will be achieved.

Teleworking has been used to support organizations during the rapidly changing work environment when the pandemic forced Human Resources (HR) functions and employees to face technology-based

Email: [syahrial.s@youch.ac.id](mailto:syahrial.s@youch.ac.id)

restructuring and work arrangements. Virtual practices are also rapidly deploying the most cost-effective solutions, while fewer employees in the future will be needed with less office space. There is no doubt that the new generation may have to work a different way from previous employers and employees have shifted to vulnerable beings who need to deal with impending layoffs; socio-psychological; economic and health costs. At the same time, individuals are and will be affected according to age; race; ethnicity; gender; personality while virtual needs that arise differ between employees who live alone and with their families. In that setting, the concept of a leader needs to be rebuilt, because the need for motivation, training, and development must be changed to the Covid-19 and post-Covid-19 era (Kniffin et al., 2020).

Human Resource Information Systems (HRIS) are likely to transform HRM functions into a more technology-based area as HR uses ever-increasing technological tools for its services. HRIS is collecting; thrifting; analyzing; using; recovering; and distributing information about HR. Through interactive techniques, HRIS can support HRM Functions, customized modules, and various IT programs that have been designed to support specific HR tasks and activities. The ethical dimension of protecting employee data is highlighted as the use of security systems, passwords, and limiting access to unauthorized persons is a necessity. Technology's contribution to transforming HR functions develops virtual workplaces; equipment; and applications; redefining the future of work and its continuity (Armstrong, 2006). Teleworking is another aspect of the new "virtual" work reality, HRIS is a new system that helps employees a lot in solving work-related problems, employees enjoy and enjoy the new system created by the company to help employees. The more a person enjoys his work, the higher the employee's performance and attachment to

the company. (Riatmaja., et al., 2021).

Specifically, the crisis is analyzed in the fourth chapter and is defined as an unwanted event that causes change with a negative effect on people. It can be classified on various levels. In particular, the Covid-19 pandemic first appeared in China and spread across the world with enormous social, economic, and political effects. During our examination, we attempted to highlight the implications of Covid-19 for the workplace as a rapidly changing environment manifesting high rates of job loss and the impending global financial crisis. Emergency changes in the workplace introduce technology and a platform-based work environment as a transition to the digital space. The role of HR must adapt to new work realities and leaders through learning and development will grow crisis leadership skills to help organizations achieve their goals (Carnevale & Hatak, 2020). Finally, recommendations for responding to this unprecedented crisis were introduced in the fifth chapter with the proposed holistic pillar-2 - a structured approach to teleworking and HRIS functions together with a new leadership model. As soil research is still precocious, future research should be focused not only on reacting to emerging challenges but also on rethinking work practices to build sustainable post-pandemic-era foundations (Dirani et al., 2020; Fernandez & Shaw, 2020).

## 2. Literature review

### 2.1 Human Resources Information System – HRIS

Management System (HRMS), e-Human Resources (e-HR) Currently, with the development of technology there is a shift to Human Resources (HRM) which tends to transform into a more technology-based field. More and more organizations are using

web-based applications and HR-related services delivered through technology as research has shown that organizations that implement advanced HR technology tools have a competitive advantage over those that do not. The modern framework requires organizations to change their HR practices and shift to the “e-HR” (electronic HR) era to simplify various processes, reduce administrative workload and other costs, increase service improvement, become more competitive, and provide valid and accurate information about employees which enable managers to make the most effective decisions that can be implemented thus forming a new, more strategic role for HR in the organization (Johnson & Gueutal, 2011). As the Society for Human Resource Management (SHRM) reports “equipped with hard data, HR can know more, do more, and be a better business advisor” (SHRM, 2002).

Like e-commerce, e-HR was first used in the 90s as a term, referring to the use of the internet in the HR field which provides information to managers and employees anytime and anywhere through internet access. “This is a shift towards automation of HR services towards information technology support in HR services” (Ruël et al., 2004). Today “a total e-HR system can include enterprise resource planning (ERP) software, HR service center, interactive voice response (IVR), web applications, voice recognition systems (VRS), and manager and employee portals” (Lengnick-Hall & Moritz, 2003). A more specialized aspect of e-HR is considered as Human Resource Information System (HRIS) or Human Resource Management System (HRM). According to Papalexandri & Bourantas, (2002), HRIS is a system that individuals can collect; store; analyze; use; recover and distribute information about human resources of an organization Thite & Kavanagh (2012) argues that HRIS includes not only computer hardware but also

software; people; forms; policies; procedures; and data (Thite & Kavanagh, 2012) “Keeping in mind the customer” is a fundamental principle of every organization and HRIS “helps by providing technology to produce accurate and timely employee information. still to fulfill this purpose” (Thite & Kavanagh, 2012, p.13). To continue, its implementation can influence and, in some cases, limit the personal relationship between HR staff and employees (Johnson & Gueutal, 2011).

There are several elements in the implementation of human resource information systems that are used by companies that implement human resource information systems as follows (Thite and Javanagh, 2011). There are 5 elements in the use of the system in HRIS, the Teleworking System, the Recruitment System, the Benefits System, the Benefits System and the Performance System.

## 2.2 Covid-19 Pandemic Crisis

A crisis in general can be defined as an unwanted event that causes a change that will have a negative effect on people (Lerbinger, 2012). In particular, crises can be classified at different levels. Vigh (2008), describes the individual crisis as something specific to a period in a person's life where the individual is negatively challenged and faced with difficulties in managing external forces and decision making while Lerbinger (2012) defines the various characteristics that make up an organizational crisis. Any event that occurs suddenly, unwanted, unpredictable, ambiguous, with a high degree of impact that breaks normality and interrupts setting goals, challenges organizational survival, causes stress, and requires quick action and decisions to be taken is considered an organizational crisis. Crisis is also defined by location such as workplace (eg industrial accident, Claus, 2011) and non-work related hazards (eg

illness, road accident, medical emergency) (Druckman, et al., 2012), regional hazard: pandemic such as SARS, MERS, (Tan & Enderwick, 2006) natural disasters (Merlot & De Cieri, 2011).

Another aspect of the crisis can be economic or health. The economic crisis is a long-term economic condition characterized by slow growth in economic activity, increased unemployment, low prices, low levels of trade and investment. The economic crisis faced in the 1930s is called the Great Depression. The global and financial crisis in 2008 has been several times more severe as manifested not only in finance but also in real economic sectors (Ngowi, 2013). A health crisis or public health crisis is a serious situation that can affect people in one or more geographic areas or even globally and can be the result of disease, industrial processes, or bad policies. The impact of a health crisis can have an impact on public health, loss of life and the economy. The Covid-19 coronavirus pandemic is a defining global health crisis for us of time and the greatest challenge we have faced since the Second World War.” However, not only is this health crisis an unprecedented socio-economic crisis and it will create social, economic and political effects that will leave deep and long-lasting scars. The virus started from Wuhan in China in December 2019 and has spread worldwide except Antarctica, reported by the World Health Organization (WHO).

### 3. Method

According to Sekaran (2003), the population is the sum of all the objects to be studied. The population in this study were all permanent employees at Yogyakarta Startup companies, totaling 88 people. During the Covid-19 pandemic, the Human Resources Department implemented the Human Resources information system. The sample

is part of the population that is expected to represent the population in the study. In preparing the sample, it is necessary to prepare a sampling frame, namely a list of all the sampling elements in the sampling population. Both from the length of work, age, and permanent employee status.

1. Independent or Independent Variable  
 Independent variables are variables that affect the existence of other variables. In this study, the independent variables are the HRIS human resource information system, which has 5 dimensions (figure 1), including:

- a) X1 : Teleworking system
- b) X2 : Recruitment system
- c) X3 : Allowance system
- d) X4 : Benefits system
- e) X5 : Performance system

2. Dependent or Dependent Variable  
 The dependent variable is a variable that is influenced by other variables. In this study, depending on the variable, Covid-19 Pandemic Crisis (Y).

Figure 1. Variables

### 4. Results and discussion

Table 1 shows Performance Validity Test Results. Table 2 shows Interest Validity Test Results. In table 3 and 4 are Performance Reliability Test Results and Interest Reliability Test Results shown, respectively. Table 5 presents results of Multiple Linear Regression Analysis.

**Table 3.** Performance Reliability Test Results

Variable	<i>Alpha Cronbach</i>	Description
Teleworking system	0,956	Reliable
Recruitment system	0,934	Reliable
Allowance system	0,935	Reliable
Benefits system	0,789	Reliable
Performance system	0,887	Reliable

**Table 4.** Interest Reliability Test Results

Variabel	<i>Alpha Cronbach</i>	Description
Teleworking system	0,852	Reliable
Recruitment system	0,787	Reliable
Allowance system	0,734	Reliable
Benefits system	0,676	Reliable
Performance system	0,775	Reliable

**Table 5.** Multiple Linear Regression Analysis results

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-4.934	2.645		-1.876	.066
	Teleworking	.145	.033	.345	4.167	.000
	Recruitment	.087	.021	.309	3.973	.000
	Allowances	.069	.022	.277	3.912	.000
	Benefits	.221	.051	.372	4.834	.000
	performance	.102	.040	.231	2.573	.012

Based on these equations it can be described as follows:

1. Constant

A constant value of -4.934 means that the variables covering the teleworking system, recruitment system, allowance system, benefits system, and performance system do not change or are considered constant so the direction of the employee performance value at the start-up company is minus -4.934.

2. Direct evidence regression coefficient (b1)

Teleworking variable has a positive regression coefficient on employee performance, with a regression coefficient of 0.145. With this positive influence, it means that the teleworking system on employee performance at startups in Yogyakarta shows a unidirectional relationship, meaning that the higher the use of the teleworking system in the eyes of employees, the higher the performance of employees at startup

companies in Yogyakarta, assuming other variables remain the same.

3. Regression coefficient of reliability (b2)

The recruiting system variable has a positive regression coefficient on consumer satisfaction at startups in Yogyakarta, with a regression coefficient of 0.087. With this positive influence, it means that the recruitment system and employee performance results show one-way results, that any increase in employee performance can be due to a good recruitment system, assuming the lin variable remains the same.

4. Assurance regression coefficient (b3)

The benefits system variable has a positive regression coefficient on employee performance at startup companies in Yogyakarta, with a regression coefficient of 0.069. With this positive influence, it means that employee performance guarantees at startup companies in Yogyakarta show a

unidirectional relationship, meaning that a better benefits system will lead to high employee performance, assuming other variables remain constant.

5. Responsiveness regression coefficient (b4)

The benefits system variable has a positive regression coefficient on employee performance at startup companies in Yogyakarta, with a regression coefficient of 0.221. With this positive influence, it means that the benefits system for employee performance at startup companies in Yogyakarta shows a unidirectional relationship, meaning that the benefits system for startup companies in Yogyakarta will lead to higher employee performance, assuming other variables are constant.

6. Empathy regression coefficient (b5)

The performance system variable has a positive regression coefficient on employee performance at startup companies in Yogyakarta, with a regression coefficient of 0.102, this means that the implementation of the performance system on employee performance at startup companies in Yogyakarta shows a unidirectional relationship, which means the better the performance system from the company, causing better employee performance, assuming other variables are constant.

The results of multiple linear regression analysis show that there is a positive and significant influence in the simultaneous implementation of the teleworking system, recruiting system, benefits system, benefits system, and performance system for the three companies affected by the Covid-19 pandemic crisis. Research on virtual teamwork should focus on emotional expression and management in cyberspace and innovation to enable optimal system work. Also, as various forms of virtual teams have emerged (face-to-face, virtual teams, combined), further work on team classification would be useful. From a virtual

standpoint scholars of leadership and management should focus on participatory relationships in high-virtuality work settings - communication and feedback mechanisms from leaders, along with leadership approaches. Additionally, an assessment of the Covid-19 changes in the training program shifting to online status and how that will affect the efficiency, accessibility, and effectiveness of the training program should be carried out. Trust and how it is empowered through virtual systems, especially for newcomers is another important issue for future research (Kniffin et al., 2020).

Research should seek to identify ways for organizations to support social interactions while WFH employees and assess the efficiency of practices or innovations introduced (eg, virtual lunches) during the Covid-19 period to reduce loneliness and increase resilience. A new health program for employees dealing with isolation should be created. In addition, researchers should examine the effectiveness of the Covid-19 and post-Covid eras on redesign and craft work to improve working conditions compared to the pre-pandemic period. Illness in relation to WFH modalities is another issue examined further for the post-Covid era along with the contemporary preservation of employees' privacy rights concerning health checks (Kniffin et al., 2020).

During the pandemic, teleworking, and in particular, WFH has been widely implemented. In that context, an evaluation will be carried out on companies implementing teleworking needed in the post-Covid era. It is interesting to identify whether the crisis has been perceived as a driver that has paved the way for future teleworking or simply as an urgent response action with limited future applications (Belzunegui-Eraso, & Erro-Garcés, 2020). In terms of teleworking (and e-leadership which will be mentioned below), we also

recommend that research methods will shift with application to larger samples and more methods such as longitudinal or experimental (Contreras et al., 2020). Teleworking studies should also focus on how an individual's work and non-work experiences influence one another, and how an individual's work and non-work identities are expressed at home. In addition, the effects of the Covid-19 quarantine and WFH on productivity, creativity, and innovation are important for further study. Motivation and authenticity in work is another topic that will be discussed as an implication of WFH practices in the post-Covid era, especially at times when employees will enter between collocated settings (Kniffin et al., 2020).

## 5. Conclusion

This article discusses the impact of Covid-19 in the workplace with a focus on HRIS. As

the pandemic is still ongoing, researchers working around the world are still a work in progress, and access to relevant and up-to-date resources is limited. Therefore, research is still in a premature stage. In addition, this research was compiled during the lockdown, and due to limitations in granting employees access to answer questionnaires, it has been decided to approach the topic solely through a literature review based mostly on online resources due to the current state of affairs. In fact, the field is very broad, for example, the pandemic has affected various aspects of work life, which has a broad impact. Therefore, after reviewing the challenges of the pandemic, it seems that HRM needs to focus on reviewing and changing its tools and practices to suit the new workplace realities, while there are still many issues for future research that are important for further study.

## PROCESS PRIORITIZATION OF THE UNIVERSITY OF SZEGED

**Abstract:** Operation development is time-consuming and needs a large amount of effort. Therefore, to ensure its efficiency and effectiveness, those processes should be optimized first, which can provide the most significant benefits. Our paper introduces an innovative method the University of Szeged applied for selecting these processes by their potential for optimization, involving constraint- and benefit-related attributes in the assessment. In addition, process network definition and process regulation principles are also presented. This complex method is one of the fundamental tools of the quality management activities of the University aims to help the organization meets the evolving requirements of the higher education sector.

**Keywords:** process prioritization, process assessment, university operation development

### 1. Introduction

Many organizations face the problem of how to share their limited resources among development initiatives. When there is an urgent need for improvement because of operational issues, the decision is relatively easy; focus on ‘firefighting’ and then conduct corrective and preventive actions. However, when the source of the development plan is a strategic level initiative aiming to improve the operation of more than one process, there are not enough resources – in many cases, at least – to develop everything parallelly. In this situation, decision-makers need a prioritization method.

The first and most widely applied process management-related prioritization tool might be the PEMM (Process and Enterprise Maturity Model) by Michael Hammer. It analyses the performance of processes by five “enablers”:

- design: purpose, context, documentation,

- performers: knowledge, skills, the behavior of employers,
- owner: identity, activities, authority,
- infrastructure: information systems, human resources,
- metrics: definition, uses.

In addition, at an organizational level, the method looks at four “capabilities”:

- leadership: awareness, alignment, behavior, style,
- culture: teamwork, customer focus, responsibility, attitude toward change,
- expertise: people, methodology,
- governance: process model, accountability, integration.

Hammer suggests that his framework can help the management plan process-based transformations (Hammer, 2007). However, although this method identifies obstacles to process development, it does not show which processes should be optimized first.

Many researchers apply different Multi-Criteria Decision-Making (MCDM)

frameworks to prioritize processes or other entities. Five of the most popular ones may be:

- Analytic Hierarchy Process (AHP),
- Analytic Network Process (ANP),
- Technique for Order of Preference by Similarity to Ideal Solution (TOPSIS),
- VIKOR and
- Fuzzy Logic.

Alexander and his team comprehensively reviewed the abovementioned methods as possible ways of Lean assessment. They compared them by their popularity, simplicity of application, and superior outcomes in previous research. The researchers concluded that the fuzzy logic technique and its combinations with the others were popular in assessing Lean with greater accuracy. At the same time, the TOPSIS and the VIKOR had the more significant advantage of providing multiple and quick decisions. They highlighted that the ensemble methods provided more accuracy than standalone techniques (Alexander, 2022). We applied their results as fundamental approaches for our development.

Yildirim proposed the Digitalisation Opportunity and Priority Assessment (DOPA) based method, which combined Failure Mode and Effect Analysis (FMEA) and Voice of Customer (VoC) methods for digitalization priority setting problems. The researchers' method assessed failure and effect dimensions of processes in a product of importance, frequency, and digital control level variables (Yildirim, 2022). This approach with a redesigned set of variables could also be applied to our prioritization problems.

Researchers in Kazakhstan applied the general methods of hierarchy analysis, expert assessments, and the criteria approach to develop a decision support tool for distance learning quality assessment

(Shaporeva, 2022). However, their method was not ready to use directly in process prioritization but could be applied as a methodological basis in our project.

University professors from Russia proposed the Lean Methodology to improve service quality in higher professional education. They introduced a model for assessing the efficiency of lean mechanisms for increasing the service quality of higher professional education (Glushchenko, 2021). Unfortunately, their model did not include factors that could be used in process prioritization. Still, the suggested approach of thinking through the optimization opportunity of processes from the perspectives of Lean wastes was motivating.

In another project, researchers used fuzzy logic to create a Lean Six Sigma (LSS) readiness assessment model for enterprises in the clothing industry. They identified critical success factors (CSF) as enablers (e.g., management responsibility), criteria (e.g., organizational structure), and attributes (e.g., smooth information flow) (Abbes, 2022). Although these CSFs are not process-related, and the industry of their case study is far from higher education, the proposed assessment method has good results to be adapted in process prioritization.

Total Quality Management (TQM) is frequently implemented by universities for operation development purposes. Professors from Egypt identified some obstacles that could cause difficulties in TQM implementation in higher education. They categorized the obstacles into items such as top management, students, human resources, financial resources, educational technology, community service, scientific research, organizational culture, and educational curriculum. They found that the highest obstacles that limited TQM were financial resources obstacles, followed by organizational culture obstacles (Sabra, 2020). We used this grouping technique as a benchmark in our assessment.

Based on the approaches mentioned above and the personal experiences of the process assessment team members, a specific process prioritization and optimization method was developed to help management set goals and scope of operation development actions. The management requirements for the method were defined as follows:

- be easy to understand,
- be easy to apply,
- be easy to modify,
- reflect differences among the attitudes and circumstances of organizational units,
- contain only significant factors,
- be applicable in simulations,
- provide precise results.

To meet requirements, the proposed method was a combined and simplified version of the most widely used MCDM techniques, which

- was created, and
- the related questionnaire could be filled up in Microsoft Excel,
- the organizational unit specialties could be considered by factor weights,
- factor selection and definition were the results of consensus,

- factor weights could be modified in the assessment phase to see their effect on the outcomes,
- the list of processes was also presented by factors and priority.

This paper introduces the method in detail. Although the values of factors and weights are not actual, they can be used to demonstrate the calculation and the presentation of results.

## 2. Experiment

The assessment team defined the process matrix of the Directorate for Strategy and Development by the Operation Fields and the Operation Categories as follows:

- Operation Fields: 1. Strategy Management; 2. Partner Management; 3. Research, Development, Innovation Management; 4. Management Systems.
- Operation Categories: A. Planning; B. Organization; C. Controlling.

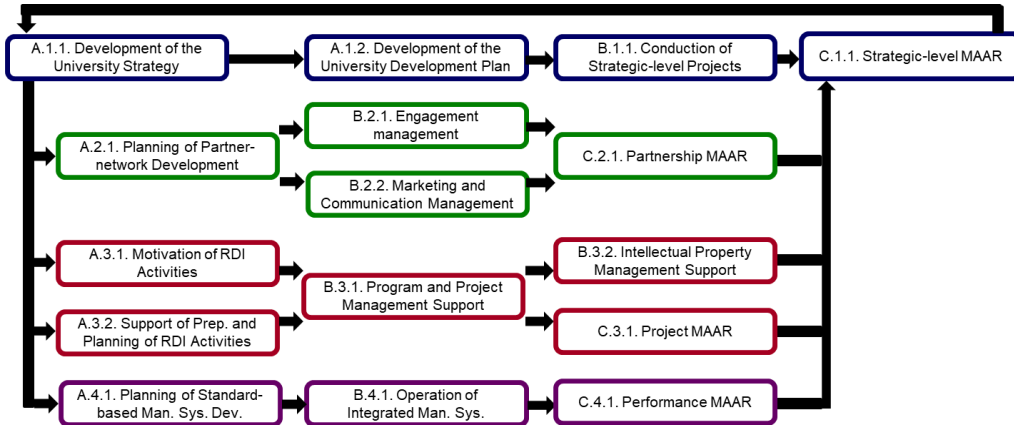

Operation Fields and Operation Categories Determined the Operation Content as a set of Main Processes (Figure 1).

**Figure 1.** Structure of the Operation Fields, the Operation Categories, and the Operation Content as a set of Main Processes.

The main processes are parts of the Process Network (Figure 2). The arrows between processes demonstrate the dominant Input-

Output connections defined in SIPOC tables (Tables 1, 2, 3, and 4).

**Figure 2.** The Process Network with the arrows between processes demonstrates the dominant Input-Output connections.

B.4.1.	Data, information, reports, development proposals	C.4.1. Performance Measurement, Assessment, Analysis, and Reporting	Data, information, reports	C.1.1.

In addition, Main Processes were also defined with initiative and closing events and subprocesses.

As for prioritization, a set of factors was defined. Then, top and middle managers of organization units were asked to select the most relevant ones and give weight to them, reflecting importance. Factors were categorized into two groups as follows (see also Tables 5 and 6):

- **Process Criticality:** how critical to optimize the process to improve operation. In other words, the potential positive effect of optimization on the overall operation of the University.
- **Process Improvability:** how difficult to optimize the process to improve operation. In other words, the potential obstacles of optimization.

**Table 5.** Name, meaning, and scale of Criticality (Cr) Factors.

Factor	Meaning and scale
Transaction Number (T)	How frequently does the process run? 1 – annually; 2 – monthly; 3 – weekly; 4 – daily
Human Resource Need (H)	How many human resources are needed? 1 – one resource, small processing time; 2 – one resource, long processing time; 3 – more resources, small processing time; 4 – more resources, long processing time
Default Rate (D)	How frequently do failures occur? 1 – null or negligible; 2 – 1-10%; 3 – 10-50%; 4 – above 50%
Maintainability (M)	How difficult and time-consuming is the correction? 1 – simple, fast; 2 – simple, slow; 3 – complex, fast; 4 – complex, slow
Relevance (R)	What is the connection between strategy and the process like? 1 – weak and indirect; 2 – weak, but direct; 3 – strong, but indirect; 4 – strong and direct

**Table 6.** Name, meaning, and scale of Improvability (Im) Factors.

Factor	Meaning and scale
Control (C)	How strictly is the process controlled by laws or by university regulations? 1 – liberally or in no way, easy to modify; 2 – strictly, easy to modify; 3 – liberally, difficult to modify; 4 – strictly, difficult to modify
Level of Automatization (A)	How strictly do IT applications determine the process run? 1 – liberally or in no way, easy to modify; 2 – strictly, easy to modify; 3 – liberally, difficult to modify; 4 – strictly, difficult to modify
Flexibility (F)	How flexible and proactive is the process staff? 1 – flexible, proactive; 2 – flexible, inactive; 3 inflexible, inactive; 4 – inflexible, resistant to changes

Weights (I) were given on a Likert scale between 1 and 4, where one meant less important, and four meant highly important.

Process Priority was calculated as follows:

$$Pr = \frac{Cr}{Im} = \frac{TI_T + HI_H + DI_D + MI_M + RI_R}{CI_C + AI_A + FI_F}$$

where:

- Pr: Process Priority,
- Cr: Process Criticality,
- Im: Process Improvability,
- T: Transaction Number,
- I<sub>T</sub>: Weight of Transaction Number,
- H: Human Resource Need,
- I<sub>H</sub>: Weight of Human Resource Need,
- D: Default Rate,
- I<sub>D</sub>: Weight of Default Rate,
- M: Maintainability,
- I<sub>M</sub>: Weight of Maintainability,
- R: Relevance,
- I<sub>R</sub>: Weight of Relevance,
- C: Control,
- I<sub>C</sub>: Weight of Control,
- A: Level of Automatization,
- I<sub>A</sub>: Weight of Level of Automatization,
- F: Flexibility,
- I<sub>F</sub>: Weight of Flexibility.

Processes were assessed by individual factors and ordered by criticality, improvability, and priority. The individual factor-based assessment, together with the identification of process sensitivity, aimed to select approaches for optimization as shown by the following examples:

- time reduction approach mainly for time-sensitive processes with a high value of T and M,
- cost reduction approach mainly for cost-sensitive processes with a high value of T and H,
- failure reduction approach mainly for quality-sensitive processes with a high value of D and M,
- nonconformity reduction approach mainly for regulation-sensitive processes with a high value of D, M, and C,
- risk reduction approach mainly for risk-sensitive processes with a high value of T, D, and M,
- continuity approach mainly for availability-sensitive processes with a high value of T, D, and M,
- flexibility approach mainly for change-sensitive processes with a high value of T and F.

The order of processes by Criticality reflects the potential positive effect of optimization. Conversely, the order of processes by Improvability reflects the potential

optimization obstacles.

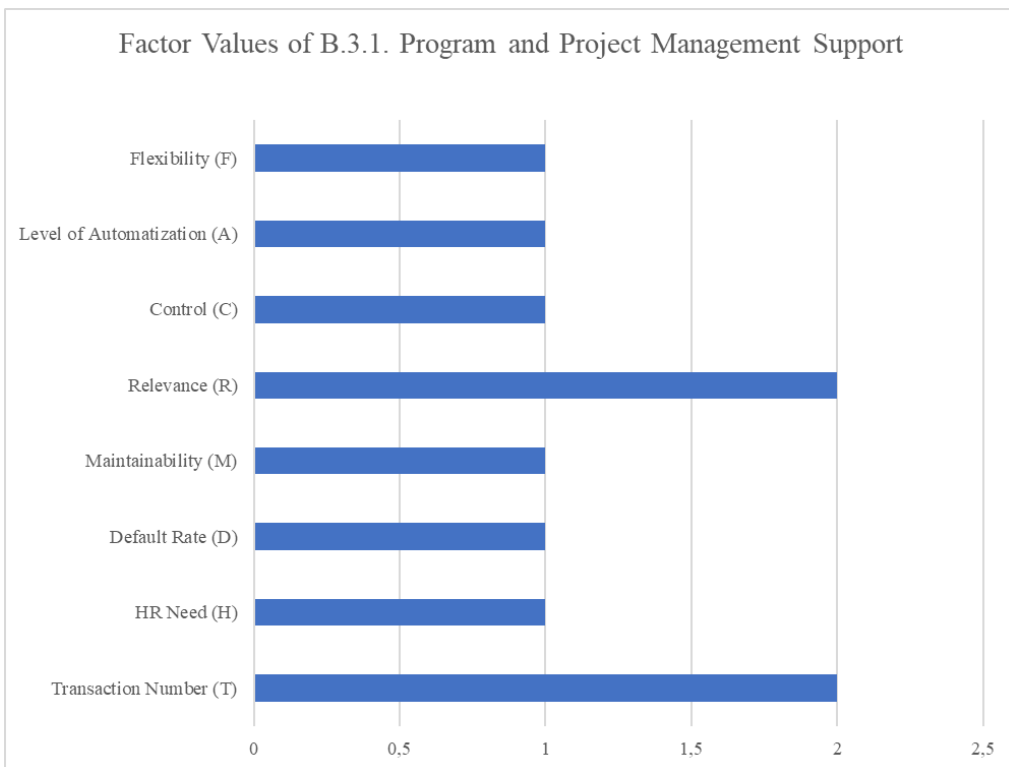

### 3. Results and Discussion

Since the assessment results contain sensitive information about the University, we modified the actual values of factors and the real order of processes.

Twenty-seven managers were involved in the survey. They were asked to rank factors

and processes. The final values were calculated as the average of their answers.

The result of the assessment by individual factors is demonstrated by the graph in Figure 3. Based on factor values and the complex time, cost, and quality sensitivity, this process should be optimized to reduce processing time and cost and achieve strategy-relevant objectives.

**Figure 3.** Factor Values of B.3.1. Program and Project Management Support as an example for the assessment by individual factors.

The order of processes by Criticality Factors is presented in Figure 4. According to the illustration, the A.4.1. Planning of Standard-based Management Systems Development provides the most considerable benefits.

The order of processes by Improvability Factors is presented in Figure 5. According to the illustration, the C.1.1. Strategic-level Measurement, Assessment, Analysis, and Reporting (MAAR) has the most significant obstacles from an optimization perspective.

**Figure 4.** Criticality Factors of Processes in alphabetical order.

**Figure 5.** Improvability Factors of Processes in alphabetical order.

The order of processes by Priority is presented in Figure 6. According to the illustration, the A.2.1. Planning of Partner-network Development, the B.1.1.

Conduction of Strategic-level Projects, and the B.3.1. Program and Project Management Support are the essential processes from an optimization perspective.

**Figure 6.** Priority of Processes in alphabetical order.

Based on the results, the management and the professional team concluded that the new prioritization method met the previously defined requirements and served the preparation of operation development activities effectively.

After the assessment, the quality and process development team created a proposal with the assessment results and the improvement plan, including the names of the processes and the suggested optimization methods. The latter combined Lean, Six Sigma DMAIC, and BPR techniques. The main steps and tools were as follows:

1. Completing Project Charter: business background, problem statement, goal statement, in-scope, out-of-scope, risk assessment, project management processes, and project organization.

2. Process mapping (As-Is): L2 SIPOC-model, L3 cross-functional flow-chart, task attribute table, RACI-matrix.
3. Process assessment: process indicators, value-added flow analysis, waste identification.
4. Problem-solving: brainstorming, root-cause analysis, selection matrix, cost-benefit analysis.
5. Process mapping (To-Be): L2 SIPOC-model, L3 cross-functional flow-chart, task attribute table, RACI-matrix, process indicators.
6. Process automation: workflow definition, specification, and development.
7. Process documentation: Standard Operating Procedure, Workflow User Guide.

8. Process implementation: process presentation, workshops with key users, and on-the-job training.

#### 4. Conclusion

The application of process prioritization and optimization method described above succeeded. It was easy to understand and apply, it could provide realistic results reflecting the similarities and the

differences of organization units, and finally, it was helpful in operation development. Therefore, the approach and the techniques can be applied for process assessment and improvement in universities and other organizations, including service and manufacturing companies, with the same or amended set of factors and scales.

## **INDUSTRY 4.0: SOME ASPECTS OF DEVELOPING DIDACTIC FMC**

***Abstract:** The paper discusses the modern concept of FMC management model intended for education in accordance with the Industry 4.0 strategy. The concept of managing didactic teaching aids should be based on intelligent interconnection of mechanical engineering, electronics and software, which contributes to the responding to the development of new technologies and business models. The integration of dozens of technologies is supported, some of which having been developed decades ago, but new technologies that are included in this concept are being developed almost daily. Mechanical engineers and specialized technicians trained on such or similar teaching aids are qualified to form cyber-physical systems in the fields of design, construction, and manufacturing.*

***Keywords:** Industry 4.0, CPS, Education, FMC, RFID, IoT*

### **1. Introduction**

Managing flexible manufacturing systems has been of great importance since its inception, up to the present day where automation and flexibility, among other requirements, represent key aspects of computer-integrated manufacturing and Industry 4.0. Managing can be performed at different levels, starting from computer management of individual units of the manufacturing system in real-time; management of production cells, assembly cells, measurement and control cells, and transport systems, as well as coordination and control of the entire flexible manufacturing system. The introduction of new technologies that belong to the framework of Industry 4.0 (such as modern information and communication technologies, advanced levels of automation, etc.) significantly changes the concept of manufacturing systems, both in terms of their management and the functioning. That

is why the model of managing didactic FMC (DFMC) is being viewed through the prism of Industry 4.0.

The fourth industrial revolution is characterized by the production of cyber-physical systems (CPS) based on the integration of data and knowledge. The main roles of CPS are to meet the dynamic manufacturing demands and improve efficiency, as well as to maximize the utilization of the entire industry. Industry 4.0 encompasses numerous technologies that are involved in horizontal and vertical integration, including radio frequency identification (RFID), the internet of things (IoT), cloud manufacturing, and many others.

The Industry 4.0 model promotes the connection and communication of physical components such as sensors, devices, and machines, both with each other and with the internet. According to M. Milosevic et al. (2019), the manufacturing process is divided

Corresponding author: Gligorije Mirkov  
Email: [gmirkov@sbb.rs](mailto:gmirkov@sbb.rs)

into small units among which the information about successive process steps is exchanged and shared, contributing to increased flexibility and reduced coordination complexity. The goal of Industry 4.0 is to achieve higher levels of operational efficiency and productivity, as well as higher levels of automation. The main characteristics of Industry 4.0 are digitization, optimization, and adaptation to manufacturing requirements; automation and flexibility; human-machine interaction (HMI); and automated data exchange and communication. These characteristics not only correlate highly to the internet technologies and advanced intelligent algorithms but also indicate that Industry 4.0 is a process of creating new value and knowledge management.

The digitization of manufacturing allows people, products, and manufacturing facilities to be intelligently interconnected, creating the potential for increased quality, efficiency, and transparency in manufacturing. Simulation and virtual commissioning (Digital Twin) save time and money, providing a clear and efficient tool for training and research. It is possible to switch between the real system and the simulation in order to use the appropriate perspective for each purpose. In a modern, networked factory, machines and workpieces communicate with each other, as well as with ERP (Enterprise Resource Planning) systems and MES (Manufacturing Execution Systems). The increasing of computer power enables the analysis and classification of huge amounts of data that can be used to make profitable conclusions. The servicing of machines and equipment is facilitated and accelerated by digitization within the factory. Machines can independently order upcoming services, and automated downtime evaluation allows the efficient process improvement. Industrial robots become increasingly important when it comes to automated and optimal assembly of products

and their variants. For this reason, flexible cells with robotic components/systems usually constitute the core of the entire system in CP factories. With the development of the Internet of Things (IoT), and especially with the emergence and wider availability of RFID systems and their potential applications in manufacturing, a reliable method of automatic information collection and resource identification in real-time appears. Accordingly, the product and process data can be collected, exchanged, processed, and stored in the system, and as such can be applied to improve the flexibility or desired performance of manufacturing systems, or to move towards the paradigm of intelligent manufacturing. At this point, the significant issues related to the possible application of RFID technology within flexible systems can be identified, including the development of an RFID-based framework for integrating automated manufacturing systems and management information systems in factories, where RFID technology enables real-time traceability, visibility and interoperability in order to improve the overall performance of manufacturing systems.

The use of RFID devices provides new possibilities for modeling Flexible Manufacturing Cells (FMC), opening up new directions in design aimed primarily at achieving greater flexibility. Decentralized management in FMC is based on a computer intelligence system that uses the information carried by RFID tags. This RFID tag information, using adequate software solutions, provides intelligent, adaptable, and active management in obtaining the manufacturing procedures. The data for individual processing operations (e.g. specific operations, technological procedures, quality, time, priority) can be entered via RFID technology on an adequate information carrier (tag) connected to the component, decentralizing the management process and making the process more

flexible. Properly placed RFID readers in the working environment, i.e. near the manufacturing line, have the role of tracking, controlling, and detecting objects. This system based on RFID technology should potentially provide high system flexibility, which is the subject of this research.

The limited flexibility and insufficient speed response to the rapid changes in the manufacturing program in classical FMC architecture can potentially be compensated for by using RFID technology, and it is reflected in the ability increase of the subordinate computers within the system, i.e. the computers within the system gain importance in relation to the previous partial autonomous control. The flexible system gains a new role in this new situation, and the performed tasks are more complex, previously unknown to management, i.e. unpredictable, processed in real-time or, in special cases, called from the memory of the control system computer.

## 2. FMC Status (DFMC)

In the operation of classical flexible systems, in the case of didactic FMC, multiple problems arise which can be grouped into several categories. One of them relates to the weaker flexibility of the transportation system, i.e. the parts distribution, the causes of which can originate from the central control system, and it particularly shows in the case of smaller parts with more complex configurations. Another problem is related to the small number of controlled input-output functions and incomplete integration of DNC (Direct Numerical Control) into the control system. These shortcomings directly affect the modification of programs in control units, reducing the flexibility of the entire system. One possible problem within a flexible system is the temporary storage of parts in a manual warehouse.

When studying didactic flexible machining systems, the elements of the educational

process must also be taken into account (safety, clarity, dual control of the process and verification of written programs, etc.), as well as the selection of adequate components that make up the system as a whole. Since there are only a few companies in the world dealing with this issue, solutions must be sought in laboratories of higher education institutions, which, in order to ensure a proper educational process, must leave certain program codes open, taking into account the specificity of integrated equipment, educational process, maintenance, machine learning, or reengineering.

## 3. Literature Review Seen Through the Flexibility Prism of Industry 4.0 Flexibility

Companies strive for internal flexibility by adopting Industry 4.0 technologies. They perceive Industry 4.0 technologies as drivers of various internal manufacturing flexibility strategies. In this sense, findings show that cloud computing, big data, IoT, and data analytics (including AI techniques) affect all segments/dimensions/parameters of flexibility. Therefore, they can be characterized as general-purpose technologies or fundamental technologies that enable flexible manufacturing (Frank et al., 2019). These technologies do not provide flexibility on their own, but enable the identification and traceability of products, machines and materials, and provide real-time data on operations, allowing faster decision-making. The results of the analyzed study, as well as some others, show that achieving different degrees of flexibility largely depends on specific factors of the particular manufacturing, such as company manufacturing volume, process types, product diversity, life cycle, complexity, etc. Dalenogare et al. (2018) pointed out the results of research that show that companies seek flexibility mainly through investments

in equipment. One of the key questions is: Why don't industries achieve operational flexibility as one of their main benefits from Industry 4.0? The explanation is given in the answer that the factory conditions the investments in Industry 4.0, limiting what companies can implement for flexible manufacturing lines. The need for investment in upgrading the company's infrastructure is one of the biggest challenges in achieving flexibility, according to Contador et al. (2020). The analysis results showed that in companies with a large product range and short life cycles, the implementation of advanced technologies such as robots is hindered because they need to be frequently reprogrammed, thus increasing manufacturing time and costs. In such cases, technologies that increase the work productivity and flexibility are more productive because their workers are still the most flexible part of manufacturing system. On the other hand, the companies with great scope and low variations of manufacturing facilities demand highly automatised machines for special purposes in order to achieve market competitiveness. This compromise between productivity and flexibility is in accordance with areas of mass production, which is illustrated by problems with collaborative robots being very flexible, but ceasing to function all the time.

Worker adaptation to Industry 4.0 technologies has been the most frequently mentioned challenge for flexibility, as workers currently lack the necessary knowledge and training to handle the technologies (Dornelles et al., 2021). Industry 4.0 requires a different type of worker, capable of performing cognitive labor, including data processing, information interpretation, and decision-making (Ortt et al., 2020). Operators can also participate in design and decision-making, providing operational information for greater work flexibility. Although these technologies are

important, their design is still limited for wider use. More ergonomic and flexible design allows better configuration processes and helps operators in more complex tasks (Longo et al., 2017). Despite the potential of these technologies to help workers, their use is still limited, and only a few companies use them in the production applications for specific uses, such as maintenance and quality inspection (Holm, 2018).

Material (working piece) flow flexibility offers the possibility of manufacturing products by different paths, increasing the use of a larger number of machines and reducing the time flow. Traditionally, automated material handling systems are not designed to be reconfigurable, and changes in material flow arrangements often require significant halts for physical modifications and reprogramming. By applying the technologies used in Industry 4.0, new opportunities arise for creating flexible material handling systems, manufacturing management systems (ERP, MES), and material traceability systems, which are recognized as essential technologies that allow the management of many materials within factories. Moreover, autonomous robotic vehicles such as AGVs improve flexibility in terms of the ease of programming and automatic reconfiguration of transport routes. However, their use is still limited by the physical aspects of products, such as the size and cubage of transported materials.

Companies face serious challenges in achieving flexibility in their manufacturing processes (in our discussion, machining and routing). This is mainly because these two types of flexibility depend heavily on the effort required for flexible planning and design of processes and products, such as design for manufacturing techniques. In this sense, companies define their sequence operations and routes in order to optimize manufacturing time and process quality, which limits the flexibility of the line. In the

case of routing flexibility, this may happen because it requires high availability of alternative resources (Eiers et al., 2018). It has been observed that the studied companies primarily focus on increasing quality and productivity; therefore, they invest in resources for special purposes and equipment for each type of the product, limiting routing flexibility (Eiers et al., 2018). In that regard, simulation technologies can be an important tool for managers to define new route plans (Chan et al., 2006).

In flexibility operations, companies have stated that changes in the sequence of the same are still a major obstacle. Companies tend to define the manufacturing sequence in line with the technical requirements of the product or to optimize the line, making it difficult to influence changes in the sequence. Simulation tools can improve operation flexibility because they allow process modeling and analysis to find alternative sequencing of the operations. Therefore, PLM and CAD systems are useful tools for translating knowledge between fields.

The results have also shown the significance of other concepts that are factors of unforeseen circumstances for the analyzed Industry 4.0 technologies, such as modularity. These systems can be integrated with CPS for managing complex, customized manufacturing processes and rapidly adapting production capacity and functionality over time (Morgan et al., 2021). Additionally, Lean tools, ERP, and MES are expected to aid flexibility when combined with Industry 4.0 technologies (Marcon et al., 2022).

Andon systems in combination with IoT allow the equipment to respond to error warnings, stop operations, or change product routes (Rosin et al., 2020). Electronic "Kanban" (Kanban is a visual signal used to trigger action. Kanban is a Japanese word and a popular method in managing Lean

flows. Roughly translated, it means "you can see the card" (Wikipedia.) can automatically detect their inventory levels and order parts, enabling a more diverse configuration for different product designs (Marcon et al., 2022). Moreover, IoT can ensure that the right products go to the right workstations and automatically redirect products in case of errors, which is part of the "Jidoka" (By definition, Jidoka is a "Lean" method widely accepted in manufacturing and product development. Also known as autonomy, it is a simple way to protect your company from delivering low-quality products or defects to your customers while trying to maintain your time pace. Jidoka relies on four simple principles to ensure that the company delivers defect-free products: detect abnormalities, stop the process, solve the immediate problem, and investigate and solve the root of its cause.) principle. The complementarity of these concepts with unforeseen company circumstances is crucial for flexibility and productivity.

#### 4. Paper submission

One of the main characteristics of Industry 4.0 is integration. Industry 4.0 is characterized by three main types of integration: horizontal integration, vertical integration, and end-to-end integration (Kin, Liu, & Grosvenor, 2016). Liao et al. (2017) have specified these three types of integration:

- Horizontal integration is the integration of different IT systems used in various phases of manufacturing process and business planning within a company (e.g. inbound logistics, manufacturing, outbound logistics, marketing) and between several different companies (value networks) (Kusiak, 2017)
- Vertical integration is the integration of different IT systems

at different hierarchical levels (e.g. sensor and actuator level, manufacturing and execution level, manufacturing control level, and corporate planning levels) for end-to-end delivery solutions; and

- Digital end-to-end integration represents integration throughout the entire engineering process so that the digital and physical worlds are integrated throughout the product value chain, as well as in different companies, while also incorporating customer requirements.

Horizontal integration in didactic conditions can be sought in the integration of similar, independent educational technological systems at different levels. This integration simulates the integration that would occur between corporations. An example of this could be the integration between institutions that possess Industry 4.0-compliant equipment and complete the given technological process. Vertical integration plays an important role in flexibility routing and operations, as the management of a flexible string of operations and routes requires an integrated system. Vertical integration enables the information about the manufacturing complexity to be automatically sent to all subsystems (workstations) during rapid production change phases. Smart machines form a self-organized system via vertical integration that can be dynamically reconfigured to adapt to different types of products, and massive amounts of information are collected and processed to make the manufacturing process transparent.

## 5. Multi-Agent DFMC Management System Based on Macro Programming and RFID

The modified block diagram of the DFMC control model based on a multi-agent

structure, macro programming, and RFID is shown in Figure 1 (Gligorić, M. 2021). The main characteristics of the presented control model are:

- The carrier of technological and manipulation information is an RFID tag attached to the work piece (in cases of combination with pallet transport, the tag can be moved to the bottom of the pallet),
- Agents and multi-agents manage processes in approximately real-time (operation sequence, system reconfiguration, supervision, etc.) which increases DFMC flexibility,
- The transport system is based on a robot that has the property of reconfigurability (Reconfigurable robotic systems consist of at least two collaborative robots, one of which has the ability to be reconfigured. Reconfigurable robots and reconfiguration robotic systems are types of robotic systems that have the ability to restore their original function, completely or partially, after the partial damage of the system or the need for a change in certain characteristics. This is achieved by making changes to individual components.),
- DFMC modularity is achieved by using different types of flexible processing and additional machines, as well as different types of transport systems,
- Open modular structure that allows combining and mixing different intelligent transport and manipulation systems in the manufacturing process,
- Openness of software codes for research and analysis purposes,
- Partial approach to adjusting and analyzing DFMC processes (belonging to Industry 3.0), etc.

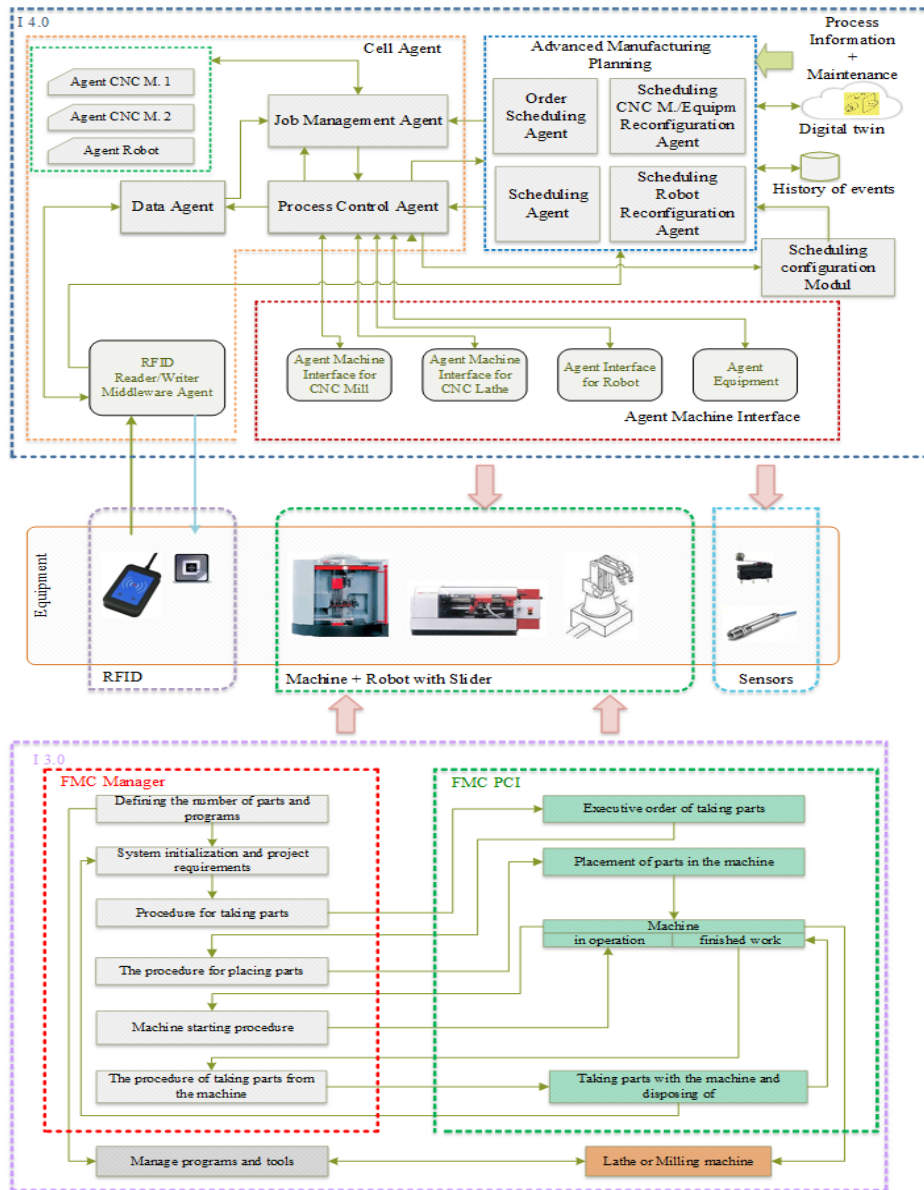

Figure 1. Block diagram of DFMC control

## 6. Conclusion

The competencies, knowledge outcomes, and skills for "smart" personnel need to be modernized and upgraded by incorporating

the knowledge necessary to implement the requirements of Industry 4.0 strategy. In order to achieve this, it is necessary to provide adequate teaching aids that offer: automatic product identification, real-time process technology planning, and

disburdenment of the control system, i.e. management localization. The multi-agent architecture of the proposed model for managing didactic flexible cells is capable of providing interoperability of RFID technology for a given constructive solution, as it enables a distributed system of management and supervision for DFMC. The management model has an advantage over smaller-sized parts that require fast program changes in processing (CNC machines) and manipulative systems (robots

with external peripheral axes) as it tends towards adaptive, "ad-hoc" management, solving unknown and unpredictable situations. This designed model introduces a flexible cell to a higher level of management. The management model combines: technology based on agents, parametric programming of CNC machines, and flexible tools and methods in the processes of generating technological procedures and transport within DFMC.

## **PARADIGMS OF APPLICATION OF ICT IN TEACHING**

***Abstract:** The mass application of ICT and computer software in teaching, caused by the current crisis with the pandemic, found many educational institutions and teachers unprepared and insufficiently trained for their effective application in the teaching process. In order for teachers to use ICT efficiently and effectively in teaching, they need to be willing to learn new skills. Daily and functional use requires the use of more sophisticated functions of computer programs that carry out the learning and teaching process. Integrating ICT into the learning and teaching process is of crucial importance in the information society of the 21st century. The rapid development of ICT constantly affects the challenges of life and work, and therefore of pupils and students through the educational system as members of a society in which ICT is an indispensable part. It was the development of information technologies that initiated improvements in various areas such as: finance, business, health, education and others. This particularly reflected the rapid progress in the field of education and encouraged the introduction of e-learning, which is a direct result of the integration of education and technology and is considered a powerful medium for learning.*

***Keywords:** distance learning, electronic learning, neuro-fuzzy methodology*

### **1. Introduction**

New teaching methods in ICT education advocate the active role of students in their own education, and place teachers in the position of expert advisers and coordinators of the learning process.

Blended learning and a mix of content delivery tools are the right solution for capturing student attention and tracking student progress.

The subject of research in this paper is the teaching process of mathematics implemented in a traditional and modern way with the use of ICT. In this context, the experiences of many mathematics teachers have shown that students have the most problems with acquiring the content of this

school subject. Motive is a very strong factor that can influence overcoming this problem. From there came the idea to determine how the implementation of teaching can influence the level of motivation for learning mathematics.

The goal of the research of this work is to provide some kind of contribution to the establishment of a positive attitude of students towards mathematics by encouraging motivation to acquire new knowledge, as well as by contributing to the methodology of teaching mathematics.

Technology-assisted learning or standardized lessons can mitigate instructional weaknesses and significantly improve test scores.

## 2. The position of ICT in teaching

Technology-assisted learning or standardized lessons can mitigate instructional weaknesses and significantly improve test scores. Ljajić believes that ICT is defined as a combination of information technology with other technologies, especially communication technology. In practice, several types of analysis of the impact of ICT on the learning process are applied, and one of them is the SWOT analysis.

By using this analysis, we are given the opportunity to determine the strengths and weaknesses of the education system itself, as well as to improve the quality of education itself. With the help of SWOT analysis, for example, we can define each platform separately and determine which platform is the best and most represented for primary, secondary and higher education. All platforms that are used in teaching are important and therefore are proportionately represented in education. The most frequently used distance learning tools were Zoom meetings, Google meet, Email, Moodle online classroom and Cisco Webex, which students found easy to use. The Moodle online classroom, e-mail communication and online lectures were chosen as the most suitable ways of presenting the study material.

In addition to computer/digital literacy, teachers see ICT as fostering students' interest in subject matter and learning and attitudes towards information technology as

a learning tool as a key part of a lifelong interest in learning. Building on this, it becomes clear that ICT must be linked to the specific needs of individual countries while ICT is used as a student-centered tool, unlike traditional pedagogy.

### 2.1. Factors affecting the application of ICT in teaching

In the scientific literature, there is a significant number of works that highlight the strategic importance of modern ICT in educational institutions that address the issue of information and digital literacy as a function of the quality of education (Petković et al. 2018). However, despite the number of works that deal with these topics separately, no works were found that give a complete insight into the above-mentioned problem, providing an answer to the question to what extent the IT literacy of educators affects the improvement of quality in educational institutions and in what mutual relationship are these variables.

There are a number of comparative methodologies on the market so that each institution can choose an effective e-learning platform according to its needs.

In the following, we present the results of the research conducted at the Higher Education Institution in the territory of Kosovo and Metohija (KM). To the survey question about the factors that influence the degree of ICT application at the Higher Education Institution.

**Table 1.** Factors affecting the level of ICT application at the Higher Education Institution in function of the gender of the student (Milićević et al. 2021)

No.	Factors affecting the degree of application ICT in colleges/universities	Gender of students		Total
		Male	Females	
1	Activity and expertise of the teaching staff	108	63	171
2	ICT faculty/university equipment	150	125	275
3	Activities of the faculty dean/school director	37	25	62
	<i>Total</i>	295	213	508

**Table 2.** Factors affecting the level of ICT application in function of the age of the students (Milićević et al. 2021)

No.	Factors affecting the level of ICT application at colleges/universities	Age of students					Total
		19-25	26-32	33-39	40-46	54-60	
1	Activity and expertise of the teaching staff	152	13	3	2	1	171
2	ICT faculty/high school equipment	256	14	4	1	0	275
3	Activities of the Dean/Director	56	5	1	0	0	62
	<i>Total</i>	464	32	8	3	1	508

Although educational systems in Europe have been investing considerable resources in information technology since the early 1980s, when it comes to educational institutions, there are still no international standardized indicators that would show the contribution of technology and the effectiveness of its use in education (Pedro 2012). In the absence of relevant research on the application of e-teaching in the function of improving the quality of education in the Republic of Serbia, especially in the territory of Kosovo and Metohija, the purpose and justification of research in the conditions of the current pandemic is multiple.

## 2.2. Aspects of ICT application in education

When integrating technology into the pedagogical process, it is important that the teacher has the skills that allow him to use technology properly in the classroom (Denić et al. 2019). The didactic design of lessons is based on learning objectives, so it is important to adapt the use of ICT tools to the content needs of students, and not the other way around. An essential element of the success of the introduction of ICT is the choice of approach, which must be aimed at the active participation of students. Research indicates that the integrated use of ICT requires more preparation time and greater operational reliability. Research on students showed that their response to the use of e.g. mobile devices in study work is positive, although most do not believe that their

learning performance has improved (Kinash, Brand, Mathev & Kordiban 2011). Although learning outcomes are not improved, the perceived comfort and flexibility of study work can also be significantly increased. A key problem is the differences between students' opinions about their knowledge of using ICT and actual knowledge or achievements (Hatlevik, Throndsen, Loi & Gudmundsdottir 2018), as well as the duration and intensity of the use of smart devices. Felisoni and Godoi (Felisoni & Godoi 2018), for example, find that daily long-term smartphone use has a markedly negative impact on academic performance. In this context, an important role is played by teachers, who by choosing ICT and appropriate didactic use make an important contribution to the way of working within the study process, as well as to the adaptation of learning to new situations using new modern technology.

All innovations that require teachers to change many aspects of their daily routines are very demanding. Complex innovations can only be successful if a number of mutually complementary conditions are met. Therefore, the following questions should be addressed:

- What kinds of ICT skills do teachers need? What policies and programs are effective in preparing and motivating teachers for their role in education for the information society?
- What is the impact of ICT on teachers' working conditions?

Implications for changes in teacher professional development and other elements of the education system differ in how individual systems transition from traditional education to (1) technological literacy, (2) knowledge deepening, and (3) knowledge creation. Of the three approaches, the technological literacy approach involves the most fundamental policy changes. The goal of this approach is to prepare students, citizens and a workforce capable of embracing new technologies to support social development and improve economic productivity.

Application of modern ICT in teaching can take place in two directions:

- The role of modern technology is to transmit information through software

that communicates with the student and gives him instructions;

Another way is to understand learning as the ability to solve problems using one's own mind (the student comes to the solution independently, by observation, analysis, drawing a conclusion).

- For the application of ICT in teaching, the teacher is enabled to:
- Designing the classroom,
- Integrating ICT into the teaching process,
- Education of students to use computers in class,
- IT literacy of teachers,
- Ergonomics of the teaching space,
- Use of computers in teaching.

**Table 3.** Indicators of successful application of ICT in an educational institution

Indicators of successful application of ICT in an educational institution	Indicator
Technological means	optimization of equipment types and characteristics in accordance with the needs and requirements of the educational institution
Installed technologies	planning, coordination and verification of requests, communication media, furniture, lighting, security and insurance, educational institutions
Technologies available to students and teachers	providing staff who can support adequate work and learning for ICT users
Technology service	maintenance and upgrading of hardware and software
Professional development	development of human capacities of employees in an educational institution – INSET for teachers, librarians, professional associates and other employees
Planned technologies	documentation of ICT implementation plans and its placement in the educational public
Used technology	monitoring the time spent at the computer with the aim of carrying out various educational tasks of the participants in the educational process
Achieved educational outcomes	level of ICT competence of users of ICT resources
Effectiveness in mastering certain teaching subjects	achievement of educational goals, including independence in learning
Funding	total money spent on ICT implementation

### 3. Research results

Empirical data, that is, the results of research on the expectations and experiences of pupils, students and teachers in integrating distance learning into their educational activities can be an important guide for the future in terms of strategies for the development of teaching-pedagogical practice.

- SWOT analysis and discussion of student and teacher survey results

This analysis assesses internal and external factors, as well as current and future potential. SWOT analysis works best when different groups within the organization are free to provide real data rather than prescriptive messages.

- Research indicates that teachers, students and pupils must know the right way to integrate ICT into education, why and when e-learning activities are undertaken and what the expected benefits can be. In a survey of the most common distance learning problems users encountered, the majority cited the following: technical difficulties, unclear teacher instructions, and uneven workload. Teachers and students in higher education highlighted the advantages of didactic use of ICT in the learning and teaching process: active participation of students, the possibility of receiving quick feedback and the development of discussion, more transparent visualization of content and the possibility of adapting content and tasks.
- The research carried out within this paper indicates that teachers in higher education believe that the knowledge, skills and

competences of teachers represent factors that must be fulfilled, that is, satisfied, as a condition for the effective and successful use of ICT in the teaching process during the COVID-19 virus pandemic. In this sense, the importance of the technological and didactic knowledge of the teacher is emphasized, which is also connected with the ability to critically assess the appropriateness of the use of certain ICT, that is, distance learning in specific learning situations. Bullets and

### 4. Conclusion

Research indicates that teachers, students and pupils must know the right way to integrate ICT into education, why and when e-learning activities are undertaken and what the expected benefits can be. In a survey of the most common distance learning problems users encountered, the majority cited the following: technical difficulties, unclear teacher instructions, and uneven workload. Teachers and students in higher education emphasized the advantages of didactic use of ICT in the learning and teaching process: active participation of students, the possibility of receiving quick feedback and development of discussion, more transparent visualization.

## DISTANCE LEARNING COMMUNICATION STRATEGY AT THE POLICE INSPECTORATE SCHOOL IN SOUTH KALIMANTAN

**Abstract:** *This study aims to analyze the planning, implementation and evaluation of the 49th Batch of 2020 Communication during the Covid-19 pandemic in South Kalimantan, which focused on the use of virtual learning in the distance learning process which is believed to provide easier learning, can communicate directly so that material is easy to accept. . All Education, totaling 1,550 people, implemented distance learning because it was seen as safer during the Covid pandemic, including the Police Inspector School Education. Methods This research was carried out using a qualitative approach. This type of research is descriptive qualitative. Data collection techniques are interviews, observation and documentation. the theory used is educational communication theory and interpersonal communication. Results of the study: The form of lesson planning includes the Learning Implementation Plan. Implementation of this distance learning by using the media application zoom meeting and whatsapp. Distance learning is carried out by lecturers, teaching materials will be sent and provided specifically for students who will then be given assignments to be evaluated by lecturers to evaluate the achievement of distance learning. Suggestion: communication strategies and planning, implementation and evaluation of distance learning need to be improved so that the future will be even better.*

**Keywords:** *distance learning, communication strategy, Police Inspectorate School*

### 1. Introduction

In the era of the industrial revolution 4.0, we are faced with the emergence of a new corona virus (nCov) pandemic that causes coronavirus disease 2019 (COVID-19) which has occurred in all countries, including Indonesia, which has had an impact on all life. No exception in education and lifestyle of people throughout the

country. The most striking changes can be seen in the way people live their social lives and the teaching and learning process. All learning from elementary to tertiary level (university) is controlled from home ( work from home and school from home ).

The distribution of people in the category of People Under Monitoring (ODP), People Without Symptoms (OTG) and Patients Under Monitoring (PDP) in Indonesia

showed a significant increase from 2 positive patients on 6 March 2020 to 4,839 on 14 April 2020, with an average the increase per day reached 200-300 entering April 2020, requiring the government to issue instructions regarding social restrictions. With an increase in the number of people who are positive for COVID-19, of course schools must be able to prepare a strategy for a distance learning system both in terms of educators and students and their supporting infrastructure so that learning can run smoothly.

Based on Circular Letter number 1 of 2020 concerning the prevention of corona virus disease (COVID-19) in Higher Education, the Ministry of Education and Culture states that the implementation of Distance Learning (PJJ) is adapted to the conditions of Higher Education (PT) and directs students to conduct learning from home ( school from home ). Campuses can take advantage of online learning applications such as Google Clasroo, Edmodo, Schoology, Classdojo, zoom meetings and other applications.

Education is one of the important aspects of life that has colored human life since the beginning, has become a guardian of life, and human basic needs (Yusuf, 2018: 7). Education is the learning of knowledge, skills and habits of a group of people passed down from one generation to the next through teaching, training or research. Education often takes place under the guidance of others, but is also possible on a self-taught basis. Every individual has the opportunity to learn without any obstacles. Online or distance learning makes students have to study independently, look for other learning resources that support learning on campus, sometimes the COVID-19 pandemic causes learning to be carried out face-to-face in class, so during conditions like this it must be done with the PJJ system.

In this case, of course, technology has a very important role to facilitate interaction, communication and presentation so that the

learning process goes well (Muhibbinsyah, 2004:10). Therefore, the role of learning media is needed to facilitate communication between educators and students (Borisova et al., 2016). However, if it is not used properly, of course it will only cause problems, failure occurs and learning does not go well (Blue Journal &Gurdner, nd) and will only be used as evaluation material for distance learning (Moore et al., 2010: 7).

e-Learning is an electronic-based learning process in which its use can be accessed online (Weni&Isnani, 2016: 144 – 127 ). Improving mastery of learning materials, increasing interaction between students and educators and facilitating the learning process are the objectives of e-Learning in its application (Darmayanti et al., 2007:99-133). So it is effectively used during this pandemic. However, its use is lacking because the content is only in the form of text or presentation slides , there is a need for development to increase interest in learning (Cucus&Aprilinda, 2016: 1-5). The development of e-Learning , the google classroom application as a learning medium during a pandemic is considered effective because its use is effective and efficient and can be done flexibly anytime and anywhere, is practical to use, and can improve learning outcomes (Subandi et al., 2018: 460– 463 ). However, the use of Google Classroom must be balanced and adapted to a good internet connection, this is also a problem if there is a delay in submitting assignments due to a slow connection (Fauzan&Arifin, 2019). Therefore, in its use should be adjusted to suitability of the level of learning, the quality of learning as well as the intensity and time.

The use of virtual learning in the distance learning process is believed to provide more ease of learning, being able to communicate directly so that material is easy to accept (Munawaroh, 2005). The use of virtual learning can be used one of them with the zoom application . This application is carried out as if it were happening in classroom

learning, the use of applications that are easy to use, but lately data theft has often occurred on users so that it is not safe to use and its use requires a large internet connection (Nuryana, 2020). At this time there are many applications that are used, such as being able to use webex, microsoft and other zoom meetings so that users feel safe.

Zoom Meeting itself is a learning medium using video. The founder of the Zoom Meeting application, Eric Yuan, was inaugurated in 2011 whose head office is in San Jose, California. This application is not only used for learning but can be used for office matters and other matters. This platform is free so it can be used by anyone with a time limit of forty minutes and there is no time limit if our account is paid. In this Zoom Meeting application, we can communicate directly with anyone via video. Therefore, it is suitable to be used as a learning medium.

All education implements distance learning because it is seen as safer during the Covid 19 pandemic, including the School of Police Inspector Class 49th TA. 2020. The Sumber Bachelor Police Inspector School is a Police education for graduates needed in the Police profession to be educated and formed into Police Inspectors who have the knowledge, skills, abilities and toughness. Commendable attitude and behavior in carrying out police duties in accordance with their role as a police inspector who is an expert in his field of knowledge to support his duties,

Education is the right of all nations as stated in the 1945 Constitution Article 31 paragraph (1) every citizen has the right to education. (2) every citizen is obliged to attend education and the government is obliged to finance it ( Emanuel Sujatmoko, 2010: 182). The students were also asked to return to their respective areas and return to Sukabumi at an undetermined time. this results in hampered learning. However, there is the best solution, namely the Police

Inspector School institute, which chooses to use the platform, namely WIB, to facilitate student learning and is seen as safer during the current Covid-19 pandemic. Therefore, learning for 49th batch of SIP students in 2020 is different from that of last year's SIP students.

Where all the learning and training provided must be conveyed via distance learning (PJJ) zoom meetings and whatsapp groups). However, Distance Learning (PJJ) also has advantages and disadvantages when learning takes place. The advantages of distance learning include: 1) Students can interact with lecturers, friends and learning materials without having to be limited by distance and time, students can communicate with their lecturers via e-mail, if students need additional information related to the material he learns, he can access the internet more easily. changing the role of students from those who are usually passive to be active. 2) educators can control students' learning activities through the internet, educators can use teaching materials or study instructions that are structured and scheduled via the internet, so they can discuss with students. 3) availability of e-moderating facilities where lecturers and students can communicate easily via internet facilities on a regular basis or whenever communication activities are carried out without being limited by distance, place and time; E-learning can present lessons in an interesting way. However, the use of the internet for learning or e-learning is also inseparable from various shortcomings, including: 1) For students who do not have high learning motivation, they tend to fail. 2) lack of personnel who know and have internet skills. 3) the lack of interaction between lecturers and students or even between students themselves can slow down the formation of values in the teaching and learning process; the tendency to ignore academic or social aspects and instead encourage the growth of business/commercial aspects. the learning

and teaching process tends towards training rather than education, not all places have internet facilities. 3) lack of personnel who know and have internet skills; lack of mastery of computer language. 4) Unstable signal 5) Human Error (Unfocused, Drowsiness etc). In order for distance learning to be achieved, a communication strategy is needed.

**2. Research methodology**

The type of research used is descriptive, namely analyzing and presenting facts systematically so that they can be more easily understood and concluded. This research was carried out using a qualitative approach, namely research in which the data are in the form of words (not numbers) derived from interviews, notes, document reports, etc., or research in which the emphasis is on an analytical description of an event or process as existence in a natural environment to derive a deep meaning from the process. This approach is a process.

A qualitative approach is used to reveal descriptive power and information about what they do and what they experience towards the focus of the research. Qualitative research has characteristics including: scientific, human as an instrument, using qualitative methods, inductive data analysis, descriptive, more concerned with process than results, there is focus, there are criteria for data validity, research design is provisional, research results are negotiated and agreed together.

The type of research used in this research is a case study. In this case, Nana SyaodihSukmadinata explained that a case study is a research study conducted on an integrated system. This unit can be in the form of programs, activities, events or a group of individuals related by a certain place, time or bond. In short, a case study is a research directed at collecting data, taking meaning, obtaining understanding from the

case.

Qualitative research is research based on post-positivism philosophy which is used to examine the condition of natural objects where the researcher is the key instrument and the results of his research emphasize meaning rather than generalization (Sugiyono, 2009). Descriptive research is research conducted to describe a variable, either one variable or more (independent) without making comparisons, or linking one variable to another (Sugiyono, 2009).

**3. Results and discussion**

Setukpa is an abbreviation of the School for the Formation of Officers whose task is to carry out the function of forming Polri officers from Polri members. Setukpa used to be called Secapa (Officer Candidate School). Setukpa is led by Keala, abbreviated as Kasetukpa, who is responsible to Kalemdikpol. Currently Kasukpa is led by Brigadier General Mardiaz Kusin Dwihananto.

**Figure 1.** Setukpa based on research results in 2022

Police Education & Training Institute (Lemdiklat) is a supporting element for implementing education and development under the Chief of Police with the task of planning, developing and organizing Police education in the framework of "Creating Professional, Modern and Reliable Tri Brata Personnel (Promoter)", based on the type of Polri education which includes professional, managerial education ( leadership), academic, and vocational as well as managing the education component in the ranks of the National Police Education and Training Center. The Polri Education and Training Institute is led by a Commissioner General of Police, assisted by 4 (four) Bureau Chiefs with the rank of Brigadier General of Police (Remin Bureau, Education and Training Bureau, Curriculum Bureau and Jianbang Bureau). The Polri Education and Training Institute is located on Jl. Ciputat Raya No. 40, Pondok Pinang, Kebayoran Lama, South Jakarta.

**Strategic Vision**

- VISION : To make Polri Education Institute a center of excellence in producing PRECISION POLRI members
- STRATEGY: Learning Institute for Education & Training & Position the Polri campus as a VITAL POLRI OBJECT

**KalemdiklatPolri Priority Programs:**

1. Creating a Healthy Campus
2. Creating a Safe Campus with Maximum Security
3. A Campus With a Precision Curriculum That Responds to the Challenges of Current Tasks & a Sense of Nationality
4. Making Campus a Favorite Place & Achievement Personnel
5. Building the Campus as a Center of Excellence
6. Building a Precision Campus Pilot Project

7. Creating a National Campus
8. Creating a Campus with a Strong Structure
9. Developing Sticks to Unkam
10. Increasing Lpdp Graduates
11. Equivalence of State Scholarship Masters & Doctoral Graduates with Sespimmen&Sespimti
12. Centralized Education & Training Coordination
13. Fulfillment of Sarpras Main Function of Police Practice at the Police Academy

**4. Communication Planning**

The term communication planning comes from the words planning and communication. Planning itself comes from the word plan which means everything that will or should be done. If everything that will or must be done is systematically pursued and stated in writing, it is called planning. In simple terms it can be said that planning is basically a process or effort or act of making a plan. The actions taken in making a plan are none other than the act of making decisions about what will and should be done. GR Terry (Mardikanto, 1992:281) states that planning is a process of selecting and linking facts and using them to compile assumptions that are expected to occur in the future and then formulate proposed activities to achieve the expected goals. . The important thing to note is that a plan is always oriented to the future (future oriented).

Meanwhile, communication, as you have learned in the Introduction to Communications Module, is basically the process of conveying messages from communicators to communicants, either directly or through the media with the aim of changing behavior. According to Bloom's Taxonomy (Winkel, 1990: 132), behavior change can occur in the cognitive domain, affective domain, or psychomotor domain.

Cognitive behavior is behavior related to aspects of cognition (intellectual ability or knowledge); affective behavior is behavior related to mental attitude; and psychomotor behavior is behavior related to skills. Changes in behavior in the cognitive aspect can simply be interpreted as a change from a state of not knowing to knowing; affective behavior change is a change from unwilling to willing; and changes in psychomotor behavior is a change from unable to be able.

Changes in behavior as described above that occur in the communicant or the target of communication do not automatically occur at every completion of a communication activity. Changes in the three types of behavior will only occur if the communication process carried out is truly designed and planned for the intended change objectives. In other words, changes in the communicant's behavior can occur as expected if a mature communication plan is carried out beforehand.

Then the question will arise: "What and how is the communication plan?" In simple terms it can be stated, communication planning is a written statement regarding a series of actions about how a communication activity will or must be carried out in order to achieve behavior change according to what we want. Because communication activities are basically in the form of conveying information (messages) by the communicator to the communicant, communication planning mainly concerns communicator planning, message planning, and media planning.

A written statement about everything that will or must be carried out in a communication activity is of course not just an explanation, but must be a systematic and detailed description so that it can be used as a guide in its implementation. A good plan (including a communication plan) is a plan that can actually be used as a guide that can help facilitate the implementation of an activity. Why is that, because it is possible

that in a communication project the people involved in a planning process are not necessarily involved as executors at the same time, and conversely the executors of communication activities may not be the people involved in the planning process. Therefore, between planning activities and implementation activities can be in the form of two activities (projects) each of which stands alone even though both are under the same project.

Good communication planning can determine the success of programs that will be implemented in the community. According to Middleton, good communication planning has several stages, namely, 1) collection of base line data and needs assessment; 2) formulation of communication objectives; 3) planning analysis and strategy development; 4) audience analysis and segmentation; 5) media selection; 6) message design and development; 7) management planning; 8) implementation of training; 9) implementation or execution; 10) Program evaluation. The following describes each of these stages:

#### Distance Learning (PJJ)

A Distance Study Program established with an establishment permit from the Decree of the Minister of Research, Technology and Higher Education of the Republic of Indonesia. Minister of Education and Culture (Mendikbud) Nadiem Anwar Makarim said distance learning (PJJ) could be implemented permanently after the Covid-19 pandemic. Currently, the Ministry of Education and Culture is preparing the PJJ curriculum and learning modules.

Nadiem explained, the use of technology will be fundamental in learning. The application is not only PJJ, but also the hybrid model. The use of technology provides opportunities for schools to carry out various kinds of learning activities. Nadiem said the Covid-19 pandemic had

provided an opportunity for the world of education to carry out various kinds of efficiency and technology.

Nonetheless, adapting and experimenting utilizing technology for learning activities. Currently, the Ministry of Education and Culture is conducting curriculum formulation to PJJ assessment. The curriculum is structured by considering the simplification of learning and focuses on aspects of literacy, numeracy, and character education. The team from the Ministry of Education and Culture, namely Balitbang, is preparing the curriculum.

In simple terms, the media is an intermediary in the learning process both in class and outside the classroom, which is intended to arouse attention and concentration and motivation of students to learn, but with changes in the teaching process carried out by lecturers in special situations, lecturers appear to increase their role as operators and as designers. in the delivery of learning materials. Nana Sujana (2011: 111) states that the pattern of teaching is the responsibility of the lecturer and the media, meaning that the increasing need for teaching activities, both quantitatively and qualitatively, will demand the ability of lecturers in the field of teaching technology. Hardhono (2012: 361) states that technology can be used for the development of distance education by involving a larger number of students in Indonesia.

Pannen (2012: 11) defines distance teaching as based on the separation between lecturers and students in space and time, which is designed systematically through the use of technology. Distance teaching or what is called Distance Learning initially developed in the United States, Germany, France and England, and in 1840 Sir Isac Pitman taught remotely using letters, and in 1980 the International Correspondence School (ICS) built a system of lectures home study courses as the forerunner of learning. distance learning (distance learning) which later

developed into e-learning (Ali Taufik, 2019: 1).

In a study that Web Media will be an effective and efficient means of distance learning between lecturers and students so that they can carry out the teaching-learning process without being limited by place and time (AtmokoNugroho, 2012). In a distance learning process, lecturers are expected to be able to managing online classes, designing and directing learning systems implemented by students so that there is conformity with the learning objectives to be achieved, there will be a balance and harmony between quality development and quantity development (Sardiman 2013: 170). Distance teaching is a single mode as an effort to develop distance learning using technology that can be used as an alternative to spur the development and improvement of educational functions, add new experiences and insights into teaching to be able to reach educational services to meet community needs in order to anticipate future education (Zuhairi 2012: 45).

Perry and Rumble (1987) emphasized that in the context of distance education, the meaning of the word distance is the absence of face-to-face contact between lecturers and students when the teaching and learning process occurs. Thus, distance education or PJJ is two-way communication bridged by media such as letters, telephone, radio, internet, computers, smart devices and so on.

Meanwhile, according to the Higher Education Law number 12 of 2012, article 31 concerning Distance Education (PJJ) explains that PJJ is a teaching and learning process that is carried out remotely through the use of various communication media. supported by learning facilities and services as well as an assessment system that guarantees the quality of graduates according to National Standards

Therefore, according to Perraton (1981) if we want to build a theory of distance

education, it cannot be separated from existing educational philosophy and communication theory or diffusion theory. He said that in developing distance education one should consider the aspects of expansion and dialogue.

Expansion (expansion) or equity and development of education is necessary because education is related to power. Humans who are not educated are generally in a weaker position than educated humans so that from this perspective the assumption appears that education is synonymous with the process of gaining power. Thus, how the expansion process takes place (dialogue) becomes important.

The word "dialogue" in this case, if not interpreted carefully, is like a double-edged sword; strengthening the development of the concept of conventional education and weakening the concept of distance education. By highlighting the psychological aspects of dialogue, we tend to conclude that education will be effective because students feel more comfortable and motivated to learn.

Without dialogue, education will turn into indoctrination. Distance education experts must consider this and examine all possibilities to present the concept of learning as a comfortable activity, not a burden. PJJ will not be completed without a clear theoretical basis. From a theoretical point of view, Sewart, Keagan, & Holmberg (1983) outlines three main theories regarding distance education, the theory of autonomy and independent learning, industrialization of education, and interactive communication.

The first theory is the theory of autonomy and independent learning, basically heavily influenced by social democratic views and liberal educational philosophy which states that every individual has the right to equal opportunities in education and every instructional effort should be pursued in such a way as to give freedom and independence

to participants. Learn in the learning process. Students have the freedom to consider and decide for themselves what to learn and how to learn it. That is, if in conventional education students communicate more interpersonally or consult with humans, then in distance education they do more intrapersonal communication with input in the form of information or teaching materials in printed or non-printed forms.

The second theory is the theory of educational industrialization put forward by Peters (1973). He said that the distance education system (PJJ) is a form of industrialization of teaching and learning activities which in its implementation is characterized by division of labor and mass production (teaching materials). PJJ is a method for teaching knowledge, skills, and attitudes by applying various principles of industrialization and the use of technology whose aim is to mass produce quality teaching materials so that they can be used simultaneously by a large number of students whose homes are spread all over the country.

The third theory is the theory of interaction and communication. This theory arose because many education experts agreed that the notion of independent learning does not mean self-study. Contact between students and components of institutions providing distance education is still needed, both for administrative and academic purposes; sometimes even psychological. Regarding academic matters, because it concerns the essence of education itself, distance education institutions always provide tutors. Thus, interaction between students and teachers still occurs even though the frequency and intensity of communication is limited. How to interact itself can be through face-to-face or using communication media such as letters, telephones, computers, and so on.

Holmberg (1977), including supporters of this interaction and communication theory, views distance education as a learning process in which students are not under direct supervision by the teacher as is the case in classroom teaching although they still receive assistance in the form of guidance, planning learning activities, and teaching in tutorials.

He introduced the concept of "guided didactic conversation", namely the existence of dialogue that guides and educates students so that they feel engrossed in being invited to 'talk' to discuss topics they are interested in. That is, the teaching materials studied by students must be designed in such a way that they are interesting and "self-instructed". We often hear this teaching material as a module. Both conventional modules and electronic modules are increasingly popular today. This looks more fun and encourages responsible learning.

### Learning Media Used in PJJ

In practice, the development of distance education can be seen from the development of the learning media it uses. According to Giltrow (1989) in developed countries, initially paper or printed teaching materials dominated the distance education media, then in the 1950s non-printed teaching materials such as audiovisual began to be widely used.

In the 1980s, it was difficult to know the dominant type of media. The last decade has led to the dominance of electronic learning media. Well, especially now in the era of very sophisticated information technology. Even virtual face-to-face or direct long-distance interactions have become commonplace. For newly established distance education institutions, especially in developing countries, printed teaching materials are used more because perhaps from an economic, technological and cultural point of view they are deemed more

appropriate. This is somewhat different from the situation of distance education in developed countries. In line with the development of computer technology, the development and use of non-print media in developed countries is quite intensive because the constraints for making interactive teaching materials are relatively reduced compared to the previous decade.

Currently in developing countries like Indonesia, technological problems are no longer a major problem. The current problem is the limited ability of human resources to take advantage of this technological sophistication. Moreover, the character of the Indonesian people who tend to be reluctant to cooperate and have an instant mentality of making learning media works by educators are still far from the needs of students. However, I am personally optimistic that it will gradually get better in the future. Where electronic interactive media is increasingly familiar.

### PJJ elements

From the several definitions of PJJ that have been developed by experts, if identified, distance education contains at least several elements of PJJ as follows:

1. Separation of Lecturers and students (although not completely),
2. Student independence (expected to be relatively higher than conventional education student independence/responsible learning),
3. Organizing mass production (industrial) of teaching materials, and
4. Utilization of interactive learning media, communicative media, adaptive or the like.

Planning for Distance Learning Communication (PJJ) at the 49th Batch of 2020 Student Police Inspectorate School during the Covid 19 Pandemic in South Kalimantan.

# 14<sup>th</sup> IQC International Quality Conference

QUALITY RESEARCH

In distance learning there is a form of learning planning among them that is Plan Implementation Learning. Distance learning has certain components. Every educator should prepare components learning before carrying out learning activities such as curricula and tools other. In learning distance Farthere is a number of component matter This explained by (Dr. Munir, 2008) state that component process learning distance Farthat is consists from curriculum, material learning instructional media, guidance tutorials snd strategy in learning .

Form planning which moment this used on period new normal. These educators race on semester programs and lesson plans. And this new thing is contained in the draft Minister of Education and Culture on LearningDistance learning is a guarantee of implementing distance learning more

quality, system management learning. Which fulfil standard guarantee education quality, stipulated condition main for unit education. Which will organize Learning Distance Far.

On learning distance Far Also there isparty-party which involved in learning planning. These parties include educators (Gadik) and Ban Bin Girl.

This statement is supported by the results of an interview with Mr. Yudi Martias Anas as a girl at SetukpaLemdiklatPolri: Learning Implementation Plan (RPP) used during Distance Learning (PJJ)Adjusted to the schedule that was made by Bag Bin girl . The RPP provided is 329 pages for 6 months of learning for students in the form of the National Police Education and Training Center.

Figure 2. Setukpa Class 49 Education Calendar for 2020

Second party, the really role important in learning distance far. According to (Majid, 2005), planning can be interpreted as a drafting process, material lesson exists, use media teaching, and arranged evaluation in the allocation of time carried out at a certain time to achieve predetermined goals. So that the implementation of good learning with consider circumstances and situation.

In the distance learning strategy teaching and learning activities must be carried out. And the important role is to pay attention to the psychology of students, lest they feel uncomfortable or stressed when studying because they are burdened with piling up assignments. So you must have the right strategy to create effective distance learning, one of which is the 5M strategy. The 5M strategy itself consists of humanizing relationships, understanding concepts, building sustainability, choosing challenges, and empowering contexts. To find out the meaning of these methods, you can listen to the following explanation:

### *1. Humanizing Relationships*

Humanizing relationships has a meaning as a learning practice that is oriented towards building positive relationships with each other, starting from parents, students and lecturers. Prior to distance learning, lecturers could communicate with students and parents directly, but after PJJ, each party concerned had to access the internet and technology to communicate and build relationships.

To implement this, you can build a good relationship with parents of students, by knowing the profile, conditions of parents, and time to accompany children to study. This is done to ensure that the child's learning atmosphere is conducive.

As a lecturer, you can also discuss with students' parents about student learning methods, student habits that are carried out at home, student family backgrounds, student development and learning processes,

work and conditions of student parents. Through these discussions, you can get closer to the parents of students and get to know what students need.

### *2. Understand the Concept*

Understanding a concept is learning that goes beyond mastering content. Understanding the concept has a deep meaning and can be applied in a variety of ways. Where the tasks given in learning are related to the surrounding environment and the problems that are happening. But before that, you can communicate with parents first to help the student's learning process at home.

In implementing this strategy, you must first communicate with students about the study guide. Where students not only master the content or content, but mastery of competencies that can be applied in various contexts.

As a lecturer, you can discuss with students' parents about learning activities at home, whether there are obstacles or problems that cannot be overcome. If so, maybe you can help the student by providing additional material. Also discuss children's learning goals, where learning activities not only make children know, but understand the context of learning to be applied in life.

### *3. Building Sustainability*

Building sustainability is a learning practice to guide students in understanding directed and sustainable learning through feedback. In this case, you can give students clear and detailed assignments. After that, you can provide feedback in the form of grades, to find out students' abilities and motivate them to study to be more enthusiastic.

Then, most of the programs and needs at PJJ have met the criteria needed in the learning process. From the planning side of the input aspect, effective results are obtained. Where the infrastructure as PJJ facilities and

infrastructure is sufficient. lecturers and students also have adequate competence in the field of IT which is much needed in the PJJ process.

**4. Choose a Challenge**

Choosing a challenge means more challenging learning practices, for example by guiding students to understand their skills through a meaningful and tiered process. When teaching and learning activities take place, you don't just tell students to write, but you can combine them with more exciting discussions and activities to make students more active.

As a Lecturer, you can invite students to get involved in implementing this strategy. Where you can identify your interests, talents and skills in a variety of ways according to your profile. To support learning activities, it can also provide a choice of media and the right way to learn and do assignments and arrange good study time.

**5. Empower Context**

Empowering context has a meaning as a

learning practice that directs students to use resources and opportunities in various communities as a source of learning and a place to contribute to change. The assignments given during learning can also be adapted to the context of everyday life.

**5. Implementation of Distance Learning Communication (PJJ) at the 49th Batch of 2020 Student Police Inspectorate School during the Covid 19 Pandemic in South Kalimantan**

Implementation learning distance far this is wrong one method for overcome circumstances pandemic like this, so that participant educate still can study even at home. Matter this in accordance with the Minister Education And Culture Republic Indonesia related Letter Circular Number 4 of 2020 concerning Implementation of Education Policy in Period Emergency Spread Coronas Virus disease Covid-19.

**Figure 3. PJJ Stage 2 Weekly Lesson Schedule**  
 Source: documentation from the 2022 Research Results

Implementation learning distance Far this by using the media application zoom meeting and Whats App. Medialearning is Wrong Onethe most important component in learning activities. There are many learning mediathe form of which is by using electronic communication tools. According to Alaby (2020: 282) states that the implementation of distance learning (PJJ) can take advantage of WhatsApp social media in tertiary institutions, WhatsApp can be used as a media for lectures, presentations and discussions, then initially the lecturer gives material to his students in the group, then the lecturer gives instructions to work on the questions or argue about the material, when students express their ideas or opinions, it must be accompanied by their

name, absent number and the names of group members so that the lecturer can give an assessment to all students participating in the group directly.

Sahidillah and Miftahurrisqi (2019:54) state that distance learning (PJJ) can utilize WhatsApp. WhatsApp can be used as a medium for discussion, the learning created will be interesting if all children play their proper role. The position is required for Lecturers to be more creative in developing lessons or material to be taught through distance learning (PJJ) by utilizing WhatsApp . This statement is supported by the results of an interview with Mr. Erik Sonjaya as a girl at SetukpaLemdiklatPolri:

**Figure 4.** Gadik Kuswadi provides excellent service material to SIP 49 students,  
Source from 2020 documentation, 2022 research results

Submission of material in accordance with the girl in charge which is divided into several classes of distance learning students. via zoom meetings. For the determination of study time 1 day 5 units, 1 unit 90 minutes . For assignments collected 3-7 days via whatsapp group.

The mechanism for implementing distance learning via zoom meetings lasts approximately 11 hours a day. This statement is supported by the results of an interview with Mr. Fannan as a student at SetukpaLemdiklatPolri:

In my opinion, the lesson plan is good. learning is carried out from 08.00 – 12.00 then ISHOMA and continues again at 14.00-18.00. work on assignments 3-7 days via whatsapp group.

research results

## 6. Evaluation of Distance Learning Communication (PJJ) at the 49th Batch of 2020 Student Police Inspectorate School during the Covid 19 Pandemic in South Kalimantan

This statement is supported by the results of an interview with Mrs. Maya as a student at SetukpaLemdiklatPolri

In my opinion, this lesson plan is good, in accordance with the existing curriculum. The duration of time needed in learning is approximately 11 hours a day. Ishoma included. during our study we were required to pay attention to the material presented because all sessions had questions such as post tests at the end of the material. And we are also asked to review the material that has been submitted. Not forgetting the group and

individual assignments which are always our job.

This is in accordance with the opinion of Prawiyogi et. al. (2020: 95) that in distance learning or online lectures conducted by lecturers, teaching materials or materials will be delivered and provided specifically for students who will then be given assignments to be evaluated by lecturers.

Distance learning (PJJ) during the Covid-19 pandemic made students and girls have to adapt to new situations and conditions like today. Distance learning (PJJ) must still contain educational aspects and be carried out properly without reducing the quality and quality of education adopted by each educational institution.

1. Distance learning requires planning such as:
2. Formulating Learning Outcomes The formulation of learning outcomes refers to the description of the subjects that will be used in learning. The formulation of learning outcomes can be seen in the syllabus or learning implementation plan (RPP).
3. Mapping and Organizing Learning Materials Mapping and organizing learning materials is an effort to determine and classify learning materials into subject matter, sub-topics, and subject matter according to predetermined learning outcomes. Based on the predetermined learning outcomes, the tutor makes sub-topics which will then be broken down into several subject matter.
4. Choose and define learning activities

According to Wisman's theory (2017), things that need to be done to improve the quality of educational communication are: identifying communication goals, choosing the right media, studying objectives, attractiveness and credibility. The target of communication in educational communication carried out by these lecturers is students who become students. This means that the target of communication is the

millennial generation who are used to using new media so that lecturers are also required to be able to keep up with their students.

virtual face-to-face distance learning (PJJ) during the Covid-19 pandemic are Zoom , Microsoft Teams , and Google Meet. In addition, distance learning (PJJ) is also assisted by other media such as Google Form, Whatsapp, Google Drive and even social media which is usually used when the main media experiences problems, or is used to collect assignments and exams. This media can be directly accessed easily by girls and students so that they can communicate and connect with each other. In order for the message to be received and understood properly by the recipient of the message (communicant), a communication strategy is needed.

As stated by Wedananta (2016) the communication strategy has the aim of simplifying and paraphrasing explanations to avoid difficulty in understanding by the target audience. Wijaya (2015: 59) also conveys that a communication strategy can design programs in a comprehensive , logical, comprehensive, realistic and integrative manner . Gadik's communication strategy also aims to simplify learning in a comprehensive , logical, thorough, realistic and integrative direction so that students can achieve a good understanding even if they only learn from home through their respective media. The thing to do is to identify the problem that occurs. Problems that often arise in the communication process according to Marhaeni (in Syaipudin, 2020:29) are:

1. Barriers because the sender of the message is not able to convey the message to the audience
2. The message conveyed is unclear or unclear, has multiple, ambiguous or multiple interpretations and there is no similarity in the symbols (language) used between the sender and the recipient of the message.

3. Interference with signals or lines, or the flow of electricity,
4. Defocusing the recipient's attention so that the message received is not comprehensive or intact
5. Untimely, unclear feedback.

These obstacles arose in distance learning (PJJ) activities that were carried out and became a separate problem for girls. This disturbance can be in the form of signal disturbances which hinder the learning process so that the girl must also apply new strategies or methods to be able to achieve the targets she wants to achieve. Besides that, the girl also experienced obstacles in giving feedback from students.

Distance learning (PJJ) should pay attention to and adjust the tone, intonation and articulation of speech when delivering material during distance learning (PJJ). This is one of the strategies so that the delivery of material can be better. It is hoped that the material will be much more clearly conveyed.

Strategy by doing Problem Based Learning (PBL). In doing PBL, students are asked to provide answers to the questions given regarding the material discussed so that students can study well independently. Sometimes, students are also asked to present their work in distance learning sessions (PJJ). The easiest way to evaluate is to give a post-test or light questions about learning. By doing this, students' understanding of the lessons given during distance learning (PJJ) can be calculated with an average value. This is in accordance with the opinion of Prawiyogi et. al. (2020: 95) that in distance learning or online lectures conducted by lecturers, teaching materials or materials will be delivered and provided specifically for students who will then be given assignments to be evaluated by lecturers.

In addition, this can also be done by looking at the development of students while

participating in online learning. Apart from teaching in online classes, lecturers also open opportunities for students who wish to consult. Lecturers create special channels or forums through the new media used. Through these channels or forums, students can ask questions about learning and lectures. New media was chosen as one of the right alternatives to connect lecturers with students who wish to consult online because according to Ward's opinion that new media has the impression of being without mediation because it can be accessed directly without going through complicated procedures like conventional media so that it can be accessed directly by both parties (Moenawar, et. al. 2017:41).

## **7. CONCLUSION**

Learning planning starts from the stage of learning planning forms that are used in the form of learning implementation plans (RPP). In the implementation of learning there are indicators, ease of activities for students, learning media for students and assessment tools. Implementation of

Distance Learning Communication (PJJ) at the Police Inspectorate School for Students Batch 49 of 2020 during the Covid 19 pandemic in South Kalimantan.

The mechanism for implementing distance learning communication (PJJ) via the zoom meeting application and whatsapp group. The implementation of learning has been going well according to the schedule received, but the obstacles during the implementation of the interruption/blockage of signals that cannot be prevented. And sometimes the delivery of material is not clear.

Evaluation of Distance Learning Communication (PJJ) at the Police Inspectorate School for Students Batch 49 of 2020 during the Covid 19 pandemic in South Kalimantan. The achievement of distance learning is very much achieved. The evaluation used is a post test after the material ends, the task of reviewing the material by making a video presentation, daily assignments are collected with a duration of 3-7 days via the whatsapp group.

## COLLEGIALITY IN THE ORGANIZATIONAL WORK OF STUDENTS AND THEIR EXPRESSIONS OF THE SCHOOL VALUES: AN ETHNOGRAPHIC STUDY

**Abstract:** Collegial model of leadership has become apparent as expressed by the student leaders working in the campus organizations in the university. It aims to explain how these understanding of collegial model of leadership and supportive model relates to Marist culture/education such as in articulating the values of family spirit, presence, love of work which are seemingly related to collegiality. This study aims to describe collegiality in the organization work of students and their expressions of the school core values through a realist ethnographic approach to inquiry in order to generate a holistic portrait of that shared culture from the emic experiences of the student leaders in a Marist School in the Philippines. Several themes emerged to characterize collegiality in the organization work of students: Establishing and Nurturing the ties; School Identity and Values Influencing their Relationship; Collegial-Interactions as Reflective of the School Values; and Instinctive Act of Sharing with the Work to Accomplish. The study provides a holistic portrait of the student leaders of a Marist school on how they manifest collegial-interaction in the organizational work and how school core values are expressed on their interactions. It is affirming that student leaders in this university manifest collegiality in a unique and positive way by not only manifesting it on work-level relationship but instead it develops into more personalized level of relating and connecting with each other.

**Keywords:** Collegiality, Organizational Work, School Core Values, Realist Ethnography

### 1. Introduction

Collegiality is one of the most important factors in determining the quality of a school. It is assumed that the task of developing collegiality may be integral to the task of improving schools. Collaboration appears to be the unifying theme that

characterized many of the new developments in the successful schools of the 1990s. Even the recent literature on school improvement has also shown that the most promising strategy for sustained, substantive school improvement is developing the ability among school personnel to function as professional collegial communities (Shah, 2012). But in this study, collegiality is seen

from the lenses of students and student leaders working in the campus organizations as officers and leaders. Various studies and literatures have already defined the concept of collegial leadership as manifested by leaders in the organizations. Collegiality is commonly understood as a collaborative leadership expressed through behaviors, communication and set of beliefs of leaders that sustain collaborative processes and forces. Bush (2003) as cited by Shrifian (2011) explains in his model of collegial leadership that power and decision-making are shared with the members of the organization. The model further assumes that organizations determine policies and make decisions through a process of discussion leading to consensus. On the same article, Brundrett (1998) cited by Shrifian (2011) further explained that collegial models assume a common set of values held by members of the organization which guide the managerial activities of the organization and are thought to lead to shared educational objectives and the importance of “shared vision” as a basis for collegial decision-making.

The collegial model of organizational behavior refers to a group of people sharing a common goal and is related to teamwork. The basis of the collegial model is teamwork in which everyone works as a peer or colleague. In this model, the leader works to develop a better team and acts as a mutual contributor, a coach, a guide, who directs the team members to perform well rather than his own performance and not as a boss. The psychological result of this approach is that the members feel a sense of self-discipline as they own the responsibility of the work. This condition makes them feel that they are important and hold a place in the organization. Therefore they are inspired towards performing better in their workplace (Chauhan, 2021). Moreillon (2019) explained how collegiality and teamwork becomes essential in the context of work. To

say that there is collegiality, members of the organization see each other as companions or equals sharing and cooperating for their collective goals. In other words, there is the atmosphere of friendship, caring, and respect for one another (Mooney, et. al 2012). Teamwork implies that colleagues work collectively in an effective and efficient way to accomplish a task. The members of the organizations contributes to the achievement of the goal and everyone will share on the ‘credit’ for the outcome. Mooney (2012) further defined collegial leadership as a process involved in leaders systematically, but informally relating to persons and groups of equivalent authority in a different area for the betterment of the organization to advance a mutual mission. It involves individuals who possess the skills, abilities to effectively interact with colleagues. Similarly, Singh (2013) also emphasized that collegiality forms the backbone of a shared leadership. As a social skill, leadership makes people respect and follow others. A collegial leader shares power and authority equally among a group of colleagues which creates an atmosphere where members work together as a team to solve problems. In terms of support, a leader who uses the collegial style shows characteristics that allows to build a supportive environment where there is encouragement, listening, discerning and respect for difference and divergence of viewpoints. With the stressful nature of organizational work, it is said that social support is one of the most effective means by which people can cope with. There’s a question whether are there any cultural differences on how people utilize their social support networks. A review of studies on culture and social support presents evidence that Asians and Asian Americans are more hesitant to explicitly ask for support from others than European Americans because they are more concerned about the potentially negative relational consequences of such behaviors. Asians and Asian

Americans are more likely to use and benefit from forms of support that do not involve explicit disclosure of personal stressful events and feelings of distress (Kim, et.al, 2008).

Organizations are defined as a "process for social action" in which individuals voluntarily engaged in the work of the organization to accomplish its purpose. Being a member of a work organization fulfills basic needs met earlier in the primary family social group. Members consider the work organization a surrogate family, forming psychological attachments as well as value and ego links and they transfer needs, feelings and expectations developed in early childhood to their work. Work provides a place where individuals can belong, can express themselves openly and can receive honest feedback. Group members learn that their problems are not unique. Peers provide self-understanding and self-acceptance, a source of security which reduces tension. Psychosocial support is primarily in terms of expert cognitive advice from supervisors; emotional support from counselor; or behavioral support. Because emotional support is spontaneously developed and given, an individual is more likely to perceive it as genuine. Behavioral support is provided by helping the person do the job or by sharing responsibility with the person. Supportive work groups, where responsibilities are shared, are less personally stressful (Chapman, 1993).

In an organization, stable and durable relationships represent several resource interdependencies that lead to informal pattern of 'ties' that is called 'structure'. In the Weberian tradition, these social and informal relationships have long been considered by the bureaucratic model as particularistic obstacles to efficient collective action (Perrow 1986 as cited by Lazega 2005). In the collegial model, however, some of these durable relationships become the basis of a social discipline that

helps members cooperate and exchange, monitor, pressure, and sanction each other, and negotiate uncertain values (Lazega, 2005).

In this study, the intention is to relate how this collegial model of leadership has become apparent as expressed by the student leaders working in the campus organizations in the university. It aims to explain how these understanding of collegial model of leadership and supportive model relates to Marist culture/education such as in articulating the values of family spirit, presence, love of work which are seemingly related to collegiality. The student leaders of the university may have understood the Marist ideals or traditions because they have probably been conditioned to understand and live the values through the different orientations and formation activities given to them. However, what really is the dynamics in the student organizations when it comes to support culture and collegial interactions? How do Marist student leaders experience collegial support in the actual work in the organization? How collegial support with each other as officers been manifested and/or lived? How do they support each other? What kind of support they give and receive? How did they receive support from others? What kind of support? Martins and Terblanche (2003) explains that it is culture that is genuinely related with values and beliefs that are shared by individuals in an organization which includes the activity and behavioral set of standards. This research study intent to describe the collegial-interaction manifested and lived by the student leaders in one Marist School in the Philippines.

## **2. The Context of the Culture-Sharing Group**

Marist School is a Catholic educational community established by the Marist Brothers Inspired by the Blessed Virgin

Mary and St. Marcellin Champagnat's love for Jesus and his Gospel. The Marist Brothers of the Schools (FMS), commonly known as the Marist Brothers, is a congregation of men who devoted their lives to Christian education throughout the world, running Catholic schools or otherwise for the training and guidance of youth. It was founded in France in 1817 by Saint Marcellin Champagnat, who realized the values of Catholic Education in schools wherein God, the Blessed Virgin, Catholic Doctrine, and morality are part of the daily program. Marist is an identity of educators, students, alumni who have been part of the mission for education by the Marist Brothers- a religious congregation that is founded by Marcellin Champagnat, a priest from France. Champagnat is the Patron Saint of the university.

The Marist identity were introduced as ideals to which all Marists, students and adults alike, should commit to. The Pillars are: Presence which refers to caring for each other, seeking relationships founded on love, being attentive and welcoming with a sense of openness. Simplicity is being straightforward and genuine, humble and modest, 'doing good quietly'. Family Spirit refer to relating to each other as members of a loving family, building community, offering the warmth of welcoming, acceptance and belonging, sharing our successes and failures, setting clear standards of honesty, mutual respect, and tolerance. Love of Work... being generous of heart, constant, and persevering in our daily work, confident, visionary, decisive in meeting the needs of our community and encouraging each other to discover the dignity of our work with young people and with each other and In the Way of Mary... seeing Mary as a perfect model of being Marist, tender, strong, constant in faith, open to God's calling us to our own journey of discipleship (The International Marist Education Commission, 1998).

Notre Dame of Marbel University as the setting of this study is a Marist anchors its faith and life on the following core values as foundational qualities with which the Marist Brothers, Mission Partners, and students approach the entire educational process and academic atmosphere of the University. Family Spirit refers to the a relationship premised on love and expressed in a style which Marcellin called "family spirit." Akin to the characteristic of a good family are a warmth of welcome, acceptance, belongingness and authentic concern which should prevail where everyone has a sense of being valued and believed in, regardless of their role or their social standing. Marian is attributed to Mary as the perfect model of the Marist Educator, as she was for Marcellin. As a woman, a layperson and Jesus' first follower, she is the inspiration in living out personal faith and virtue of simplicity. Love of work implies a cheerful and careful preparation of all the things one does. It values the dignity of work as a powerful means of self-fulfillment, of giving purpose and meaning to life, and of contributing to the general economic, social and cultural well-being. Preference for the least favored is to be with those who are excluded from the mainstream of society, and those whose material poverty leads to deprivation in relation to health, family life, schooling, and educational values. Quality education is characterized as holistic where students are progressively initiated into their life-long challenge of harmonizing faith, culture and life. Integrity of Creation speaks about "Respect for the value of life" and "care for the mother earth" are two major themes in valuing the integrity of creation. It upholds life-giving values and promotes stewardship of the earth. Culture sensitivity means openness and respect to the different culture of peoples. It promotes dialogue as a way of enhancing unity in diversity. On the individual level, it is a communication between two persons with different views,

different values and traditions, to learn from each other in order for them to change and grow (ndmu.edu.ph)

### 3. Statement of the Problem

This study aims to describe collegiality in the organization work of students and their expressions of the school core values through a realist ethnographic approach to inquiry in order to generate a holistic portrait of that shared culture from the emic experiences of the student leaders in a Marist School in the Philippines.

### 4. Methods

This study utilizes a realist ethnographic approach in describing shared collegiality culture from the emic experiences of the student leaders in a Marist School in the Philippines. In this study, the researcher is interested on describing the shared patterns of actions, behaviors and some expressions of the student leaders in a Marist school on their involvement and participation in the campus organizational work and how they naturally express the core values of the institution on their interaction with each other. In this study, the Marist student leaders are the participants who belong to the culture-sharing group. These members of the group are officers of the supreme student government and collegiate student councils. They have consistently been involved in student leadership since first year in the college. All of the participants who were interviewed have served their organizations for at least 2 years. They were identified to be the active officers of the student organizations in the university. They have been visible in every organizational and institutional programs and activities. They take part in the planning, organizing, implementing, facilitating and evaluating the programs of the organizations of the university. They have been facilitators of

various formation programs for their fellow students and have also been taking part or even initiated various community extension services in the community. They all have been participated in the Marist formation leadership program of the university. This is a uniquely Marist way of forming and honing the leadership of the students in a way of a Marist.

What makes it realist ethnography? In this research, it reflects a particular stance taken by the researcher toward the group being studied. It is an objective presentation of the situation written in a third person point of view. The study narrates what has been heard and learned from sharing of the experiences and from the researcher's personal observations through his engagements and immersion with the day to day activities and interactions of the participants. The researcher ensures to be in the background as an omniscient reporter of the shared narratives and common patterns of behaviors and actions to be able to interpret how such culture of collegiality in the organizational work among students leaders in a Marist School is being lived. In the most generic sense, ethnography consists of the process of observing human behavior in a holistic cultural context. An ethnography is expected to offer a detailed and comprehensive description of culture—an account of the behaviors, beliefs, attitudes, and values of the people under study. It is 'the science of cultural description Walcott, 1975: William, 2006). In this research, the culture-sharing group are Student leaders of NDMU and the phenomenon of interest is the collegiality and their reflective expression of the school values.

### 5. Results and Discussion

Collegiality in the campus organizational work of student leaders is expressed through the themes that emerged from the experiences, reflections and narratives

shared by student leaders who have willingly participated in this study. The participants were eight (8) student leaders of the university who have been officers of the supreme student government and student council for the two consecutive school years (2020-2021 and 2021-2022). They were identified participants because of their active involvement as leaders in every activity, program and meeting being held by the student organizations. The researcher being the ethnographer in this study served as participant-observer being the in-charge of the Student Affairs and Development of the university whose role is to supervise all the undertakings of the students in the organizations. As declared in this research method, the research took one (1) school year to do observation, participate actively in the meetings and activities of the students and mingle with them before the conduct of the actual data gathering to be able to capture the spontaneity of the setting and context of the phenomenon being studied.

The study intended to describe collegiality in the organizational work as expressed by the student leaders in a Marist school in the Philippines. What makes this intention significant? Collegiality as a construct, in the case of most organizations be it for students, professional, politics, etc., has been a basic norm which is expected for every member to manifest. While it is true that collegial interaction must be a norm for every organization, the interest of this study is to look into how this concept of collegiality is being characterized as lived or expressed by the student leaders of a Marist school considering that a Marist institution is also guided with its core values where family spirit, love of work, presence among others are highly emphasized to be instilled for every student and for the student leaders in the campus organizations. The 'being Marist' of the interactions of the student leaders while they are actively engaging with student organization is the interest of this

research but with concentration on the aspect of their collegial-interactions and how they reflectively express the school core values. The following are the emerging themes that describe collegiality among student leaders in the campus organization in a Marist School and how these become reflective of the core values of the university.

## **6. Establishing and Nurturing the ties**

The students were asked to share their impressions, experiences and meaning of their interactions within the organizations while working for their specific goals or tasks. They were also asked to describe what collegiality means for them and how such becomes apparent or translated on their work relationship. Collegiality in the organizational work as shared by the students has emphasis on unfolding the kind of *relationship* they intentionally developed by exerting deliberate efforts on dealing and connecting with each other as officers of the Supreme Student Government and Collegiate Student Council of the university. *Why is it described to be intentional and/or deliberate efforts on establishing this good relationship among them?* As observed, student officers from the start are aware of the importance of rapport and good relationship in any organization to succeed in attaining the goal. In most of the organizations in the campus, initiating team building and community building activities have become part of the culture of the organizations as included in their annual and semestral plans. Aside from this, the series of meetings, constant interaction staying in their respective offices, usual conversation be it relevant to organizational work or personal matters contribute in building that rapport among them. This '*relationship*' that they intend to establish is more than just work-level or professional level of relationship as described by most of the

participants. As observed, they have profoundly developed that connections deeply like family where they care and show affective ties or connections with each other.

**Strongly personalized 'affective' ties** describe the interpersonal relationship that is experienced and shared by the student leaders from their intentional or explicit strategies on establishing this kind of relationship to nurturing phase. Affective is psychologically understood to have connections to feelings, emotions and attitudes and moods of a person. As relates to the domains of teaching, it is always referred to the emotional aspect of the learners that pedagogical process should have to enrich in order to enhance learning. The theme 'affective ties' deals with their personalized level of 'relating' and 'connecting' with each other that satisfies their emotional needs.

*Emotionally connected...like ang comfort with one another from beginning to end and also nga maka-share sa ila sang sang mga concerns mo...maka-open up... Comfortable ka with that..(P2)*

*Mafeel mo gid ang care sang bawat isa..(P5)  
Tapos everytime nga ng mag-breakdown ka or may ara ka sang problem ma-understand man sang co-organization mo biskan pirmi gin- hambal nga lain ang personal sa professional.. (P1)*

*Gina-cherish ko gid tanan nga support...Mabatyagan ko gid ang concern sang mga upod ko sa SSG. Kis-a ayawn ko ka-balance sang academics and obligations as officer, daw nabudlayan na ako mag comply, ara lang sila para mag ulikid kag magpafeel nga di kanag iisa sa amo nan ga struggle. Gina paintindi nila nga daw normal lang gid na maexperience sang mga officers. So, sa akon ang mga words nga ina very helpful gid...maka-ease gid sang balatyagon... (P5)*

*Daw malipay man ko nga ginsupportahan ko sang mga tao (referring to co-*

*officers)biskan bago pa man lang kami kilalahanay. Sa short time nga daw nag-upod kami, grabe na ang amon nga bond...close na gid,,biska outside pa sa organizational work...(P3)*

*Makita nila ko nga sa picture sa ssg very happy naku sir.. Atleast that time na notice ko nga daw na tagaan ko sang chance nga to prove myself nga tama ko. (P6)*

**'Friendship' ties:** When this group of participants asked to share their narratives on their experience of collaboration, teamwork, support and collegiality the way they have understood the concepts, essentially, they all mentioned that their treatment with each other has gradually developed into more than just being colleagues or co-officers. In their respective organizations, they said that they become are 'true-to-life-friends' and treating each other as 'family'. As observed being in the Student Affairs for quite a long time, this is something the researcher may affirm. Relationship of student leaders develop through time from being simply part of the organization to a deeper level of friendship through their constant engagement and company doing organizational work in school.

*Daw sa amo bi sir, daw wala gid namon naemphasize kung ano ang position sa council or what, we treat gid each other nga daw equal lang kami regardless of position. At the end of the day we are true friends. (P1)*

As discussed, the 'establishing' usually happens at the beginning of every school year. This is always true since every school year, transition is happening on the leadership roles of the student leaders. The set of officers changes year by year. As part of the dynamics of every student organization, be it in the Marist school or non-Marist, some officers remain as officers for the next two or three terms, some stay for only a term, and others have been officers of

the student council their whole life in the university. In other words, the composition of leaders changes every term. Thus, the kind of relationship among these officers every term may also vary depending on the compositions of the leaders with consideration to their attitudes, personalities, perspective and their intentions. Anyhow, the nature of relationship in every organization can be unpredictable considering these factors influencing their interactions. What is common among the student leaders who were interviewed was their experience being provided with emotional support and by their colleagues. The engagement usually starts with just being co-officers and colleagues in the organization. Their constant encounter working every day for organizational matters has nurtured the relationship into being not only colleagues at work but became 'friends' and that work or tasks in the organization becomes bonding time. Organizational work has become interesting and exciting every time they are with the group.

*Daw life blood...Daw life blood sa akon...Daw life blood ko gid ang maging officer. kung бага kung wala siguro yong mga support ng mga kasama ko dito, ang mental state ko siguro sir kay indi nami...Gusto ko gid ang akon experience with the group. We treat each other as more than just officers. We are friends, we are family.. (P2)*

*So for me na experience ko gid as a student leader nga may ara gid sang support when comes to preparation. Ang preparation be sir is bag-o be sa akon ang amo sini nga type sang preparation. First time ko nga maka batyag nga sa tanan mo nga hulag dapat bal-an sang tanan. Sa tanan nga hulag dapat kung anu ang ubrahon ko dapat bal-an ni kuya, bal-an ni.....Bal.an ni kuya Jay kay pati sila ma apektuhan man daw..So for me, this is connections. Not not they wanted to control me, but I feel they have concern*

*on me. They want me to learn and do things right....(P4)*

*Work becomes easy because of the trust and friendship that we have developed. Lain gid abi ang bonding sa council. After work sa council, my time gid na kami para lang magtambay- tambay kag mag sige istorya kag kinadlaw. Nadevelop gid namon sa council ang good relationship. (P5)*

*Ang support for me is give time sa mga tao. Sa mga tao around sa imo nga mag give sang initiative parehas sinang ginahambal nila sir initiative mag hatag sang full self sa pag-build sang good camaraderie..(P4)*

*May mag kamusta sa imo pirmi..maglibre sa imo kaon..Siguro ano na ang mental state ko kag ang physical state ko subong...,So, para sa akon amo gid ina gapabuhi sa akon ang support nga ma baton ko halin sa mga upod ko.. ( P2)*

*Very vocal ko nga tao. Grabe ko ka garet-garet sa tanan sir siguro ang mahatag ko lang support is the love.. Amo ina ang gusto ko nga ihatag sa ila. Emotional support sir daw amo nalang na ma-give ko sa ila sir biskan emotional support sir amo na ang ma-give ko sa ila kay more on abi sa ubra ko sir as a student leader pag tagaan ko task ubrahon ko dason so after sina ang halimbawa wala naku ubrahon mag help ko nga mag gaan ang boot nila kay kung kis.a abi sir ga-cause abi sir sang tremendous nga problem is ang emotion kung hindi mag ka-intindihanay ang isa mag-inaway amo na te daw mag-lainay buot..Di namon na gusto... Ako hindi ko na gusto sa isa ka organization kay tungod lang sina may mag lain buot may mag halin amo na bala.. (P4).*

*Amo ina una sir ang mahambal ko gid nga support nga nahatag ko gid sa SSG kag sa mga na agyan ko nga mga organization is thee emotional support kay amu man ng kaylangan ko kag bal.an ko kaylangan ko sa mga upod ko (P5)*

## 7. School Identity and Values Influencing their Relationship

The question is that, is it always natural that officers working on the same organization in school would transcend work-level relationship into deep friendship? This is where this research takes off. Can it be because from the beginning, these student officers have already been aware of the values of family spirit and presence that the institution is trying to instill among them in whatever context be it at home, in school, school organizations or non-school organization undertaking? It is quite interesting to examine how these relationship develop and how collegiality as an organizational norm is being expressed by the student officers from their day to day interaction while working in the organization.

When the participants of the study were asked to actually describe their personal experience dealing with their fellow officers in the organization, they describe their relationship to be 'connected', 'supportive', 'smooth', 'open', and 'belonginess'. These words are very much similar or related to Marist values on *Family spirit* and even *presence*. When they were asked why they actually have these kind of interactions, most of them said that it is because, '*they are in the Marist*'.

*School and these are the values that the school is trying to instill in them and that they are all aware. Being Marist student, we are expected to conform to values of the Marist. That is why we really try our best to live up the core values in everything we do in the organization. (P6)*

*Pagsiling mo nga Marist leader, magtatak gid dayun ang mga core values sang school. Example presence...so, ginatry gid ina natun i-emphasize sa atun interactions...(P5)*

*Ako sir ang interaction namon, talaga is all about building that connection with your officers. Sa umpisa medyo mahirap kay lain lain kami courses, lain-lain ginhalinan nag school sang high school, but we know nga sa Marist school, lain ang values nga ga instill. So, ginalive nuo gid ina namon nga mga values. Ang amon relationship sa organization, ginatry gi namon strengthened. (P1)*

*Sabay kami gakaon, sa apartment ururupod man kami. Nadevelop gid na namon nag relationship umpisa tong nagkasabay kami as officers. So ang amon nga interaction gaextend asta sa amon gina-istaran. Kung kaisa, myh mga issues iban sa amon. So, di na namon gina pakialaman. Pero magets naming yun. Ginahayaan lang namon asta nga mag okay na saka kausapin. So, madala namon ang relationship halin sa organizational work that we do in school. Nadevelop gid siya. (P4)*

*Halin man ko sa non-Marist school and I must say nga naappreciate ko gid ang Marist way of leading. Gina-tudlo kag gina emphasize gid ang values. That's why, kung sa organization, gina-ensure man nga gina translate ining mga values because we are aware nga amo na ang expectations from us. But, eventually, sa akon nga experience, masiling ko nga ang relationship namon, ang bonding, daw ka-natural na lang dayun. Mafeel ko nga very comfortable na kmi.. (P2)*

With these sharing of the student leaders, it can be inferred their knowledge and appreciation of the school identity that is 'Marist' considering its values may have significantly been influencing student leaders' way of directing or leading the organization and that includes the way they shape the relationship or interaction between and among them. While it is understandable that officers may have actually been influenced by the school's identity and values in shaping the way they '*relate*', '*connect*' and '*deal*', which usually is the

goal of every institution, the effort on nurturing this kind of relationship is also evident on the actions of the leaders as shared by them. After they establish at the beginning of the school year as the term of office commences, they do much effort as well on trying to strengthen and consistently maintain the family spirit and belongingness not only as influenced by the school values but it has eventually become their values learned from being part of the organization.

### 8. Collegial-Interactions as Reflective of the School Values

*'Presence'* is one of the core values of the university that is reflective of the relationship manifested by the student leaders in working for student organizations. Presence emerged as a shared expression of *common emotional* support given by each one of them. When asked what kind of emotional support do they usually receive and share with others, what's emerged is their explicit expression of giving comfort through their words, actions, and just by being there.

*Like ako ang naka assign dire pero always sila ga-inquire sa akun kung may iban kapa nga need..Basi need mo sang tao dira or just by asking question like okay ka pa ba dira nakakaon ka na or ng mga concern nila...(P1)*

*Kung mamangkot na sila if hago ba dira ako nalang mag sagot sina. Amo sina biskan sila may ara man sila sarili kag gina respect nila ang schedule ko sir subong sa SSG kag if academics, academics man. If mahambal ka nga di ka free, kay may amo ka sini nga event, sal-on sang isa so ma feel ko gid nga amu to support...(P2)*

*Kung anuman ang gina-stressan nila ara lang ko to listen, kay hindi man ko very ano gid sa mga words like indi man ko ano gid sa pag-wakal di parehas sa iban ko nga upod nga student leaders nga very ano gid*

*sila talkative or like the way nga mag-communicate ka kay daw maka-reach out gid sa other people. For me, ang way ko nalang gid is mag listen kay kis.a kailangan mo gid sang iban nga tao to listen gid sa iban man nila nga mga upod. (P3)*

*Dapat hatagan mo man sila sang for example sir kumustahon mo gid sila kung basi my hinanakit man sila sa sarili nila nga hala anu man ning akon ubra man like ng sa akon nalang... Tapos like dapat need man nila sang mga pa-comfort man sir nga dapat may chikadora time man sila habang ga-work sila. (P4)*

*For me Sir, ang sa akon, ma-define mo gid siya or ma-identify mo siya kay nga gid gina suportahan ko sang mga upod ko biskan presence lang nila ara... (P5)*

*Siguro sir as a very vocal nga tao, very vocal nga tao tapos grabe ko ka garet-garet sa tanan sir siguro ang mahatag ko lang support is the love...(P6)*

*Mag ask na sila, ga-anu na kamo da? Okay na kamo? Daw basi di kamo okay? Kung ano ang ka sadyahon ko sir as a person amuna ang gusto ko nga ihatag sa ila kung mag joke ko..Biskan emotional support sir daw amo nalang na ma-give ko sa ila. Biskan emotional support sir amo na ang ma-give ko sa ila kay more on abi sa ubra ko sir as a student leader...(P7).*

*Ang support nila is daw sila na ang naging reminder ko throughout man sato nga mga time kung mag breakdown man ko ara man sila, so emotionally, physically, kag mentally ara gid ang support nga ging pang hatag sang mga friends ko sa mga na upod ko as a student leaders sir.(P3)*

As experienced by the participants, they have shared that what they considered to be Marist in terms of their interaction with the group is *'feeling'* the atmosphere of being really part of the organization. Common example is the intentional way of *giving of comfort* when a colleague feels down because of overwhelming tasks to do in the

organizations. Comfort is felt when one opens up/shares similar experience with the other; listens to the stories of frustrations/disappointment for not feeling good about the outcome of the tasks; feels the company of a colleague and when one feels that task becomes easy and attainable because of the presence of the other. For them, this is an example of emotional support. The participants shared about their experiences being open to one another to share their concerns and listen too for the others. They also share that being open manifests being comfortable with each one. To give comfort has become part of their conscious and deliberate response to make a colleague feel better in time of so much stress. As shared by one participant, in times of stress, one initiates laughter to ease the situation. For them, presence, be it in a form of giving comfort is a concrete meaning of collegiality. Support is given through accompanying the members/colleagues and making others feel at ease by one's presence/character/personality.

*Attentiveness.* They sensitively recognize the situation when a co-officer feels down, feels bad, feels uncomfortable, and not on an active mood in the same way that their colleagues also try to be attentive to their situation when they feel the same. For them, being attentive to the condition and their co-officers and being able to find ways how to facilitate their needs is an expression of collegiality. They do not demand for an output once they know that the colleague is trying to cope with some personal issues/concerns by extending/offering help in completing the task if they feel that a colleague is having difficulty or issues. Here, it can be noted the sensitivity of the student leaders to recognize what is going on with their colleagues. Common example is that *they tend to* initiate in giving the necessary help to a colleague because they feel the need to give help for others in accomplishing the tasks. They too have experienced how

others have been attentive and sensitive to their conditions. For them, that's the Marxist way of relating each other while working for the goals. They would ask and be observant to the changes and dynamics of the mood by being sensitive on the emotions of their colleagues. They value how one feels, and how the others respond emotionally to feedback and criticism. They all agree that everyone seems to listen to each other's concerns making colleagues feel better when they feel down/ uplifting their emotions.

Support is manifested through understanding one's situation/condition too. When stressed with school works, demands, requirements, colleagues in the student council expressed their concern to the person by doing the following: assume one's tasks be it at home / student council-related tasks. Tolerance on the shown undesirable behavior (like being easily irritated). They adjust the tone of conversation from the usual/natural manner of conversation (from asserting to submitting to the person) by observing the mood of the other officers. Consoling is also evident on their interactions with the person who is experiencing problems/challenges. It is also observed how student leaders manifest being careful (tact) in giving feedback so as not to inflict hurt to the colleague. In times that a colleague missed classes or requirements, academic support is provided by giving/sharing with some notes and information for some missed classes. lectures, reviewers, etc. There are instances, that colleagues also tend to filter some disturbances that may hinder the work of a colleague being performed. They willingly to take over/ assume obligations of others when necessary in order to help lessen/improve the work. How they care for the health condition of others has also been observed and shared by the participants.

*This college sir tong diba anu tong May provincial chapter ay May to april so exam examination academic week tapos NSTP culmination tapos may Q.E sa accountancy*

so that time palang sir ga suffer naku kay daw ga duwa duwa naku sa course ko ba kay daw adlaw adlaw nalang ko depress amu sina plus ga balik-balik ko sa school kay mag process sang amuni nga papers sa culmination plus nagsali pagid ko dance interpretative kay pwerte abi ko kay feelingon ko (tawanan) amusina abi mo kaya kaya mo gid so so sa time nga to sir naga apartment pagid kame so didtu abi kada abot ko na sa apartment ara lang gid da si Ate Cas kag si Philip si Danica. My one time gid sir nga grabe gid hebe ko nag hebe ko sina tapos sila ara lang gid sila da sa gilid sir ga pamati lang sila tapos pagka aga tanan nga mga orobrahon kay naka hati man na sa amon sir, ging ubra na nila tanan wala naku nila ging tandog kung baga ginpabay-an ko nila nga matulog tapos pag abot ko naman sa school ang batasan ko be na sir nag pag mag inti ulo ko ng daw gina dali dali ko tanan nga ubra ba so sila princess hindi ko gets tong adlaw nga to wala ko nila gina baisan ga pati lang sila buas ako nalang sina bangs a ako nalang ma ubra sini kay para dira kanalang pungko kanalang amusina amu to hindi ko gets sir kay gina supladahan ko na sila pag ok lang gyapon pakikitungo nila sakun tapos, pirme pagid ko nila gina hambalan nga ayos kalang ako nalang di dri kanalang.. (P1)

Nabatyagan ko gid to sir nga may mga tao man gali nga maka intindi ba nga damu damu ka ubra tapos okay lang sa ila nga pagbigyan ka anay nila sang time nga na kay ma understand ka nila gina supportahan nila nga kag bal an nila nga passionate ka gid sa amuni nga bagay so sige lang kay gaadjust ka paman daw tanan nga bagay nga factors ma understand nila sir so amuna. (P2)

Tapos kis-a if my eh assign sa amon halimbawa si....gadali sila tapos gina in-charge nila ko so wala ko ma tap nga tao ones nga mag chat ko sa GC ara dayon sila ..Ara dayon na sila nga mag hambal nga

sige updan ka namon ako nalang dira..Bal an gid nila ang akon nga needs..(P3)

Gina-assign sa editing tapos mga upod ko (inaudible) hindi kabalo mag-edit pero ang support nga ginhatag is bisan may mga lutang gid ko nga mga moments sa pag edit ko like very patient ang mga tao sa palibot ko nga mag bulig sa akon nga i-point-out ang mga mistake ko without sang mga kalain nga remarks...

**Empowering and 'pushing'.** Support is shown by ensuring that colleagues/fellow officers are guided in accomplishing their tasks; Affirming one's potential as a leader; Affirming colleagues' potential- to gain confidence; to believe on ones' abilities/potentials; Boosting the confidence of a colleague to believe that; Gaining confidence because of the affirmation of colleagues in the group; Gained confidence on what one has been doing due to the affirmation of colleagues; Sharing knowledge gained from experiences for other to also learn.

Budlay abi siya sir nga mgstart ka nga isipon mo bal-an mo na tanan kay kung di ka mag accept sang support daw sarili mo lang gihapon gina-hambal mo nga mali. Nga-a. Di mo kailangan tanggapon ang support nila kag ang support nila didto ka naka-build sang imo nga confidence...(P3)

Kis-a sa kung mga edits nga dali lang siya himoon daw agawon pa parehas sini ni ....Agawon nya pa sa akon ang himoon basta mahimo ko lang ang mga major part nga pag-edit pero ng mga content na eh build up amo ina na makita ko gid ang support nga from her or from sa iban man nga mga ka upod ko ..(P4)

Makita nga na budlayan ang isa ginabuligan so parehas sini nga as a student leader nga mag travel sometimes gina-check nila ko kung nahimo mo na imo nga task, kag kung naka ano nako sang deadlines ko man nga naka-fill in nga and also mga small things

*gid sir ngaa mga gaps ko man kis.a nga... ginapush gid nila ko nga makaya ang mga tasks..Ginapafeel nila nga kaya ko gid himuon kaya ginaassgin nila sa akon...(P4)*

*For me sir ang support nga ma baton ko and everything else daw gina himo nya ko stable sa tanan ko nga gina himo or like as a person gid kay may mga times nga biskan sa sarili ko wala naku tiwala, tapos everytime na maka-isip ko support sa mga upod ko daw didto nga ma gain ko man ang confidence...(P1)*

*Tiwala sa sarili ko sa mga ginahimo ko nga hindi ko mag doubt sa mga actions lalo nga halin sa nga nagka covid or like daw nag separate ang everyone since sang senior high daw nadula na tong dati ko nga version nga kung diin confident ko as a person na mag take out nga iba-iba responsibilities..(P2)*

*Ti subong duu naga amat-amat palang gain naman na nga kung mas diin nag open naman ko liwat sa mga tao, nga biskan backward man ko from time to time, pero ara gid ang support or like or ang pag -anu gid daw assurance halin sa mga people around me nga ang support gid big deal gid para sakun nga gina cherish ko gid ang each nga small man na or dako man ni nga support so gina anu ko gid ma remember ko always tapos gina apply ko man sa self ko kung anu man mahambal sang tao sakun nga as support sir (P5)*

## **9. Instinctive Act to Share with the Work to Do**

They also show presence by making themselves available when their colleagues need some help from them. For instance, they ask colleagues what can be done to help on the tasks. They voluntarily offer help when felt that a colleague is having a hard time completing the assignment. They ask how colleagues feel about doing or performing a task. The second theme that

emerge on describing student leaders' experience of collegiality in the organizational work in a Marist School is their instinctive actions to willingly *share with the work or tasks*. The act of helping is a common thing among people in any context. But the word '*instinctive*' gives more meaning on the concept of 'helping' and/or sharing in the context of the Marist student leaders. What they were saying was that, helping and sharing with the work is very spontaneous, natural, automatic, and it becomes a habit. When they were asked to describe the experience of sharing with the work, they commonly said, it's just but part of the 'being' leaders more so of the 'being' Marist. When asked to elaborate a little more about that 'being' leader and Marist, they said, its unexplainable. Some said, they do not know, they just love the idea that helping and extending help with co-officers becomes so natural for them without thinking of anything as returns.

Practically, they are all conscious of the fact that extending is necessary to be able to make the work done efficiently. They are all aware how each one of them affects the others. When one member is not able to fulfill his/her tasks, it will consequently affect the entire organization. As a participant observer, this is evident on their meetings, discussions, how they make follow up with the other's work, asking each committee to report on the progress of their work and agree how they can collaborate with others. It can be noted from the interactions and sharing of experiences of the student officers that collegiality in the organization work is reflective of the kind of relationship and support that they share. Support is manifested through the initiative to help without being asked to give help or render service. For them, to give support is voluntarily given. One cannot give genuine support unless it is out of volunteerism. Support is manifested in terms of initiating

acts to guide other officers who encounter challenges to accomplish the task assigned to them. Support is also manifested by showing understanding with the situation of a colleague who is experiencing personal issues in academic, peers, family, and relationship with others. They show willingness to assume roles in order to implement the goals of the organization.

There are also other forms of acts to share in accomplishing the tasks of the organization. They shared about the support they experienced in terms of the decision making for the organization. This usually happens during ordinary meal time, organizational meal, spontaneous moment to have conversation during free time. For them, the conversation with co-officers on organizational matters help a lot on affirming their ideas and some decisions. That for them is sharing not only their physical strength for the work but ideas that are helpful for the organization.

As observed by them, the group usually is open for deliberation of issues and concerns. They like the idea that they discuss and negotiate. As experienced by the participants, they understand that discussion is always part of the process of making discussions and they're open to negotiate. When asked why they believe it that way, their common response was that because it is one thing that has also been instilled in them by the school. To have dialogue is part of being 'belong' and that everyone is given value. As mentioned by one officer, it has always been instilled in them the beauty of openness and negotiation to uphold the value of respect to differences.

*Siguro ang support for me is volunteerism na sya, may ara sang volunteerism nga word kanang nga connect sa support kay hindi ka maka give, or hindi ka maka accept sang support kung hindi mo sya volunteer gina hatag sa mga tao.. (P1)*

*Ang support for me is kung gaano ka gid ka-initiative mag-give time sa imo upod magbulig sa ila task biskan di pa na imo trabaho..(P2)*

*Ga-think initiative na daan sa self mo, or like halin sa peers mo...need na ikaw siliangan..Amo gid nakita ko dri sa amon nga interaction...Mag an gid ang work kay ang mga kaupod ko sa organization may ara gid tanan willingness to help. Makita mo gid ang pagka-Marist spirit.. (P3)*

*Pag tagaan ko task ubrahon ko dason so after sina halimbawa wala naku ubrahon mag help ko sa iban para mabulogan sila sa ila work...biskan wala nko nila ginahagad..Daw nami sa feeling nga nagahelp sa ila work nga matapos.. Sadya lang gid tana.. (P4)*

## 10. Implications

The study provides a holistic portrait of the student leaders of a Marist school on how they manifest collegial-interaction in the organizational work and how school core values are expressed on their interactions. It is affirming that student leaders in this university manifest collegiality in a unique and positive way by not only manifesting it on work-level relationship but instead it develops into more personalized level of relating and connecting with each other. This affirms the initiatives and efforts of the school on instilling the core values to the students especially to the student leaders who are considered to be models of the values. With this result, it means that the school may continue to implement its good practices that nurture the relationship of the students leaders in the organization as they also contribute to their productivity and growth. As reflected in the themes, they feel good, they are happy, they feel motivated and positive because of the comforting presence and affective connections that they have with their co-officers whom they considered friends and family in school.

Though, the school may also consider to engage more students into other dynamics that may also strengthen their expressions of other core values not only limiting to family

spirit, presence and love for work but to manifest as well other values while working in the organizations.

**IMPLEMENTATION OF UTILIZING  
STUDENT INTERESTS AND TALENTS IN  
INCREASING STUDENT LEARNING  
OUTCOMES AT SMK NEGERI 1  
MARTAPURA AND SMK NEGERI 1 SUNGAI  
PINANG IN THE FIELD OF NATURAL  
SCIENCES**

**Abstract:** *The phenomenon of unemployment is a real picture of the condition of education in Indonesia in the aspect of developing students' interests and talents. School as a place of learning should be a place to develop students' interests and talents. An important aspect of developing students' interests and talents is having an awareness of their interests and talents. This awareness is able to lead him to a number of strategic choices in the future related to the chosen field of study, a conducive learning environment and the choice of profession according to his interests and talents. Knowledge of these interests and talents needs to be facilitated by schools, parents and the community. Regarding the empirical theory and themes discussed in this study, it is linear if the research category set is qualitative. Qualitative research must be supported by a number of data that can provide a brief description of the actual conditions that occur in the field. Qualitative research and using descriptive analysis techniques in this study aims to find out the problems and get accurate data, researchers use interviews, observation, and documentation. Research data collection was based on qualitative concepts, namely data collected based on observational activities at research locations, interviews with research subjects and research data documentation in the form of research location photo data and implementation document data. The research findings show that the implementation of the utilization of interests and talents is carried out when students register and at the same time choose the majors they are interested in. Students also choose intra and extracurricular activities to support their interests and talents. Students are also asked to fill out a student needs questionnaire as a basis for counseling services. However, at the implementation level, the use of interest has not been accompanied by a special aptitude test to support student interest.*

**Keywords:** *implementation, interest, talent, learning outcomes*

## 1. Introduction

The fundamental terminology of educational institutions is comprehensively understood in relation to the quality of formal educational institutions, namely Senior High Schools. One indicator of student acceptance and satisfaction in obtaining educational services with several supporting variables, it is explained that student satisfaction has a central place among quality indicators for higher education institutions as well as business schools (Gibson, 2010). Nevertheless, the changing environment and the differences between universities and business schools require the introduction of new measurement parameters for both student satisfaction and the new initiatives that are generated through them (Zhao and Ferran, 2016). competencies possessed, among others, explained that such approaches seek to address the tension between standards that specify the level of competence required for entry into the profession and the use of these standards as the definition of competence for serving teachers with considerable experience (Forde and McMahon, 2019). Forde et al. (2016) this is a means to maintain a developmental change orientation and relevance, without depressing or stalling practice' (Forde et al., 2016: p. 28).

School is a formal educational institution that holds and controls a vital role in improving the quality of learning output in a progressive and planned manner, so that collaborative cooperation is needed in the implemented model school. The planning function is running well and is more focused and the organizational management function is carried out in an effort to divide tasks and authority as a form of setting job descriptions for every school member. The principal, assisted by the vice principal, moves within the organizational structure and is expected to meet the organizational targets. Even though the progress is

constrained by time constraints and school activities that run concurrently and students with heterogeneous family backgrounds, overall the school program that has been set is expected to meet its target at the end of the learning year with comprehensive management.

Schools are progressively collaborating with other parties who have a linear vision and mission with school policies, including comparative studies and feasibility studies which are important indicators and variables in the International Organization for Standardization (ISO) and quality assurance in education. This series of school activities is useful in increasing the ability of human resources, so that school services in achieving educational program targets can increase progressively. In other words, it is explained that high school is a formal educational institution as a medium and location for learning and teaching. However, along with its development, Senior High School has experienced a development of meaning and usage but it is still in basic terminology that has not changed. Senior High School is a place, location or forum that is believed and recognized as a place for the process of education or learning to take place which is arranged systematically and experiences dynamic development over time (Wanidison&Shaddiq, 2021).

The process of accepting new students ideally goes through a number of stages that must be carried out. These stages include forming a committee for accepting new students which involves all elements of the teacher, administrative staff, and the school board/school committee; making and posting announcements of acceptance of new students which are carried out openly. This information must include a brief description of the institution, requirements for registration of new students regarding general and special conditions, how to register, time of registration, place of registration, registration fee, time and place

of selection, and announcement of selection results (Badrudin, 2014: 32).

Acceptance of New Students is the school's annual agenda and a number of strategies in Admission of New Students ( PPDB) are carried out directly in the form of socialization, print media publications, and online and offline publications through the media banners, banners, flyers and promotional stickers. The general target of the PPDB agenda is to find students and promote schools (Subbeh, 2018). There are four components in the implementation of educational policies, including those who implement educational policies, administrative processes, expected compliance and the impact of implementing these educational policies.

The opinion of Ripley and Franklin states that there are two aspects that are the focus of the implementation of educational policies, including compliance or compliance of implementers with agreed operational procedures and standards; phenomena that occur in the implementation process, obstacles and levels of success. The Indonesian government's policy regarding PPDB is to carry out online and offline registration and provide maximum service to the community.

Psychologically, human potential consists of the ability to think/reason and feel in the heart. Possession of potential and talent can be used to recognize and understand the progressive development of civilization and the increasing variety of challenges.

Individuals who have maximum potential must be able to determine career planning targets and must understand the global labor market and understand their desires. Careers are strongly influenced by their interests and talents, so that the individual is able to determine and plan his career appropriately. Interest arises because there is attention to an object and the attention given can lead to the desire to identify, learn, and prove further.

This condition shows that in interest, besides attention, there is also an effort to get something from the intended object of interest.

Meanwhile Buchori (2015: 135), states that interest is a person's awareness, that an object, a person, a problem or situation has something to do with him. Thus, interest must be viewed as a conscious response and if the perspective of interest is not interpreted optimally then it does not contain true intentions and goals. Meanwhile, Sadirman (2016: 76) states that a person's interest in an object will be more visible if the target object is related to the individual's wants and needs.

This opinion gives an understanding that the conditions that occur are closely related to personal needs, so that there is a tendency when seen and observed by individuals is a relationship between specific desires and needs. Foerthiono&Sadjarto's opinion (2014: 56), interest is a person's interest in an aspect, and this condition will encourage him to make a decision/action, whereas according to Shaleh, et al (2018: 263), interest can be interpreted as a tendency to pay attention and act towards people, activities or situations related to objects that are accompanied by feelings of pleasure. Zaid (2015: 47) says that interest is someone's interest that creates a desire to focus on that condition.

Interest according to Eysenck (2018: 76) is an aspect of the human mind that can encourage achieving goals. If the individual has an interest in an object, then it tends to pay attention or feel greater pleasure for that object. Interest related to one's participation contained in activities and interests is also closely related to encouragement, emotional reactions and motives. According to Sukartini (2015: 65), interest analysis can be carried out on a number of aspects, including desire For know or own object Which interested in, objectsoractivity Which respected, kind activity Forreach that

condition liked, the effort to realize the desire, a sense of pleasure towards something which interested him.

## **2. Research methods**

Research conducted at Vocational High School (SMK) Negeri 1 Martapura and SMK Negeri 1 Sungai Pinang is categorized in a qualitative scope and focuses on linear meaning with quality data implemented in qualitative analysis but consistent with quantity data as a phenomenon to support qualitative analysis of strengthening meaning as the final conclusion of the study. Data collection techniques in qualitative research can generally be categorized into two techniques, namely interactive and non-interactive data collection. The implementation of interactive techniques became the basis for conducting research at SMK Negeri 1 Martapura and SMK Negeri 1 Sungai Pinang which included semi-structured interviews. The implementation of qualitative research uses rigorous structured interviews and is carried out based on questions that lead to the depth of information and is carried out using structured informal techniques. In-depth interviews can be conducted at times and context conditions that are considered most appropriate in order to obtain complete, honest and in-depth data.

Observations at SMK Negeri 1 Martapura and SMK Negeri 1 Sungai Pinang are aimed at exploring data in the form of events, places or locations, and objects, as well as recorded images, while observation plays a role in SMK Negeri 1 Martapura and SMK Negeri 1 Sungai Pinang, the author comes directly through observation on learning activities. While direct observation at the locus is carried out by ensuring compatibility between research objectives and objects and to find out the conditions for utilizing students' interests and talents in improving student learning outcomes at research sites

and documentation in the form of writing and pictures is presented in the form of a number of quotations about documents reported in research.

The various documentation collected at SMK Negeri 1 Martapura and SMK Negeri 1 Sungai Pinang varied in nature from simple written to more complete and could even be in the form of other objects, whereas in this study, the stages of data collection in the form of research documentation were based on document data collected obtained at SMK Negeri 1 Martapura and SMK Negeri 1 Sungai Pinang. Research photo documentation in the form of photos of school buildings, facilities and infrastructure and learning facilities at SMK Negeri 1 Martapura and SMK Negeri 1 Sungai Pinang.

Data analysis according to Bogdan in Sugiyono is the process of systematically searching for and compiling data obtained from interviews, field notes, and other materials so that they can be easily understood and the findings can be informed to others. While the analysis of qualitative data is inductive, namely analysis based on the data obtained. Meanwhile, based on the opinion of Miles and Huberman (1992: 16) the analysis consists of three streams of activities that occur simultaneously, namely data reduction, data presentation, drawing conclusions/verification. It was explained that data reduction is a selection process, focusing attention on simplifying, abstracting, and transforming raw data that emerges from a number of field notes or field notes. Data reduction in this study was carried out through screening of primary and secondary data that did not support the theme, title and discussion and analysis of research data at SMK Negeri 1 Martapura and SMK Negeri 1 Sungai Pinang. Some of the data reduced in this study included documents on the status and rank of teachers as well as facilities and infrastructure at SMK Negeri 1 Martapura and SMK Negeri 1

Sungai Pinang which were not directly related to the research discussion . The next stage is the presentation of data or data display. Miles and Huberman limit the presentation of data as a set of structured information that gives the possibility of drawing conclusions and taking action. A number of student achievement matrices are presented by the author as a brief description regarding the success of the Principal's policy at SMK Negeri 1 Martapura and SMK Negeri 1 Sungai Pinang in learning activities. The organizational structure chart is also shown as the basis for the Principal's

top-down policy instruction flow. The final stage of data analysis in this study is drawing conclusions. Drawing conclusions according to Miles and Huberman is part of the activity of the complete configuration. The conclusion of this study is based on primary and secondary data collected at SMK Negeri 1 Martapura and SMK Negeri 1 Sungai Pinang and have undergone data reduction stages. A schematic description of the data analysis process using Miles and Huberman's interactive data analysis model can be seen in the following chart (Figure 1).

Figure 1. Interactive data analysis model

### 3. Results and Discussion

#### 3.1. Student Specialization Process at SMK Negeri 1 Martapura and SMK Negeri 1 Sungai Pinang

Acceptance of New Students or PPDB is an entry point for students to choose the major they are interested in and before making their choice, students who register have made considerations through searching for school information, majors and future professional possibilities after they graduate from Vocational High School or SMK .

The research findings show that the implementation of the use of interests and talents in improving student learning outcomes at SMK Negeri 1 Martapura and SMKN 1 Sungai Pinang shows that students who register have an incentive to choose a particular major due to an interest in a

particular field of study as an option in determining a future career.

Every time a new school year approaches, each school prepares a New Student Acceptance Program or PPBD and the mechanism that is carried out differs depending on the program and field of study that the school concentrates on. This condition is stated in the Minister of Education and Culture of the Republic of Indonesia Number 1 of 2021 concerning Acceptance of New Students in Kindergartens, Elementary Schools, Junior High Schools, High Schools, and Vocational High Schools article 32 (2) Selection of prospective new students for class ten SMK taking into account a number of aspects, including report cards attached with a certificate of rating of students from their school of origin, academic and non-academic achievements; and/or aptitude and

interest test results in accordance with the chosen field of expertise using criteria set by the school, and the business world, the industrial world, or professional associations.

These three points make it easier for schools to map students' interests and talents when prospective students register. Basically, each student has different interests and talents, so that data relating to academic and non-academic grades, student achievement and aptitude tests are taken into consideration in determining majors and student learning support activities.

The short term goal is that students are able to improve their learning outcomes while the long term goal is that students are able to play a role or work according to their interests and talents. The substance of achieving school targets effectively and efficiently really supports maximum school performance. Efficiency can be fulfilled if limited resource management achieves a margin above the target simultaneously. Meanwhile, the effectiveness of the balance of planning and achievement can only be surpassed if there is positive collaboration with the school community. Regarding school performance, which must always be consistent, cannot be separated from the discussion of an effective assessment system or measurement of school performance indicators. Thus, it is considered important to test the performance of these schools by making relevant and linear comparisons with similar schools. There are several performance indicators that are specific to their flow, among others, it is explained that a system has continuous stages to be assessed and measured both qualitatively and quantitatively. The outcomes achieved have flexibility towards developments and changes in policies and fluctuating social conditions. The flexibility of these results must be supported by data that can be processed, analyzed and collected efficiently, practically and economically.

Several determinant variables are explained in a scientific study, among others conducted by Tsinidou, Gerogiannis, and Fitsilis (2010) identified the quality determinants as academic staff, administrative services, library services, curriculum structure, location, facilities and career prospects. The authors run an analytical hierarchical process to determine the relative importance of each factor .

The debate about school performance cannot be separated from all the variables that support and influence it. The facts show that schools are institutions and organizations that are fully responsible for learning or education services that meet the quality standards set by ISO and the Education Quality Assurance Institute (LPMP). Thus, school performance will be assessed objectively based on the National Education Standards. There are parameters that are used to assess and determine school performance, at least there are several substances that must be assessed including content standards, educator and education staff standards, graduation competency standards, process standards, facilities and infrastructure standards, management standards, financing standards and educational assessment standards .

The implementation of sustainable school management has a significant effect on improving teacher performance. This condition is due to a comprehensive understanding of school management which makes educators and educational staff have sufficient understanding of the management and organization of schools as formal educational institutions. The use of learning planning methods and techniques enables teachers to improve their performance and competence.

Several categorizations of educational quality are explained in a study: a new factor was introduced by the doctoral thesis of Jewett (2012): brand and ranking. This factor has greater importance for the choice of

business school than faculty qualifications, the importance of mission, continuous quality improvement, and assessment. Focusing on the approach to surveying students, Elliot and Shin (2002) established an alternative approach to measuring overall student satisfaction using a multiple-item weighted gap score analysis and not a simple “yes” or “no” answer in surveys of students on their satisfaction with the institution. Student feedback also plays an important role in surveying. Comparison with the conditions that occurred in the research locations was at least used as a basis for measuring adjustments and improvements according to government policies which were very volatile, especially during the coronavirus disease 2019 (COVID-19) pandemic.

The reality at the research location is in stark contrast to the established concept and vision and mission. Irregular organizational management and lack of sufficient understanding of the roles, obligations, authorities and responsibilities of each school stake holder make the education system that is not run as expected. This gap is further exacerbated by the derivative problem which broadens the basic problem.

A study shows that there is a simultaneous increase in the quality of education related to the decision-making system and the accuracy of the policies taken based on the phenomena that occur in the research location, explained that Debnath et al. (2005) considered feedback from students to be important for upgrading the quality of a management education system. In this vein, the structure of the feedback form is crucial in the decision-making process, as students do not know what is important to them in terms of teaching and learning.

Meanwhile, related to the urgency of improving the quality of education, several stages of competency improvement and assessment of curriculum design and learning must be carried out immediately,

and it is explained that: in order to address this emerging need, a common framework for a quality assurance model would provide consistent assessment of learning design, content, and pedagogy (Puzziferro & Shelton, 2008).

The quality of education quality standards must be supported by several conceptual and contextual dimensions adapted to the differences in the characteristics of the research locations. It is explained that: the perception of quality assurance is very multi-dimensional and contextual and a gap exists in the view between professionals in quality assurance and academic staff and students (Smidt, 2015, p. 626). Several key dimensions of quality in higher education include excellence, value, consistency, and meeting needs and expectations; yet no one quality assurance framework can address all aspects of quality, so choices are made about what kinds of quality are assessed (Harvey, 2014; Wilger, 1997).

Based on the data found by researchers at SMKN 1 Martapura and SMKN 1 Sungai Pinang, it was stated that new student admissions were carried out online. Students who register prepare a number of files and submit them online. When asked about the origin of the information obtained related to the school, the answer emerged that the information was obtained through social media, including Instagram, WhatsApp, and also because there were relatives who had previously attended school in that place.

Students are given the convenience to access information related to PPDB through social media. If we review further, basically students who register fall into the classification of the generation born between 1995 and 2015. This classification is more familiar as Generation Z which is a generation that is familiar with the internet. As explained in Wikipedia, Generation Z is referred to as the generation, the internet generation, they have similarities with the Millennial Generation, but they are able to

apply all activities at one time, such as tweeting using a cellphone, browsing with a PC, and listening to music using a headset. Whatever is done is mostly related to cyberspace. From an early age they have been familiar with technology and are familiar with sophisticated gadgets that indirectly affect their personality. Thus, schools should take advantage of the role of social media both in order to introduce school profiles and in relation to programs for developing students' interests and talents. Furthermore, the use of technology and information has an impact on the dissemination of information both academic and non-academic. Social media is very easy to use, all accounts registered as friends on social media will be informed quickly. Utilization of social media can be used for various aspects ranging from announcements, socialization, department activities, results of extracurricular activities, student achievements and other activities. The wider use of social media has a positive impact on schools so that students are able to identify information more quickly and are able to process it into updated information that prioritizes the use of technology and information.

There is a difference between interest and aptitude. As stated by Slameto in Djaali's book, he also stated that interest is a preference for and a sense of attachment to an aspect or activity, without anyone ordering it. Interest will direct a person's activities towards goals, so that hard work, patience, and willingness to do work that can realize or achieve these life goals will appear. Thus, interest unites with a person's desire and will in living and realizing his life goals. Interest is not a genetic factor but is obtained through a process and interest in something can be learned through the learning process. Interest in something is learned and influences learning and is able to influence the acceptance of new interests. Thus it can be concluded that interest in

something is the result of learning and contributes to learning even though interest is not an essential entity.

Regarding talent which is something that appears from birth and is a gift from Allah SWT. As stated by Beni S. Ambarjaya that talent is one of the human abilities to carry out an activity and has existed since humans existed. This fact is closely related to intelligence which is a mental structure that creates skills in understanding something. Interest and talent have an interrelated relationship and talent is closely related to interest, interest is a preference for and a sense of interest in an activity, without being told. Thus gifted children are encouraged by the interests that exist within them.

### **3.2. Implementation of Utilizing Student Interests and Talents in Improving Student Learning Outcomes at SMK Negeri 1 Martapura and SMK Negeri 1 Sungai Pinang.**

The specialization of students in SMK is a process of making choices and decisions by students in the field of expertise studies, expertise study programs, and competency skills based on understanding their own potential and existing opportunities. This context is related to guidance and counseling to help students to understand themselves, accept themselves, direct themselves, make self-decisions, realize their decisions responsibly.

Guidance and counseling services are carried out with the aim that students can take advantage of their interests and talents so that learning outcomes can increase. Guidance and counseling services are still general in nature, namely informative because there is no test to determine student talent, so the services provided are general in nature, the first step given is to conduct an assessment of student needs which will then be used as a Guidance and Counseling

service program.

The services provided by Guidance and Counseling Teachers (BK) are career guidance services, study services, social and individual. In certain cases, home visits will be carried out on students. However, in certain cases, there is a student talent assessment program that is carried out for Children with Special Needs or ABK. Students with special needs will be given recommendations for majors according to the results of tests from psychologists. The basic framework for education quality must be evaluated consistently and the assessment includes curriculum design, content standards and continuous learning systems. Related to these conditions, it was explained that: A common framework for a quality assurance model would provide consistent assessment of learning design, content, and pedagogy (Puzziferro & Shelton, 2008).

Comparative research related to the similarity of the research variables explained that although Schindler et al. (2015) identified four broad conceptualizations of quality in higher education (quality as purposeful, transformative, exceptional, and accountable), there is no agreement on a definition of quality (p. 8). Probably, the main obstacle in developing a common framework is how different regions address the matter, since “accreditation and quality assurance are no longer purely national undertakings” (Green, Marmolejo, & Egron-Polak, 2012, p. 452), and different jurisdictions take different approaches to quality assurance and accreditation programs.

Meanwhile, accreditation is explained as an assessment of the quality of education: accreditation is a review of the quality of higher education institutions and programs” (CHEA, 2014, para.1). An institution or program is granted accreditation for meeting minimum standards of quality. One common accreditation theme is quality assurance assessment and continuous improvement.

Accrediting agencies have developed standards and procedures to guide institutions in the process of voluntary commitment to continuous improvement, by way of application for accreditation. These standards are used by review committees as the basis for judgment and to make recommendations and decisions.

The standardization of the competence of educators must be supported by academic abilities and educational systems and policies that experience simultaneous development within a certain period of time, especially those that occur in developing countries, it is explained that: increasingly professional standards for teaching are being adopted in education systems as a means to improve teacher quality, codify professional practice and regulate the teaching profession and education systems; particularly developing countries, look to systems where professional standards are more well established for guidance on their development and implementation (Gallie and Keevey, 2014: p. 1).

The following research as a comparative analysis was conducted by Taylor (2016): in his thesis Teachers' experience of professional standards for teachers: A case study of the enactment of teaching standards in a high performing school system makes reference to the literature review conducted as part of the Teaching Scotland's Future review which reported that “studies on the impact of [teacher] accreditation are almost non-existent” (Minister, Hulme, Elliot, & Lewin, 2010, p. 41 in Taylor, 2016: p. 1).

The variable of success and achievement of formal education institutions lies in the management of the school principal and as a leader when carrying out the educational process, the effectiveness of decision making is largely determined by competence and leadership in managing the school's resources, while the quality of education is strongly influenced by the performance of teaching and educational staff. Teacher

performance has a significant impact on the quality of education. Regarding this fact, there are research conclusions that support this statement, namely: a report commissioned to support the development of professional standards in South Africa (CDE), sought to draw lessons from the experiences of other countries; to make recommendations for the adoption of best practice in the field; and to identify the priorities for the effective development and implementation of teacher professional standards (CDE, 2017:1).

However, teachers cannot produce quality and work output according to the target if they are not supported by adequate infrastructure, appropriate methods, relevant media and a synergized curriculum. Some of these variables will be perfect in supporting teacher performance, especially in learning activities if there are competencies that support them. Performance is understood or means a positive value from the entire process of work activities and its management with the aim of achieving the expected targets. As a public education service institution, customer satisfaction is considered a priority. This fundamental reason can be understood and implemented by providing perfect service so that there is continuity and consistency within a certain period of time.

The principal as the leader of a formal educational institution has a number of substantial functions in its implementation. In order to understand this, the following describes several types of leadership characters or in the discussion of education that the principal is closely related to the performance of teaching and educational staff. There are three leadership characters that are often found in leadership systems, namely frontline leadership, executive leadership or execution, and innovator leadership in updating the organizational climate. Research that supports this explanation has found a conclusion and is

cited as follows The Center for Development and Enterprise (CDE ) study found a high degree of homogeneity with regard to the content, format, and implementation of standards in the educational systems studied which included The United States of America ( USA), England, Australia, Jamaica, Namibia and Chile (CDE, 2017).

Students who understand their talents tend to more easily develop their potential. Besides being able to choose a major that suits their abilities, students can also be more motivated to improve their learning outcomes. The process of developing students' interests and talents is carried out in schools in the form of classroom learning, practice, practice questions, and deepening of the material. Likewise, the Student Affairs division prepares other supporting activity programs in the form of extracurriculars which are also selected based on student interests. The extracurricular program is also a manifestation of developing students' interests and talents. Not a few students have made the name of the school proud with a myriad of achievements.

Even though the school has not yet held an aptitude test, there are several characteristics of gifted children in certain fields. One of the characteristics of gifted children in Paul E. Vernon's view is the drive for a high sense of intellectual curiosity . Students who choose a major on their own will have the opportunity to be gifted in their chosen field. However, there is still a probability that the field of study chosen is not in accordance with talent ownership.

Implementation of the Utilization of Students' Interests and Talents in Improving Student Learning Outcomes at SMK Negeri 1 Martapura and SMK Negeri 1 Sungai Pinang forms the basis for prospective students who have been accepted to be prepared for face-to-face learning processes. Face-to-Face Meetings or PTM are implemented after receiving an Appeal Letter from the South Kalimantan Provincial

Education Office and adjusted to the COVID-19 case in each of the regional zones. Some schools have implemented it 100% but there are areas that have only implemented it 50% according to the attached document.

There is an adaptation process if previously students carried out the learning process online, then slowly students return to face-to-face learning. There are a number of parties who say that it is more conducive if the learning process is carried out face to face. This condition has a significant effect because as a vocational school, of course, it is required to be skilled psychomotorically and not only in evaluating cognitive aspects. One's understanding of the three aspects, namely cognitive, affective and psychomotor aspects. As Rusman's opinion, a student's learning outcomes are a number of experiences gained by students covering the cognitive, affective and psychomotor domains. The learning outcomes will also be seen based on changes in student attitudes and behavior.

These conditions basically become a material consideration for schools and students in determining the majors or fields of interest. Every student who registers certainly has talents and tendencies of interest in certain fields which can be known when students register, so it is hoped that the basic nature or potential of students can develop properly. One of the school's strategies in mapping students' talents and interests is through a student needs questionnaire provided by the Counseling Guidance Teacher.

Students who have registered as students at SMKN 1 Martapura and SMKN 1 Sungai Pinang are given a student needs questionnaire. This condition also applies to students of class XI and XII as a basis for guidance and counseling services. Likewise students with special needs to get recommendations in choosing the appropriate major. One of the important

stages in the utilization of interests and talents is an instrument owned by the school to determine students' talents and interests. Every school should have an instrument as a basis for conducting career guidance services to students.

In addition to distributing student needs questionnaires by counseling teachers, the results of mapping these interests and talents will later become recommendations for conducting counseling services to students, including the tendency of students' interest in certain fields. Researchers focus on the importance of aptitude tests as stated by Dewa Ketut that aptitude tests can be divided into two broad categories, known as general aptitude tests and special aptitude tests. General aptitude tests are designed to reveal a wider range of talents, especially with regard to schoolwork. Aptitude tests in specific areas include tests for musical aptitude, artistic aptitude, mechanical aptitude, and clerical aptitude.

An understanding of a number of competencies possessed by gifted students must be distinguished between gifted children who have succeeded in realizing their potential in superior achievements, including outstanding school achievements or having won composing competitions or scientific work competitions and students who are potentially gifted, but due to certain reasons have not been successful. Realize their potential and excellence. The conditions that occurred in the class made it possible only to achieve on an average basis, but in fact it was able to be higher than the target.

When students have taken an aptitude test, it will be easier for the school to direct students' interests and talents, so that their learning outcomes are expected to be able to obtain significant improvements. Although an aptitude test has not yet been held, the school has made efforts to facilitate these students' interests and talents so that they are able to develop through classroom learning,

a number of practical activities, practice questions, and deepening the material.

The assessment and evaluation stage is an important stage because these conditions are a measure for students in mastering the majors taken. This stage will also be input for educators on strategies that should be carried out to improve, enhance and develop students' interests and talents. As stated by Susanto, learning outcomes are a number of changes that occur in students, both concerning cognitive, affective, and psychomotor aspects as a result of learning activities. Thus, student progress reports are not just reports made every semester but will be more meaningful if there is follow-up coaching and student development at school.

The basic framework for education quality must be evaluated consistently and the assessment includes curriculum design, content standards and continuous learning systems. Related to these conditions, it was explained that: A common framework for a quality assurance model would provide consistent assessment of learning design, content, and pedagogy (Puzziferro& Shelton, 2008). Comparative research related to the similarity of the research variables explained that although Schindler et al . (2015): identified four broad conceptualizations of quality in higher education (quality as purposeful, transformative, exceptional, and accountable), there is no agreement on a definition of quality (p. 8). Probably, the main obstacle in developing a common framework is how different regions address the matter, since “accreditation and quality assurance are no longer purely national undertakings” ( Green, Marmolejo, &Egron-Polak, 2012, p. 452), and different jurisdictions take different approaches to quality assurance and accreditation programs. Meanwhile, accreditation is explained as an assessment of the quality of education. Accreditation is a review of the quality of higher education institutions and programs” (CHEA, 2014, para. 1). An

institution or program is granted accreditation for meeting minimum standards of quality. One common accreditation theme is quality assurance assessment and continuous improvement. Accrediting agencies have developed standards and procedures to guide institutions in the process of voluntary commitment to continuous improvement, by way of application for accreditation. These standards are used by review committees as the basis for judgment and to make recommendations and decisions. The standardization of the competence of educators must be supported by academic abilities and educational systems and policies that experience simultaneous development within a certain period of time, especially those that occur in developing countries, it is explained that: increasingly professional standards for teaching are being adopted in education systems as a means to improve teacher quality, codify professional practice and regulate the teaching profession and education systems; particularly developing countries, look to systems where professional standards are more well established for guidance on their development and implementation (Gallie and Keevey, 2014: p. 1).

The following research as a comparative analysis was conducted by Taylor (2016): in his thesis Teachers' experience of professional standards for teachers: A case study of the enactment of teaching standards in a high performing school system makes reference to the literature review conducted as part of the Teaching Scotland's Future review which reported that “studies on the impact of [teacher] accreditation are almost non-existent” (Minister, Hulme, Elliot, & Lewin, 2010, p. 41 in Taylor, 2016: p. 1).

The variable of success and achievement of formal education institutions lies in the management of the school principal and as a leader when carrying out the educational process, the effectiveness of decision making

is largely determined by competence and leadership in managing the school's resources. Meanwhile, the quality of education is strongly influenced by the performance of teaching and educational staff. Teacher performance has a significant impact on the quality of education. Regarding this fact, there are research conclusions that support this statement, namely: a report commissioned to support the development of professional standards in South Africa (CDE, sought to draw lessons from the experiences of other countries; to make recommendations for the adoption of best practice in the field; and to identify the priorities for the effective development and implementation of teacher professional standards (CDE, 2017: 1).

However, teachers cannot produce quality and work output according to the target if they are not supported by adequate infrastructure, appropriate methods, relevant media and a synergized curriculum. Some of these variables will be perfect in supporting teacher performance, especially in learning activities if there are competencies that support them. Performance is understood or means a positive value from the entire process of work activities and its management with the aim of achieving the expected targets. As a public education service institution, customer satisfaction is considered a priority. This fundamental reason can be understood and implemented by providing perfect service so that there is continuity and consistency within a certain period of time.

The principal as the leader of a formal educational institution has a number of substantial functions in its implementation. In order to understand this, the following describes several types of leadership characters or in the discussion of education that the principal is closely related to the performance of teaching and educational staff. There are three leadership characters that are often found in leadership systems,

namely frontline leadership, executive leadership or execution, and innovator leadership in updating the organizational climate. Research supporting this explanation has come to a conclusion and is cited as follows. The Center for Development and Enterprise (CDE) study found a high degree of homogeneity with regard to content, format, and application of standards in the education systems studied which included the United States, United Kingdom, Australia, Jamaica, Namibia, and Chile (CDE, 2017).

#### 4. Conclusion

Utilization of interests and talents, especially in the vocational education environment, is indeed a crucial problem because every student who has studied at school is expected to have the ability and competence to enter the world of work or profession according to his or her interests and talents. Interest is an individual's interest in carrying out an activity followed by pleasure, so that it will produce satisfaction with the results achieved. The higher the interest an individual has in carrying out a task, the higher the results he achieves. Interest in discipline and concentration in learning is the beginning of a whole series of learning processes at certain stages, including the interest of junior high school graduates in selecting senior high schools which are the next stage of education at a higher level.

Individual career planning is one of the urgent issues because careers are considered aspects that require maximum individual preparation in optimizing their potential.

1. The specialization process carried out at SMK Negeri 1 Martapura and SMK Negeri 1 Sungai Pinang is carried out when students register at school. Students search for information related to schools and majors of interest, then they prepare a number of files to be sent to the

school. In addition, students who officially become students at SMK Negeri 1 Martapura and SMK Negeri 1 Sungai Pinang will also receive a student needs questionnaire. Likewise with class XI and XII students get the same material. The student needs questionnaire is provided as a basis for creating a counseling guidance service program. In addition, the two schools have not carried out a kind of aptitude test, only that the aptitude test is intended for students with special needs with the help of psychologists with the costs being borne by the parents of the students concerned.

2. The implementation of the use of interests and talents in improving student learning outcomes at SMK Negeri 1 Martapura and SMK Negeri 1 Sungai Pinang has been running according to the circular from the South Kalimantan Provincial Education Office. Regarding the conditions of the teaching and learning process carried out online and a number of schools have begun to be tested for Face-to-Face Meetings or PTM, students can begin to study face-to-face and practice or train their mastery skills in the field of study

being studied. As one of the implementations of student talent interests, the school also facilitates students with a number of intra and extracurricular activities that students have previously chosen. A number of these activities are able to increase students' interests and talents, so that their potential is growing. Forms of developing students' talents and interests in implementing competition activities are both academic and non-academic. Assessment and evaluation of student learning outcomes are generally seen based on student development in implementing their interests and talents. Based on progress reports and student achievements, it is submitted in the form of a report from the extracurricular supervisor. Assessment and evaluation in each department related to talent is the responsibility of productive teachers. The next stage is an assessment based on student learning outcomes from both the homeroom teacher, subject teacher, productive teacher and extracurricular coaches, when evaluating learning outcomes and student achievement in class promotion meetings.

## A TEACHER OR AN ACTOR? ON EMOTIONS AND THE EMOTIONAL LABOR AMONG TEACHERS: A LITERATURE REVIEW

**Abstract:** *The teaching profession involves demands of various kinds as recently more and more space has been given to the emotional aspect that emerges from teaching. This trend stems from the awareness that teachers need to cope not only with pedagogical tasks but also with emotional burdens since teaching does not only involve pedagogical training as it carries many emotional aspects. In recent years, more and more studies address the issue of emotions in teaching. The concept of emotional labor refers to the ability to regulate emotions in an occupational setting. Studies on emotional labor among teachers have been conducted in the United States, in Europe and Asia. The concept of emotional work was first coined in 1983 by the American sociologist Arlie Hochschild. Two main techniques (strategies) have been identified: "surface acting" - the expression of an ideal emotion that is inconsistent with the authentic emotion and "deep acting" - turning the ideal emotion into an authentic emotion in order to match the expression of the emotions demanded by the organization. Based on studies that have indicated the relevance of emotional labor to teaching, this study seeks to review the topic of emotional labor and demonstrate a link between emotional labor and emotional regulation among teachers.*

**Keywords:** *teaching profession, emotional labor, emotional regulation, surface acting, deep acting, pedagogical training, occupational setting, studies, United States, Europe, Asia, emotional work, Arlie Hochschild*

### 1. Introduction

An important theoretical contribution that emerged in the 1960s and 1970s concerned the issue of discrete emotions. Theorists assumed that there is a limited number of basic emotions - sadness, anger, fear, shame, joy, interest, contempt, disgust, and surprise - each having distinctive neurophysiological, physiognomic, motivational, and phenomenological characteristics. For

example, there are unique motivational characteristics associated with each emotion such as fear motivates escape, anger motivates aggression, shame leads to withdrawal and more. Emotions are also conceived as having dimensional properties within the framework of discrete emotions. In other words, emotions can vary in frequency, intensity, their hedonic tone and arousal level (Magai, 2001; Panksepp, 1998). The importance of these theories is

---

Corresponding author: Nagem Farrah  
Email: [fnagham@gmail.com](mailto:fnagham@gmail.com)

that they undermine the view that emotions are merely disruptive and maladaptive forces in human life (Magai, 2001) and in fact, these theories place emotions at the center of many contexts in our lives. One of these contexts is the subject of emotional labor.

The concept of "emotional labor" was coined by the American sociologist Arlie Hochschild in her book *The Managed Heart* (1983). Hochschild described the work of emotions as necessary to "induce or suppress feeling in order to sustain the outward countenance that produces the proper state of mind in others" (p. 7). The concept can be interpreted in many ways, but if we simplify, we can argue that we engage in emotional labor when we feel the need to suppress our emotions. That is, keep a smile on all day, even if it is a fake smile, because if you work in a service provider industry, you cannot exhibit a sad or depressed face at work despite what you feel inside. Hochschild cited as an example, flight attendants who are expected to smile and be friendly even in stressful situations. According to Hochschild's definition, emotional labor is a combination of emotional management and life management. This is the invisible labor, for which we are not paid, that we perform to keep our environment and those surrounding us happy and comfortable. The concept includes many aspects of therapy such as, for example, emotional labor, mental load, mental burden, home management, clerical work, invisible labor (Hochschild, 1983). The expression of emotional labor stems from situations in which we actually work.

According to this theory, Hochschild (1983) argued that in a certain sense, we all engage in playacting all the time. However, our acting can be expressed in two strategies: External acting and deep acting. The external acting focuses on changing emotional expressions while deep acting concentrates on transforming internal emotions to express the desired emotion. The external acting that

is done on the surface, include forging emotions that are not really felt, and hiding real emotions. For example, the way we sometimes change our outward appearance that is expressed in body language, the posed shrug, the controlled sigh (Hochschild, 1983). Whereas deep acting changes internal emotional states to truly experience the desired emotion (Grandey, 2000). Here, what we present is the result of working on our feelings. As the Russian director Constantin Stanislavski described as physical behavior that comes from a deep place of feeling. That is, the person who is acting, does not try to look happy or sad, but conveys what he supposedly feels and others may not know that the person they're facing is not feeling what outwardly, they seem to be feeling (Hochschild, 1983).

It is evident that these acting strategies are significant since a study by Hülshager and Schewe (2011) found that in organizations, external acting was positively associated with emotional exhaustion, depersonalization, and psychological health, which are causes of burnout. In contrast, deep acting was positively associated with emotional performance, customer satisfaction, and a sense of personal achievement (Brotheridge & Lee, 2003; Grandey, 2003; Hülshager & Schewe, 2011; Johnson & Spector, 2007).

In the broader sense of emotional management to meet Hochschild's organizational norms, Grandey (2000) argued that emotional labor is a process of transforming internal emotions and external expressions, in order to reach organizational goals. Since Hochschild's pioneering research on stewardship (Hochschild, 1983), several other professions related to emotion management at work have been explored. For example, emotional labor has been shown to be performed on a daily basis by nurses, police officers, salespeople, bank employees and hotel workers (Chou et al., 2012; Gray, 2010; Lv et al., 2012; Moon &

Hur, 2011; Schaible & Gecas, 2010). The present study discusses the field of emotional labor in the context of the teaching profession.

## 2. Literature Review

It has become increasingly clear that the teaching profession places many emotional demands on those who practice it, along with the pedagogical-educational requirements of the profession (Schutz et al., 2006; Zembylas & Schutz, 2009). The literature suggests that teaching is an emotionally demanding profession because the work and the environment are vague and conflictual in nature and involve many stressors (Conley & You, 2014; Schutz & Lanehart, 2002; Somech, 2016). Studies have shown that teachers' emotions are crucial in a variety of aspects related to their work at school: in teaching practices, the relationship between them and their students, issues related to reform and change processes, and understanding the power relations and social structures within the school and the wider social circles around it (Zembylas & Schutz, 2009).

Teachers face a plethora of emotions in the classroom. Among the different emotions of teachers, positive emotions such as pleasure and pride were examined (Frenzel et al., 2009b; Sutton, 2007). Winograd (2003) lists five positive emotions that are included in the emotional demands of the teaching profession. First, students' love and enthusiasm, showing passion and enthusiasm for the current subject, avoiding both extreme and negative emotions, love their work and show a sense of humor and laughter in the face of their own mistakes as teachers. However, teachers also have to cope with negative emotions such as anxiety, anger, and frustration. Teachers experience negative emotions and strong pressure in dealing with the demands placed on them by different stakeholders, with aggressive

behaviors on the part of students and parents, with intense ongoing activities and with pressures to meet external standards (Day, 2013; James, 2011; Sutton & Wheatley, 2003). Because teachers often experience such feelings, they can affect classroom teaching and student learning (Frenzel et al., 2009b; Sutton, 2007) as well as negatively affect the conduct of the school organization (Ashforth & Kreiner; Frenzel et al., 2009a).

In order to conceptualize teachers' emotions, one can use the control-value theory of achievement emotions that Pekrun (2006) developed. According to this theory, subjective control and value appraisals precede students' emotional experiences in the learning and achievement context. Building on Pekrun's theory of student emotions, Frenzel et al., (2009b) applied the theory principles to teachers. According to these principles, teachers' emotions are created as a result of their assessments or judgments which are related to specific situations in the classroom, with teachers' goals playing a central role in the assessment process. Thus, the teachers' assessments of the classroom situation precede the teachers' feelings. That is, the teachers may experience positive emotions such as pleasure or pride if the classroom situation is appraised by them as being consistent with their goals. Conversely, they may experience negative emotions such as anxiety, anger, or frustration if the classroom situation is inconsistent with their goals. In other words, teachers will experience pleasure when they see their students display an understanding of the material being taught, and will also feel pride when students successfully complete important tasks. On the other hand, teachers may feel anxious when they are unsure if students are constantly following the classroom assignments, and anger when the path to their goals is blocked due to students' negative behavior, and frustration when students do not understand the material, despite the teacher's effort (Frenzel

et al., 2009b ).

Various studies have found that teaching requires high levels of emotional investment from its practitioners, no less and perhaps even more, than service providers in the business sector, as this occupation requires daily, prolonged and intensive face-to-face interaction between the teacher and their students and many other factors. This profession has definite rules associated with demonstrating positive and negative emotions. Presumably, the fact that teachers are required to make an emotional investment in the face of a long list of objects when a different type of emotional investment is required for each of them, also adds to the emotional burden placed on the teacher (Ginat, 2011).

The reality in Israel, as in other countries, positions teachers as service providers, students and their parents as customers and the school administration, the supervisor and the office as principals and employers. This is all the more noticeable following the policy of opening school registration areas and creating competition between schools in some cities, which has created new rules of emotions. These rules are aimed primarily at keeping students in school where the teacher is expected to avoid expressing too negative feelings towards students for the fear that they would leave the school. There is an ethical critique of the concept of the teacher as a "service provider", since the requirement towards service providers to manage their emotions in accordance with the school's marketing interests, is in stark contrast to the rules related to demonstrating feelings as part of the internal goals of education and teaching - their educational perception and the declared school's perception. As a result, in extreme situations, a teacher will smile at their students because it benefits the school image and not necessarily because a smile and emotional support are essential to the student's development (Opletka, 2011).

Today it seems clear that emotions play an important role in the workplace. This can be particularly true in the case of teachers whose job is not only to teach, but also to create and preserve a learning-friendly environment. This means showing enthusiasm during lessons, empathic response to students' needs and concerns, hiding fatigue and anger or presenting positive emotions even when the students are stacking difficulties and behaving rudely. Teachers must teach them and simultaneously, manage their own feelings in order to meet expectations related to their profession (Cheung et al., 2011; Philipp & Schüpbach, 2010). Actions that define the concept of emotional labor. However, compared to other professions, especially commercial ones, it turned out that teachers' emotional labor has unique characteristics since interactions with students, as opposed to interactions with commercial service customers, are often long-term and repetitive. A study conducted in Poland, showed that teachers' work with students was particularly demanding, as teachers were repeatedly exposed to the negative behavior of their students (Pyzalski, 2008).

Not only do emotions interfere with the teaching process, but they also seem to be the leading contributors to emotional exhaustion. For example, it can be exceedingly difficult to control anger or irritation, when communicating with students who ignore requests or harass other students. In addition, in the education system, some students may have special educational needs, which not only affect their ability to study, but also require more attention from their teachers. Teachers are supposed to help these children overcome obstacles by providing adequate support, reorganize lessons or provide extra time. Thus, working with children with learning disabilities, emotional and behavioral difficulties, health problems or other needs, can be particularly stressful and emotional

(Antoniou et al., 2000; Male & May, 1997; Mackenzie, 2012).

### 3. Emotional Labor Among Teachers

Studies have shown that teachers believe they should act according to display rules that include expressing positive emotions and suppressing negative emotions (Schutz et al., 2007; Sutton, 2004; Zembylas, 2003). Levine-Brown (2011) found that the rules associated with demonstrating emotions in the teaching profession are in fact the product of teachers' own inference as a derivative of the image of the "ideal teacher." The teachers who participated in the study admitted that they found themselves "playing the role" through pretending to express warmth and caring (Levine-Brown, 2011). Wróbel (2013), who researched the rules associated with demonstrating emotions in the Polish education system, also noted that these rules are not as clear and explicit as in other service professions, although in practice, teachers are required to face high expectations of being nice and patient all the time, and never tired or angry (Wróbel, 2013). Studies that focused on teachers as emotional laborers, found that emotional involvement is an integral part of the teaching profession (Näring et al., 2006; Philipp & Schüpbach, 2010; Sutton & Wheatley, 2003; Zapf & Holz, 2006). These rules of playacting stem from teachers' perceptions of appropriate behavior toward their students (Keller et al., 2014). The efforts that teachers make to follow these rules are actually related to the concept of emotional labor (Lee et al., 2018). Similar findings to studies that have examined emotional labor in organizations (Brotheridge & Lee, 2003; Grandey, 2003; Hülshager & Schewe, 2011; Johnson & Spector, 2007) were found in research about the acting strategies, both surface and deep

acting, among teachers. The study by Näring et al. (2006) explored how the acting strategies discussed by Hochschild (1983) associated with emotional exhaustion, depersonalization, and personal achievement of teachers. The study found that surface acting was found to be positively associated with teachers' emotional exhaustion and depersonalization, and was negatively related to their personal achievements, whereas the opposite was found for deep acting (Näring et al., 2006). Furthermore, in their longitudinal study, Philipp & Schüpbach (2010) found that teachers who tended to external acting, exhibited more emotional exhaustion, whereas teachers who employed a deep acting strategy, exhibited less significant emotional exhaustion after one year (Philipp & Schüpbach, 2010) and enhanced their job performance over time (Hülshager et al., 2010). These findings suggest that a deep acting strategy may be a more beneficial emotional labor strategy for teachers.

Keller et al. (2014) who examined the correlations between teachers' emotional labor strategies and their discrete emotions, found that negative enjoyment, anxiety, and anger, positively predicted the adoption of on the surface acting strategies. In addition, Lee et al. (2014) found that acting on the surface was in a positive correlation with anxiety, anger and frustration, and in a negative correlation with pleasure. In contrast, deep acting was found in a positive correlation with pleasure, and in a negative correlation with anxiety, anger, and frustration. These findings suggest the beneficial effects of deep acting on teachers' emotional experiences. Given that teachers' emotional labor and discrete emotions have been found to be factors in explaining emotional exhaustion (Keller et al., 2014), it can be argued that there is relevance to the question of what discrete emotions teachers actually express, fake and hide, while they are teaching (Lee & Van Vlack, 2018; Taxer

& Frenzel, 2015). A study conducted in the United States on emotional investment among teachers, focused mainly on the expression of positive emotions and the suppression of negative emotions, based on the assumption that good teaching is charged with positive emotions. In order for teachers to meet their job requirements, they are required to fake positive emotion, or reinforce such emotions, even when they do not actually experience these feelings (Pfister, 2015). Thus, there is great importance to research examining how teachers' emotions are correlated with their emotional labor strategies and their emotional regulation.

#### **4. Emotional Labor and Emotional Regulation Among Teachers**

There are three aspects to emotional regulation. First, although most of the time, humans try to reduce the negative emotion, emotional regulation is not just about that. People amplify, maintain, and lower both negative and positive emotions (Parrott, 1993). Second, many situations in which emotional regulation is activated are conscious, such as a decision to make a dramatic change or to restrain oneself when being angry. However, emotional regulation can also occur subconsciously, when for instance, a person exaggerates in their enthusiastic response to a gift they have received, that is not particularly attractive (Cole, 1986), or when a person quickly diverts attention from something annoying (Boden & Baunieisier, 1997). Third, emotional regulation cannot be viewed as a positive or negative phenomenon since the same emotion regulation strategies that allow physicians, for example, to perform their work successfully (Smith & Kleinman, 1989) can also neutralize empathy among people engaged in interrogation and torture (Bandura, 1977).

Emotions and emotional reactions can serve people well, however, there are events where the emotional reactions do more harm than good. According to Gross (2002) such situations support the idea that emotions need to be regulated, which is particularly relevant in a school setting where there are rules for social conduct. Gross' definition of emotional regulation is the ability to control the experience and the expression of emotions. That is, emotions do not force us to react as we react but only increase the chance that we will react in this way. This flexibility allows us to regulate our emotions. For example, when we are afraid, we can flee, but do not always do so. When we are angry, we can hit, but not always do it and when we are very amused, we can laugh out loud, but not always do so. The way we regulate our emotions is important, since our well-being is inextricably linked to our emotions (Gross, 2002).

Emotional regulation is considered to be one of the three general aspects required for emotional skill. The other two are: (a) understanding or appreciating emotion - the ability to correctly identify, evaluate and understand a person's emotional expressions and internal emotional states; (b) expression of emotion - a person's ability to transmit his emotions by verbal (language) and non-verbal means (facial and voice expressions, gestures, posture) (Weare, 2004). Although understanding emotions, emotional expression and emotional regulation are often referred to as separate concepts, understanding and expressing emotion are in fact important stages of emotional regulation (Gross & Thompson, 2006), which is actually corresponds with emotional labor.

Theoretically, although the body of research discusses the similarities between emotion regulation (Gross, 1998) and emotional labor (Hochschild, 1983), empirical studies on the relationship between them is lacking. Such research was conducted by Lee et al. (2016). The authors examined the relationship

between the two structures, emotional labor and emotional regulation, as well as their relationships with discreet emotions of high school teachers (Lee et al., 2016). The study found positive correlation between reappraisal and deep acting, and between suppressive strategies and surface acting. However, a weak correlation was found between emotional labor and emotional regulation, suggesting that cognitive reappraisal and deep acting, as well as oppression and surface acting, are not entirely geared to the same emotional management strategies, despite their similar ideas in the two research approaches. The authors explained this by implying that sometimes emotional labor strategies are related to specific motives while emotional regulation strategies are unrelated. For example, when people fake or hide their emotions, they act cynically, however, when they strive to change their emotions, they are honest. In contrast, people can also use emotional regulation strategies for various reasons. They can reappraise or suppress emotions for honest or cynical reasons. However, the study findings showed strong correlation to emotional labor when deep acting was positively related to teachers' positive emotions and suppression and surface strategies were positively related to negative emotions (i.e., suppression with anxiety; surface acting with anxiety, anger, and frustration) (Lee et al., 2016). In general, emotional labor strategies seem to be more related to teachers' emotions than emotional regulation strategies. In particular it seems that as in other studies cited in this paper, surface acting is the strategy with the biggest drawbacks for use by teachers.

## 5. Summary

Teachers adapt themselves to their job definitions and take on the image involved in the job and the meanings stem from it. Therefore, they adopt an expression of

emotion adjusted to the "role code". For example, they show enthusiasm or stay calm, even when their students are interfering in class. In fact, it is a suppression of emotions (e.g. anger) or faking a positive emotion to maintain the image that the role requires. Although the study by Lee et al. (2016) did not find significant positive relations between emotional labor and emotional regulation, the present paper shows that there must be a strong link between the two. Hochschild (1983) coined the term "emotional labor" to describe how employees express feelings that suit the rules of the organization or the job and they actually lose an authentic sense of identity and inner coherence to their true values and feelings. The term "deep acting" by which Hochschild described a situation in which individuals adapt their feelings to society's expectations of them, versus "surface acting" which is a representation of external behavior without matching the internal emotions of the person that acts. Thus, in order to be successful in the labor of displaying emotions, one must control the type of emotions experienced or those expressed, and this requires a skill of emotional regulation, response-focused, in which true emotions are hidden, or falsified.

According to Hochschild (1983) any form of acting, based on levels of self-deception, can affect an individual's authentic sense of identity. It can be concluded that emotional labor, in both its strategies, surface and deep, requires emotional regulation. When one fakes his or her negative emotions, in order to conform to the role code and the rules of the place, not only does one feel these negative emotions within him, it can also provoke anger within and be upsetting. That is, the very fact that a person has to pretend and falsify positive emotions when they feel negative emotions, and in that process, they do not react in anger, requires from such a person emotional regulation. It apply to the second strategy of emotional labor as well,

the deep acting, where a person needs to actually "convince" oneself to enter into a "mode" of positive emotions when they do not feel such emotions, requires emotional regulation since in this process, a person needs to restrain, actually transcend above his or her, true feelings, and adopt not only a positive response in situations where their emotions are negative, but to work on their negative emotions and actually change them, to feel and communicate positive feelings. In other words, suppress their true emotions.

Thus, this study, which indeed discusses mainly teachers, can be applied to any other profession. The researcher's recommendation is to conduct further studies that will examine in depth, the relations between emotional labor and emotional regulation among teachers since teachers are in different situations from commercial organizations. As mentioned earlier, teachers

do not "sell" goods and do not receive a monetary benefit, the more they sell. The role of the teacher is more often than not, being performed out of a sense of a mission and their "customers", i.e., the students, cannot, as in the commercial world, switch to another supplier if they are not satisfied with the service. Thus, it is in fact a unique system of interactions that must be examined in a unique and specific way to the world of teaching and be cautious in applying the principles that are in the commercial world.

**Acknowledgment:** I would like to thank the staff in the school in which I have the honor to teach, and in particular, the teachers who helped me throughout many interactions, to understand their emotional world and to arrive at this paper, from a deeper understanding of my colleagues who enriched and expanded my perspective, even before I started writing.

## ASSESSING THE CONSTRUCTION SUPERVISORS' COMPETENCY TRAITS AND WORK QUALITIES ASSOCIATED WITH ENGLISH PROFICIENCY FOR EFFECTIVE COMMUNICATION IN THE INDUSTRIAL FLOWS: SRI LANKAN PERSPECTIVE

**Abstract:** *With a focus on addressing the industry's knowledge gap on the use of methodical approaches to improve communication flows and productivity-related benefits/outcomes sustainably, this study intends to evaluate the competency traits and work qualities associated with construction site supervisors' proficiency in English for efficient communication in a developing country's perspective. Totally, sixty-two Sri Lankan construction supervisors were subjected to well-designed modern apprenticeship elements, and their pertinent competency traits and work qualities were evaluated using a well-designed grading mechanism associated with functional apprenticeship frameworks/manuals/tools. At various stages of the research plan, academic reviews, expert consultations, statistical tests and other blended methodologies were used. The results demonstrate the quantitative performance ratings of relevant supervisory work qualities, ensuring adaptability, reliability and generalisability. The study resulted in a conceptualised pump that allows new values of highly practicable supervision qualities to pour in towards flowing considerable impacts on current practices of many rising industries/nations.*

**Keywords:** *Construction Supervision, Job Qualities, English Proficiency, Communication, Performance Evaluation, Work-based Training*

### 1. Introduction

The competency approach can be effectively applied to produce an effective human resource management function that is in line with the organisation's strategy (Serpell & Ferrada, 2006). Nonetheless, some have noted that there is always a chance that human resource systems will undermine an organisation's competitive advantages by

impeding the mobilisation of modern competence or the proper exploitation of ones that already exist (Lindgren, Henfridsson, & Schultze, 2004). Taking on construction organisations, the construction site supervisors are the key human resources who are in charge of executing a wide range of construction site activities connected with the organisational goals by communicating with various work categories (Manoharan,

Dissanayake, Pathirana, Deegahawature, & Silva, 2022). The site supervisors, who act as a link between the project/site manager and the employees, must implement general planning rules at the level of the construction process (Manoharan et al., 2022). This necessitates that site supervisors create work schedules and share them with the staff members responsible for carrying them out (Serpell & Ferrada, 2006). Importantly, effective communication is essential to assure that projects are successful in terms of schedule and cost management (Gamil & Rahman, 2017). It is particularly crucial on construction sites, where the bulk of activities depend on the effectiveness of communication (Renault & Agumba, 2016). Similarly, effective communication is moreover significant for influencing project outcomes on construction sites (Olanrewaju, Tan, & Kwan, 2017).

The need to connect and gather information from all disciplines is extremely important as the world moves toward industrialisation and technological innovation (Pek & Mee, 2015). Communication skills are seen as an acquired competence that is necessary for social interaction, information transmission and knowledge sharing (Markovic & Salamzadeh, 2018). The ability to effectively deliver/share ideas, thoughts and opinions is the key benefit of effective communication (Serpell & Ferrada, 2006). The effectiveness of the information to be exchanged or delivered may be hampered if the communication process fails (Markovic & Salamzadeh, 2018).

Taking on the Sri Lankan construction context, the rapid increase in foreign labourers in the Sri Lankan construction sector needs to be a concern in the recent scenario since it may cause a number of issues associated with economical, cultural and environmental aspects (Manoharan, Dissanayake, Pathirana, Deegahawature, & Silva, 2021b). In order to address a scarcity of skilled/semi-skilled construction workers in

the country, Sri Lanka has considered importing a large number of workers from regional nations (Weerakkody, 2019). Compared to other industrial sectors, the construction industry largely absorbs foreign employees in Sri Lanka. The construction sector leads in the list of sectors that intake foreign workers in Sri Lanka, whereas the tourism and plantation sectors followed up second and third in the list, respectively (Weerakkody, 2019). Noticeably, the intake of foreigners to the tourism sector is three times higher than the plantation sector in size, whereas the influx of foreign workers into the construction sector is two times larger than the tourism sector in Sri Lanka, as per the statistical data provided by Weerakkody (2019). Since the majority of the foreign workers employed in Sri Lanka originated from countries with lower exchange rates, such as Bangladesh, Indonesia, India, Myanmar, Nepal and Vietnam, they are unable to interact with their supervisory staff in the local language, which could cause their job to be delayed and put at risk (Valitherm, 2014; Manoharan et al., 2021b). Due to the wide range of nationalities present in most of the high-scale infrastructure development projects in Sri Lanka, such projects are diverse in terms of both culture and language with communication during work (Manoharan et al., 2021b). TVEC (2018) highlights that a substantial language barrier is one of such major issues that prevent workers from being able to communicate adequately.

According to Wei and Yaznifard (2015), the language barrier is a key challenge in the construction business in many Asian countries as well, particularly for the communication flows around the tasks performed by supervisory staff dealing with foreign workers and project management staff. Salleh, Nordin, and Rashid (2012) also concur that the language barrier becomes more challenging when foreign workers are unable to understand the instructions. They

are unable to reach the degree of effective communication required to complete the project tasks, which makes it more troublesome as the project becomes more complicated (Salleh et al., 2012). Poor communication skills may make it impossible to complete project duties, but they may also have a number of other consequences that significantly impact construction projects (Wei & Yaznifard, 2015). Emuze and James (2013) contend that poor communication may hamper the pace of construction projects, which can also affect the projects' success in terms of schedule and money, as well as resulting in conflicts between shareholders. Inadequate communication may also result in project reworks, which add time and expense and may have unfavourable effects (Emuze & James, 2013). Similar views have been expressed by Marhani, Adnan, Baharuddin, Esa, and Hassan (2012), who claimed that poor communication could result in decreased productivity and work quality, leading to the failure of the projects.

Concerns about the usage of the English language have grown significantly in recent years, not just in Sri Lanka but in a great number of industrialised and emerging nations (Silva, Warnakulasuriya, & Arachchige, 2018; Mee et al., 2020). It is important to highlight the Malaysian construction sector, where English is given equal weight to Malay, even though Malay has long been the official national language of Malaysia (Mee et al., 2020). But, Pek et al. (2019) state that the supervisory/technical workers who come from non-English-speaking nations encounter language barriers in the Malaysian construction sector. Being able to at least speak in English, whether in an official or informal situation, is essential given that it is an international language (Mee et al., 2020). According to Ahmed (2015), an individual who can speak English well will have access to the entire world, as English is a language that is used on a global scale.

It has been difficult to effectively

communicate with people from diverse cultures (Jenifer & Raman, 2015). Relatively little use or practice of the English language in work activities can be the major fact that results in one of the most important issues in supervisory/technical workers' incapacity to speak English well (Ne'matullah, 2017). On the other hand, it needs to consider the increasing popularity of mobile applications and computerised tools, which has changed how working staff need to be familiar with the use of the English language for communicating with job tasks (Poh, Ung, & Tan, 2011; Ne'matullah, 2017). Learning the language in a variety of settings will aid speakers in developing their proficiency (Ne'matullah, 2017). Juhana (2012) highlights that several causes may be to blame for the hesitation to use English among industrial workers. The psychological issues that prevent such workers from being able to communicate include fear of making mistakes, anxiety, shyness, lack of drive and lack of confidence (Juhana, 2012).

### 1.1. Problem statement

Relating to the aspects discussed above, recent studies and the discussions with the skill sector council of Sri Lanka and construction industry experts have revealed that the above-stated language barriers need to be primarily solved among the communication channels centred on the site supervisory workers in construction projects since they are the key resources to directly connect organisational policies with the quality and productivity of work operations. Sources highlight that lack of proficiency in the English language among site supervisors has been the leading factor that results in ineffective communication outcomes and workflows in the construction industry of many numerous emerging nations, namely South Africa (Windapo, 2016), Nigeria (Nwosu, 2018), India (Anil, Chitranjan, & Jayeshkumar, 2019), etc., similar to the Sri

Lankan context (Silva et al., 2018). Such sources further reveal that this has led to making a large number of construction firms experiencing productivity loss and quality-related issues in their project outcomes. More sources spotlight the absence of methodical apprenticeship practices among the vocational and industrial training organisations of such countries to address this significant problem (TVEC, 2018; Anil et al., 2019; Manoharan, Dissanayake, Pathirana, Deegahawature, & Silva, 2020). On the other hand, this study reveals the factuality that even though some earlier studies have identified these problems, they lack to come up with systematic actions to solve or reduce the impacts of those problems. Consequently, this study finds the gaps in industrial knowledge on how to approach the apprenticeship components and attributes connected with the English proficiency of construction supervisors and what generalised outcomes need to be achieved intending to enhance communication flows and productivity-related benefits/outcomes in a sustainable manner.

### **1.2. The study's aim and significance**

Commensurate with the above-stated problems and requirements, the intention of this study is to assess the competency elements and quality characteristics associated with construction site supervisors' proficiency in English for efficient communication in the industrial flows in the Sri Lankan construction context within a methodical frame. By comprehending the proficiency levels of site supervisory attributes/qualities in this track, the study may provide useful procedures and systematic ways to upgrade the industrial practices towards filling the industrial knowledge gaps stated above up to a certain level.

## **2. Literature review**

Communication across cultures is hampered by inherent constraints like language and culture (Sapar & Abuisaac, 2015). Many factors, including books, magazines, newspapers, the internet, radio and movies, all contributed to the disparities in language, as the socio-cultural environment is a key factor in defining one's skill in English (Shabani & Alipoor, 2017). English for specific purposes (ESP) has a similar learning process to other teaching methods, according to Ahmadi and Bajelani (2012). Even though the contents of ESP differ from those of common English, there is no accounting for distinctions between teaching processes. As a result, ESP embraces all forms of communication in a cross-cultural situation and does not solely focus on vocational communication (Ahmadi & Bajelani, 2012).

The percentage of people who use English in a professional setting has grown significantly (Chien & Hsu, 2010). In terms of international workers, their goal is to carry out the precise instructions provided by their clients. They need to be proficient in the English language to do this since the industry they work in expects them to grasp terms specific to that industry (Chien & Hsu, 2010). The constraints that cultural variation put on cross-cultural communication led to a number of issues at work (Jenifer & Raman, 2015). If these obstacles are not removed, they will eventually have an impact on the organisation's productivity.

The ability to read materials and comprehend the instructions given for activities to be taken is the most crucial quality for international workers. They will be accustomed to working with manuals, instructions/procedures and invoices throughout their careers in the construction industry. Olanrewaju et al. (2017) state that efficient worker communication is crucial to the site's productivity. Early intervention is necessary to resolve issues that cause communication barriers, which impede project performance

and on-site productivity. According to Sapar and Abuisaac (2015), organisational performance cannot be improved unless these communication impediments are eliminated.

Ne'matullah (2017) investigated the communicative barriers to the productivity of the construction industry in Malaysia and highlighted the following unfavourable outcomes due to the lack of proficiency in English among construction site supervisors.

- Causing project completion delays
- Lowering work qualities
- Putting foreign workers at greater risk
- Resulting in the wastage of resources and supplies

Ne'matullah (2017) have observed that there were numerous instances in which construction projects have requested extensions of time (EOT) or are being disregarded since construction companies are unable to finish the project by the deadline as a result of the above-highlighted significant outcomes. This indicates the necessity for language corpus research and language training to be carried out to reduce misunderstandings, miscommunications and carelessness within the construction industrial process flows.

On the other hand, it is significant to note the findings of Serpell and Ferrada (2006), who proposed a useful competency framework for construction site supervisors employed in developing nations. Importantly, the following work attributes are emphasised by Serpell and Ferrada (2006) among the supervision job roles to coordinate and organise the execution of the essential operational tasks in accordance with project plans.

- Organising the work site and operational procedures in compliance with the construction project's tactical plan and organisational policies

- Organising and carrying out work teams' operational actions in accordance with time, cost, safety and quality indicators
- Controlling resource distribution to ensure that it complies with process plans and quality standards for basic site operations
- Coordinating the execution of site tasks in various directions according to the operational strategical characteristics
- Leading both internal and external teams performing different construction project flows in compliance with the human resource management rules of the organisation
  - Distributing roles and responsibilities throughout the various stages of the construction process according to the human resources plan
  - Implementing safety, quality and environmental standards among internal and external construction employees connected to organisational policies
  - Developing the skills of construction workers engaged in fundamental construction processes and assessing their proficiency under corporate and project policies
- Overseeing the development and execution of construction operations while assuring adherence to the quality system, safety and environmental standards of the organisation
  - Monitoring the completion of construction goals while assuring adherence to legal, safety, environmental and corporate principles

- Measuring how well construction is going in relation to the project's operational and tactical schedule
- Reporting the progress status of operational tasks according to the measures of the operational plan and performance indicators
- Devoted to the organisational values and ideals of the company
- Devoted to ensuring the security of both human beings and material resources
- Adaptable and flexible in the face of hostile circumstances and conditions

Moreover, in order to assure the above-listed work attributes, Serpell and Ferrada (2006) presented the critical competency characteristics under the three categories, which are education and training, abilities and performance and attitudes, as shown below.

- Education and training
  - Recognise the ideas and components involved in a construction project's tactical and operational planning
  - Identify and assess construction tools and materials that are regularly utilised in site operations.
  - Recognise various construction methods
  - Distinguish and employ standards for environmental protection, safety and quality
- Abilities and performance
  - Oversee and incorporate operational working teams in operational planning
  - Involve individuals in quality, environmental and safety standards
  - Outline operationally-level plans for construction projects
  - Use management technologies to assess the quality and progress of construction projects
- Attitudes
  - Oriented toward the project's vision, mission and strategic objectives

Besides, Manoharan et al. (2020) have investigated the critical factors influencing construction productivity and determined supervisory skills as a leading significant factor in the list. It is important to note that Manoharan et al. (2020) presented a set of supervisory training programme outcomes (STPOs) that can be very useful for skill development authorities and construction industry organisations to take the necessary steps for the enhancement of supervisory abilities in construction. This study emphasises that English language proficiency and communication characteristics are essential to a quarter of the STPOs presented by Manoharan et al. (2020), and such STPOs are highlighted below.

- Carryout self-learning on modern theories, advanced technologies and practices related to construction works (STPO1)
- Assist in conducting field investigations, surveys and tests required for feasibility studies of construction works (STPO2)
- Maintain the records of the construction tasks and help in preparing the reports effectively (STPO3)
- Be a good communicator and team player among the construction workers (STPO4)

On the basis of the STPOs of Manoharan et al. (2020), a construction supervisory training guide model was comprehensively designed by Manoharan, Dissanayake, Pathirana, Deegahawature, and Silva (2021a) to upgrade the supervisory attributes with the intention of

providing productive ways to handle evolving challenges and opportunities of the industry in the current and next normal conditions. The site supervisory training guiding model of Manoharan et al. (2021a) importantly comprises 12 competency units (CUs), where one of those CUs significantly focuses on the supervisory characteristics of proficiency in English for efficient communication in the industrial flows. Noticeably, the competency characteristics of the relevant CU are subdivided into four competency elements (CEs), as shown in Table 1 and Table 2. Additionally, Manoharan et al. (2021a)

presented the mapping and distributed weights of relevant CEs and CU, along with learning domains of Bloom’s taxonomy, as described in Table 1. The scheme of this weighting displays the sectional view of site supervisory competencies under cognitive/knowledge, skill and affective/attitude attributes when it takes on their proficiency in English required for efficient communication in the industrial flows. Overall, it indicates a ratio of 6:9:5 between those three attribute categories, respectively.

**Table 1.** Mapping and distributed weights of the competency elements (CEs) and competency unit (CU) relevant to proficiency in English for efficient communication in the construction industrial flows, along with learning domains of Bloom’s taxonomy, presented by Manoharan et al. (2021a)

Competency Elements (CEs) / Competency Unit (CU)	Weight (%)	Learning Domain and Domain Levels																		
		Cognitive/ Knowledge Levels (C)				Psychomotor/Skill Levels (P)							Affective/Attitude Levels (A)							
		C1	C2	C3	C4	P1	P2	P3	P4	P5	P6	P7	A1	A2	A3	A4	A5			
CE[i] – Follow grammatical aspects at the word, phrase, sentence and paragraph levels in writing	20	14				2	2									2				
CE[ii] – Search the texts and key areas in the books/articles/documents	20	7				4	7									2				
CE[iii] – Write notes, emails, formal letters, notices, survey reports, laboratory reports, biographies and personal profiles	30	4	5			2	3	5	5							3	3			
CE[iv] – Listen, speak and communicate with others in English	30					2	3	5	5							8	7			
CU – Proficiency in English for efficient communication in the construction industrial flows	100	25	5	0	0	10	15	10	10	0	0	0	0			15	10	0	0	0
		30				45										25				

C1 – Remembering and Understanding, C2 – Applying, C3 – Analyzing and Evaluating, C4 – Creating, P1 – Perception, P2 – Set, P3 – Guided Response, P4 – Mechanism, P5 – Complex Over Response, P6 – Adaptation, P7 – Origination, A1 – Receiving Phenomena, A2 – Responding to Phenomena, A3 – Valueing, A4 – Organization, A5 – Characterization

Additionally, Table 2 shows the mapping levels of relevant CEs and CU, along with the STPOs of Manoharan et al. (2020). The following statement categories were considered by Manoharan et al. (2021a) for

deciding the mapping levels between CEs and STPOs. In the process of deciding these mapping levels, the supervisors’ skill capacities required in the next normal, the learning demands, the industry’s expectations

and the practicalities were all carefully assessed by Manoharan et al. (2021a).

- Introduced (I): The learnt contents give an overview of the intended outcomes.
- Emphasised (E): The learnt contents assert the needed results or outcomes.
- Reinforced (R): The learnt contents act as pillars for strengthening the materials in the direction of the desired result.

- Advanced (A): The learnt materials represent a vigorous level of interaction with the resources in order to achieve the desired results.

As per the obtained mapping levels between CEs and STPOs, the level of mapping of CU against each STPO was determined by Manoharan et al. (2021a) whether it is considerably (C)/ moderately (M)/ slightly (S) accomplishing the needed characteristics, as shown in Table 2.

**Table 2.** Mapping levels of competency elements (CEs) and competency unit (CU) relevant to proficiency in English for efficient communication in the construction industrial flows, along with the supervisory training programme outcomes (STPOs) of Manoharan et al. (2020), presented by Manoharan et al. (2021a)

Competency Elements (CEs) / Competency Unit (CU)	Supervisory Training Programme Outcomes (STPOs) of Manoharan et al. (2020)			
	1	2	3	4
CE[i]				E
CE[ii]	E	I	E	I
CE[iii]	E	E	R	R
CE[iv]		E	E	R
CU – Proficiency in English for efficient communication in the construction industrial flows	M	M	C	C

STPOs of Manoharan et al. (2020):

STPO(1): Carryout self-learning on modern theories, advanced technologies and practices related to construction works

STPO(2): Assist in conducting field investigations, surveys and tests required for feasibility studies of construction works

STPO(3): Maintain the records of the construction tasks and help in preparing the reports effectively

STPO(4): Be a good communicator and team player among the construction workers

Mapping between CEs and POs: I – Introduced level; E – Emphasised level; R – Reinforced level

Mapping between CU and POs: S – Slightly accomplishing; M – Moderately accomplishing; C – Considerably accomplishing

### 3. Methodology

Figure 1 shows the layout design for the flow of the mechanism associated with the research plan/methodology based on the research aim/objectives. Continuous consultative processes with different academic and industry professionals were held, as illustrated in Figure 1, with a specific focus on the essential measures in construction site supervisory qualities for the facts and difficulties outlined in the above sections (introduction and literature review).

Notably, the consultative discussion sessions were carried out connected with different flows shown in Figure 1, and the participants were considered into three categories, where each category consisted of around 10 experts. University academics with a PhD or master’s degree in the field of civil engineering and more than five years of professional experience took part in these consulting sessions (Category 1). Additionally, these consultative discussion sessions included participation from industry specialists who held chartered engineering credentials and extensive experience working as project

directors, managers and engineers (Category 2). Moreover, academics and industry professionals who have expertise in the English language and communication aspects also played some key roles in these consultative sessions (Category 3). Problem-

focused and action-oriented communication strategies were applied at every stage of the consultative process, particularly to identify the problematic areas, understand the effects and establish necessary actions/solutions using the expertise.

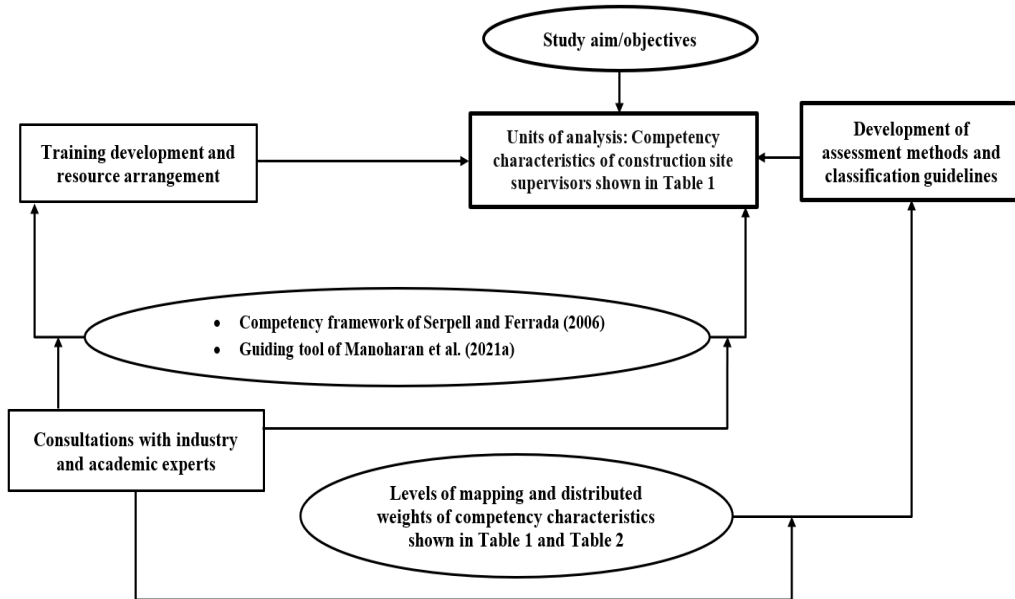

Figure 1. The flow of the mechanism associated with the study methodology

### 3.1. Validation of the applicability of the competency framework of Serpell and Ferrada (2006) and the supervisory training guiding tool Manoharan et al. (2021a) for supplying a foundation that is consistent with the characteristics of the current research aim/objectives

It was found that only a few studies have offered models or methods to carry out apprenticeship aspects at construction project sites, despite the literature evaluation of the current research revealing a wide range of factors that affect diverse construction systems. According to the needs and peculiarities of the industrial environment, there are significant restrictions when employing such models or tools, according to the current research. Despite discussing

productivity development, the major shortcomings of those models and technologies are the absence of specific competency traits and performance evaluation processes. At present point, the primary causes of this constraint are the limited capital resources and the inability to adopt the current technology of many construction businesses in underdeveloped countries. The construction sector in industrialised nations often uses the computerised tools provided by Hai et al. (2018). A fundamental issue in the design of these models and tools is that they disregard techniques for making work activities broader.

As per the analysis of the flaws, gaps and limitations in the past study findings, the

competency framework of Serpell and Ferrada (2006) and the construction site supervisory apprenticeship manual by Manoharan et al. (2021a) served as the foundation for the layout design of the study mechanism, as can be seen in Figure 1. The above-mentioned consultative results and reviews from industry experts were used to support the emphasis on using these apprenticeship tools while also taking into account the aim/objectives of the study and other important factors, as per the factors outlined in the later part of the literature review section. Importantly, the expert reviews validated the consideration of competency characteristics of construction site supervisors (CEs and CU) shown in Table 1 as the major units of analysis for achieving the aim/objectives of this study. The expert reviews chiefly stated that these CEs and CU are fully essential for achieving the work attributes of supervisory workers emphasised in the competency framework of Serpell and Ferrada (2006), as well as considerably matching with the critical competency characteristics highlighted by Serpell and Ferrada (2006) under the categories, namely education and training, abilities and performance and attitudes, as discussed in the above literature review section.

### **3.2. Training development and resource arrangement**

An advanced construction supervisory apprenticeship with a diploma qualification level of the Sri Lankan National Occupational Qualification Framework (SLQF) was comprehensively designed in accordance with the use of the apprenticeship manual of Manoharan et al. (2021a). This apprenticeship development followed a number of methods while taking into account innovative qualities in light of the new typical situations in the construction business. It is significant to note that the intended apprenticeship qualification level was SLQF

level 3, which is comparable to the National Vocational Qualification Framework (NVQF) level 5 in Sri Lanka. Therefore, the admission standard for the criteria of NVQF level 5 or SLQF level 3 was followed by the selection of site supervisory personnel. Notably, the Tertiary and Vocational Education Commission of Sri Lanka authorises the NVQF, which is a nationally uniform framework that upholds the legitimacy of vocational educational certification awarded in Sri Lanka based on internationally benchmarked norms and procedures (TVEC, 2021). On the other hand, the University Grant Commission (UGC) of Sri Lanka authorises the SLQF, a framework that awards higher education qualifications produced by both public and private higher education institutions (UGC, 2015). Surprisingly, the SLQF includes the lateral mobility pathways for higher education and the workforce that are tied to the NVQF.

The apprenticeship-providing institution was chosen by conducting a SWOT analysis and consulting with experts. Institutional directors and academic heads from several departments made significant contributions to the consultative talks surrounding this SWOT analysis. Before the apprenticeship began, the essential approvals for the detailed design of the curriculum, ethics, quality control and financial aspects were obtained through a series of procedures carried out with several academic and administrative committees operating in the selected institution. With the intention of providing systematic apprenticeship delivery at the institution with a long-term emphasis, other significant resource arrangements were made, including the creation of a new Board of Study, the creation of program by-laws, the appointment of human resources assigned to various academic tasks and administrative work processes, etc.

The potential site supervising staff were first identified and encouraged to apply for the suggested apprenticeship using the snowball

sampling technique. This sampling strategy is useful in overcoming the challenges of obtaining samples with the appropriate traits for the study's applications. In order to locate more construction supervisory workers who could be interested in applying for the planned apprenticeship, a noticeable number of supervisors were first included in the sample by running a series of awareness sessions within a number of well-known industrial enterprises. By following the guidelines outlined in the programme by-laws, 62 construction supervisors were ultimately selected for the proposed apprenticeship based on their educational and professional backgrounds as well as the scores received during the selection interview session. In particular, a panel of academics used the interview sessions to assess the candidates' cognitive and self-management qualities relating to communication, commitment, curiosity and self-discipline. Notably, 40% of the chosen supervisory staff were working on building construction projects, whereas the same percentage can be implied to the supervisory staff employed in road construction projects. A notable percentage (around 15%) of the selected supervisory staff were involved in water supply project work. Taking into consideration of the chosen supervisory staff, it was also apparent that there was a large representation of each of Sri Lanka's nine provinces among their group, whereas none of them fit into the category of workers with less than one year's worth of experience.

### **3.3. The significance of the inclusion of the pertinent competency unit that carries out the elements of the research applications**

More importantly, the newly developed apprenticeship included a specific competency unit that used a number of job-integrated learning approaches to site supervisory abilities in line with the primary

goals of the current research. The relevant competency unit primarily addressed the characteristics of all the CEs stated in Tables 1 and 2. Noticeably, the components of this specific competency unit were assessed by a panel of subject matter experts. Here, the panel was made up of nine experts with an equal composition between the three categories of experts who participated in the consultative discussions, as stated in the first paragraph of the methodology section. The review of the proposed competency unit specifically focused on competency factors and objectives, training outcomes and their weights, training contents, delivery methods, assessment strategies, as well as the relevant mapping level outcomes and the types of resources that were required.

The proposed apprenticeship's academic delivery components were uniformly distributed among the selected supervisory staff in accordance with the programme's by-laws and institutional quality assurance procedures. For the purpose of evaluating the traits of supervisory work qualities, a grading criterion was meticulously created, as demonstrated in Table 3. The weighting of CEs in relation to the learning domains listed in Table 1 was tied to the grading criteria that were constructed. The CEs with the relevant STPOs presented by Manoharan et al. (2020) (shown in Table 2) and the advanced site supervisory work attributes of supervisory workers emphasised by Serpell and Ferrada (2006) in their competency framework were also taken into consideration by this collective mechanism of the competency evaluation process. Within the base of this mechanism/framework, written examination, oral tests, listening exercises, speaking activities, group work activities, activity-oriented tasks, work-based assignments and other interactive tasks were carried out for evaluating the supervisory competencies and qualities.

It is significant to highlight that the expert review panel confirmed the validity of the

designed grading guide and the detailed designs of the competency evaluation components. Surprisingly, the pertinent competency unit states that 30% of the apprenticeship was devoted to enhancing the cognitive (knowledge-based) qualities of site supervision, notably in terms of assessing how the supervisory work qualities perceive problems and apply solutions. Also, 45% of the apprenticeship was used to assess site supervisory psychomotor qualities, with a focus on perceptions and action mechanisms related to problem identification and resolution. The emotional (attitude and

emotion-based) site supervisory qualities were the emphasis of the final quarter of the apprenticeship, particularly how their work qualities connected with paying attention to and willingly acting on the problem-solving parts. The overall ratio of the construction supervisory cognitive, psychomotor and emotional qualities to the necessary aspects of competency characteristics was 6:9:5. The chosen supervisors were given a grade level that came within the range of scores presented in Table 3 after being evaluated for each and every CE according to the grading standards and descriptions.

**Table 3.** The developed criteria for the classification of construction supervisors into different groups/grades

Score Range	Group/Grade	Standard Levels	Descriptions
>=85	A+	Superior	Higher in status, quality and rank
75-84	A	Excellent	Incredibly good; outstanding
60-74	B	Good	Having adequate qualities with high standards
45-59	C	Pass	Demonstrates potential
35-44	D	Conditional Pass	Demonstrates potential but lacks the necessary groundwork in some important areas
<=34	E	Fail	Unsuccessful in achieving the requirements

**3.4. Validation of the method of applying research tools**

It is noteworthy to state that the experts mentioned in Section 3.3 were involved in the overall evaluation process of validating the methods of applying research tools. The evaluation process crucially included a series of observations and evidence-based discussions centred on the plans drawn up and the research tools utilised for the research objectives’ direction within the processes illustrated in the above sub-sections.

**4. Results and discussion**

**4.1. Classification of construction supervisors’ competency traits and work qualities with the performance ratings and grades**

Figure 2 demonstrates the classification of construction supervisory work qualities with the percentages of construction supervisors for each competency feature or factor at different grade levels while also taking the entire competency unit into account when allocating the apprenticeship components.

Taking into the supervisors’ qualities in following grammatical aspects at the word, phrase, sentence and paragraph levels in writing (CE[i]), 30% of the supervisors showed that they have adequate qualities with high standards, whereas the remaining 70% were found at the pass or conditional pass level. When it comes to supervisors’ quality attributes in investigating the texts and key areas in the books/articles/documents (CE[ii]), the supervisory qualities seem better

compared to CE[i]. Considering the major reason for this difference, the discussions with the experts underlined the intensification of the awareness and understanding of the supervisory workers on the significance of work-oriented searching practices associated with their regular work process and demands of learning. In CE[ii], the work qualities of one-tenth of supervisors were incredibly

good, whereas half of the supervisors' qualities were found to be adequate with high standards. Among the remaining supervisors, three-quarters of them were found to be at demonstrated potential level, and a quarter of the supervisors were identified with a lack of the necessary groundwork in some characteristics of CE[ii].

**Figure 2.** Classification of construction supervisors' competency traits and work qualities into different groups/grades

Compared to the first two CEs, the supervisory qualities were identified much better in CE[iii], which relates to writing notes, emails, formal letters, notices, survey reports, laboratory reports, biographies and personal profiles. Taking into consideration this significant difference, the expert discussions drew attention to the significance of the work process and responsibilities associated with the characteristics of CE[iii] than the learning demand for a wide range of tasks in relation to communication aspects where the supervisory staff are involved in their daily work routines. Under the characteristics of CE[iii], 40% of the supervisors showed their qualities at an excellent or superior level, whereas half of the supervisors showed their proficiency at an adequate level with high standards, and the remaining 10% of the supervisors were found to be at demonstrated potential level. Noticeably, none of the supervisors was found with lacking part of the groundwork in any characteristics of CE[iii]. On the other hand, two-fifths of the supervisors proved their competence in listening, speaking and communicating in English (CE[iv]) with adequate qualities and high standards, whereas 25% of this portion were outstanding in the competency characteristics associated with CE[iv]. Here, among the remaining

three-fifths of the supervisors, nearly a 4:3 ratio was reported between the supervisors who were at the pass and conditional pass levels, respectively. Noticeably, none of the supervisors was found to be unsuccessful in achieving the requirements under the characteristics of any CEs at any stage.

Taking on the whole competency unit category, 5% of the supervisors were at grade A which signifies their excellent/outstanding level of quality of communication attributes associated with English proficiency in the industrial work processes. In addition, 53% of the supervisors were at grade B which implies that they have an adequate level of work qualities and high standards of communication attributes associated with English proficiency in the industrial flows, whereas the remaining 42% of the supervisors were at grade C indicating such qualities/attributes of them at a demonstrated potential level. In the matter of the whole competency unit category, none of the supervisors was found at the conditional pass or failure stage. The results shown in Figure 2 further reveal that there are no significant differences in the results when comparing the proportions of the supervisors in each grade level based on the types of projects where they are employed.

**Table 4.** Average score values of construction site supervisors under the required competency characteristics relevant to proficiency in English for efficient communication in the construction industrial flows

Competency Elements (CEs) / Competency Unit (CU)	Road Projects			Building Projects			Water Supply Projects			Overall		
	AVS	STD	CV	AVS	STD	CV	AVS	STD	CV	AVS	STD	CV
CE[i]	50.15	6.56	0.13	50.46	6.14	0.12	58.11	9.57	0.16	51.63	7.56	0.15
CE[ii]	63.52	7.45	0.12	61.42	8.46	0.14	61.84	8.14	0.13	62.36	7.86	0.13
CE[iii]	70.06	6.82	0.10	70.64	6.61	0.09	63.12	8.35	0.13	69.14	7.14	0.10
CE[iv]	55.61	8.21	0.15	56.44	7.85	0.14	52.01	7.89	0.15	55.78	8.11	0.15
CU – Proficiency in English for efficient communication in the construction industrial flows	60.44	7.18	0.12	60.50	8.34	0.14	58.53	8.22	0.14	60.27	7.81	0.13

AVS – Average score, SDV – Standard deviation, CV – Coefficient of variation

**Figure 3.** Curves showing frequency distributions of construction supervisors' scores under the required competency characteristics

Table 4 displays the average performance ratings they received for each competency factor, whereas Figure 3 demonstrates the curves that show frequency distributions of construction supervisors' scores under the required competency traits. The lowest average score overall was recorded by CE[i],

which was nearly 52 (indicating middle levels of grade C). The expert discussions pointed to the lack of foundation given to the grammatical use in Sri Lankan secondary/school education and the lack of significance considered by other parties to the grammatical aspects in the usual work

practices and communicational flows of supervisory job roles, as the major causes for the lowest score values in CE[i]. On the other hand, the highest average score was obtained by CE[iii], which was nearly 69 (indicating upper levels of grade B). The overall average scores for the various project types did not significantly differ from one another and were almost closer to the average score value of the supervisors' overall competency unit, which was around 60 (indicating the lower marginal levels of grade B). This highlight that the given apprenticeship components can be particularly adaptable and transferrable to the supervisory methods used in all different sorts of construction project practices by following this procedure connected with the study aims/objectives.

Considering the further depth of analysis on all CEs, the mean values are almost closer between the supervisors working in building and road construction projects for each CE, whereas some notable differences can be seen in the average scores of supervisors working in water supply works compared to other project types, especially in the competency factors of CE[i] and CE[iii]. When it comes to finding out the major reason for these differences, it can be justified that the characteristics of different types of project practices, working patterns and site policies might influence the work qualities of supervisors in following grammatical aspects in writing (CE[i]) and writing notes, emails, formal letters, notices, survey reports, laboratory reports, biographies and personal profiles (CE[iii]).

**Table 5.** The developed new guideline generalising the results associated with the construction supervisory attribute levels in English language proficiency for efficient communication in the construction industrial flows

Competency Elements (CEs) / Competency Unit (CU)	Road Projects	Building Projects	Water Supply Projects	Overall
CE[i]	C	C	C	C
CE[ii]	B	B	B	B
CE[iii]	B	B	B	B
CE[iv]	C	C	C	C
CU – Proficiency in English for efficient	B	B	C	B

**4.2. Assurance of the results and outcomes concerning adaptability, generalisability and reliability**

The coefficient of variation (CV) values of the scores were under 16% in all the categories, and this assures that the outcomes are comparable between raters and that they fall within the range of CV values set forth by Statistics Canada (2020). This increases the reliability that the provided apprenticeship components will be extensively applicable to the industry sector's long-term purposes. The observations of a group of experts on the outcomes (detailed in Section 3.4) must also be given special consideration. The pool of specialists determined that all of the competency factor categories were sufficient as a whole, intriguingly emphasising the importance of broadening the applications of this research process in numerous emerging industries and nations for their quick adoption of industrialised practices.

An important result of this study is the formation of a new generalised guide that may be useful in forecasting and understanding what degrees of attributes can be taken into consideration in supervisory qualities, as demonstrated in Table 5. This could significantly enhance the procedures for decision-making, knowledge management, performance management and communication management components of resource planning in terms of improvements in proficiency and work outputs.

communication in the construction industrial flows				
--	--	--	--	--

The construct validation of the current case study applications was wonderfully evident according to the conceptualised rules for case study techniques supplied by Yin (2002) since the study exhibits the evidence and justifications with the locations of each instance of the units of analysis (CEs). The findings, demonstrated in Table 5, unquestionably show how haphazardly the case study's units of analysis are connected. The illustration of patterns of variance in each CE while taking into account various project practices has ensured the internal validity of the results. Most importantly, the findings of the expert interviews, reviews and data analysis demonstrated that the suggested applications and methods could be generalised, valid and used for various scopes and boundaries within the site practices. This guarantees both the measured outputs and the external verification of the proposed uses/mechanisms. It also demonstrates that the suggested techniques and applications can be used as initiatives in other emerging industries.

#### 4.3. Discussion on the current research findings compared with past studies

The current research findings can be very helpful for the construction industry in emerging countries like Sri Lankan contexts to take systematic approaches to handle a wide range of challenges highlighted by Valitherm (2014), Weerakkody (2019) and Manoharan et al. (2021b) due to the increase of foreign employees, as described in the introduction and literature review sections. Considering numerous studies (Jenifer & Raman, 2015; Sapar & Abuisaac, 2015; Windapo, 2016; Ne'matullah, 2017; Olanrewaju et al., 2017; Nwosu, 2018; Silva et al., 2018) highlighted that the language barriers and communication impediments significantly impact the organisational

performance and productivity, the current study findings provided generalisable ways to polish out the communication flows within the project practices. In particular, the generalisability of the current study findings will lead to open a way for addressing the psychological issues, such as fear of making errors, lack of drive, lack of confidence, anxiety and shyness (listed by Juhana (2012)), that prevent the local site supervisory workers from communicating with foreign workers. This may lead to avoiding misunderstandings, miscommunications and carelessness within the construction industrial process flows, as well as making construction organisations experience the reduction of project delays, reduction of wastages of resources/supplies, advancement of work qualities and lower risks of working with foreign resources. More importantly, the current study findings strengthen the external validity of the competency framework presented by Serpell and Ferrada (2006) and the training guide tool of Manoharan et al. (2021a) for construction site supervisors employed in developing nations. As described in the methodology section, the competency evaluation methods are well connected with the internal structure of such tools. Additionally, the current research findings may also support the application of the advanced computerised models proposed by Hai et al. (2018) for upgrading skill evaluation methods in apprenticeship practices. According to the recommendations provided by Hai et al. (2018), computerised sophisticated technologies can be used in the future to further enhance the existing study applications.

In addition to the above, the current study outcomes will have considerable influences on polishing up the construction site supervisory qualities to perform the professional job with the capability to manage various construction processes towards

achieving the following competency outcomes of Bachelor's level degree qualifications (the qualification level of SLQF 5 / NVQ 7) suggested by Manoharan et al. (2022).

- Compare, analyse and categorise diverse management and technology applications using the optimisation approaches with the purpose of enhancing productivity and performance in the industry sector
- Use pertinent codes of practice for designing concrete, steel, masonry and timber structures
- Use computerised procedures in modeling techniques of architectural and structural designs
- Identify suitable research-based approaches for solving industrialised challenges
- Use construction techniques with a proper grasp of the factors causing environmental change on a global scale, which results in hazards from both nature and human activity
- Execute the assessment and decision-making procedures pertaining to production and operation as well as evaluate the quality of the processes and products in accordance with the organisational needs
- Execute the methods to maximise the value and quality of construction practices by lowering supply chain logistics costs and inventories
- Use the services of banks and insurance providers to make proper decisions for achieving productivity and profitability-related benefits in industrial operations
- Investigate the economic literature on guided technical advancement and behavioural modification for raising the effectiveness and productivity of business operations

- Analyse the demands for business and service environments to execute marketing strategies for organisational activities
- Manage entrepreneurial ventures in the construction sector to attain the anticipated levels of productivity and profitability
- Implement resource arrangements, awareness campaigns and promotional efforts for worker apprenticeship initiatives to strengthen relationships between industrial and institutional businesses on a national and worldwide level

## **5. Conclusion**

By adding new qualities of construction site supervision, which may be crucial in improving the effectiveness and productiveness of construction operational flows, this research has partially filled the industry's knowledge gap related to skill upgrading issues. By polishing out the communicational qualities of site supervisory attributes, the research has opened the pump to allow the highly workable characteristics to flow in and improve the site communication structures of site management. The current study has laid a reinforcement layer to upgrade the supervision roles to deal with international practices and industrial communication channels for handling the challenges associated with technological advancement towards obtaining benefits related to higher performance, quality, productivity, safety and sustainability of the industrial flows in the next normal conditions. The results of this study may stimulate changes to different training curricula in tertiary and vocational education institutions as well as the field of vocational training to accommodate the changing needs and problems of the industry under the new normal characteristics.

It is significant to note that only relatively modest differences were found in the results, despite the fact that project conditions, organisational policies/instructions, operational characteristics, size and quality of resources, financial scales and ethical regulations varied significantly among the selected construction projects where the applications of this research were processed. This ensures that the applications of this research will provide sustainable advantages to a number of construction-related sectors, assuring the adaptability, dependability and generalisability of the overall results.

Only those employed as site supervisors in the construction industry, whose level of competence ranges from technician to managerial level, are qualified to enter into this study applications as the samples, which is a notable limitation that this research emphasises on the use of site supervisors. Furthermore, a thorough analysis of the supervisory qualities in the context of Sri Lankan construction served as the basis for the grading levels shown in Table 5. Anyhow, the peculiarities of construction supervision procedures may differ in various contexts of growing economies and sectors. So, taking into account the circumstances of various developing countries, there might be minor discrepancies in such grade levels, but such differences are not anticipated to be of a significant magnitude. The results of the expert consultation also showed that the grade levels shown in Table 5 can generally agree with the opinions of other emerging nations. Taking into account these factors, it is appropriate to state that this research has provided a contemporary manual that summarises the capability levels of construction site supervisory workers associated with the pertinent aspects of the research problem replicating the settings of developing countries. Yet, this study suggests that future research examines the variations in these grade levels by comparing the managerial responsibilities and work habits

of other countries and industrialised sectors. Future studies can benefit greatly from the generalised methodologies and mechanisms that the current study provided for such a purpose. As a result, the findings of the current study have the potential to significantly influence how site planning, stakeholder management, supply chain management and communication management aspects are currently practised in other developing industrial regions and countries. The current research also suggests that future studies may use mixed-method approaches to examine productivity variations in relation to changes in site supervisory work qualities. Furthermore, this research highlights the necessity for other competency-based characteristics and working approaches/patterns in site supervision and other job categories to be evaluated in future studies under varied conditions.

The consultations with the experts revealed that the structure of the current study's competency framework can be further polished out by adding more supervisory competency factors associated with the ESP characteristics for performing the business and marketing related needs of the industry matters in order to achieve the higher levels of competency outcomes suggested by Manoharan et al. (2022). Within this concept, this study conclusively emphasises the consideration of the following competency elements that future studies may focus on to expand the current study applications/findings.

- Communicate verbally in practical business contexts with greater fluency, accuracy and confidence
- Express supervisory attributes effectively on business-oriented written aspects
- Use words and phrases related to business and marketing to express supervisory characteristics

- Develop strategic competence that helps in efficient communication in English

**Acknowledgment:** The authors extend their sincere gratitude to the academic and industry

professionals who participated actively in the consulting and review sessions for this study. The University of Peradeniya and the Wayamba University of Sri Lanka are also acknowledged by the authors for their crucial support in organising the resources for this study.

## EXPERIMENTAL STUDY ON SOFT CLAY SOILS TO IMPROVE SETTLEMENT AND ULTIMATE STRESS USING THERMOS MECHANICAL LOADS

**Abstract:** *The electrothermal method was used to treat soft clay soil under load in this study. The experiment model was adopted to study settlement behavior. The effect of heat on settlement and maximum stress, of soft clay soils, were studied. The variables studied are the distance between the heaters, the heating time, and the temperature of the source. A model was used with dimensions (60 \* 40 \* 60 ) cm, and heaters were used in each model, and the power of each heater was 925 watts, and the number of models used was 37 models. The first examination was without heat treatment, and settlement was measured in it directly. As for the rest of the tests, heat treatment was used in it, and the tests were divided into two phases. The first stage is the heat treatment stage, and the second stage is the stage of placing the mechanical load on the soil. The mechanical load is weights placed on the soil through the footing. The tests were divided according to the research structure into three cases and according to the distance between the two heaters (20,30,40) cm. In each case, the tests are conducted according to the heating time, where the heating time was used (4,8,12) consecutive hours, and each time 4 tests were used at different temperatures (200,300,400,500) degrees Celsius. An improvement value of 99.8% in the settlement was obtained when the source temperature was 500°C, with a heating time of 12 hours, and the distance between the heaters was 20 cm. An improvement in maximum stress of 425% was obtained when the source temperature was 500 °C, the heating time was 12 h, and the distance between the heaters was 20 cm. The conclusions of the study are that the settlement decreases with increasing temperature and the ultimate stress increases with increasing temperature.*

**Keywords:** *Experimental stud, soft clay soils, ultimate stress, thermos, mechanical loads*

### 1. Introduction

Soft clay soils make up much of the land in southern Iraq. It is necessary to strengthen this soil, especially in these places, to

stimulate economic development and to create projects in various disciplines because the formation of projects on this soil is difficult. As a result, the technology used to improve these soils must be financially

efficient, rapid, and durable.[1] Many regions of the world also have soft loamy soils, which have the maximum stress and lead to large settlements when loaded.[2] Dirt properties can be improved by using various techniques, including chemical treatment, artificial soil reinforcement, removal, replacement with different filling materials, etc., to reduce excessive settlements and improve maximum stress.[3] However, there are several things to consider when selecting a technique to measure the degree of improvement. It includes the area and volume of soil to be treated, soil type, access to raw materials, access to necessary equipment, disposal of waste and water pollution, effects on nearby structures, local experience, amount of time available, and cost [4],[5]. Since 1955, the heat treatment method has been used only by the Soviets, and in particular in Russia and Ukraine, and the use has decreased due to high fuel prices.[6] Clay-rich soil and stones form the basis for many towns, cities, transportation lines, and structures. Due to their capacity to contract or expand in response to variations in water content, the clays composed of montmorillonite pose a serious risk to technical construction. The underground water table's diffusional flow of moisture via the soil's pores, rainfall's gravity flux of water into the ground, and other sources might all play a role in the moisture shift. Soft soils require more damage than floods, volcanoes, tornadoes, earthquakes, or other natural disasters. By improving the soil or utilizing specific types of foundations, the detrimental effect of expansive soil on structures can be avoided or mitigated.[7] Heat treatment was one of the suggested types of improvement techniques utilized to address the issue of building on expanding soil. Investigating the physical characteristics of the soft soil existing in particular locations of Iraq is vital to ascertain the remedies for reducing damages.[8] The electric heating method

was used recently in Korea, where a researcher used the heating method in one of the locations in Korea, and he used temperatures between (70 and 110) °C. The researcher obtained good results for the maximum stress and slump in the soil [9] also [10], [11] investigated fine clay's ultimate bearing capability and final settlement after thermal treatment. After combining Baghdad clay with enough water to give it a shear strength of 7 kPa, he conducted seven typical experiments on clay soil inside a square steel box with a length of 750 mm after heat treatment, two of which were used as a standard without treatment. for reference. This innovative gas-heating system uses wells to heat. Four square patterns of boreholes with 3.5 cm diameters, 30 cm lengths, and 3d, 4d, 5d, 6d, and 7d distances (d being the well diameter) were heated for six hours each. A 150 mm long, 20 mm thick square aluminum plinth was placed in the soft clay surface area and loaded monotonously until the settlement reached 10% of the foot width. The results showed that as spacing rises, bearing capacity increases and stability falls until a maximum limit (5d), when it declines and stability increases. 5d space has the best bearing capacity and settlement.

In this study, a model was used in which soft clay is used to study settlement behavior, and heat treatment is done with two heaters for each test. It put several variables in the treatment, which are the time factor, the distance between the heaters, and the change in the source temperature. The study aims to study the effect of heating on the settlement of the model, find out the optimal distance between the heaters and the base, and find out the optimum temperature.

## 2. Methodology of study

The research structure relied on heating the soft clay soil with heaters, as two heaters it

can be used in each test at a specified distance. The distances between the two heaters it (20,30,40) cm, and in each of these distances, 4 tests were used, with a temperature of (200,300,400,500) degrees Celsius for each test, and a heating time of 12 hours. After heating the model the model is loaded with cumulative loads and settlement is measured.

### 2.1. Materials used in the model

Soft soil. The samples used in the investigation were taken from a site in the east of the city of Nasiriyah, which is located within the coordinates (31.05238, 46.20908). The ground was excavated to a level of 1.5 m to obtain this soil. Table 1 shows the types

of soft soils used in this research. The USCS classification indicates that the soil is CL soil. Figure. 1 shows the particle size.

**Figure 1.** Plate (2) Soil improvement using Heaters [11]

**Table 1.** Physical properties of natural soil used

Properties	Value	Specification

Percent of Silt	27	ASTM D 422 -2006
Percent of Sand	6	ASTM D 422 -2006
Unified Soil Classification System	CL	ASTM D 2487 -2006 (USCS)
Optimum Moisture Content (O.M.C) %	19	ASTM D 698 -2007
Maximum Unit Weight (kN/m <sup>3</sup> )	15.5	ASTM D 698 -2007
Shrinkage limit	15	

### 2.2. Heating system

To improve the soil, generate heat within the soil, and conduct sample tests, try to be as close as possible to what is happening in the field. A special heating system was made. This system has a powered panel with temperature control systems and sensors on the edge of the heater that plugs directly into the electrical panel. The heater is an electric heater with a length of 50 cm and a diameter of 1 cm with a maximum power of 925 watts connected to the heating system. As shown

in Figure 2.

### 3. Preparation of soil bed and testing

Several tests of soil physical properties, including soil, liquid limits, plastic limits, and density tests, are performed before the preparation stage to ensure the effectiveness of the preparation procedures. It also performed a series of soils requiring a shear strength (C) of 40 kPa with a moisture

content of 34%. The soil was moistened and mixed with water according to the moisture content. The moist soil was stored in airtight plastic bags for 2 days to ensure even moisture distribution [10]. Then, the soil was compacted in a cubic form, the dimensions of which are 60 cm x 40 cm x 60 cm, in the form of layers, and the thickness of each layer was 10 cm. Thirteen typical tests were then performed. The first model is without the use of heat. The following four models were investigated at different temperatures (200,300,400,500) °C and heaters were used. After that, the distance from the center of the base was changed. used four tests at the same temperatures as above and a distance of 15 cm from the center of the base for each variable. Then a distance of 20 cm from the center of the foundation was used. The mechanical load is an iron foundation with dimensions of 15 cm in length, 5 cm in width, and 2 cm in thickness. Various vertical loads are placed on it. These loads come from the foundation pressure via a pipe connected to it by a jack. The load cell is used to read the results through the Data Logger. Figure 2 shows the first stage of the test and Figure 3 shows the second stage of the test.

**Figure 2.** Dimension box test with installing heating system

**Figure 3.** Preparer clay soil with installing static load and heaters

## 4. Results and discussion

Depending on how one interprets Terzaghi's proposal (1943),[12]. The failure rate threshold is 10% of the baseline width in all model testing. The maximum amount of failure allowed in any of the model tests was 10% of the total width of the structure. Furthermore, load location was verified using standards from the American Society for Testing and Materials (ASTM), namely the 1195 and 1196 editions.[13]. Soil is also characterized by the degree of cohesion, which is measured by park [9]. That's what's on the plate, by the way.

**Figure 4.** The change in the degree of soil cohesion according to the shape of the curve obtained from the plate load test

### 4.1. Heating system

The heaters were placed at a distance of 20 cm from the center of the footing and in the longitudinal direction, that is, the distance

between the two heaters was 40 cm. In this case, the heaters in the models were run for different times for each model (4,8,12) hours, depending on the figure (4). Soil cohesion was rated for all tests. Figures (5), (6), and (7) are curves between stress and settlement for times (4, 8, and 12) hours, respectively.

4 models were tested at different temperatures (200,300,400,500) °C,

From Figure (5) and footing on what Terzaki said about the collapse when flattening 5 mm, the maximum stress of the model without the use of heating was very small and was about 42.5 kN / m<sup>2</sup>, after the application of heat there was a stress tolerance and the maximum stress tolerance is ( 44.5, 58, 68, 61) kN/m<sup>2</sup>. For the tests (200, 300, 400, 500) ° C, respectively, also, based on the curve of the model without temperature, the failure occurred with a maximum stress of 42.5 KN / m<sup>2</sup>, and when compared with the tests models whose temperature was (200, 300, 400, 500) °C. the settlement at this point is (4.2, 2.6, 1.2, 0.9) mm, respectively, and the percentage of improvement it (16%, 48%, 76%, and 82%, respectively).

For Figure (6), which resulted from an increase in the heating time to 8 hours, the maximum stress is (48.5, 56.3, 65.6, 70) kN / m<sup>2</sup>. (200, 300, 400, and 500 degrees Celsius, respectively, also, based on the curve of the model without temperature, the failure occurs with a maximum stress of 42.5 KN / m<sup>2</sup>, and when compared to the models whose temperature was (200, 300, 400, 500) degrees Celsius, the settlement at this point it (4.3, 2.4, 1, 0.9) mm, respectively, and the percentage of improvement in flattening it (14%, 52%, 80%, and .82%, respectively).

For Figure (7). Where is the maximum stress (79, 91, 102, 116) kN/m<sup>2</sup>. For the tests (200, 300, 400, 500) degrees Celsius, respectively.

Also, footing on the curve for the model without temperature, it can be noted that the failure occurred with a maximum stress of 42.5 kN/m<sup>2</sup>, and when compared to models whose temperature was (200, 300, 400, and 500) °C. the decrease at this point was (1.5, 0.6, 0.5, 0.5) mm, respectively, and the percentage of improvement in the settlement was (70%, 88%, 90%, and 90%, respectively). This means that settlement is reduced by increasing the heating time and increasing the temperature of the heaters. Temperatures from the source,

For Figure (8), the settlement values are taken at different temperatures at all times. It is noted that the settlement values decrease with increasing temperatures as well as with increasing heating time.

For Fig. (9), the maximum stress values increase with increasing temperatures and heating time. It is also noted from Figures (5) and (6) that the best value for settlement is 0.5 mm, and this value is when the heating time is 12 hours and the temperature is 500°C and 400°C. It is also noted that the best value for the maximum stress is 116 kN/m<sup>2</sup>, and this also occurs when the temperature is 500 °C with a heating time of 12 hours.

It is also noted from Figures (5), (6), and (7) that all curves contain crumbs, and these crumbs increase with increasing temperatures and heating time. The reason for this is that the models, after heating, lose the amount of water they contain due to the exit of water vapor, as the place of water is replaced by voids, and these voids have not been settled, and the examination is carried out immediately. after heating. Referring to figure (4), the soil did not change its condition and remained somewhat cohesive in all shapes.

Figure 5. The relationship between stress and settlement when the heating time is 4 hours and the distance between the heater and the center of the base is 20 cm

Figure 6. The relationship between stress and settlement when the heating time is 8 hours and the distance between the heater and the center of the base is 20 cm

Figure 7. The relationship between stress and settlement when the heating time is 12 hours and the distance between the heater and the center of the base is 20 cm

**Figure 8.** The relationship between settlement and heating time for temperatures (200,300,400,500) degrees Celsius

**Figure 9.** The relationship between the maximum stress and the heating time for temperatures (200,300,400,500) degrees Celsius

#### 4.2. The Distance between the Heater and the Center of the Footing is 15 cm

The distance between the two heaters is approximately 15 cm from the center of the footing, and the rest of the variables are studied, including the duration of heating at different temperatures. And 12 models were tested, each of these models carries a constant heating time and constant temperature, and the time and temperature are changed for each model. As in the previous case

For Figure (10) and based on what Terzaki said about the failure when flattening 5 mm, the maximum stress of the model without using its heating is very small and was about 42.5 kN / m<sup>2</sup>, after applying heat the maximum stress (53, 49, 60, 71 ) kN/sqm. For the tests (200, 300, 400, 500) °C, respectively, also, footing on the curve of the model without temperature, the failure occurred with a maximum stress of 42.5 kN / m<sup>2</sup>, and when compared with models whose temperature was (200, 300, 400, 500) degrees Celsius. The settlement at this point was (2.7, 3.8, 2.9, 2.4) mm, respectively, and

the percentage of improvement was (46%, 24%, 42%, and 52%, respectively). Noting that the percentage of improvement in settlement increases with increasing temperatures from the source as shown in Figure (10). It is noted that the highest percentage of improvement in settlement is when the model is heated by 500 degrees Celsius and that the differences between the rest of the other temperatures are slight. It is noted that all the curves in Figure (10) classify the soil within the composition of cohesive clay and as classified (Figure 4).

For Figure (11) by increasing the heating time to 8 hours after applying heat, the maximum stress is (66, 89, 95, 111) kN/m<sup>2</sup>. For the tests (200, 300, 400, 500) degrees Celsius. , respectively, also, footing on the curve of the model without temperature, it can be noted that the failure occurred with a maximum stress of 42.5 kN/m<sup>2</sup>, and when compared with the models whose temperature was (200, 300, 400, 500) degrees c. It is noted that the settlement at

this point was (1.4, 1.2, 1.5, 1) mm, respectively, and the percentage of improvement was (72%, 76%, 70%, and 80%, respectively). It is noted that the soil in this case transformed after being heated from a cohesive substance to a less cohesive one.

For Figure (12), and by increasing the heating time to 12 hours after applying heat, the maximum stress is (80, 108, 117, 122) kN / m<sup>2</sup>. For the tests (200, 300, 400, 500) degrees Celsius. , respectively, also, based on the curve of the model without temperature, the failure occurred with a maximum stress of 42.5 kN/m<sup>2</sup>, and when compared to the models whose temperature was (200, 300, 400, 500) °C. The settlement at this point was (0.9, 0.8, 0.75, 0.75) mm, respectively, and the percentage of improvement was (82%, 84%, 85%, and 85%, respectively). As the soil moved from a state of cohesion to a less dense cohesion for all tests

**Figure 10.** The relationship between stress and settlement when the heating time is 4 hours and the distance between the heater and the center of the base is 15 cm

All different times and settlement values and temperatures are taken. It is noted that the settlement value decreases with increasing temperature, as well as a significant increase in the maximum stress value with varying values. Referring to Figure (13), it is noted

that the settlement values decrease with the increase in temperature as well as with the increase in the heating time; Also, concerning Fig. (14), the maximum stress values increase with increasing temperatures and increasing heating time. It is also noted

from Figures (13) and (14) that the minimum value for settlement is 0.75 mm, and this value is when the heating period is 12 hours and the temperature is 500 °C. It is also noted that the best value for the maximum stress is 112 kN/m<sup>2</sup>, and this also occurs when the temperature is 500°C with a heating time of 12 hours. It is also noted from Figures (11), (11), and (12) that all

curves contain crumbs, and these crumbs increase with increasing temperatures and heating time. The reason for this is that the models, after heating, lose the amount of water they contain due to the exit of water vapor, as they replace the place of water with voids, and these voids have not been settled, and the examination is carried out immediately after heating.

**Figure 11.** The relationship between stress and settlement when the heating time is 8 hours and the distance between the heater and the center of the base is 15 cm

**Figure 12.** The relationship between stress and settlement when the heating time is 12 hours and the distance between the heater and the center of the base is 15 cm

Figure 13. The relationship between the settlement and the heating time for temperatures (200,300,400,500) degrees Celsius

Figure 14. The relationship between the maximum stress and the heating time for temperatures (200,300,400,500) degrees Celsius

#### 4.3. The Distance between the Heater and the Center of the Footing is 10 cm

Figure (15) and footing on what Terzaki said about the collapse when flattening 5 mm, the maximum stress of the model without the use of heating was very small and was about 42.5 kN / m<sup>2</sup>, after applying heat there was a stress tolerance and the maximum stress tolerance reached (52, 60, 73, 96) kN/sqm. For the tests (200, 300, 400, 500) °C, respectively, also, based on the curve of the model without temperature, it can be noted that the failure occurred with a maximum

stress of 42.5 kN / m<sup>2</sup>, and when compared with the models whose temperature was (200, 300, 400, 500) °C. it can be noted that the settlement at this point was (2.9, 2.2, 1.5, 0.9) mm, respectively, and the percentage of improvement was (42%, 56%, 70%, and 82%, respectively). Noting that the percentage of improvement in subsidence increases with increasing temperatures from the source as shown in Figure (3.18). It is noted that the highest percentage of improvement in the settlement is when the model is heated by 500 °C and that the differences between the rest of the other

temperatures are slight. It is noted the curves the curve in Figure (4.18) classifies the soil within the composition of less cohesion clay For Figure (16) and by increasing the heating time to 8 hours after applying heat, the maximum pressure was (49.9, 60, 69.9, 119) kN/m<sup>2</sup>. For the tests (200, 300, 400, 500) °C, , respectively, also, based on the curve of the model without temperature, it can be noted that the failure occurred with a maximum stress of 42.5 kN/m<sup>2</sup>, and when compared

with the models whose temperature was (200, 300, 400, 500°C). It is noted that the decrease at this point was (3.7, 2.5, 1.5, 0.9) mm, respectively, and the percentage of improvement was (26%, 50%, 70%, and 82%, respectively). It is noted that when the soil is heated to temperate and res (500, 400,300) °C, it changes after being heated and moves from a cohesive substance to a less dense cohesion. As for a temperature of roof 200 °C, it turns into less cohesion.

**Figure 15.** The relationship between stress and settlement when the heating time is 4 hours and the distance between the heater and the center of the base is 10 cm

**Figure 16.** The relationship between stress and settlement when the heating time is 8 hours and the distance between the heater and the center of the base is 10 cm

For Figure (17) and by increasing the heating time to 12 hours after applying heat, the maximum stress was (72, 149.8, 170, 223) kN/m<sup>2</sup>. For the tests (200, 300, 400, 500) °C, respectively, also, based on the curve of the model without temperature, it can be noted that the failure occurred with a maximum stress of 42.5 kN/m<sup>2</sup>, and when compared with the models whose temperature was (200, 300, 400, 500) °C. It is noted that the

settlement at this point was (1.1, 0.03, 0.02, 0.01) mm, respectively, and the percentage of improvement was (78%, 99.4%, 99.4%, 99.4%, respectively). It was observed that the soil moved from a state of cohesion to a partially cohesive soil for temperatures (500,400,300) °C. While it remained coherent at a temperature of 200 °C.

**Figure 17.** The relationship between stress and settlement when the heating time is 12 hours and the distance between the heater and the center of the base is 10 cm

**Figure 18.** The relationship between the maximum stress and the heating time for temperatures (200,300,400,500) degrees Celsius

At all different times, values and temperatures are taken. It is noted that the settlement value decreases with increasing

temperature, in addition to a significant increase in the maximum stress value with varying values. Referring to Figure (18), it is

noted that the settlement values decrease with increasing temperature as well as with increasing heating concerning respect to Fig. (19), the maximum stress values increase with increasing temperatures and increasing heating time. It is also noted from Figures (18) and (19) that the lowest value of the

settlement is 0.01 mm, and this value is when the heating period is 12 hours and the temperature is 500 °C. It is also noted that the best value for the maximum stress is 223 kN/m<sup>2</sup>, and this also occurs when the temperature is 500°C with a heating time of 12 hours.

**Figure 19.** The relationship between the settlement and the heating time for temperatures (200,300,400,500) degrees Celsius

It is also noted that the best value for the maximum stress is 223 kN/m<sup>2</sup>, and this also occurs when the temperature is 500°C with a heating time of 12 hours. It is also noted from Figures, (15), (16) and (17) that all curves contain crumbs, and these crumbs increase with increasing temperatures and heating time. The reason for this is that the models, after heating, lose the amount of water they contain due to the exit of water vapor, as the place of water is replaced by voids, and these voids have not been settled, and the examination is carried out immediately after heating.

## 5. Results Observed During the Tests

Since the best settlement ratio occurred when the distance between the two heaters

and the footing center was equal to 10 cm and when the temperature was 500 °C, we are now attaching pictures showing the shape of the model upon examination multiple times t is noted that the cracks increase with the increase of the heating time and that the width of the largest crack was 2 cm. By measuring the depth, it was found that the largest depth is 3 cm, as the cracks were in the surface layer only. It is also noted that there is a white layer surrounding the heater, and the diameter of this layer increases with the increase in the heating time, which indicates This region has lost its water content and also indicates that the heat transfer is in a diagonal direction, that is, it surrounds the heater from all sides and evenly.

## 6. CONCLUSION

Preliminary results from examining the results of empirical models are summarized in this paragraph. The following proposal may be considered for subsequent endeavors.

1. The settlement value increases with the increase in the source temperature and increases with the decrease in the distance between the heaters. It increases with the increase in the heating time as well, as the best settlement is when the distance between the heater and the heater is 20 cm, the temperature of the heater is 500 degrees Celsius, and the heating time is 12 hours, where the settlement improvement rate is 99.8%.
2. The value of the maximum stress increases with increasing temperature and decreasing the distance between the heaters, where the best improvement ratio for the maximum stress reaches 425% when the temperature is 500 °C and the distance between the heater and the base center is 10 cm and the heating time is 12 hours
3. Cracks that occur in the soil due to heat are ineffective and are only on the surface

## **MONITORING SIMPLE LINEAR PROFILES IN PRODUCING POLYMER CONCRETES**

***Abstract:** Statistical monitoring of one or more critical parameters of a process is an effective measure to identify and prevent assignable cause(s). Often it is appropriate and even necessary to monitor a function or profile related to various quality characteristics of the underlying process. In recent years, several studies have been presented on successful applications of profile monitoring. In this research, we investigate and analyze the polymer concrete process by means of simple linear profile monitoring. In this context, quality control tests for the production process of polymer concrete are carried out as an industrial case study. The functional relationship between fracture toughness and fracture energy as a response variable and the combination of the constituent factors of polymer concrete as an explanatory variable is monitored through profile approaches and the effectiveness of each method is evaluated. Fracture toughness experiments under mode I have been conducted on symmetric semi-circular bend (SCB) specimen.*

***Keywords:** Simple linear profile, Polymer concrete, Semi-circular bend specimen, Fracture behavior*

### **1. Introduction**

Currently, most of the methods used for quality monitoring are product testing and are not designed to control the design process. Therefore, the quality characteristics of the product can be defined as a relationship or profile and controlled accordingly. If this relationship or profile is under control over time, it can be concluded that the process is under statistical control and thus meets the defined quality specifications. If this relationship is not under control, it indicates the existence of one or more specific causes in the process that should be extracted and considered as potential causes of changes in the process in terms of quality characteristics of the profile through analysis.

The use of profiles in researches such as

Noorossana et al. [1], Woodall et al. [2], and Kang and Albin [3] has been accepted as comprehensive research in the field of profile monitoring. Since monitoring profiles is a relatively new area in statistical process control (SPC), Woodall's review article [4] examines the concepts and definitions related to this knowledge of process control and various methods used in monitoring profiles. In the 2018-2008 period, a conceptual classification based on categorization and evaluation of articles was also carried out in Maleki et al.'s review article [5]. For each category of articles, the approaches, methods, and algorithms used in profile monitoring were examined, and analysis and review of research results were provided. One of the most commonly used types of profiles is the simple linear profile, which is used to investigate the relationship

between two variables with the assumption that they have a linear relationship. Some approaches have been developed for simple linear profiles in phases I and II, including Mahmood et al. [6], Aly et al. [7], Soleimani et al. [8], Saghaei et al. [9], Abbasi Ganji and Sadeghpour Gildeh [10], Khalafi et al. [11], Haq et al. [12], Abbasi et al. [13], Dirbaz et al. [14], and Yeganeh et al. [15].

Multiple scientific studies published in recent years have demonstrated the success of using profiles in various real-world and operational processes. One of the most important and fundamental studies is the investigation and control of aircraft stability in wind tunnels by Parker et al. [16]. Their monitoring method is based on multivariable profiles, which has been examined in various sources, including reference [17]. Mahmoud et al. [18] developed their research to detect shifts and time changes and investigated the change point technique based on Parker et al.'s work. Huwang et al. [19] presented an example of the application of their proposed method in the field of monitoring and detection in the semiconductor production industry. In this industry, the quality of a printed wafer is measured by electron microscopy during the DRIE process in laboratories. Zeng et al. [20] also studied the application of non-normal data in the production process of low-friction glass. Low-friction glasses are effective types of energy-efficient glasses produced by physical or chemical processes in which solid materials such as metal, metal oxide, or metal nitride sit on flat glass. Amiri et al. [21] showed an application of multivariate profiles in examining the quality of automobile engines in the automotive industry. Montgomery [22] showed that in the process of manufacturing car engines, there is a Quadratic polynomial relationship between the engine torque and its speed. To monitor the quality of pharmaceutical products, Dawod et al. [23] used a linear profile within the Bayesian approach

framework with two equally weighted moving average charts,  $HWMA_R$  and  $HWMA_{PT}$ . In their research, the main objective was to investigate the stability of pharmaceutical product quality and control variance. These mentioned cases are some examples of research carried out over the past two decades in the area of profile implementation in industry and its practical applications.

Therefore, considering industrial production and the approach to quality improvement, emphasis on quality control and improvement, as well as increasing efficiency, seems to be of great importance. In the next section, the research method and data validation will be examined. The third section discusses monitoring profiles using three different methods in phase I, and the fourth section examines monitoring profiles in phase II. Finally, the fifth section presents the results and future recommendations.

## 2. Research Methodology

Polymer concretes are actually a new generation of efficient and chemically resistant materials whose weight percentage is related to mineral fillers, aggregates, and polymeric carriers. Polymer concrete has properties such as high resistance to corrosion, lighter weight than traditional concrete, high resistance to impact and fracture, ability to be produced in various shapes, high resistance to fire, and high resistance to temperature changes.

In 2022, Aliha et al. [24] conducted an optimization of epoxy concrete mixtures using the Taguchi method. In this study, a Taguchi experimental design was presented for optimizing the ratio of different materials in the epoxy concrete mixture to achieve maximum energy and fracture toughness. Experiments were conducted on various mixtures of epoxy concrete with different ratios of different materials. The results showed that by optimizing the ratios of

different materials in the epoxy concrete mixture, it is possible to achieve the maximum energy and fracture toughness. In other words, using optimal ratios of different materials produces epoxy concrete surfaces with higher fracture resistance and greater fracture energy.

In this upcoming study, 15 polymer concrete profiles with specific dimensions and equal weight were evaluated for fracture toughness using the optimal ratios presented in the study by Aliha et al. [24]. Each profile is optimized in four optimal combinations. Given the chosen method of simple linear profile monitoring, all breaking load

experiments were conducted under identical conditions. The output of the experiment data under the 4 optimal combinations of epoxy resin (25-28%), fine aggregate (28-31%), and coarse aggregate (41-44%) are presented in Table 1.

The recorded data from the process was investigated in terms of the independence and normality of errors. The output, verified using EViews software, confirms acceptable levels for the following cases. The calculated value for the Durbin-Watson test statistic is 2.17, and the Jarque-Bera test statistic is 0.44, confirming the independence of errors.

### 3. Linear profile monitoring in phase I

#### 3.1. Hotelling's T<sup>2</sup> control chart by Mestek et al. in phase I

Therefore, Mestek et al. [25] used this method for monitoring the stability of Fe<sup>3+</sup> photometric determination with sulfosalicylic acid for the first time in 1994. This method is used when the independent variable X is under control and its value is constant for different samples. The T<sup>2</sup> statistic of Mestek et al. [25] based on the random variable vector Y is as follows:

$$T_j^2 = (Y_j - \bar{Y})^T S^{-1} (Y_j - \bar{Y}), \quad j = 1, 2, \dots, m.$$

The T<sup>2</sup> statistic follows a beta distribution, therefore the upper control limit in this method is calculated as follows:

$$UCL = \frac{(m-1)^2}{m} B_{n/2, (m-n-1)/2, \alpha_1}$$

In such a way that  $B_{n/2, (m-n-1)/2, \alpha_1}$  represents the beta distribution with shape parameters  $n/2$  and  $(m-n-1)/2$ .  $\alpha_1$  is the false-alarm probability which is obtained based on the overall false-alarm probability. Therefore, T<sup>2</sup> statistic for the data in Table 1 is shown in Table 2 and the control chart is obtained as Figure 1.

According to Figure 1, it is evident that all values are within control limits. Therefore, the estimated model can be used for monitoring in phase II.

**Table 2.** The values of the  $T^2$  statistic of Mestek et al. [25]

### 3.2. Hotelling's $T^2$ control chart by Stover and Brill in phase I

The monitoring of profiles in the Hotelling's  $T^2$  Stover and Brill [26] control chart is based on using estimated values for the intercept and slope of the profile. This means that, by placing the Hotelling's  $T^2$  statistic as a reference, a vector of intercept and slope parameters is used to form the final statistic. In other words, instead of using a response vector as in Mestek et al.'s method [25], a

vector containing the intercept and slope values is used. The  $T^2$  statistic in the Stover and Brill [26] method and the upper control limit are given by equations 3 and 4.

$$T_j^2 = (z_j - \bar{z})^T S^{-1} (z_j - \bar{z}), \quad j = 1, 2, \dots, m.$$

$$UCL = \frac{(m-1)^2}{m} B_{1, (m-3)/2, \alpha_1}$$

In a way that  $B_{1, (m-3)/2, \alpha_1}$  represents the percentile of the beta distribution with shape parameters 1 and  $(m-3)/2$ . In this case, after

calculating the distance from the intercept and slope for each of the sample profiles and presenting it in Table 3, the  $T^2$  statistic was calculated using Stover and Brill's method

[26], which is shown in Table 4 and Figure 2. In this case, similar to the control chart by Mestek et al. [25], all profile values are within control limits.

**Figure 2.** Performance of the T<sup>2</sup> statistic of Stover and Brill [26]

Kang and Albin [3] also introduced a statistic based on the Hotelling's T<sup>2</sup> statistic for monitoring profiles in phase I. The T<sup>2</sup> control chart of Kang and Albin [3], similar to the T<sup>2</sup> control chart of Stover and Brill [26], is based on sequential vectors obtained from least squares estimates, for the intercept and slope of the variable response function Y. The methods of Kang and Albin [3] and Stover and Brill [26] are similar to each other, but the difference in their calculation of the variance-covariance matrix leads to a difference in the marginal distribution of their statistics. Therefore, the Kang and Albin [3] chart will be briefly discussed in the next section, and the T<sup>2</sup> method based on sequential differences will be examined.

### 3.3. Hotelling's T<sup>2</sup> control chart based on the successive differences estimator in phase I

One of the methods used to estimate the variance-covariance matrix in calculating the T<sup>2</sup> statistic is using successive differences. This method was introduced by Williams et al. [27] in 2006, which resulted in a new statistic called the successive T<sup>2</sup> control chart due to the difference in estimating the variance-covariance matrix. The T<sup>2</sup> statistic is calculated in this method as follows:

$$T_j^2 = (Y_j - \bar{Y})^T S_D^{-1} (Y_j - \bar{Y}), \quad j = 1, 2, \dots, m.$$

If in phase I, the observations consist of a sequence of independent random variables

with the identical distribution, then S<sub>D</sub> is an unbiased estimator for Σ, obtained as follows:

$$S_D = \frac{V^T V}{2(m-1)}$$

Since in this method, V<sub>j=z<sub>j+1</sub>-z<sub>j</sub></sub> is obtained for each sample, there is no independence between samples. Therefore, precise control limits cannot be used based on the beta distribution [27]. To calculate the upper limit of the control chart, the following formulas have been proposed by Noorossana et al. [1] for the overall false alarm probability of 0.01, 0.05, and 0.1, respectively. These formulas were derived using 7-9 equations after performing the simulation process for different sample sizes and overall false alarms.

$$UCL_{\alpha=0.01} = 7.38 + 2.33 \log_e m$$

$$UCL_{\alpha=0.05} = 5.51 + 2.01 \log_e m$$

$$UCL_{\alpha=0.1} = 4.39 + 1.93 \log_e m$$

Using the calculated values of intercept and slope in Table 3, the matrix of successive differences can be formed as follows:

$$V_j = \begin{pmatrix} -6.23 & 16.78 \\ 1.85 & -4.79 \\ -4.38 & 11.85 \\ 5.70 & -14.97 \\ -1.45 & 3.68 \\ 1.34 & -4.90 \\ -1.87 & 6.42 \\ 1.77 & -5.46 \\ -3.52 & 9.75 \\ -2.64 & 7.59 \\ 2.45 & -7.47 \\ -1.32 & 4.20 \\ 7.74 & -21.10 \\ 1.04 & -3.15 \\ -5.15 & 14.23 \end{pmatrix}$$

The values of the calculated statistical parameters, along with control chart, are listed in Table 5 and Figure 3 in order.

### 4. Monitoring simple linear profile in phase II

The process of monitoring and control is practically carried out in the first and second phases. Generally, the main objective in the phase I is to identify out-of-control data among the in-control process data, estimate the process parameters based on the in-control data, and create phase I control limits accordingly. In the phase II, the main goal is to quickly identify changes in the parameters from in-control state [1]. In this study, after performing statistical control of the polymer concrete manufacturing process in phase I, the focus is on monitoring and statistical analysis under controlled conditions in phase II. Following the estimation of regression parameters and statistical control of the process in phase I, other methods are used for process control in phase II in order to provide alerts for any changes with a reason

in the process that cause it to go out-of-control as soon as possible. The use of the  $T^2$  control chart for phase II control of simple linear profiles was first introduced by Kang and Albin [3]. When a process is under statistical control, the  $T^2$  statistic follows a chi-square distribution with two degrees of freedom in equation 10.

$$T_j^2 = (z_j - \mu)^T \Sigma^{-1} (z_j - \mu), \quad j = 1, 2, \dots, m.$$
 The upper control limit is obtained according to the equation 11.

$$UCL = \chi_{2, \alpha}^2$$

In phase I, necessary investigations were conducted to ensure the process control of polymer concrete manufacturing based on the data shown in Table 1. Hence, the process control can be ensured for phase II by using the  $T^2$  chart for analysis. The results of the calculations are presented in Table 6 and Figure 4.

**Table 6.** The values of the  $T^2$  control chart in phase II

Profile	$z$		$(z_j - \mu)$		$T^2$
	$a_j$	$b_j$	Part 1	Part 2	
1	9.33	-12.49	4.65	-12.65	3.57
2	3.10	4.29	-1.58	4.13	0.67
3	4.95	-0.50	0.27	-0.66	0.06
4	0.58	11.35	-4.10	11.19	2.69
5	6.28	-3.62	1.60	-3.78	2.63

11	-0.08	13.45	-4.76	13.29	3.56
12	2.37	5.98	-2.31	5.82	2.48
13	1.05	10.18	-3.63	10.02	2.02
14	8.79	-10.92	4.11	-11.08	3.07
15	9.83	-14.07	5.15	-14.23	4.09

**Figure 4.** Title Performance of the  $T^2$  control chart in phase II

The Figure 4 shows profiles that are under control. In all examined cases in this section, the profiles were in-control. It is advisable to use a Shewhart control chart to monitor the variance of the process when using  $T^2$  control charts for phase I monitoring. Therefore, it can be ensured with confidence that the estimated predictors are accurate for controlling the regression parameters.

## 5. Conclusion

If it is determined in a specific process that there is a functional relationship between technical characteristics, then controlling this category of processes using traditional statistical process control methods does not have the necessary effectiveness. Therefore, monitoring profiles and selecting a suitable model can be a very important and fundamental approach in increasing the accuracy of process monitoring. For each model, monitoring methods should be designed that effectively identify the presence of changes and are also suitable for interpreting out-of-control alarms.

In this article, statistical process control of the production process of polymer concrete components was addressed using simple linear profile monitoring methods. One of the most important quality characteristics in the process, namely the functional relationship between the amount of load at which the produced component breaks as the response variable and the optimal changes in

the combination of polymer concrete ingredients as the explanatory variable, was controlled using a simple linear regression model. The aim of this article was to investigate all stages of phase one and two of profile monitoring. First, the normality and independence of errors were examined, and after ensuring confidence in them, linear profile monitoring in phase one was carried out using several well-known methods including  $T^2$  Mestek et al. [25], Stover and Brill [26], and  $T^2$  chart based on successive differences. After ensuring stability and estimating the process parameters, the monitored chart conditions were examined.

The outputs of the results indicate that the performance of these methods differs slightly, although the results of the charts confirm their accuracy and validity. The evidence shows that the Stover and Brill [26] method is more sensitive for this issue, while the Mestek et al. [25] method and successive differences have less sensitivity in their outputs. Additionally, the control chart in phase II showed that it could indicate changes in the process to an acceptable degree. It is recommended that for future research, other simple linear profile monitoring methods in phases I and II, such as the F-test method in phase I and control chart methods like MCUSUM, MEWMA, and others for simultaneous monitoring of simple linear profile parameters in phase II can be used and the resulting data analyzed. Furthermore, by adding other explanatory and response variables to this issue or similar

cases, multiple linear profiles or multivariate linear profiles can be monitored and analyzed.

## **MODEL BASED SIX SIGMA CONCEPT AND PROCESS CAPABILITY INDICES: THE RESEARCH STUDY OF OIL INDUSTRIAL CASE IN YEMEN**

***Abstract:** Process capability indices are utilized extensively in the quality control inspection process, both at the level of production and for general business operations. They take into consideration both the location and the deviation from the specified limits and targets. Several literatures have contained contributions on this issue. Existing PCIs based on Six Sigma, on the other hand, merely displayed a range of quality levels rather than a single quality level value. Thus, previous studies have found the insufficient and ineffective deployment of Six Sigma to process control and yield process. Motivated by industrial Aden oil refinery process performance case study, we discuss the density characteristic of oil to estimate the process yield, and the capacity of the process. In addition, an effort to identify the level of quality in which the refinery operates. By investigating two different methods for estimating process yield, the sigma level, which are by extends the indices to estimate capacity, level of sigma, and yield process. The analyses and findings indicated that the indices outperformed the existing indices. Ultimately, Six Sigma-based process yield index represents a potential approach that other industries and practitioners can utilize to assess process performance and quality control.*

***Keywords:** Quality level and process capability; industrial process performance; performance precision; quality control; density characteristic, tolerance limit*

### **1. Introduction**

In today's competitive enterprises are expected to provide high-quality and cost-effective products that continuously fulfill the engineering design specifications and consumer desires (Felipe et al, 2017; Krolczyk et al., 2015). So, companies must focus on quality and process capabilities to gain a competitive edge in a world of informed customers (Leiva, et.al, 2014; Lupo, 2015; Krolczyk et al., 2015). Manufacturers have always tried to identify

variation sources to reduce it (Goodwin, 2015). Process capability means a process can consistently fulfill customer expectations and design criteria (Felipe et al, 2017). It is a scientific and methodical method that employs control charts and capacity indicators to identify and eliminate artificial causes of variation until statistical control is achieved. where the variation hinders process capability and output, according to Kotz et al, (1998); Shahriari et al, (2009) "Since process variation can never be entirely eliminated, the management of such

variation is the key to product quality, “Process capability indices PCIs are sophisticated statistical tools used by industry to evaluate manufacturing process performance and analyze variability compared to specification limitations (Chakraborty & Chatterjee, 2016).. They utilize the mean and variation of a product attribute to assess manufacturing tolerance. PCIs are easy and useful tools for engineers to communicate and provide numerical measurements of whether a manufacturing process can produce consistent products within set specification boundaries (Pan, et al 2016; Srinivasan, et al, 2016; Pearn, et al 2014; Pham, 2015).

(PCIs are intended for industry to quantify how successfully a production process can reproduce items within factory specification limits (Pearn, et al, 2011). PCIs are sophisticated statistical tools used by industry to evaluate manufacturing process performance and analyze variability compared to specification limitations (Chakraborty & Chatterjee, 2016). They are utilizing the mean and variation of a product attribute to assess manufacturing tolerance. They are utilizing the mean and variation of a product attribute to assess manufacturing tolerance. PCIs are convenient and effective tools for engineers to communicate and provide numerical measures of whether a manufacturing process can produce consistent products within predetermined specification limits (Pan,et al 2016; Srinivasan, et al, 2016; Allam, et al, 2014; Parchami, et al, 2014; Pearn, et al 2014). PCIs are intended for industry to quantify how successfully a production process can reproduce things within factory specifications (Pearn, et al, 2011).

Several PCIs, including as together with other essential statistical tools for quality assurance, are utilized in order to evaluate the performance of the production process for cases containing a single quality characteristic feature (Chakraborty et. al 2016; Coetzer et al, 2016; Dianda, et al 2017; Felipe, et al 2017; Lupo, 2015; Pearn, et al 2011). PCIs are a type of statistical measurement that is used in industrial enterprises to assess the performance of processes for scenarios that include a particular product attribute (Goodwin, 2015).

Quantitative quality control relies heavily on the assessment of the process capability, and process capability indices (PCIs) are statistical measurements of the process capability (Chakraborty et. al 2016; Coetzer et al, 2016; Dianda, et al 2017; Felipe, et al 2017; Lupo, 2015; Pearn, et al 2011). In the most recent decades, a great number of PCIs have been presented, and they have found widespread use in a variety of sectors. Many studies have used process capacity indices to determine process quality levels in line with the Six Sigma concept. Existing PCIs based on Six Sigma, on the other hand, merely displayed a range of quality levels rather than a single quality level value. As a result, past studies have found insufficient and ineffective deployment of Six Sigma to process control and yield process.

## 2. Process Actual Yield Indices Based on Six Sigma - $6\sigma$

According to Kane who presented the  $C_{pk}$  process capability index, which is defined as following

$$C_{pk} = Cp \left( 1 - \frac{|T - \mu|}{U - L/2} \right) = \frac{U - L}{6\sigma} \left( 1 - \frac{|T - \mu|}{U - L/2} \right) \quad (1)$$

where,  $L$  and  $U$  are the tolerance limits  $\sigma$  is standard deviation  $\mu$  is the mean  $T = (U + L)/2$  is the target  $|\mu - T| = \delta\sigma (0 < \delta \leq 1.5)$  variation coefficient and that the  $\delta$  is equal to a constant value which is 1.5, Hence, based on Six Sigma concept, assuming the attendance of the idea of six Sigma, this means that the symbols are interpreted as follows  $T = (U + L)/2, U - L = 2L\sigma, |\mu - T| = \delta\sigma (0 < \delta \leq 1.5), \sigma = \frac{(U - L)/2}{6}$ , thus  $C_{pk}$  can be extended to  $SSC_{pk}$ , and the  $SSC_{pk}$  index can be computed as follows:

$$SSC_{pk} = \frac{2L\sigma}{6\sigma} \left(1 - \frac{2\delta\sigma}{2L\sigma}\right) = \frac{L - \delta}{3}$$

After that, many analyses of the yield process. According to Boyles, (1994); Chen et al., (2003); Perakis & Xekalaki, (2003); Vännman & Albing, (2007); Wang (2013) the  $C_p, C_{pk}$  have the relationship with rate :  $\%Y \geq 2\phi(3C_i) - 1$  Where  $C \in (C_p, C_{pk})$  Furthermore  $C_p, C_{pk}$  the Possess, have a rate relationship that is one-to-one, which represents the true values that are generated by the process.  $Y \geq 2\Phi(3C_i) - 1$  Where  $C_s \in (C_p, C_{pk})$  Process yield  $Y$  is the most prevalent quality standard in manufacturing. The index determines yield. This allows these indices to accurately reflect yield characteristics and serve as an external product quality reference and quality control employees. Chen et al., (2016) Process yield  $Y$  equals the proportion of product units that meet standards as the equation (3)

$$Y = \int_{LSL}^{USL} 1 dF(x)$$

Where a cumulative distribution function  $F(x)$ . Process yield states that each product within control boundaries is certified and has the same quality criteria. Loss happens when a product doesn't fulfill quality criteria.

Equations (2) and (3) demonstrate the link between process yield and Cpk index for different, where process yield is substituted by PPM non-conformities. Process yield cannot be predicted using Cpk. 1986 saw Motorola's Six Sigma Strategy. The term "six sigma process" stems from the idea that the upper and lower specification limits are two times six standard deviations apart,  $(USL - LSL) = 12\sigma$ .

In 1986, Motorola launched a quality improvement effort under the direction of engineer Bill Smith [14–16] to address product quality issues. Smith advocated that products be built more precisely to specification and set the following goal: To achieve higher accuracy, the tolerance interval limits ( $L$  and  $U$ ) should be  $\pm 6\sigma$  new from the centered procedure mean. The former accuracy (equivalent to a minimal capacity  $C_{pk} = 1.33$  assuming tolerance limitations were only  $\pm 4\sigma$  old off the process average. The statistical quality control 3 sigma rule states that no problems occur outside the interval  $\pm 3\sigma$  of the average. The ratio of the domain outside the tolerance range without defects (beyond  $\pm 3\sigma$  compared with mean) then the tolerance interval will increase 25% (result from the ratio  $\sigma_{old} / 4\sigma_{old}$  to 50% (result from  $\pm 3\sigma_{mww} / 6\sigma_{mww}$  (Boroiu et al., 2023). Hence, the safety zone is doubled.

Figure 1 shows key components of process precision: The picture shows two value distributions—the initial one (precision  $4\sigma_{old}$ ) and the new one (precision  $6\sigma_{NEW}$ ) because quality is improved by increasing process precision, not tolerance interval.

**Figure 1.** Process precision improvement:  $6\sigma$  versus  $4\sigma$

Even Michael Harry, who implemented Bill Smith's proposal and is connected with the newly concept and other authors who portray the notion's beginnings (Raval & Muralidharan, 2016) don't emphasize this. Montgomery (2009) agrees that improving accuracy improves quality. "Variability: The root of defects," Bass (2007) says. Nevertheless, This is the optimum situation, which may be true immediately after modifying the process,

short-term performance, where the fraction of non-conformities is  $2 \cdot F(6) = 2, 0.0001 = 0.0002$  PPM, where  $F(x)$  integral Laplace function. (Boroju et al., 2023). But, with time, the process will wander from its original location. Based on this hypothesis, Bill Smith advocated using the  $1.5 \sigma$  process drift depicted in Figure 2. This process drift value was chosen without much scientific justification, supposing that a specific cause caused it.

**Figure 2.** 1.5 Shift process distribution

In this case, the level sigma process is six if specification limits interval is twice  $U - L = 2L\sigma$  and  $T - \mu = \delta = 1.5$ , then the  $C_{pk} = 1.5$ . also according to Six Sigma,  $C_{pk} = 2$  if sigma=6 and  $T - \mu = \delta = 0$ . This analysis assumes that  $\delta = 1.5$  has a stable value of 1.5 (constant value) and the level sigma = 6. Additionally, process centering  $\mu$  can estimate:  $T + 1.5\sigma \geq \hat{\mu} \geq T - 1.5\sigma$  thus, the level of the Sigma can be calculated according to the following equation

$$L_c = \hat{L}\sigma = \min\left[\frac{1-\delta}{\lambda} + 1.5, \frac{1+\delta}{\lambda} + 1.5\right]$$

Where,

$$\hat{\lambda} = \frac{((U-L)/2)/6}{(U-L)/2} = \frac{\sigma}{d}, \hat{\delta} = \frac{|\mu-T|}{d} = \frac{1.5\sigma}{d}$$

According to Equations (3) and (4) Assuming Motorola and Six Sigma, process yield can be calculated:

$$SSY = \int_{L^*}^{U^*} N(\hat{\mu}, \hat{\sigma}) dx = \Phi(1.5 + L_c) - \Phi(1.5 - L_c)$$

Where

$$U^* = U + 1.5\sigma = \hat{\mu} + 4.5 \hat{\sigma}_{ss} / \sqrt{n},$$

$$L^* = (L - 1.5\sigma) = (\hat{\mu} - 4.5 \hat{\sigma}_s) / \sqrt{n},$$

$\Phi(\cdot)$  is the cumulative distribution of the standard normal random variable,

$$T - 1.5\sigma \leq \hat{\mu} \leq T + 1.5\sigma. \quad \hat{\sigma}_{Si} = \frac{Si}{C_4(V)}$$

and  $\hat{\sigma} = \frac{(U-L)/2}{6}$  also There are different ways to estimate standard deviation  $\hat{\sigma}$  but the best way can be defined as a mathematical expression:  $\hat{\sigma}_{Si}$  is used for

S.D estimation. Here  $V = \sum_{i=1}^q n - q + 1$ , and

$$Si = \sqrt{\frac{1}{n-1} (X_{ij} - \bar{x}_i)^2}$$
 are unbiased.

According to equations 2 and 3, the yield process is:

$$2\Phi(3SS\hat{C}_{pk}) - 1 \leq SS\hat{Y} \leq \Phi(3SS\hat{C}_{pk})$$

When  $SS\hat{C}_{pk}$ ,  $L\sigma$  and  $SSY$  are have one to one relationship. In light of value  $SS\hat{C}_{pk}$  index, there is a guideline to interpreting the results of this index and the yield process. For example, if  $SS\hat{C}_{pk} = 0.5$  the process is capable and guarantees that the level sigma equals there sigma and when  $SS\hat{C}_{pk} = 1.5$ , the process is super and guarantees that the yield process will be not less than 0.999996602268 equivalently not more than 3.5 defect per million opportunities DPMO.. Six Sigma estimates process yield in two ways:

$$\left. \begin{aligned} \text{way (A) } SS\hat{Y} &= \Phi(1.5 + L\hat{\sigma}) - \Phi(1.5 - L\hat{\sigma}), \\ \text{way (B) } SS\hat{Y} &= 2\Phi(3SS\hat{C}_{pk}) - 1 \leq SS\hat{Y} \leq \Phi(3SS\hat{C}_{pk}). \end{aligned} \right\}$$

Boyles (1994) proposed the yield index  $S_{pk}$ . The index  $S_{pk}$  establishes a relationship between process performance and tolerance limits to accurately evaluate yield process, and it is defined as follows:

$$S_{pk} = \frac{1}{3} \Phi^{-1} \left[ \frac{1}{2} \Phi\left(\frac{U-\mu}{\sigma}\right) + \frac{1}{2} \Phi\left(\frac{\mu-L}{\sigma}\right) \right]$$

where  $\Phi(\cdot)$  is the cumulative distribution. The relationship between yield (Y) and index  $S_{pk}$  is:

$$Y = 2\Phi(3S_{pk}) - 1$$

By use Equations (7), (8), and (9) can be expanded  $S_{pk}$  to  $SSS_{pk}$  as follows:

$$SSS_{pk} = \frac{1}{3} \Phi^{-1} \left[ \frac{1}{2} (\Phi(3SS\hat{Y})) + 1 \right]$$

The  $SSS_{pk}$  is a useful tool for estimating the yield process at the 6 sigma level. It has a one-to-one correspondence with the yield process, in a similar way to the index  $S_{pk}$ , the following relationship describes how the two are related:

$$SS\hat{Y} = 2\Phi(3SSS_{pk}) - 1$$

In this study's the index  $SSS_{pk}$  is connected to process yield by six sigma since Equations (7), (10) and (11) may be rearranged as follows:

$$\begin{aligned} \text{way (A) } SSS_{pk} &= \frac{1}{3} \Phi^{-1} \left( \frac{1}{2} [\Phi(1.5 + L\hat{\sigma}) - \Phi(1.5 - L\hat{\sigma})] + 1 \right) \\ &= \frac{1}{3} \Phi^{-1} \left( (\Phi(SS\hat{Y}) + 1) / 2 \right) \end{aligned}$$

$$\begin{aligned} \text{way (B) } SSS_{pk} &= 2\Phi(3SS\hat{C}_{pk}) - 1 \leq SS\hat{Y} \leq \Phi(3SS\hat{C}_{pk}) \\ &= \frac{1}{3} \Phi^{-1} \left( (\Phi(SS\hat{Y}) + 1) / 2 \right) \end{aligned}$$

$SS\hat{C}_{pk}$  index or  $L\sigma$  and  $SSY$  have one to one relationship when  $T - \mu = \delta = 1.5$ . Follow this idea the yield process This way generates a yield by

$$SSY = \frac{1}{3} \Phi^{-1} \left[ \frac{1}{2} \Phi(3SS\hat{C}_{pk}) + 1 \right] \quad \text{where}$$

$$SS\hat{C}_{pk} = \frac{(L\sigma - 1.5)}{3} = \left( \frac{L\sigma}{3} - 0.5 \right). \text{ Here for a}$$

process achieving the level of quality or  $\hat{L}\sigma$  level of Sigma can be calculated as shown in equation 4 or  $\hat{L}\sigma = \Phi^{-1}(SSY)$

### 3. The Methodology of this Study

This study uses Process Capability Indices (PCIs) and Six Sigma (SS) to improve

industrial process performance evaluation. This research technique focused on finding current performance and then extensive examination of performance evaluation indices to develop performance. Measuring current process performance is vital to discover the process's capabilities and reasons of faults and variability. The industry should use data gathering, data characterization, statistical tests, and generic estimators to measure and improve process performance using Six Sigma. Figure 3 (Appendix) shows this study's methodological flowchart.

### 4. Measurement and Evaluation of Six Sigma Process Performance in Aden Refinery

The first thing that has to be done in order to ascertain the state of the process performance in any industry is to measure the present performance. There are a lot of different indicators that may be used to figure out how well the process is doing right now. The majority of these indicators are evaluated using a wide number of estimating techniques, each of which results in a unique set of findings. As a result, it is very necessary to make use of the right estimating methodologies and measuring instruments while evaluating the performance of the process. This is basically the primary focus of a great number of research, and the purpose of this study is to produce accurate indicators for monitoring and assessing the performance of processes in industrial settings. As a result, the purpose of this study is to provide a case study that measures and evaluates the process performance of an oil refinery in Yemen.

#### 4.1. Data Acquisition and Collection

Controlling petrol properties requires similar density. Its physical liquid feature makes density important. Oil density should be

between 0.70 and 0.73. Thus, density affects fuel quality. Density determines the kind, volume, and transport or distillation of fuel. Thus, if the density is over 0.73, the oil is kerosene, but below 0.70, it becomes vapors and gases. (Ali & Ahmed, 2017; Aden Refinery 2016). This method obtains density relative data: First, a hydrometer is used to randomly sample oil from the tank's upper, middle, and lower regions. Since tank density varies, the sample is mixed. After mixing, the material is examined for density in the lab. 50 product samples, each with four items, were taken at even intervals (every 8 h) after the random data was gathered to 200 size samples. Important statistical tests were done to validate the data for further study. It includes normality, stationary, autocorrelation, heteroscedasticity (autoregressive model), and process capacity tests. The gasoline characteristic tests for density, normalcy, and stationary showed no unit root. Also, the density characteristic data does not have autoregressive and the results indicate that the process is capable at density characteristic, so the results for density characteristic concluded that normality, stationary, not autoregressive, and capable that means the tested on density characteristic are statistically reliable for further analysis we implement the process actual yield indexes based on six sigma concept and the results are discussed in the next section

## 4.2. Results and Discussions

According to the calculated and the guide to interpret the output of the process yield

index and level process of sigma are explained in Table (1). Here, it should be noted that, the existing PCIs had not considered the probability of a  $1.5\sigma$  process mean change when assessing product or service quality. Many studies have used process capacity indices to determine process quality levels in line with the Six Sigma concept. Existing PCIs based on Six Sigma, on the other hand, merely displayed a range of quality levels rather than a single quality level value. As a result, past studies have found insufficient and ineffective deployment of Six Sigma to process control and yield process. This necessitates investigating indexes in this study based on Six Sigma idea to evaluate product quality characteristic for our results on an index evaluate and measure the process based on the idea of six sigmas as evidenced in the paragraphs under section 2 of the process actual yield indications based on six sigmas –  $6\sigma$ . The result of the process yield index SSSPK for the A and B cases of estimation, for density characteristic is the same results where and also for percentage of yield was achieved for density characteristic for A and B cases of estimation is the same results where and . So, there is a one-to-one correspondence between the process yield index, level sigma and yield process In both cases the A and B the judge to interpret the outcomes of a process when as following: if the is 1.5, then the sigma level is 6 and the yield percent is high at 0.999996681. According to the calculated cases, A and B provide a guide to interpret the outcomes of the process yield index, and Sigma levels are explained in Table 1.

**Table 1.** Grading description for cases A and B with sigma levels

yield index value	Grading	levels Sigma
$SSS_{pk} < 0.5$	Inadequate	$LS < 2.5$
$0.5 \leq SSS_{pk} < 0.833$	Capable	$3 \leq LS < 4$
$0.833 \leq SSS_{pk} < 1.17$	Satisfactory	$4 \leq LS < 5$
$1.17 \leq SSS_{pk} < 1.5$	Excellent	$5 \leq LS < 6$
$SSS_{pk} \geq 1.5$	Super	$LS \geq 6$

Aside from this, it has been clear during the course of the previous discussion and analysis that there is a correlation of one to

one between the  $SSY_i$  yield and the  $SSS_{pk}$  yield index in both of the processes that are used to calculate yield.

**Table 2.** The comparison between process performance indices

Oil Quality Characteristic	Traditional indices		indices beads Sigma		
	$C_{pk}$	$S_{pk}$	$SSC_{pk}$	$L\sigma$	$SSS_{pk}$
Density	0.785	0.904	0.874	4.12	0.951

Based on Table 2 it can be seen that the indices  $SSC_{pk}$ ,  $SSS_{pk}$  and  $L\sigma$  reflect the results of the capacity, yield and sigma level of the process according to the idea of Six Sigma. Also based on Table 2, it can be seen that the proposed  $SSC_{pk}$ ,  $SSS_{pk}$  indices, produced better results when compared to the traditional indices using the two different cases of estimation for the characteristic oil density, where the guideline for traditional indices  $C_{pk}$ ,  $S_{pk}$  annotated in Table 1. Meanwhile the indices  $SSC_{pk}$ ,  $SSS_{pk}$  provide a guide to interpret the output of the process: capacity indices, yield and level of sigma process are explained in the Table 2.

## 5. Conclusion

Six-sigma, a quality improvement technique, uses indices to measure sigma for a quality feature. The indicators help quality control and engineering staff identify sigma process levels. This study provided a statistical method using PCIs and SS to measure and improve industrial process performance evaluation. This industrial case study evaluates Aden's oil refinery process performance. To do this, density data from

200 random samples was gathered to measure process quality. Data normality, stationary, and non-autoregressive were found via density characteristic statistical tests. Table 3 shows that Six Sigma indicators outperformed conventional indicators. Process yield  $SSY$  matches performance index.  $SSC_{pk}$ ,  $SSS_{pk}$ , and  $L\sigma$  hence, when consumers require high process quality for a certain quality attribute, boost product process yield. Yield increases with performance index value and decreases with performance index value. These indices can accurately depict yield characteristics to provide a baseline for quality control or manufacturers and a product quality reference for outside parties. This study developed a viable way to analyze process yield that engineers in manufacturing or quality control may use to evaluate yield processes and quality.

## TAILORABILITY OF FABRICS – A REVIEW

**Abstract:** *Tailorability is the ability of fabrics to be shaped, cut, and sewn to fit a particular body shape or garment style. In recent years, there has been a growing interest in developing fabrics that are highly tailorable to meet the diverse needs of consumers. This paper provides an overview of the current research on the tailorability of fabrics. The review focuses on the methods used to measure the tailorability of fabrics, factors affecting tailorability, and predicting tailorability. The paper concludes with a discussion of the challenges and opportunities for further research in this area.*

**Keywords:** *Tailorability, fabric, garment style, body shape*

### 1. Introduction

The main purpose of the clothing is to protect human beings or individuals from atmospheric conditions. Fabric properties are the result of fibre and yarn characteristics and the fabric geometry, which include fabric structure, number of yarns per inch and tension on yarn components. Fibres, yarns, fabrics, dyes, pre-treatments and finishes all are directed to the end use of a product. They are to be worn, used upon, and walked on. They protect the man as well as enhance his appearance and his environment [1].

Presently the end fabric can be manufactured by different fabric formation technologies from the fibres. One of the most common ways of fabric formation is weaving by interlacing the warp and weft yarns. The tailorability properties of the fabrics are mostly related to the conversion of the fabric into the garment with ease means without more problems with the conversion of flat fabric material into the 3D garment [2].

### 2. Background

Tailoring is the process of converting the 2-dimensional flat sheet type fabric into its intended end product which is usually a garment i.e., three-dimensional in shape when in use [3]. Tailorability is the term used synonymously to 'making - up' properties [4]. Throughout history, it could be found that the human being is the creature who invested much time, thought and energy in dressing and adorning the human body. Tailoring is the process which by means of sewing and clothing may be made more or less to fit the human frame. The very idea of tailoring is "fit", and "well-tailored" means more fit rather than less [6]. Quality is the important aspect of a tailored garment which is moulded to fit the body and can be achieved by formation of seams of supportive fabrics. These are shaped and formed by various construction techniques into the lines of the garment as they fit the body. A well-tailored garment maintains the dimensional stability of the garment on and off the body throughout the life garment. As a thumb rule to test the fabric quality and tailoring quality the fabric is gathered in

---

Corresponding author: Pravin H. Ukey  
Email: [ukeypravin@gmail.com](mailto:ukeypravin@gmail.com)

hand and crushed, and good quality fabrics springs back into shape quickly and smoothly. A good quality tailored garment must be made of such fabric [7].

The garment is formed by various processes like design and construction of patterns for the components of the design. The fit of the garment to the contour of the body is considered while patterning, so that the proper fit patterns can be produced. The fit of the garment related to the shape and size of the garment will be strongly influenced by the physical and mechanical properties of the fabric. This means that certain fabric properties such as the tendency of the fabric to stretch, shrink, distort and drape due to stresses induced during use under static and dynamic situations are to be taken into account while drafting patterns for a garment [2]. In the cutting and spreading process, the layers of the fabrics are superimposed on a cutting table, this permits layers to be cut simultaneously into the components for further processing. Any stretch in fabric layers produced by in-place or lateral stresses on superimposed fabric layers will affect the stress-free dimensions of garment patterns [7]. Apart from the colour and pattern the performance of the apparel fabrics is generally not specified in objective terms, though satisfactory wear performance requires certain minimum values of mechanical strength, e.g., tensile, burst and tear strength and resistance to abrasion [8]. In practice, the satisfactory performance of apparel fabrics depends on subjective characteristics such as comfort, appearance and drape. Researchers have tried to correlate the fundamental fabric properties to the subjectively assessed performance characteristics of fabrics. There are some reports on the relationship between the subjective and objective evaluation of fabrics [9].

### 3. Sewability of the fabrics

Sewability is characteristic of the fabric which allows it to be seamed at the full limit of performance during a high-speed sewing machine without weakening or degrading the fabric [10]. Seam formation is the process of joining two or more pieces of fabric material with different stitches. Seam quality is measured by the stitching quality parameters such as size, slippage and strength. It is measured in terms of a Seam Efficiency Index (SEI) [11] and the garment quality is depending on the quality of the fabric as well as the seams [12]. The SEI could be used to optimise the sewing conditions, for various factors and needles of different types, such as type of seam, type and number of stitches per unit of length, and selection of sewing thread. The durability of a seam depends largely on its strength and its relationship with the elasticity of the material. Besides, a seam must be durable so that it will not abrade or wear easily during everyday use, including laundering [13]. It has been observed that the loss in breaking strength is up to 30 - 40% owing to friction and wear during the thread movement through the needle eye.

### 4. Sewability of Threads

Thread is the important factor while forming the seams as it holds two or more components of the fabric material, so it should work satisfactorily during the sewing process. The property of a thread to perform efficiently during the sewing operation is known as the sewability of the thread. The sewability of thread is extremely difficult to measure since it is affected by a limitless number of variables and combinations of variables. Therefore, when observing the performance of a specific sewing operation, it is impossible to determine whether one is measuring the sewability of the fabric or the performance of the sewing machine [14].

## 5. Fabric properties and performance

Mechanical properties such as tensile, bending, shear, compression, and surface properties are considered important in deciding the utility and mechanical comfort performance of a fabric. However, analysis of the tailoring process reveals that these properties are equally important in the making-up process of the garment. For garmenting, a flat two-dimensional fabric is converted into a three-dimensional garment. The conversion requires complex mechanical deformation of the fabric at very low loads. This conversion of the fabric's formability depends on the mechanical properties as well as on the skills of the garment manufacturer [15].

Low-stress fabric mechanical properties are important in tailoring because of the following two reasons [16].

- Fabrics are more extensible in the low-load region, these are more related to the tailoring process and the comfort of the wearer.
- The second reason is that fabric extensibility at low loads causes difficulty in the handling of fabrics during the cutting and sewing processes. Fabrics having high extensibility cause dimensional distortion

It can be said that the fabric's tensile and longitudinal compressive and shear properties are the main mechanical properties relevant to the tailoring performance.

### 5.1. Modes of Deformation

Fabric distortions are commonly the combination of two or more fundamental modes of deformation. The four main fundamental modes of fabric deformation at low levels of stress are tension/longitudinal compression, shear, bending and lateral compression. These terms may be defined as

follows:

#### *Tension/longitudinal compression*

This mode of deformation represents extension or longitudinal compression in the pre-buckling region, along one of the major fabric directions (warp or weft for woven fabric). True uniaxial fabric extension is difficult to achieve for fabrics because extension in one of the major thread directions is accompanied by a contraction of fabric in the direction applied to the normal force.

1. LT, the linearity of load elongation, affects fabric extensibility in the initial strain range; low values of LT give high extensibility but fabric dimensional stability is reduced.
2. RT, the tensile resilience; high values make the fabric more elastic.
3. EM, the tensile strain; larger values of EM in warp cause many problems in tailoring due to distortion of fabric during sewing; but in the weft, they are important for comfort in wearing and easier tailoring.

#### *Buckling*

Buckling of fabrics has been considered by many research workers, as an important property in so far as it can indicate stiffness and recovery [17]. The parameter longitudinal compression can be obtained from the buckling test.

#### *Shear*

For a woven fabric, a shear deformation refers to a rotation of one set of threads relative to the other at the yarn cross-over points in the weave. Many workers have determined this property.

1. G, the shear rigidity; high values cause difficulty in tailoring and discomfort in wearing.
2. 2HG5, the hysteresis of shear force at a higher shear angle (5); high values give

distortion in tailoring and wrinkling during wear.

### *Bending*

In the case of a bending deformation, a bending moment acts in one of the major thread directions of the fabric and is normal to the plane of the fabric. Pure bending occurs when the resulting fabric curvature is uniform along with a line of action of the bending moment

Bending properties influence the formability of a product of fabric bending rigidity and the longitudinal compressibility of fabric in its own plane prior to buckling. Bending rigidity is one of the basic fabric mechanical properties, and it also affects puckering and fabric cutting.

### *Lateral compression*

This deformation is the result of opposing forces applied from the two sides of the fabric in a direction normal to the plane of the fabric. The surfaces of fabric are typically highly compressible. Fabric surface frictional properties determine the physical behaviour of fabrics which is independent of fabric tensile, shear and bending properties, and is fundamentally different from, but not independent of, fabric compressional properties [18].

compression is measured as the degree of compressional force a fabric can sustain in a certain direction before the fabric buckling occurs. The lower the compressibility, the fabric is unable to accommodate the compressional load and the higher the chance of seam pucker. Tension is developed during sewing by the sewing thread, which tends to relax by shortening the thread path in a stitch. This is achieved by lateral and longitudinal compression. Fabric surface property, weight and thickness also influence cutting and sewing operations.

### *Fabric Tensile Test Instruments*

Since it is rare for an apparel fabric to be subject to a uniaxial tensile strain either in processing or in wear, biaxial properties are more relevant to fabric performance. Several testers have been developed which apply biaxial strains to a fabric sample [19]. The strip biaxial test can be regarded as an intermediate form of testing between the two extremes of a true biaxial tensile test and a uniaxial test. The KES-F tensile tester is suitable and is superior to the extensometer type tester in terms of the standard arrangement of the fabric gripping mechanism.

### *Fabric Shear Test Instruments*

A wide range of laboratory-built instruments and some commercially available testers, including the KES-F shear tester have been developed which measure the shearing behaviour of a flat fabric specimen. In these testers, a specimen is clamped in two jaws and a shear force is applied in the plane of the fabric in one of the major thread directions. A small tensile load is applied in a direction initially normal to the shear force to delay the onset of fabric puckering during shear testing. In Sweden during the late 1950's and early 1960's these instruments took the form of modifications to an Instron extensometer. Several purpose-built testers have also been developed. These testers can be distinguished as follows: Testers whose clamps are not maintained parallel during testing i.e., shear, and testers whose clamps are maintained parallel during testing. It has shown that the shear stress distribution is not homogeneous for testers whose clamps are not maintained parallel during testing. But while the shear stress distribution is homogeneous for the class of parallel clamps, the tensile stresses are not homogeneous in this case, being high at the free edges of the fabric [19]. These edge effects may be minimised by utilising an appropriate aspect ratio in the design of the

tester, i.e., the use of short, wide specimens as is also recommended [20]. The KES-F tester incorporates a short, wide specimen during testing, viz. nominal aspect ratio 4:1.

### Bias extension

Several authors have reported the relationship between fabric shear rigidity and the fabric "tensile" modulus in the bias direction based on a simple trellis model of fabric behaviour during shear deformation. The measurement of fabric extension in the bias direction is made difficult by the relatively large 'shearing' contraction of the fabric in the direction normal to the applied force. The ends of the fabric clamped in fixed jaws are not able to accommodate this contraction, and so provide non-homogeneous distribution over the fabric sample of both shear and tensile stresses. It is observed levels of shear stress are higher

(by over 200% in some cases) at the same levels of shear strain when calculations are based on bias extension results compared to conventional shear test results [21]. This result and its inexplicability in terms of the trellis model, or any other model, combined with the difficulty of testing noted previously, mean that the conventional shear test is currently the most accepted method of assessing the shear behaviour of fabrics on a large scale.

### 6. Control System: A tailoring chart

Control system A tailoring control chart developed in Japan is shown in Figure 1. If all the properties of a fabric fall inside the "non-control" zone, the tailoring of this fabric is easy and it will not have defects in appearance [15].

Figure 1. Interrelation between fabric mechanical parameters and tailoring processability

However, if it was found that the properties of the fabrics having good handles are not necessarily in the “non-control” zone, the fabric might not be suitable for tailoring. This means good suiting cannot be processed in tailoring. The dots and horizontal lines show the mean value and the range of distribution of the fabric properties. The control chart has been introduced for tailoring higher-grade fabrics, with special instructions for the tailoring process based on those mechanical properties that fall outside of the “non-control” zone. The difference in the smoothness of the seam line comes from the mechanical properties of the constituent fabrics. The mechanical property related to this problem is mainly the bending property in the weft direction. Another important property of fabrics for processing is fabric shrinkage caused by the steam-pressing process in the production-line system of suits. Inspection of fabric properties before tailoring is done to determine the fabric’s acceptance.

## **7. Experimental Studies on Fabric Tailorability**

In the late 1950’s and early 1960’s the first large-scale investigations of fabric tailorability were undertaken at the Swedish Institute for Textile Research (TEFO), and continued at the. Later work in this area has concentrated in Japan and at the University of New South Wales, much of this work has been directed at measuring fabric mechanical properties, notably fabric shear properties [22]. Other fabric properties investigated in relation to fabric tailorability include: fabric extensibility, fabric bending rigidity, fabric longitudinal compressibility; and fabric thickness and weight. The Japanese workers have included tailorability as an essential parameter in that it has relevance to the Garment industry. FAST, developed by CSIRO, Division of Wool Technology also gives a measure of formability. In addition, a

measure of total appearance value (TAV) is also provided by the KES-F system as an adjunct to the clothing industry. Many authors related fabric mechanical properties to subjectively assessed “making up properties”. Waesterberg concluded that fabric “adaptiveness” was correlated with fabric formability. Fabric tensile, bending and shear properties are related to the appearance of men’s summer suits [23].

## **8. Predicting Tailorability**

The production of high efficiency suits the Kawabata Evaluation system (KES-F) is a tool to that decide the fabric will be acceptability and, in some firms, a quality control system has been introduced on this basis. Fabric puckering and bubbling either during garment assembly or during the first month of wear can be predicted. The warp and weft extension under 500 g/cm load should preferably be 4% or above – otherwise, problems will be experienced on wool fabrics. In many countries, KES-F instruments are being used for quality control and product development in the textile industry. The behaviour of the fabrics during the garment construction can be predicted by the mechanical properties of fabrics.

## **9. Conclusion**

The tailorability of fabrics is an essential factor in the fashion and textile industry. The ability to modify fabrics to fit specific body shapes or designs is crucial for creating customized clothing that meets individual preferences. Factors such as fibre content, weave, weight, and stretchability influence the tailorability of fabrics. Tailors use various techniques such as cutting, sewing, and draping to modify fabrics. Advancements in technology have also revolutionized the process of altering fabrics, making them easier and more efficient. The

future of tailorability looks promising, with continued advancements in technology that

will improve the process of creating customized clothing.

## COMPARATIVE STUDY ON PRODUCTION OF PAPER FROM BANANA FIBERS USING HYDRATED LIME AND CAUSTIC SODA AS PULPING AGENTS

**Abstract:** *Banana is a dominant fruit crop grown in tropical and subtropical regions and in Eritrea, Williams and Grand Nail are the two varieties cultivated in 1900 hectares around Gash-Barka region. Subsequently 76,000 tonnes of pseudo stem wastes dumped annually, which is a potential source of banana fibers for paper products and primarily they can be used in the production of packing paper. Different chemical pulping agents of 12.5% NaOH and 12.5% Ca(OH)<sub>2</sub> at varied proportions of 400 ml and 500 ml per every 50gm of dried grounded pseudo stem samples tested in the digestion. Bleaching of the pulp in each case performed using 150 ml of 2.5% calcium hypochlorite solution. Further, final pulps of 101.3 and 185.8 gm obtained for paper making from NaOH and Ca(OH)<sub>2</sub> digestions respectively. As a result, yields of the pulps are determined as 46.66 and 56.66 % (weight) in NaOH and Ca(OH)<sub>2</sub> pulping methods. Consequently, thin papers of 100 g/m<sup>2</sup>, 200 g/m<sup>2</sup> using 20gm pulp in each case and thick papers of 290 g/m<sup>2</sup>, 270 g/m<sup>2</sup> using 40 gm pulps are fabricated from NaOH and Ca(OH)<sub>2</sub> processes. Qualities of the papers in terms of appearance and strength approximated by simple physical assessments. Paper made from NaOH pulping good in strength and the paper of Ca(OH)<sub>2</sub> process bright in color.*

**Keywords:** *Banana Pseudo Stem, Chemical Pulping, Packing Paper, Pulp Bleaching, Paper Properties*

### 1. Introduction

Paper products are integrated into nearly every aspect of our daily lives. It is an undeniably important to the society. Approximately 90 percent of this paper is produced from wood pulp such as bamboo, hardwood, softwood, jute etc. The rising

demand in paper product consumption created additional pressure on the world's forest resources since more wood need to be cut to satisfy the demand of paper. Other than for paper use farmers also chop forests for agricultural land, building houses and firewood. Along with this matter the increased awareness of pressurizing the

---

Corresponding author: Ramesh Babu Aremanda  
Email: [ramesh.nitrkl@gmail.com](mailto:ramesh.nitrkl@gmail.com)

environment led many researchers worldwide to focus on finding potential alternative raw materials for paper making from non-wood resources (Pauzi, F. M, 2015).

Since plastics usage in packing practices restricted due to serious environmental issues the demand for paper based packing materials in food and other goods package is rising every year. The demand of global paper and paperboard packing market size surpass USD 243 billion by 2030 at an expected CAGR of 2.25 % [Globe Newswire Report 2023]. In other words, paper from banana paper market size is estimated to grow by USD 63.78 million from 2022 to 2027 at a CAGR of 5.05%. [Technavio, 2023]. In Eritrea, currently there are no paper making industries other than recycling industries. Some industries such as barka cannery, soap industry, Alebu tomato paste factory etc., use wrapping paper for packing purposes. However, those packing papers are all imported. Moreover, papers can be used as a substitute partially for plastic bags used in food and package industry to mitigate with non-degradability issue of plastics wastes. Further, plastic waste generated from food and package industry have a great effect on the environment as they create ecosystem imbalance on oceans and seas.

Papers are manufactured by pulping processes such as chemical, semi-chemical, chemo-mechanical and mechanical pulping. Pulping is the process by which plant material (wood, straw, grass and soon) is reduced to a fibrous mass. Pulp refers to a suspension of cellulose fibres in water and represents the raw material for producing paper and boards, and obtaining cellulose derivatives. There are two major Pulp grades: paper-grade pulp and dissolving pulp. The properties of paper-grade pulp refer to pulp yield, pulp brightness and strength properties. The properties of dissolving-grade pulp refer to the high cellulose content and to a high reactivity

towards derivatizing chemicals. The aim of all pulping process is to separate the fibres from the lingo-cellulosic materials in order to obtain pulp grades that are suitable for paper making. Cellulosic fibres can be separated from each other by mechanical, chemical or by a combination of both treatments (Popa V 2013).

Banana is a major fruit crop of the tropical and subtropical region of the world grown on about 5.6 million hectares in 2017, primarily in Asia, America and Africa (FAOSTAT, 2017). In Eritrea there are two varieties of banana exists, which are Williams and Grand nail introduced by Israel and Dwarf Cavendishi introduced during Italian colonization. It grows around Gash-Barka region specifically in Agordat, Dgle, Haykota and Tessenei round the year grows about 1900 hectare. Production rate of banana is greatly affected by climate change i.e. production during hot season is almost twice than production during cold season. Banana crops produce large quantities of post-harvest biomass waste like pseudo stem and leaves. Currently in Eritrea 76,000 ton of pseudo stem wastes and 14,166.6 ton of peel are dumped annually as wastes, from which banana fiber can be extracted (MoA, 2022). In other words, banana peels cause environmental problems such as bad smell, origin of human diseases, affects cleanness of cities and urban areas. The natural forests are in the process of being extinguished by logging. About 70% of produced paper are derived from wood and demand of paper increasing every year. It consumes an average of 17 trees to make a ton of paper, so more and more trees are needed to meet the increasing demand (Pauzi, F. M, 2015). As trees are cutting down, forests are cleared and leads to climate change and global warming. Banana pseudo stem wastes are the main by-product of banana cultivation and are usually discarded as agricultural wastes after harvesting despite of little amount of wastes used as fertilizer. But majority of the

pseudo stem are dumped on large land cultivation areas and become a source of pollution, causing the release of carbon emissions such as CO<sub>2</sub>, over time.

To tackle the aforementioned problems, banana fiber can be used as an alternative raw material for the production of paper as it has lower lignin content than wood and also it can be a cheaper alternative to wood as it doesn't take longer years to grow despite of its availability in the form of agro-wastes. This work majorly focused on the utilization of banana pseudo stem wastes (BPSW) for the production of packing paper to serve for the food and package industry. The paper produced by mechanical pulping practices has low strength as lignin interferes with hydrogen bonding between fibers when paper is made whereas the alkali chemical pulping methods remove the lignin effectively (Monica Ek et al 2009). This study also focused on comparison of conventional alkali pulping process in terms of quality of paper, waste discharges, yield of paper etc., with locally available alkali such as hydrated lime.

## 2. Materials and Methods

### 2.1. Collection of Banana Pseudo Stems

Approximately 40 kg of fresh banana pseudo stems were collected in the month of February, 2023 from Agordat, a place for banana farming in Gash Barka zone of Eritrea and it was brought to Chemical Reaction Engineering (CRE) laboratory, Mai-Nefhi College of Engineering and Technology (MCOETEC), Mai-Nefhi, for further processing of paper production. Further the chemicals and accessories adapted for different stages of paper making process are listed in the table 1.

### 2.2. Preparations of BPSW and Alkali Solutions

The banana stem is washed several times with tap water to remove dust and soil particles present on it. Then the outer layer is peeled off, the inner fiber is cut into 10 cm long slices. These slices are sun dried to remove 90% of the moisture and are cut into small pieces for the convenience of pulping process as shown in figure 1. After, for the preparation of alkali solution, 12.5% (weight) solution of alkali chemicals, which are NaOH and Ca(OH)<sub>2</sub> are required as cooking liquors. For the makeup of 500ml of 12.5% (weight) solution require 62.5 gram of alkali compounds. Thus, 62.5 grams of NaOH or Ca(OH)<sub>2</sub> are dissolved in distilled water and makeup to 500ml of cooking liquor.

### 2.3. Pulp Making Process

Once the cooking liquor is prepared, 50 grams of raw material (dried banana stem) is added to 400ml of cooking liquor in 1000ml beaker and the level is marked. The marking of the level done to identify the level of water as it evaporates with continuous heat supply and to maintain constant alkali concentration by the additional water to compensate the loss of water in the evaporation (Marella JBR, et al 2014). Further, it is heated to about 100°C (boiling) for 1 ½ hour with continuous stirring till the pseudo stem samples starts to break down or becomes soft.

The digested fiber (pulp) is rinsed with tap water and the cooked fibers are soaked and thoroughly rinsed with water to remove residual liquor. The mixture is filtered using a fabric filter to obtain black liquor as it contains cooking chemicals that can be recovered. The alkali free fiber is then transferred into a blender along with clean 700 ml of water for the convenience of blending and the blending continued until a

smooth slurry is achieved. The blended pulp is filtered using a muslin cloth.

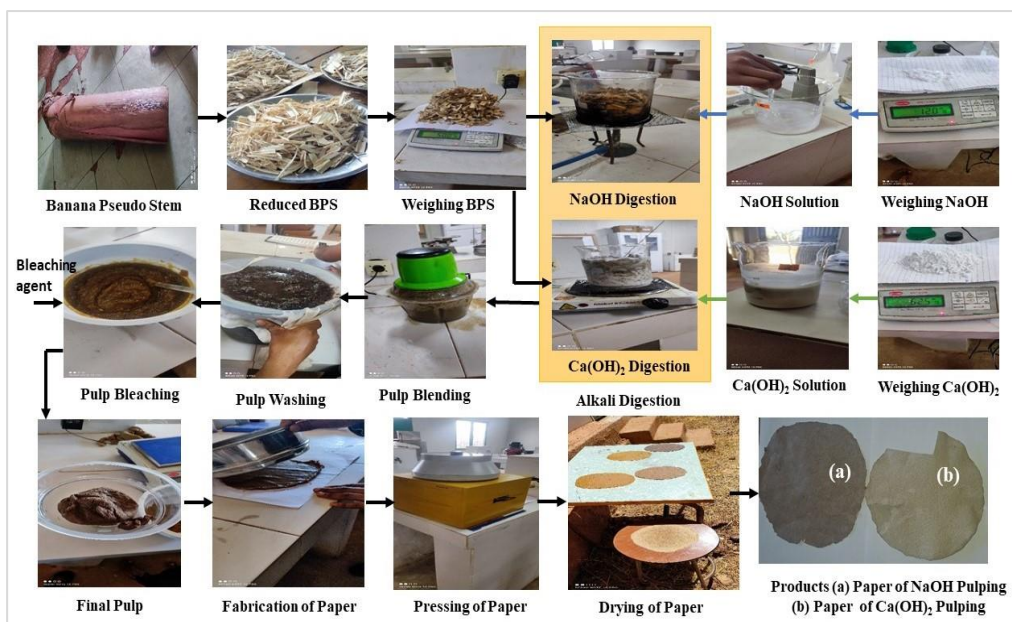

The pulp is bleached by soaking it in 2.5% of calcium hypochlorite ( $\text{Ca}(\text{HClO}_3)_2$ ) solution for 2 hours. Further, the bleached pulp is rinsed for the free of calcium hypochlorite. Then squeeze out excess water and roll up the pulp into a ball. The pulp is then ready for paper making process.

### 2.4. Paper Fabrication from Pulp

Different weights of pulp are taken to make paper of different thicknesses. The bleached pulp of 20g and 40g are weighed and blended with 500ml of water to separate fibers into a consistent solution. The blend is poured into a mold and deckle in a bowl as it allowed to drain completely prior to its removal.

**Table 1.** Chemicals or Utilities applied in Papermaking Process.

Chemical/ Utility	Purpose
Water ( $\text{H}_2\text{O}$ )	For the preparation of solutions and washing purposes
$\text{Ca}(\text{OH})_2$ and $\text{NaOH}$	Applied as alkali chemicals to remove the lignin content of the banana fiber
$\text{Ca}(\text{HClO}_3)_2$	Opted as a bleaching agent
KBr Powder	Utilized in FTIR analysis of Pulp

**Figure 1.** Production of paper from banana fibers at laboratory scale

The couch drained pulp is transferred to a felt material (pellow) and is prepared for pressing. Later, it is applied on the press to squeeze off the retained water. The felt/Pellow material removed and the semi dried pulp is transferred to a Formica covered boards, for drying overnight in the room without exposing to direct sunlight to prevent the deformation in the shape. Further, the paper products are characterized for physicochemical parameters.

## 2.5. Characterization of Pulp and Paper Products

The pulp used and the paper formed with different alkali compounds for varied masses of the pulp are tested to examine their physical properties as shown in the table below. Physical attributes of paper such as mass per unit area (GSM) and thickness, and the characterization of pulp including PH and Fourier Transfer Infra-red (FTIR) analysis for the identification of functional groups. Paper properties are determined at Eritrean Standards (ES), Asmara whereas the pulp was examined at National Drug Laboratory, Asmara. Further, thickness of paper products was determined using micrometer.

## 3. Results and Discussion

### 3.1. Material Balances & Determination Paper Yield

The banana pseudo stem applied has removed a moisture content of 90 % (by weight) under sun-drying and the remaining 10 % of fibers are chipped and consumed in the process. Based on the calculations accomplished at laboratory scale that are furnished in figure 2, Hydrated lime pulping process has witnessed with 3.6 times higher production rate of thin paper and 1.663 times higher thick paper production when compared with NaOH pulping process. In

addition, 45% less water consumption and subsequently accompanied with 45.45% of less wastewater generation are also added advantages of Ca(OH)<sub>2</sub> pulping process as provided by the Table 2.

From the annually dumped waste banana pseudo stem of 76000 tonnes, the production of pulp at rate of 77.37 ton/day can be expected from hydrated lime pulping process and 42.1 ton/day from the caustic soda pulping treatment. Further, a thinner paper product of 23.211 ton/day, 6.315 ton/day and a thicker paper product of 14.893 ton/day, 8.731 ton/day are estimated in the case of hydrated lime and caustic soda pulping treatments respectively.

To find the yield in both pulping processes, entire water in the bleached pulp must be removed by drying at a temperature of 60°C for one hour in hot air oven. [Taleat et al 2021]

$$\text{Pulp Yield} = \frac{W_2 - W_3}{W_2 - W_1}$$

Where,  $W_1$ -weight of the crucible

$W_2$ -weight of bleached pulp and crucible

$W_3$ . weight of pulp and crucible after oven drying

The calculated yield of Ca(OH)<sub>2</sub> pulping is 56.6% and for NaOH pulping the yield is 46.6%.

### 3.2. Effective Parameters on Pulping and Fabrication Processes

The optimum temperature and pressure required for cooking process are 100-120°C and 1 atm respectively. The cooking process take 1.5 hr for NaOH and 2hr for Ca(OH)<sub>2</sub>. Higher temperature causes faster delignification. There are limitations regarding how much alkali can be added to the system due to complications on the subsequent washing systems and on the recovery of the spent liquor. Excess alkali will hamper subsequent pulp washing and

overload the causticizing system [Popa,V 2013]. Further, it was noted that moisture content in the pulp and blending speed or time have direct impact on the flexibility of paper formation. In other words, molding technique and tools may limit the shape and thickness of the paper. Drying method adapted for paper product has direct impact on the shape of the paper product, direct sun-drying can restrain the shape of the paper which we have witnessed from the local paper recycling industry. Thus, drying of the paper product carried out in the room for overnight extended for 2-3 days.

### 3.3. Comparison of Paper Products

The  $\text{Ca}(\text{OH})_2$  pulping process for banana stem bagasse has a higher yield when compared to a typical soda process. The  $\text{Ca}(\text{OH})_2$  cooking process for the waste banana fiber, can be considered a technical alternative for the use of the banana stem due to its higher yield coupled with higher delignification rate when compared with a soda process.

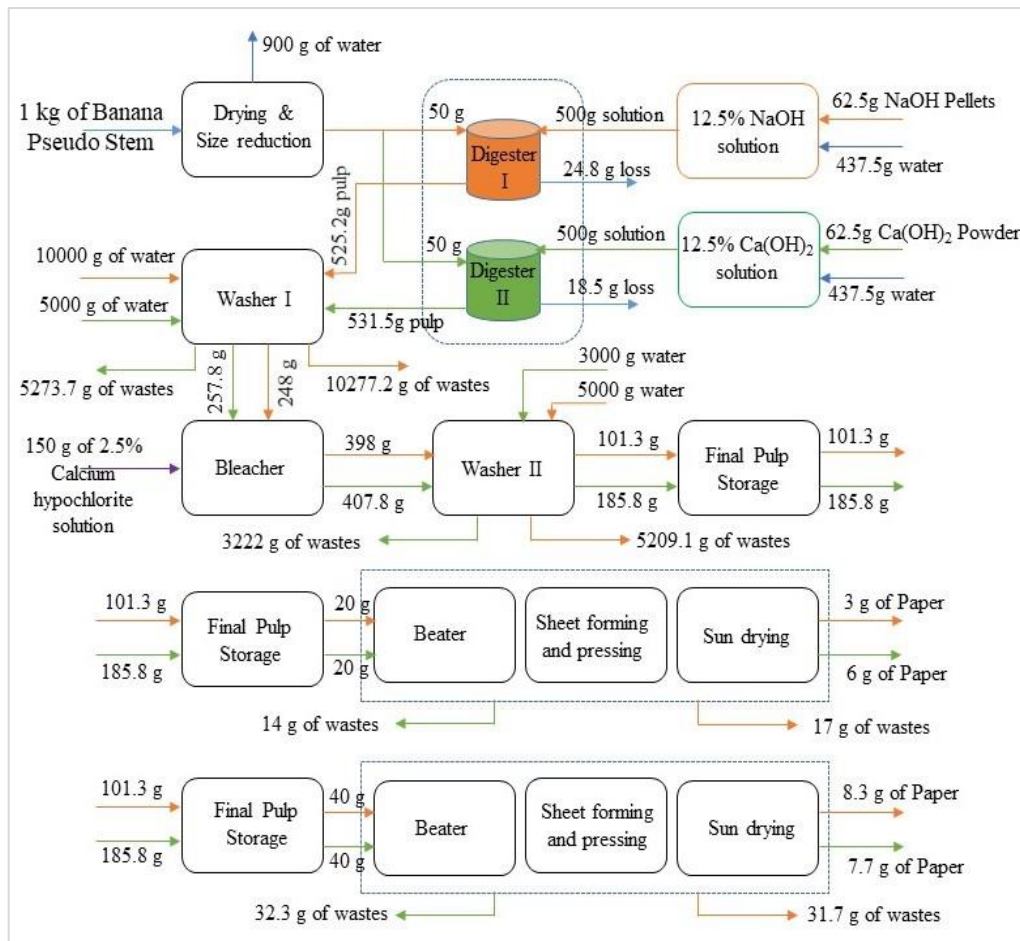

Figure 2. Material balance on paper making process at laboratory scale.

**Table 2.** Comparison of NaOH and Ca(OH)<sub>2</sub> pulping processes Per kg of BPSW

Parameter (kg)	NaOH Pulping	Ca(OH) <sub>2</sub> Pulping
Pulp	0.2026	0.3716
Thin paper	0.03	0.108
Thick paper	0.0415	0.069
Alkali required	0.125	0.125
Bleaching agent required	0.0075	0.0075
Total water consumed	31.1665	17.1675
Total wastewater generated	31.1478	16.9914

**Table 3.** Physical attributes of Paper Products

Test	NaOH		Ca(OH) <sub>2</sub>	
	20g	40g	20g	40g
GSM (g/m <sup>2</sup> )	100	290	200	270
Thickness (mm)	0.327	0.8	0.487	0.9
p <sup>H</sup>	8	8	7.5	7.5

**Table 4.** Comparison of different grades of commercial papers in terms of GSM

Reference for the Paper Product	Range of GSM	Potential Application
Sophie G. 2022	90-120	Office paper or copy paper
Sophie G. 2022	130-250	Promotional Posters usage
Sophie G. 2022	260-300	High end brochures or magazines
Sophie G. 2022, SBS (Solid Bleached Sulphate Board)	> 250	Mainly for Packing purpose
This work (Thin Paper)	100-200	Suitable for both office paper and promotional poster purposes
This Work (Thick Paper)	270-290	Suitable for high end brochures or magazines. And matches with the packing grade paper of SBS.

**Table 5.** Identification of functional groups in NaOH and Ca(OH)<sub>2</sub> treated Pulps by FTIR analysis

Frequency (cm <sup>-1</sup> )	Sample Type	Functional Group	Peak Type
1417-1559	NaOH treated pulp (a)	Nitrogen Compounds	Strong
1653-1717	NaOH treated pulp (a)	Aromatic Compounds	Medium
1350-1500	Ca(OH) <sub>2</sub> treated pulp (b)	Nitrogen Compounds	Strong
950-1200	Ca(OH) <sub>2</sub> treated pulp (b)	Carboxylic acid	Medium
860-875	Ca(OH) <sub>2</sub> treated pulp (b)	1,2,4-trisubstituted (or) alkenes	weak

Physical properties of different types of sheets prepared were compared, from the results it was observed that the tensile strength of paper made from NaOH pulping

is higher than that produced from Ca(OH)<sub>2</sub> experienced by the application of manually pulling forces. The residual alkalinity was reported as slightly higher in the case of

caustic soda derived paper. Weight of the paper per unit area were measured as GSM ( $\text{g/m}^2$ ), and the results revealed that for the case of thin paper that is formed from 20 g of the sample, hydrated lime treated paper has double weight than the case of caustic derived paper. Further, the thickness of the different papers measured revealed that,

NaOH treated paper facilitate thinner paper in both types of papers made when compared with  $\text{Ca}(\text{OH})_2$  treated paper whereas in case of thicker paper,  $\text{Ca}(\text{OH})_2$  treated paper has less GSM and more thickness that may be due to imbalance in the pressing force applied.

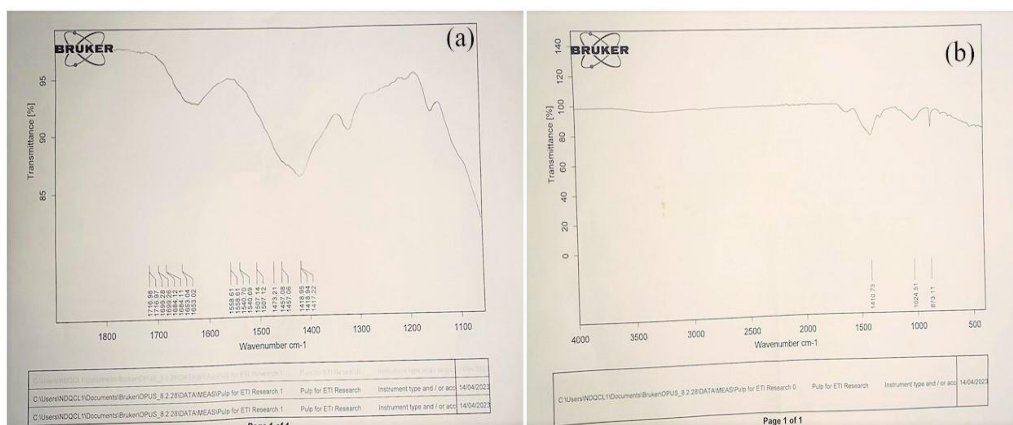

Figure 3. FTIR analysis of NaOH treated pulp (a) and  $\text{Ca}(\text{OH})_2$  treated pulp (b)

### 3.4. Economic Viability of Paper Production in Eritrea

There is high demand of packing paper in Eritrea in order to prevent the utilization of plastics in the packing industry and food industries such as Barka cannery, Alebu tomato paste factory, soap industry etc. along with commercial shops, super markets, cafes and restaurants are in need of such products for packing their goods. As per the local informants, currently, a rim paper used for colored packing imported from UAE at a price range of 88.235-92.307 Nakfa/kg, and a locally made card boards and belt papers are valued in the range 20-25 Nakfa/kg. If the production of paper by adapting the optimized process of hydrated lime digestion method have taken as a new startup, through making thin paper products that are suitable for the replacement of rim paper, could generate an income in range of 2.048 - 2.142 million Nakfa/day (0.136-

0.1428 million USD/day). Further, thick paper production could create 0.1263-0.158 million Nakfa/day. Thus, the preliminary assessment ensures that making paper from banana pseudo stem waste by hydrated lime digestion methods seems to be an economically viable business startup in Eritrea. However, detailed cost analysis which include the machinery, operations water and energy consumptions besides the treatment of the wastes are yet to be performed for further development.

### 4. Conclusions

Based on the experimental investigations on potential making of paper from BPSW using caustic soda and hydrated lime the following conclusions are drawn.

- Considering the cooking conditions applied in this research, the  $\text{Ca}(\text{OH})_2$  cooking step proved a

better delignification rate for the banana stem bagasse similar to a soda process.

- The  $\text{Ca}(\text{OH})_2$  cooking (12.5%  $\text{Ca}(\text{OH})_2$ ) using BPSW raw material can be considered as a technical alternative for pulp production.
- Hydrated lime pulping process has witnessed with 3.6 times higher production rate of thin paper and 1.663 times higher thick
- In addition, 45% less water consumption and subsequently accompanied with 45.45% of less wastewater generation are also added advantages of  $\text{Ca}(\text{OH})_2$  pulping process
- The GSM of the papers ensure their suitability in multiple applications.
- FTIR analysis has revealed that the strong presence of nitrogen compounds, medium presence of carboxylic acid and aromatic compounds and weak presence of alkenes.
- This paper production using hydrated lime pulping treatment promises a better economic

viability of an immediate local startup business.

**Acknowledgment:** Authors would like to express our deepest sense of gratitude to the department of chemical engineering for providing us an opportunity to fulfil our dream to have an exposure on research. Authors sincerely thank to staff of chemistry department laboratory, Main-Nefhi College of Science (MCS) for allowing us to use chemicals. We thankfully acknowledge the technical support rendered by Eritrean standards institute for their consistent support during physical tests. Authors convey their gratitude to the authorities of National Drug Laboratory and Azel Pharmaceuticals for their technical support. Authors extend their thanks to Mr. Fanuel Kiflay for providing sufficient raw materials and to Dr. Kahsay Neguse, the dean of MCOETEC for providing necessary letters.

Acknowledgments of people, grants, funds, etc. should be placed in a separate section before the reference list. The names of funding organizations should be written in full (optional). Do not include author biographies.

## THE INFLUENCE OF COVID-19 PANDEMIC ON FOOD SAFETY AND QUALITY ASSURANCE STANDARDS IN SELECTED COMPANIES IN POLAND

**Abstract:** *Food safety is the basic characteristic of food and the most important one because food has the direct impact on our health. Companies operating along the food chain are obliged by food law to implement the mandatory food standards such as HACCP, GHP, GMP. If they want, they can also use many voluntary food standards. The COVID-19 pandemic influenced the whole food chain and consumer behavior by the restrictions, shutdowns and fear of being infected. This paper presents the results of the survey conducted among 71 enterprises operating in the food industry in Poland in 2022. The representatives were asked to assess the influence of the pandemic on food safety standards and their usefulness during the pandemic. They were also asked about the positive and negative aspects of the pandemic from the perspective of the food industry. It was shown that the pandemic strengthened the need and understanding of the hygienic standards, collaborations with suppliers and employee training. On the other hand, caused the more frequent food quality and safety inspections, shortages of the employees and supplies, and economic losses. For some companies the pandemic was a chance for new form of sales and obtaining additional funding to minimize the negative effects.*

**Keywords:** *food, food standards, COVID-19 pandemic, pandemic effects*

### 1. Introduction

Codex Alimentarius is one of the basic document on food safety. It defined food as “any substance, whether processed, semi-processed or raw, which is intended for human consumption, and includes drink, chewing gum and any substance which has been used in the manufacture, preparation or treatment of “food” but does not include cosmetics or tobacco or substances used only as drugs”. Food safety is important for the

whole society as it has the direct influence on our lives and the lack of food safety causes big losses for the economy (Niewczas-Dobrowolska, 2020). Safe food is hazard-free food. "Hazard" means a biological, chemical or physical agent in a food or feed, or the condition of a food or feed that may cause adverse health effects (Regulation 178/2002).

Food safety - all conditions that must be met regarding in particular:

a) additives and flavorings used,

- b) the levels of pollutants,
  - c) pesticide residues,
  - d) conditions of food irradiation,
  - e) organoleptic characteristics,
- and actions that must be taken at all stages of food production or circulation in order to ensure human health and life.

Food safety is about preventing hazards to the health and life of consumers, caring for the welfare and health of plants and animals, caring for the human environment, surrounding, agricultural production and processing, as well as concern for the economic safety of consumers (Obiedziński, 2004). Food safety can be described as the strategies and activities aimed to protect foods from biological, chemical, physical, and allergenic hazards that may occur during all stages of production, distribution, and consumption (Paparella, 2020).

The COVID-19 pandemic has drawn the public's attention to the need for safety in various dimensions, for example: economic safety, food safety, safety of life. Before the pandemic we were got used to the feel of safety and stability of food production, food supply, consumer behavior etc. The COVID-19 pandemic introduced unexpected stresses on food systems, creating many immediate challenges. It has affected different stages of the food chain, simultaneously affecting farm production, food processing, transport and logistics, and final demand. Food processing was disrupted by labour shortages and shutdowns. Some employees were sick or some leaved their jobs out of fear from the infection (OECD 2020, Barman et al., 2021).

Dudek & Śpiewak (2021) said COVID-19 affected the functioning of all elements of the system and the relationships between them, involving the following segments: supply of means of agricultural and food production, primary production of agricultural raw materials and products, agri-food processing, wholesale and retail food trade, marketing, logistics and transport, food preparation and consumption, by-

product management, edible energy. Kalinowski & Wyduba (2020) and Zielińska-Chmielewska et al. (2021) concluded that the COVID-19 pandemic changed the whole food system in Poland.

## 2. The COVID-19 pandemic and food standards

In January 2020 the World Health Organization (WHO) announced the first appearance of COVID-19 virus. Since then the citizens around the world as well as the companies they had to face a situation they had never faced before. In Poland the first case of COVID-19 infection was dated on the 4<sup>th</sup> of March 2020. From this date the government introduced many restrictions, for example: close the restaurants, limit the number of clients in shops, limit the possibility to travel. In order to limit the transmission of the virus, remote work was recommended and many industries were closed or their activities were limited. These restrictions changed the reality we had known. Our basic activity as consumers that is buying and consuming was limited. We had to plan our shopping and started to prepare meals at home more often. For this reason consumers started to pay attention to products they eat.

Food processing, however, could not be shut down because it provides the basic goods necessary for survival. Therefore, companies operating in this industry had to quickly adapt to the new situation and implement mechanisms that would allow them to survive. The WHO published guidance documents addressed the food companies and the food authorities to support the food supply chain (WHO , WHOa). The main recommendations were: people who are feeling unwell should stay at home, staff working in food premises should be provided with written instructions and training on how to prevent the spread of

COVID-19, Food safety practices in food premises should continue to be delivered to the highest hygiene standards in line with established FSMS (Food Safety Management System), keep good staff hygienic practices, the primary focus of any additional hygiene and sanitation measures implemented by food businesses is on keeping the COVID-19 virus out of their businesses. The virus will enter business premises only when an infected person enters or contaminated products or items are brought into the premises. Tips for food authorities were the following: to preserve the integrity of the national food safety control system and to support international trade and the food supply chain, multi-agency cooperation and contingency, maintaining a functioning national food safety inspection programme planning, staff training. WHO also indicated the role of food safety standards in COVID-19 spread prevention. Prerequisite Programmes must ensure that COVID-19 infected workers and their contacts are excluded from food premises. Staff who are unwell or who have any symptoms of COVID-19 should not work. A procedure to allow staff to report illness by phone (or email) should be established so that workers with early stages of COVID-19 can receive reliable information and be quickly excluded from work environments. Very similar recommendations can be found in standard requirements in GHP (Good Hygienic Practice) and GMP (Good Manufacturing Practice) in staff hygiene requirements.

The COVID-19 pandemic showed the food industry the value and the meaning of hygiene restrictions as well as the role of staff behavior in the process of food safety assurance. As Djekic et al. (2011, 2021 ) wrote food safety management systems (FSMS) both obligatory (GHP, GMP, HACCP) or voluntary (ISO 22000, BRC, IFS) have several common elements: (1) prerequisite programs (PRPs) are the basis of

any FSMS, (2) HACCP or similar hazard-based approaches are important for identifying, controlling and decreasing food safety risks in the food supply chains; (3) food safety legal compliance is necessary; and (4) food-based crisis management is important to anticipate and respond to various threats such as incidents associated with the product (like recalls, withdrawals and food fraud), or emergencies affecting food companies such as natural disasters, food safety issues and food defense.

Hazard Analysis and Critical Control Point (HACCP) is a preventive programme aiming at producing and providing safe food products (Gehring & Kirkpatrick, 2020; Motariemi & Warren, 2023). It is an obligatory standard that has to be implemented by all food chain participants. HACCP is based on seven principles: (1) Conduct a Hazard Analysis, (2) Determine Critical Control Points (CCPs), (3) Establish Critical Limits, (4) Establish Monitoring Procedures, (5) Establish Corrective Actions, (6) Establish Verification Procedures, (7) Establish Record-keeping and Documentation Procedures. HACCP is implemented together with GHP and GMP practices which show the basic hygienic requirements at the work place and in the food manufactory. Food operators can also use the voluntary standards, for example ISO 22000, AiB, IFS, BRC and others. The main goal of each food standard is to ensure the food safety. Food safety is a complex issue and many external and internal factors implement it. These standards deal with food hazards mainly in a traditional division between biological, physical and chemical hazards. The pandemic appeared to be on of the external hazards that hadn't been considered. However, both in food standards and prevention of the pandemic the hygienic requirement/principles play the main role.

### **3. Changes in the food industry caused by the COVID-19 pandemic**

The major concern in food companies was to keep the production and health of their staff (Aday & Aday, 2020). Many companies had to face the labour shortage (Stephens et al., 2020). As Limon (2021) shows the pandemic allowed to increase the online sell of food goods as well as emphasized the need to maintain hygiene principles in the foodchain. Maiberger&Sunmola (2023) presented the important aspects of food safety standard that are useful during the pandemic: 1) FSMS knowledge; 2) rigorous prerequisite programmes; 3) FSMS verification and audit processes; 4) FSMS culture and 5) legal regulations. The restrictions and shutdowns resulted from the pandemic influenced the food suppliers and customers affecting jobs, economic growth, mobility (Rizou et al., 2020; Laborde et al., 2020; Knorr & Khoo, 2020). Covid-19 has also emphasized the role of human health as a core consideration in assessing supply chain resiliency. Attention to hygiene practices and social distancing measures within manufacturing plants reduce the risks of spread within the workforce, helping to protect the health and welfare of workers (Hobbs, 2021). Also the food standards helped to obey the rules of hygienic behavior. As Rejeb et al. (2020) showed pandemic poses unprecedented challenges for food supply chains. It has raised food insecurity and food safety concerns, increased supply chain and logistics costs and radically changed consumer behavior. On the positive side, the pandemic has improved the need for hygienic principles.

In the report EIT Food „Food Foresight: Impact of COVID-19 on the agri-food sector in Central and Eastern Europe” published in December 2020 four scenarios of COVID-19 impact on agri-food sector: (1) the most optimistic called “full recovery” in which the

lifting of restrictions facilitates the movement of labor, taking the pressure on farmers to earn money. At the same time, the pre-crisis scale of consumption returns, also in the HoReCa sector, driving related market segments. The agri-food industry is again experiencing the previous scale and directions of development, and the most noticeable change left after the restrictions of recent months is the continued development of e-commerce platforms; (2) “new consumer” - moderate scenario, emphasizing the long-term maintenance of pandemic consumer behavior, placing more emphasis on the nutritional value of food and how it is sourced locally. According to these assumptions, there will also be a shift from the use of catering establishments to home-cooked meals, which will result in an increase in demand for basic consumer goods and the need for the agri-food industry to adapt adequately; (3) “a new rulebook” - in this case, in opposition to the previous scenario, consumers are willing to return to their previous habits and ways of doing things, but they cannot do so due to the constraints they maintain. As a consequence, the scale of consumption is limited while maintaining the structure of the sector; (4) “distortion & disruption - this is the most pessimistic approach, in which both economic and political factors are arranged in the most unfavorable way. The simultaneous maintenance of restrictions, continued unfavorable trade conditions and the lack of sufficient political support result in a decline in consumer and business confidence and the persistence of domestic demand at a crisis level. As a result, a downward trend is growing.

Other scenarios elaborated by the Directorate-General for Research and Innovation (European Commission) in 2022 titled “After the new normal. Scenarios for Europe in the post-COVID-19 world” are consisted of five scenarios called: (1) The long recession, (2) The back to ‘normal’, (3)

Big tech shapes Europe, (4) Circular trials and real-life errors, (5) Green Utopia – New Hope. The long recession scenario is a very pessimistic, it shows the world under the crisis caused by the COVID-19 pandemic, and this crisis lasts for 20 years. The supply chains, travel industry and investment flows have not only been temporarily disrupted but at different times and for longer periods. They play a different economic role in 2040 compared to 2020. People, at least those with regular jobs, are saving and not spending their money, fearing even worse times. This behaviour is further fuelling a severe and long-term depression that defines the economy of 2040. In the second scenario people want to go back to “normal” so to the world we knew before the pandemic. This world is not ideal, characterized by social inequalities, varying levels of economic growth and food insecurity. The third scenario shows the possibilities and the need for the development of new technologies, also in everyday life. Companies focusing on innovation will gain an advantage, consumer behavior and forms will become more global. In the fourth scenario a focus on making chains resilient, and raising the quality of products and services to include more players in the markets, to provide many jobs, and to play on a level field, small and medium-sized companies hand in hand can be found. In emergent circular economies, adaptivity to find new customers and flexibility to react to offers or changing circumstances are more important principles than efficiency and lean production process optimisation. This scenario shows the need for circular economy and emphasis on national self-efficiency. The last scenario pays a big attention to the value of quality. Quality in many dimensions is more important than quantity, also the quality of food. Good quality food should be available for each consumer, the meaning of the local food will grow. People will take more responsibility for their own health.

Deloitte perceived changes in the food industry and food consumption caused by the pandemic. People will search for local food, natural, with a positive impact on their health. Globalization in the food industry will not be popular and increasing. The food chains will be then shorter. Moreover, safety will play the main role, that is why food standards and requirements will be tightened. The pandemic showed the meaning of safety as well as the need for food availability. Local and regional products will have a bigger share in the production and consumption. New IT technologies will be implemented to the food chain so it will be possible to trace the food very quickly, and also to avoid problems with food supply.

Local is the word that can be often found when we search for some recommendations toward food industry after the pandemic (DuPuis et al., 2022). Local food systems should be developed because they are more resistant to future crises as they were more resistant to the pandemic. Local chains also help to deal with disruptions in supply chains because these supplies are shorter so the risk can be controlled to a greater extent.

Some trends in the food industry were created as a result of the pandemic (Vandrunen farms). The first one is the growing demand for frozen and shelf-stable foods. Consumers will prefer this kind of food to prevent food waste and to minimize the time for food preparation. Consumers still expect high food quality and safety and the clean label. Food they buy should be as natural as it is possible and little processed. The second trend is food convenience. Food products should be convenient so easy to prepare. As a result of the pandemic and the restrictions consumers started to consume food at their homes as restaurants were closed or limited. The trend of food consumption at home will be continued as it is seen to be more safe and also cheaper. The food should also be easy to buy. The third trend shows the need for new tastes, from

various countries. The food products should be healthy, convenient and offer a wide variety of products. It doesn't mean they should be globally produced, still local food is required but with new tastes. And the last trend is 'decadent indulgences' that means consumer are characterized by the desire for low-sugar and all-natural ingredients what will shape consumers' preference for decadent snacks and desserts.

#### 4. Method and results

71 enterprises operating in Poland in the food industry and food processing took part in the study. The survey was conducted using the CAWI method and was addressed to the managers of the quality department, managers and persons responsible for ensuring food quality and safety. The main purpose of the study was to determine the usefulness of the functioning of management systems and food quality and safety assurance systems during the pandemic and to identify the changes that the pandemic caused in this regard. In the preparatory phase of the study, a literature review and face-to-face interviews with 20 people responsible for ensuring food quality and safety were conducted in order to determine possible answers to be chosen in the survey. The first question asked about the impact (on a scale of 1 to 5) of the pandemic on selected aspects of the company's functioning in terms of ensuring food quality and safety, such as: remote audits, more frequent employee training on hygiene principles and preventing the spread of COVID-19, more frequent quality inspections, the need for tightening cooperation with suppliers (cooperation with suppliers for whom we are sure in terms of compliance with safety requirements, difficulties with the purchase of raw materials / timeliness of deliveries, difficulties in meeting production schedules, staff shortages, other. The second question asked about the usefulness of food quality

and safety assurance standards during the pandemic. The aim of the next questions was to determine the positive and negative effects of the pandemic in terms of food quality and safety and the functioning of the company. The survey was conducted in 2022. The companies participating in this survey were characterized by the number of the years of experience in business, the number of the employees (Fig. 1-2) and the branch. The operating in various sectors of food processing that reflects the real situation in the food industry in Poland.

According to Statistics Poland in 2018, 16.9 thousand companies conducted production activities in the food industry, mainly of them were SMEs (67.6%). The food industry is one of the most important and fastest growing branches of the Polish economy. The Research and Markets analysis shows that by 2025 at the latest, the market of food products in Poland will break the barrier of USD 100 billion, but it may happen even faster. This is the most stable industry, the development of which even the COVID-19 pandemic did not have a major impact. The report "Data & Trends 2021" - the European organization of food producers Food Drink Europe - shows that Poland is the 4<sup>th</sup> largest food producer in the EU after France, Germany and Spain (PARP, 2022).

## 5. Changes in the functioning of food quality and safety assurance and business operations caused by the pandemic

The respondents were asked to indicate the changes the COVID-19 pandemic causes in the process of food quality and safety assurance and business operations (on the scale 1 to 5, where 1 is the lowest rank, 5 the

highest). On the basis of their average ranks it can be said that the most important changes were more frequent employee training on the principles of hygiene and preventing the spread of the COVID-19 and strengthening cooperation with suppliers (cooperation with suppliers to which we are sure to meet the food safety requirements) (Fig. 3).

Considering the number of years of the experience in business the answers were

varied (Fig. 4). For example, the companies operating in the food industry for 6 to 10 years indicated as the most important change the more frequent quality inspections as well as more frequent employee training on the principles of hygiene and preventing the spread of the COVID-19. Companies with less experience tended to downgrade changes caused by the pandemic. When we look at the answers on the basis of the number of employees of the companies we can see that the bigger companies usually gave higher ranks of changes caused by the pandemic (Fig. 5).

HACCP, GHP and GMP are to obligatory standards in the food industry. Companies operating in the food chain can also implement other standards such as ISO 22000 (Food safety management systems. Requirements for any organization in the food chain), IFS Food (International Featured Standard Food) or BRC Food (British Retail Consortium Food). Representatives of the companies taking participation in the survey were asked to decide if these standards were useful during the pandemic. 40.8% companies agreed that these standards were useful during the pandemic, however 25% of them didn't agree with this opinion and 34.2% were not able to evaluate the usefulness. The reasons why these standards were assessed as useful during the pandemic are presented in the figure 6.

The pandemic has generally drawn attention to the need for good hygiene and also the need for safety in various dimensions. Companies with 1-5 years of experience as well as companies with more than 20 years of experience more often than others indicated the answer about the usefulness of food safety standards during the pandemic. For companies with little experience food standards helped to organize their processes in the field of food safety assurance. For companies with bigger experience these standards showed the need and value of their implementation and continuous

development.

### **Negative and positive effect of the pandemic**

Companies were asked to indicate the positive and the negative effects of the pandemic. Among the positive effect they could choose: (1) the increase of the employees' awareness in the aspect of ensuring food safety and their behavior at the workplace and (2) reorganization of work, or indicate their own opinions. 40% of the respondents didn't notice the positive effects of the pandemic. The increase of the employees awareness was most often mentioned by the participants (40%). Among other positive aspects were in descending order of indications: the development of online sales, increased sales, increased number of food inspections, the possibility of obtaining funding. Apart from the positive aspects of the pandemic, survey participants also indicated negative ones from a closed list (conducting more frequent training, which requires more work and financial outlays; difficulties with the purchase of raw materials/deliveries in time; difficulties in meeting production schedule; lack of employees) and could propose their own answers (Fig. 7).

Companies having less experience (1 to 5 years) indicated the higher numbers of the negative aspects of the pandemic what may show that they were less prepared for the unpredicted situations and have less ability to cope with risks from the company external environment. As other authors showed staff awareness and hygiene are two of the most important attributes derived from the COVID-19 pandemic affecting food safety. Dudek & Spiewak (2022) on the basis of their analysis elaborated effective ways for the food system's actors to deal with the changing socio-economic situation (best practice) during the COVID-19 pandemic, these are: establishing, maintaining, developing and shortening direct relations with food consumer customers; increasing

the added value of offered products by increasing their health benefits, specifying production locations (local product), highlighting the products' flavour value, producing food in an environmentally friendly way (certified organic food); diversifying the channels and ways of selling products (middlemen, processing businesses, wholesalers and retailers, own sales outlets, including online shops); pursuing a pro-employee hiring policy (e.g., appropriate wages, good work conditions, maintaining long-term relationships with employees); launching food deliveries directly to customers (food boxes); following sanitary norms related to the pandemic during food production, such as social distancing, disinfection, wearing mouth and nose coverings, quarantine, extended work hours and shift work as well as increasing the emphasis on compliance with food safety and work safety rules.

Szczepaniak et al. (2020) concluded that food chains dealt well with the pandemic, there are no major difficulties in the functioning of food chains. There are segments in the food industry for which the COVID-19 pandemic created opportunities for an increase in production volume (e.g. products with a longer shelf life), as well as those whose sales collapsed partially or completely (e.g. products manufactured for the needs of the HoReCa sector). In a fast-growing period part of the spirits industry, namely alcohol producers, also benefited from the pandemic ethyl alcohol, as the demand - both domestic and foreign - for spirit as a disinfectant increased sharply.

## 6. Conclusions

The food sector turned out to be resilient to the external risk of the COVID-19 pandemic. Due to the provision of basic goods necessary for survival, food production could not be closed. For this reason, the food sector had to adapt to the new pandemic

reality and restrictions very quickly. To a large extent, food processing is manual work and limiting interpersonal contacts was also difficult. The food industry, as far as possible, introduced the recommendations of social distancing, wearing masks and disinfection, i.e. the 3 main recommendations of the government. In meeting these recommendations, the requirements of mandatory and optional food quality and safety assurance systems helped, i.e. disposable gloves, hygiene rules, protective clothing. Hygiene principles have always played a central role in food processing. Employees participated in training on maintaining hygiene at the workplace, in addition, the pandemic emphasized the importance of maintaining hygiene during food production. Business owners organized more frequent training in this area.

The COVID-19 pandemic as an external risk difficult to predict, has become an opportunity for some companies and a threat for others. It was, for example, an opportunity to increase production – for example food with a long shelf life, spirit. Other companies producing mainly for gastronomy or hotels had to limit their production due to smaller orders caused by the closure of gastronomy and hotels. For many companies, it was also an opportunity to start selling online. The implemented food standards helped to adapt to the pandemic situation due to the knowledge of the requirements of behavior at the workplace, the role of maintaining hygiene rules, quality and safety inspections, and generally standardization of processes. The pandemic has also shown the need for proper collaboration with suppliers and trust in the food chain. On the other hand, the only aspect in which the food standards did not help the functioning of the food industry during the pandemic was the lack of employees.

Summarizing, the food industry was the least affected by the negative effects of the pandemic among other industries, and the implemented food standards made it easier to adapt to the rapid changes in the external environment caused by the pandemic. However, as it was shown there are new challenges ahead in the food industry resulting from changes of consumers behavior and companies expectations caused by the COVID-19 pandemic. The food industry should collect the lessons learned from the pandemic and be well prepared for the future difficult to predict situations. The pandemic also showed that the trends in the market can change so it is important to monitor consumers requirements and answer them as much as it is possible. Another conclusion resulting from the pandemic is that it is worth strengthening what is good, for example to continue the high standards of food quality and safety, hygienic requirements, locally produced food with clean label. The pandemic also showed the need and possibilities of new technologies in the wide food sector, for example on line

selling, traceability systems, new technologies for food preservation.

One of the strategies in SWOT analysis (Strengths, Weaknesses, Opportunities, Threats) in the strategy maxi-mini what means that companies should strengthen their advantages, skills and minimize the threats from the outside. This strategy would be very good for the food sector for the time of the pandemic or after the pandemic. Food standards help to increase the strengths (and are the strengths in themselves) so to be more resistant to external threats like the pandemic or any other crisis that could come.

QUALITY  
RESEARCH **International Quality Conference**

---

*Dear friends,*

*By providing international platform, 14. International Quality Conference 2023 will gather experts from industry and academia in order to exchange ideas and present results of ongoing research in a range of topics.*

*This Conference has a motto "Quality, education, and innovation, the path to sustainable success".*

*We invite you to participate in this important event.*

*Sincerely yours,  
President of Organization Committee*

*Prof. dr Miladin Stefanovic*

*Mirjana Cvečković*

## PAST AND FUTURE DECADES OF WOMEN'S QUALITY OF WORK LIFE ON THE AXIS OF SOCIAL SUSTAINABILITY: TURKEY-SERBIA COMPARISON WITH EVALUATIONS, EXPECTATIONS AND RECOMMENDATIONS

**Abstract:** *With the awareness of women's power in working life, women are now seen as the key to social sustainable development. The evaluations to be made with the problem how the quality of work life of working women (in the light of criteria such as participation in employment (labor force), starting and maintaining entrepreneurship, entrepreneurship incentives, success, happiness, education, family support, salary, job satisfaction, position, etc.) has been interpreted in the last ten years, the expectations for the next ten years and the rates that will change by means of the proposed recommendations are the main subjects of this study. Interpreting the antecedents, results and future expectations of women's employment and women's work life quality in the countries with a comparison between Serbia and Turkey among the developing countries will show the importance given by the relevant nations to women employees on the axis of social sustainability.*

**Keywords:** *Social Sustainability, Women's Employment, Sustainable Quality of Work Life, Turkey, Serbia*

### 1. Introduction

Women and girls, who make up half of the world's population, are not among the first issues that come to mind when it comes to sustainability. Topics such as the climate crisis, energy problem, and water shortage generally take priority as more preferred by institutions that want to do something in the field of sustainability. Some of the depressing data on women and girls, who have to face a series of inequalities that start at the time of birth, in different areas throughout their lives, are as follows (Kolbay Hülya, 2023): Globally, approximately 15 million girls under the age of 18 are married every year.

One third of the developing countries have not been able to achieve gender equality in schooling. Worldwide, 35% of women are exposed to physical and psychological violence by their spouses, lovers or acquaintances. Approximately 133 million girls in Africa and the Middle East have been subjected to female genital mutilation. 80% of the 1.3 billion poor people in the world are women. Women are paid 24% less than men compared to the world average. Women and children are 14 times more likely to die in natural disasters than men. In 8 out of 10 households where water resources and access to water are limited, women and girls are responsible for collecting water. Women and

children constitute the majority of those who have to migrate due to climate change in the world.

The fact that women cannot find the place they deserve in society because of their gender, that they cannot be a decisive actor in politics, and that they cannot gain equal rights with men in the axis of home-work-social life are among the factors that drag not only women but also societies backwards and directly affect the sustainability of the world. In this context, knowing the antecedents and results of women's work life quality, taking measures by institutions, determining the steps to be taken especially by business life and private enterprises, and increasing the power of women in society will have a great impact.

This study considers the gender variable as one of the indicators of quality of work life and argues that there is a significant relationship between gender and quality of work life. It has also been proven by various studies (for example, Torlak Evinc & Yavuzcehre, 2008: 34; Castillion et al., 2005: 1232) that the quality of life of women is significantly lower than that of men. As a matter of fact, there are great differences in terms of gender, primarily in the fields of employment and education in underdeveloped and developing countries. Unpaid family work (housewife) is common among women living and not working in these countries, who are not allowed to work, and who come from conservative, patriarchal and traditional family circles, and women's quality of life depends on their husbands' work and social security (Torlak Evinc & Yavuzcehre, 2008: 34; Aydiner Boylu & Pacacioglu, 2016: 139). In these countries, different expectations and responsibilities such as cooking, cleaning, taking care of children and other family members, which are defined as gender roles and imposed on women by societies (Sabbah et al., 2003: 11; Shaphiro, 1998: 276), significantly lower women's quality of life.

On the other hand, business life, which is an indivisible part of life (DeCoster, 2004), comes to the fore in the interpretation of quality of life with its aspects that deeply affect people, including sadness and joy, victory and defeat, socialization and exclusion. When the studies that relate work life and quality of life are examined, it is observed that evaluations are made with the dimension of "satisfaction" (Aydiner Boylu & Pacacioglu, 2016). However, in this study, in the context of work-life quality, not only the factors that affect the level of satisfaction of the person, but also the current causes and consequences that increase and decrease the quality of women's work life by making a distinction in the context of gender are focused. When the literature is examined, while there are studies specific to women's labor force in the evaluation of perceptions of working life quality (for example, Momčilović et al., 2017, Pasli Gurdogan & Cetinkaya Uslusoy, 2019), no studies were found for the interpretation and comparison of the statistical data announced by the countries. In this context, it is thought to fill an important gap. In the related study, firstly, a literature review on the concept of quality of working life will be included, and then the data of the last ten years in the female workforce in Turkey and Serbia, two developing countries, will be interpreted. There will be general conclusions and discussion sections after the section, which will include evaluations of the changes for the next ten years, accompanied by predictions. As a result, the evaluation of the current situation for both countries will benefit the competent authorities in taking lessons and determining policies.

## **2. Review on the Concept of "Quality of Work Life"**

Working life is not a process that starts with the desire to have a job, which is to work, but ends with the end of the period of being active

at work. Because the financial gain, values, attitudes and judgments related to working life continue to be effective later on (Ozmete, 2002).

The quality of work life is basically a subject that includes different perspectives such as job design, reorganization, meeting basic human needs, harmonizing with values, in order to improve the relationship between the individual and the job, in order to increase the satisfaction of the individual with the work and working conditions. Therefore, it is a broad concept that includes moral elements such as a good and sufficient income, a material and safe working environment, human rights, human development, promotion opportunities, balancing work and other areas of life (family, friends, etc.), participation in decisions. It also tends to expand day by day. The concept was first used by Irving Bluestone for program design in increasing employee productivity in the 1960s (Goode, 1989). Later, in an international conference held in New York in 1972, the democratization of workplaces approach was discussed (Yousuf, 1995).

At the core of the concept of quality of working life with its developing structure since the 1970s, there are the following basic concepts (Ozmete, 2002): adequate and fair wages, safe and healthy working conditions, available opportunities for the use and development of human capacity, continuity of development and safety, social integration in the organization, communication in the organization, interaction between work and other areas of life, social responsibility in working life. Since the 2000s, elements such as "entrepreneurship, innovation, incentives and supports, activity in policy making, green recovery, green practices" have been added to this structure. In determining the quality of an individual's working life, it is important to understand the development, performance, participation and motivation process in working life. The level of contribution to the knowledge-skill-ability triad, the motivation

for the satisfaction of needs and ultimately the level of participation in organizational decisions, which an individual reveals as a result of his work, has a great share in the interpretation of the quality of working life.

Work life quality is a qualitative concept that aims to capture the essence of one's work experience (Easton & Van Laar, 2012). The concept takes its power from both work-related and non-work-related elements and workplace elements that can be directly affected by management (Bilge & Bilge, 2022). Since it is a multidimensional concept, it is difficult to come across a researcher who has fully defined the concept. Some have associated the concept with personality, psychological well-being or happiness (Easton & Van Laar, 2012), while others have measured it with job satisfaction (Efraty & Sirgy, 1990). Carlson (1980), on the other hand, defines the concept as a continuous process in achieving the determined goal with the active participation of employees, apart from seeing the concept as a goal in the context of the willingness of the business to develop. Therefore, it would be an erroneous approach to evaluate and measure the quality of work life based on only a single feature of the job or personality traits. In essence, each individual is different from each other, so it is useful to use more than one premise to measure the concept.

When the literature is examined, the quality of work life has been examined with the following concepts in recent years: affective well-being (Duyan et al., 2013), happiness (Pasli Gurdogan & Cetinkaya Uslusoy 2019), burnout (Mercan et al., 2023), job motivation and life satisfaction (Santas et al., 2018), stress and health (Momčilović et al., 2017). As a sample, research was conducted with a large number of participants from various sectors (for example, health, heavy industry). However, no study has been found that includes proportional evaluations of the antecedents and outcomes of women's work life quality. In this study, the work life quality

of the female workforce will be evaluated by taking into account the official researches of the two countries that are the subject of the study and especially the data in recent years.

### **3. The Place of Women in Working Life in Turkey with Statistics: The Last Ten Years**

First, general information about the population of Turkey will be given, and then the situation of women will be evaluated with statistics. In this context, according to the address-based population registration system data of the Turkish Statistical Institute (TUIK), the population of Turkey in 2022 is approximately 85.3 million, of which 42.7 million are males and 42.6 million are females (TUIK, 2023). In other words, 50.1% of the total population is men and 49.9% is women. In the related bulletin, it is stated that the median age is 34.2 years and women live longer than men in general.

In February, there were two major earthquakes in Kahramanmaraş, called the "disaster of the century" in Turkey. Due to the disaster, 10 provinces (Adıyaman, Gaziantep, Hatay, Kahramanmaraş, Kilis, Malatya, Osmaniye, Diyarbakır, Adana, Şanlıurfa) suffered various damages and had to be excluded from some statistical examinations. According to the results of the Household Labor Force Survey, the number of unemployed persons aged 15 and over is 3 million 514 thousand. Unemployment rate stands at 10.0%. While the unemployment rate is 8.7% for men, it is estimated to be 12.6% for women. While the workforce is 34 million 975 thousand people, the labor force participation rate is 53.6%. While the labor force participation rate is 71.2% for men, it is 36.4% for women. The number of people who immigrated to Turkey from abroad is approximately 740 thousand people in the last year. 51.9% of the migrant population is men and 48.1% is women. In addition, 12.1% of

the foreign population coming to Turkey are Iraqi citizens. On the contrary, the number of people who migrated abroad from Turkey is approximately 288 thousand people in the same year. 55.7% of the migrant population is men and 44.3% is women. When the age groups of the population immigrating from Turkey are examined, it is seen that the most immigrants are in the 25-29 age group with 14.4%. This age group is followed by the 30-34 age group with 12.3% and the 20-24 age group with 11.6%.

In Turkey, 49.9% of the total population is women and 50.1% is men. This proportional balance between women and men has changed in favor of women from the age group of 60 and above, due to the fact that women live longer. While the proportion of the female population is 52.2% in the 60-74 age group, it is 72.4% in the 90 and over age group. According to the results of the National Education Statistics Database, the ratio of the population aged 25 and over who completed at least one level of education in the total population increased between 2008 and 2021. While the proportion of individuals aged 25 and over who completed at least one education level in the total population was 81.1% in 2008, it was 92.1% in 2021. When this rate is analyzed by gender, while the rate of women aged 25 and over who completed at least one level of education in 2008 was 72.6%, the rate of men was 89.8%, this rate was 87.3% for women and 97.1% for men in 2021.

While the ratio of the population aged 25 and over who graduated from college and faculties, master's and doctorate degrees, in the total population was 9.8% in 2008, it became 23% in 2021. When this rate is analyzed by gender, while the rate of women aged 25 and over who graduated from higher education in 2008 is 7.6% and the rate of men is 12.1%, this rate is 20.9% for women and 25.1% for men in 2021. According to the results of the household labor force survey, the labor force participation rate for those

aged 15 and over was 51.4% in 2021. This rate was 32.8% for women and 70.3% for men. When the labor force participation rate is analyzed by education level, it is understood that the higher the education level of women, the more they participate in the labor force. While the labor force participation rate of illiterate women is 12.8%, the labor force participation rate of women with less than high school education is 25.3%, the labor force participation rate of high school graduate women is 32.5%, the labor force participation rate of women with vocational or technical high school graduates is 38.5%. The labor force participation rate of graduate women is 67.6%.

According to the results of the household labor force survey, the rate of employed people aged 15 and over in 2021 was 45.2%. This rate was 28.0% for women and 62.8% for men. The highest employment rate was in TR21 (Tekirdağ, Edirne, Kırklareli) region with 52.0%, and the lowest employment rate was in TRC3 (Mardin, Batman, Şırnak, Siirt) region with 29.9%. The highest female employment rate was 36.8% in the TR90 (Trabzon, Ordu, Giresun, Rize, Artvin, Gümüşhane) region. This region was followed by TR82 (Kastamonu, Çankırı, Sinop) with 35.6% and TR83 (Samsun, Tokat, Çorum, Amasya) with 33.8%. The lowest female employment rate was realized in TRC3 (Mardin, Batman, Şırnak, Siirt) region with 14.5%. This region was followed by TRC2 (Şanlıurfa, Diyarbakır) with 15.9% and TRB2 (Van, Muş, Bitlis, Hakkari) with 19.6%.

According to the results of the household labor force survey, the rate of part-time workers in employment was 9.9% in 2021. This rate was 16.4% for women and 7% for men. While the employment rate of individuals in the 25-49 age group with children under the age of 3 in their household was 59.8% in 2014, it is 58.9% in 2021. When this ratio is analyzed by gender, it is understood that the employment rate of

women in the 25-49 age group with children under the age of 3 in their household in 2021 is 26.1%, while the employment rate of men is 89.1%.

According to the results of the life satisfaction survey, it was observed that 63.2% of the employees in 2022 were satisfied with the time spent on commuting to work. It was observed that this rate was 67.5% for female employees and 61.5% for male employees. According to the data of the Ministry of Foreign Affairs, while the rate of female ambassadors was 11.9% in 2011, it became 27.2% in 2022. According to the data of the Grand National Assembly of Turkey, as of the end of 2022, the number of women deputies is 100 among 579 deputies. While the rate of female deputies entering the parliament was 9.1% in 2007, it became 17.3% in 2022. According to higher education statistics, the rate of female professors among professors working in higher education was 27.6% in the 2010-2011 academic year, while it was 33.2% in the 2021-2022 academic year. While the rate of women working in the associate professor staff was 40.2% in the 2021-2022 academic year, the rate of women working in the teaching staff was 50.8%. According to the results of the household workforce survey, the rate of women in senior and middle management positions in companies was 14.4% in 2012, while it was 20.7% in 2021. According to the results of the family structure survey, when the perceptions of individuals about women's work in 2021 are examined, the rate of those who think that women's work and their contribution to social life is valuable was 82.6%, while this rate was 85.6% for women and 79.5% for men. When the education gap between spouses in formal marriages is examined, it is seen that 39.4% of women are married to men with higher education than them in 2021. It was observed that the rate of women with higher education than their spouses was 15.9%, and the rate of spouses with the same education level was 42.8%. According to the divorce statistics, it

was seen that the custody of the children was mostly given to the mother as a result of the divorce cases that were finalized in 2022. While the rate of children given to the custody of the mother was 75.7%, the rate of children given to the custody of the father was 24.3%. According to the results of the family structure survey, when it is examined who does the housework in the household in 2021, it is seen that all the works are generally undertaken by a household member, except for the whitewashing/painting of the house. When the housework done by the household member is analyzed by gender, it is seen that women generally undertake the housework. Women were responsible for child care with 94.4%, laundry and dishwashing (even with a machine) with 85.6%, cooking with 85.4%, and daily tidying and cleaning of the house. The retirement age for women is 58.

According to the results of the household information technologies usage survey, the internet usage rate of individuals in the 16-74 age group in 2022 was 85.0%. While this rate was 80.9% for women, it was 89.1% for men. In addition, the rate of individuals in the 16-74 age group who ordered or purchased goods or services for personal use over the internet was 46.2% in the twelve-month period between April 2021 and March 2022. According to gender, the rate of ordering or purchasing goods or services over the internet was 42.7% for women and 49.7% for men.

According to the results of the life satisfaction survey, while the rate of those who felt insecure when walking alone at night in their neighborhood was 21.8% in 2022, this rate was 30.4% for women and 13.0% for men. 51.1% of women and 71.9% of men felt safe in their environment. While the rate of those who felt insecure while sitting alone at home was 5.0% in 2022, this rate was 6.8% for women and 3.2% for men. 80.5% of women and 88.2% of men felt safe while sitting alone at home.

The COVID-19 Pandemic has been a turning point in education, health and social fields for

many countries. As a matter of fact, this is also the case for Turkey. With the COVID-19 Pandemic in Turkey, the lives of some working women have become more difficult. In a study conducted by the Bread and Rose organization in 2021 with only women from various sectors, the measures taken in workplaces during the pandemic period were mostly found to be insufficient. It has been reported that the increasing need for cleaning in the workplace during the pandemic process is tried to be "solved" by sharing it among female workers working in production, not by employing new personnel for cleaning. The increase in the intensity of work in the relevant departments along with the increase in internet sales has led to the misinterpretation of flexible working and the uncertainty of working hours. The reason why women had to endure these conditions during this period when more work was started with fewer employees was the lack of job security and the fear of being fired. 95 percent of the women stated that they were more tired and exhausted than before the epidemic, 78 percent stated that they experienced "anxiety/anxiety", 53 percent "tension/irritability", and 51 percent "unhappiness".

Sustainable development in economy and social life is possible with the active participation of women, who make up half of the population, in all areas of life. Undoubtedly, the most important of these areas is participation in business life. Unfortunately, women's participation in business life in Turkey is still far behind what is desired. According to the Global Gender Gap Report published by the World Economic Forum in 2016, Turkey ranks 130th among 144 countries in eliminating gender inequalities in economy, education, health and politics. However, women's participation in the workforce presents significant opportunities for Turkey as well as for the rest of the world. According to the Women Matter report by McKinsey Turkey,

in the global economy, if equal participation of women in the workforce is ensured, a growth of between 12 and 28 trillion dollars in 2025 seems possible (Canakcı, 2018).

Along with all the depressing results, there are also pleasing developments. For example, a study titled "Women in Employment and Entrepreneurship" was conducted in 2022 with the cooperation of the Beko brand with Konda, and as a result of the interviews with 2789 people, the rate of continuing the business they established was 73 percent, while this rate was higher than that of men. The results of the research revealed that women are more successful in entrepreneurship than men. While the rate of women who said that they have successfully continued the initiative they started, was 31 percent, while this rate for men was 23 percent. While the women and men participating in the research expressed success in business life with the same words, these words stood out as: hard work, perseverance, struggle, courage, talent, intelligence and happiness. 47 percent of the participants measured the success of the woman by becoming a mother. 'Respectability' came first as a measure of success among working women with 36 percent. The propositions 'Women's work is not men's work' and 'It is not a problem for women to earn more' were also mostly supported by women. While 18 percent of the women participating in the study could not work on the grounds that they were dealing with child or patient care, 13 percent of the women came to the fore by being housewives. Among the participants, the rate of those who think that the society will become healthier with the increase of women's participation in business life is 76 percent. 90% of working women are of this opinion. In addition, 85 percent of women think that they should be encouraged to participate in business life. For working women, this rate rises to 94 percent. In Turkey, 85 percent of the respondents and 94 percent of working women argue that men

and women should receive equal wages (Seyda, 2022).

Finally, according to the latest data, the minimum wage in Turkey has been determined as 393.02 euros. The inflation rate is 12.09%. In addition, the gross domestic product per capita is calculated as approximately 8620 euros.

#### **4. The Place of Women in Working Life in Serbia with Statistics: The Last Ten Years**

First, general information about the Serbian population will be given, and then the situation of women will be evaluated with statistics. In this context, according to the Statistical Office of the Republic of Serbia address-based population registration system data, the population of Serbia in 2022 is approximately 6.6 million, with 3.2 million males and 3.4 million females (Statistical Office of the Republic of Serbia, 2023). In other words, 48.5% of the total population were men and 51.5% were women. In the related bulletin, it was stated that the total employment in the first quarter of 2023 was approximately 2.35 million people. Unemployment rate is around 9.4%. According to the latest data, female labour force participation was 46.62%. In other words, the percentage of the female population aged 15 and over with economic freedom is approximately 47% in Serbia (The Global Economy, 2023). Women's retirement age is 63.33 (Trading Economics, 2023).

In Serbia, women spend 2.2 times more time on unpaid household and care work than men. In recent years, women in Serbia have spent 19.2% of their day in unpaid work, while men 8.7%. According to the latest data taken in 2018, women in Serbia own more businesses than men (27%). In fact, with this ratio, the share of female business owners in Serbia falls into the fourth quintile among all countries for which data is available. The

percentage of respondents who reported having an account at a bank or other type of financial institution (on their own or with someone else) or using a mobile money service in person was 70.1% for women and 72.9% for men. In addition, women held 39.2% of the seats in the national parliament in Serbia in 2021. The proportion of women's seats in Serbia has increased since 2010. The current rate is above the average rate in upper-middle-income countries. Women represented 34.2% of those employed in senior and middle management in 2021. The share of female employment in senior and middle management in Serbia is in the third quintile among all countries for which data is available (The World Bank, 2022).

According to EuroFound's research, the frequency of work-life balance problems in Serbia is higher than the EU average. For example, in Serbia in 2016, 83% of respondents are too tired to do housework at least a few times a month. This also marked the highest share among all countries surveyed. Additionally, in Serbia, 66% of respondents had difficulty fulfilling their family responsibilities as they worked at least a few times a month in 2016, again a much larger proportion than the EU average of 38%. In addition, when the ratios by gender are examined, it is seen that the frequency of experiencing work-life balance problems in men and women is similar (EuroFound, 2016).

Finally, according to the latest data, the minimum wage in Serbia is set at 460.21 euros. Thus, in the January-February 2023 period, average net salaries and wages increased by 16.0 percent in nominal terms and by 0.1 percent in real terms compared to the same period of the previous year. It was observed that the inflation rate was declared as 16.2%. In addition, the gross domestic product per capita was calculated as approximately 6456 euros (Trading Economics, 2023).

In addition, although the exact rates could not

be reached, it was understood that female entrepreneurship in Serbia is less than male entrepreneurship, and that women's roles in the family – especially those who are entrepreneurs – are an obstacle to improving their quality of life (Momčilović et al., 2017).

## **5. The Place of Women in Working Life: Prospects for the Next Decade**

The portion of economic, environmental and social steps taken with a holistic approach on the protection of the future in the development of countries is undeniably high. With the main aim of finding solutions to the current and potential problems of our planet and leaving a more prosperous life to future generations, countries seek to be economically and socially prosperous, which can renew itself without harming the ecology, together with the decisions they take and the reports they publish. On the way to sustainable development, it is important to focus on the social dimension in terms of social benefit. In this context, businesses need to carry out their activities by taking into account the quality of life of the society and the next generations, to improve both the working and living conditions of their employees, and to ensure that they work more humanely and in prosperity. By making sustainability their policy, a total awareness is created in businesses. This change results in equal opportunity in all employee segments, transparency to all stakeholders, and sustainable value creation.

It has been observed that the business world has been reshaped and standards have changed after the COVID-19 Pandemic. The pattern of "working in the office" has been demolished, and the "remote working" system has been activated in most sectors. With the system change, there were serious decreases in costs, and changes in the demands and expectations of employers were observed. In the research conducted by many

institutions and organizations (for example, GOOINN), it has been pointed out that the business will grow in the fields of automation and research, development and supporting new technologies. It is also mentioned that with the emergence of new employment forms, it will be necessary to establish and regulate a universal protection and social protection system that will adapt to this, reduce inequality, and respond to new situations and needs. These things are expected from a society and a business in the axis of social sustainability.

There are also changes in the skills that will stand out in the future business world. The increase in communication possibilities, the digitization of the world and the rise of smart machines are transforming the sectors, and in this context, the expectations of the new generation employees are changing radically (Öndes, 2017). Ten skills that will be decisive in the business world in the next 10 years are discussed in the 'Skills for Future Professions 2020' report, recently published by the Future Institute, which is affiliated with the University of Phoenix. These skills are: intuition (seeing the deep meaning and significance behind what is being said), social intelligence (connecting with other people in a direct and deep way, understanding and adapting to their reactions), original and adaptive thinking (responding to an unexpected new situation), intercultural competence (language and keeping up with new conditions), numerical thinking (making a certain number of subjective data a summary content and making data-based reasoning), new user-added media literacy, interdisciplinary action (based on the understanding that some problems cannot be solved with a single discipline), cognitive load management (recognizing important information and learning how to improve cognitive function using various techniques), visual collaboration (being able to communicate with various parts of the world at the same time), and design mindset

(employee designing their own workspace). It is also expected that an ideal employee will be T-type in the next ten years. In other words, while the employees of the future specialize in at least one area, they should also have knowledge in other areas. Among the reasons that shape the skills in the business world of the future are the increase in life expectancy, the rise of smart machines and systems, the digital world, new media ecology, a constantly connected world and social technologies (WEF, 2020).

The future also requires change in managers and leaders. Now supports adaptive systems, has a flexible structure, inspires, cares about mental health and well-being, has the motivation and discipline to think critically, problem solving, active learning, self-control, resilience, stress tolerance, flexibility, positive thinking, empathy and action, There is a need for leaders who use digital tools and focus on quality (Yıldız, 2022). One thing we have learned with the COVID-19 Pandemic is that it will not be possible to meet today's needs for all stakeholders in working life with the current order and skills. Continuous renewal with multiple skills, strategic and future-oriented thinking and acting, and the role of facilitating leadership will become much more important.

## 6. Conclusion

There is no single agreed definition of the quality of work life. In addition, the reason for the quality of working life does not depend on a single factor. However, there is an understanding by most researchers that it is significant with job satisfaction. In any case, it seems essential for organizations that aim to increase the quality of work life, to see employees as valuable, to instill the feeling that they are the most valuable part of the organizational system. This approach also helps employees to work more motivated and willingly by meeting their socio-psychological needs (Momčilović et al.,

2017).

The concept of quality of working life seems to be meaningful together with the concept of "welfare". Because it is based on the subjective feelings of the employee in the organization and the main reason why different elements come to the fore when it is wanted to be defined by the person is that it is based on individual differences. While a person's well-being can only be measured with material elements such as "wage, salary", another person's initiation and maintenance of entrepreneurship can be mentioned together with spiritual factors such as community service level, job position, and happiness. As a result, the determinants of a working life quality are the high level of psychological well-being of the employee, being sure of the fair distribution of the wages, being seen as valuable in the organization, working in a job that matches his knowledge and skills and believing that he will develop, working in a safe and healthy environment, and having job security.

On the other hand, women are a catalyst for a fully socially sustainable life. It is obvious that they are able to do things beyond what they can do, at the point of balancing both their home and work lives. It is seen that societies add wealth with their productivity, success and perspectives at the point of sustainable development. In this article, some factors that increase the quality of women's work life are mentioned and socio-economic and socio-demographic structures of women are analysed in the light of the data obtained from the two nations. In this context, the relationship between the mentioned factors and the effects of women on the quality of working life has been tried to be revealed. The biggest limitation of the study is that the national language of the Serbian country to be researched is not known by the researcher, so only the texts written in English and because of the researches made by the official authorities are taken into account.

In summary, the basic statistical information on women in Turkey is as follows (TUIK, 2023);

- Women made up 49.9% of the population.
- Labour force participation rate of higher education graduate women is 67.6%.
- The employment rate of women is less than half of men.
- 67.5% of working women are satisfied with the time spent commuting to work.
- The rate of female deputies is 17.3%.
- The rate of women in managerial positions is 20.7%.
- Women are generally responsible for housework.
- 30.4% of women feel insecure when walking alone at night in their neighbourhood.
- Women's retirement age is 58.

In summary, the main statistical information for women in Serbia is (Statistical Office of the Republic of Serbia, 2023);

- 51.5% of the population consisted of women.
- Labour force participation was 46.62% among women.
- 27% of women are business owners.
- 70.1% of women have financial accounts.
- The proportion of seats reserved for women in the national parliament is 39.2%.
- Women represented 34.2% of those employed in the upper and middle management.
- Women's retirement age is 63.33.

When a short comparison is made in the light of the data obtained for both countries, it can be stated that the following factors are relatively more common in Serbia;

- Female population,
- Women's employment,
- The place of women at the top and middle management level,
- Number and proportion of female deputies in the parliament,
- Retirement age for women.

## THE POTENTIAL OF QWL INVESTMENT IN THE LOW-INCOME SERVICE SECTOR

**Abstract:** *This paper explores the potential benefits of implementing Quality of Work Life (QWL) tools in the low-income service sector, with a particular focus on the academic industry. By investing in QWL tools, academic institutions can create a positive work environment that fosters employee well-being, engagement, and motivation, leading to improved service quality outcomes and an enhanced student experience. The paper highlights the importance of QWL indicators such as work-life balance, job security, and employee development opportunities in promoting creativity, innovation, and continuous improvement in service organizations with a focus on academia as a service provider. It argues that companies that prioritize QWL can differentiate themselves in the marketplace, achieve higher employee retention rates, and provide better service to their customers. The paper draws upon relevant research to support the positive relationship between QWL and service quality, emphasizing its significance in the low-income service sector, such as academia. Overall, this paper suggests that investing in QWL tools can be a valuable strategy for academic institutions to improve service quality outcomes and enhance the overall student experience.*

**Keywords:** *QWL investment, service sector, employee well-being, service quality, work-life balance, employee retention.*

### 1. Introduction

In this paper, we explore the importance of QWL for the low-income service sector, with a focus on the academic industry. We review the challenges faced by low-income service workers in this industry and discuss how QWL initiatives can help address these challenges and improve employee well-being and service quality. We also provide examples of QWL initiatives that are relevant to the academic industry and highlight the potential benefits of implementing similar programs in academic institutions.

#### 1.1 Definition of QWL

Quality of Work Life (QWL) refers to the overall well-being of employees in the workplace, encompassing various aspects of their work environment and job experiences.

QWL is an umbrella term that covers a wide range of factors that can impact an employee's job satisfaction and overall sense of well-being, including work-life balance, job security, workplace culture, employee development opportunities, and more.

The dimensions of QWL include:

**Work-life balance:** This refers to the extent to which employees are able to balance their work responsibilities with their personal and family obligations. Organizations can support work-life balance by offering flexible work arrangements, such as telecommuting or flexible schedules.

**Job security:** Employees who feel secure in their jobs are likely to be more engaged and productive (Saxena, V. & Srivastava, R. K., 2015). Organizations can support job security by offering stable employment opportunities

and providing clear paths for career advancement.

**Employee development:** Providing opportunities for employees to learn and grow in their roles can enhance their job satisfaction and engagement (Markos, S. & Sridevi, M. S., 2010). Organizations can offer training programs, mentorship opportunities, and other resources to support employee development.

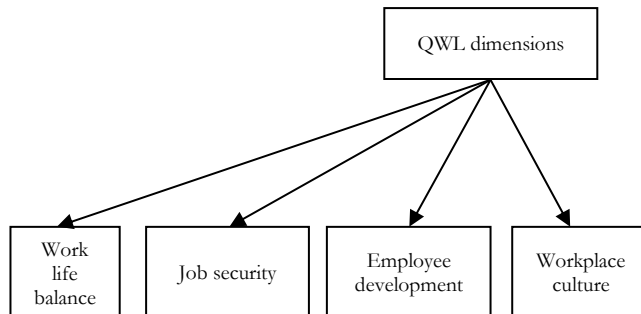

**Workplace culture:** A positive workplace culture can contribute to a sense of community and belonging among employees (Klein, K. J. & D'Aunno, T. A., 1986). Organizations can create a positive workplace culture by promoting open communication, recognizing employee contributions, and offering opportunities for employee feedback and input.

**1.2 The importance of QWL**

Quality of Work Life (QWL) is a crucial factor for organizations as it impacts various aspects of their functioning. By improving QWL indicators, organizations can create a positive work environment that fosters creativity, innovation, and continuous improvement (Li & Yeo, 2011). There are several mechanisms in which the implementation of QWL factors can contribute to organizations, as described below.

when employees feel satisfied and happy with their work environment, they tend to be more productive (Abou Elnaga, A., 2013), which ultimately benefits the organization. Higher productivity, in turn, can lead to better financial performance, employee retention, and reduced turnover rates. In addition, organizations that prioritize QWL and promote a positive work environment are more likely to attract and retain top talent. This is because employees are drawn to companies that prioritize their well-being and provide a positive work-life balance (Manning, A., 2016).

The most important argument relevant to this article is the fact that QWL has a direct impact on the quality of work that employees produce and the level of service that organizations can provide to their customers. It has been shown that companies that invest in QWL are more likely to achieve better service quality outcomes than companies that do not prioritize QWL (Mohamad, 2012). It has also been shown that QWL tools can also help service providers identify and address workplace issues that can impact service quality, such as employee turnover, absenteeism, and even burnout (Aarons 2006). When employees are motivated, engaged, and satisfied with their work environment, they are more likely to produce high-quality work and provide exceptional service to customers (Abou Elnaga, A., 2013).

**Figure 1. QWL dimensions**

### 1.3 definition and challenges of the low-income service sector

The low-income service sector is a broad term used to describe service jobs that typically pay lower wages and offer fewer benefits than jobs in other sectors. These jobs are often characterized by long hours, high levels of stress, and little job security (Borkakoty, A. et al., 2013). Examples of low-income service jobs include waiters, secretaries, security guards, and call center agents, among others.

Low-income service workers are faced with a multitude of challenges that impact their quality of life and job satisfaction. These challenges include low wages, irregular or unpredictable schedules, lack of job security, and limited opportunities for career advancement (Lambert, S. J., 1999). These workers may also be subject to poor working conditions, such as long working hours and limited break time (Lambert, S. J., 1999). These challenges can lead to high levels of stress and burnout, resulting in decreased job satisfaction and motivation, and ultimately, negatively impacting the service provided to customers (Lambert, S. J., 1999).

Moreover, the low-income service sector plays a critical role in the economy, providing essential services in industries such as healthcare, education, and hospitality (Francois, J., & Reinert, K., 1996). Despite their important contributions, low-income service workers often work in challenging conditions and earn wages that are insufficient to meet their needs.

In the context of the academic industry as a low-income service sector, it is important to consider the unique characteristics of this sector. One challenge is the limited funding and resources available for administrative support in academic institutions, leading to a heavy workload and the need to multitask (Casu, B., & Thanassoulis, E., 2006). Additionally, administrative roles in academia often require specialized knowledge and skills, which may not be

recognized or compensated appropriately. These employees also may face job insecurity and limited career advancement opportunities like in other low-income sectors. The characteristics of the work environment, such as a hierarchical structure and a culture of overwork, may further contribute to challenges for administrative employees (Sullivan, T. A., 2014). These challenges may contribute to inefficiencies and lower productivity within the administrative system, which can have a negative impact on the quality of education and research at the institution (Boštjančič, E., & Slana, Z., 2018).

### 2. the benefits of QWL in low-income service sector

The implementation of QWL factors can provide several benefits for low-income sector employees. Firstly, by improving the work environment, QWL can compensate for the low wages that these workers receive, leading to an overall improvement in their well-being, job satisfaction, and motivation (Gunawan, H., & Amalia, R., 2015). This can result in increased productivity and higher quality work, as well as reduced absenteeism and turnover rates (Aarons 2006). Secondly, QWL can provide opportunities for personal and professional development, which can lead to increased skills and knowledge, and ultimately, improved job prospects and wages. This can be particularly relevant for low-wage workers, who may have limited access to training and development opportunities.

Thirdly, by prioritizing QWL, organizations can create a positive image and reputation, which can attract more customers and ultimately lead to increased profits (Kulkarni, P. P., 2013). This can create a virtuous cycle, where higher profits can be used to provide better wages and benefits for workers, leading to further improvements in QWL and ultimately, better service quality outcomes.

By improving the work environment, providing opportunities for personal and professional development, and creating a positive image and reputation for the organization, QWL can compensate for the low wages that these workers may receive and provide them with meaningful and rewarding work experiences. Ultimately, this can lead to improved service quality outcomes and a more sustainable and equitable economy (Cavry, 1995).

### **2.1 the benefits of QWL in academia as a low-income sector**

Investing in QWL (Quality of Work Life) tools in the low-income secretarial sector of academia can have significant benefits for both the employees and the organization. As mentioned earlier, QWL tools can improve employee morale and job satisfaction, which in turn can lead to increased productivity, employee retention, and reduced turnover rates. In academia, this is especially important as the low-income secretarial sector plays a critical role in the student academic experience. These employees are often the first point of contact for students and are responsible for a wide range of tasks, such as handling inquiries, managing appointments, and processing administrative tasks.

By improving the QWL indicators in this sector, such as work-life balance, job security, and employee development opportunities, universities can create a positive work environment that fosters creativity, innovation, and continuous improvement (Li & Yeo, 2011). This can lead to employees who are better motivated, engaged, and committed to their work. As a result, they are more likely to provide high-quality service to students, which can improve the overall student experience and positively impact the reputation of the institution (Cavry, 1995).

Furthermore, investing in QWL tools in the low-income secretarial sector can also help universities to differentiate themselves from their competitors, attract top talent, and increase student enrollment (Zabadi, A. M. (2013). Students who have a positive experience with the university's administrative staff are more likely to recommend the institution to others, which can result in increased applications and ultimately increased revenue for the university (Meyer, C., & Schwager, A., 2007).

In summary, investing in QWL tools in the low-income secretarial sector of academia can have a range of benefits, including improving employee morale, increasing productivity, improving the quality of services provided to students, and attracting top talent and new students to the institution.

### **3. Conclusions & recommendations**

This article highlights the potential benefits of investing in Quality of Work Life (QWL) tools in the academic industry, which is a low-income service sector. By improving QWL indicators such as work-life balance, job security, and employee development opportunities, service organizations can create a positive work environment that promotes employee well-being, engagement, and motivation, leading to better service quality outcomes. Companies that prioritize QWL can differentiate themselves in the marketplace, achieve higher employee retention, and ultimately provide better service to their customers. QWL is an essential factor for organizations as it impacts various aspects of their functioning, and it has a direct impact on the quality of work that employees produce and the level of service that organizations can provide to their customers.

Based on the findings of this article, we recommend that academic institutions invest

in QWL tools to improve the well-being, engagement, and motivation of their secretary offering flexible work arrangements, stable employment opportunities, training programs, mentorship opportunities, and promoting open communication, recognizing employee contributions, and offering opportunities for employee feedback and input. It is also important to ensure that employees have a safe and healthy work environment, providing resources such as ergonomic workstations, health insurance, and mental health support to promote employee health and safety. By prioritizing QWL, academic institutions can attract and retain top talent, achieve higher employee retention, and ultimately provide better service to their students, enhancing the overall academic experience.

To be more concrete, here are a few recommendations of how to improve QWL in the secretary low-income sector of the

academia. First, improve working conditions; Secretarial service work can often involve long hours, repetitive tasks, and high stress. Providing ergonomic workstations, comfortable seating, and appropriate lighting can help improve the physical working conditions. Additionally, provide training and development opportunities: Offering professional development opportunities, such as training workshops, webinars, and conferences, can help employees enhance their skills and knowledge, which can lead to increased job satisfaction and motivation. Encouraging employees to pursue higher education or certifications can also be beneficial.

By implementing these recommendations, academic institutions can create a work environment that prioritizes employee well-being and ultimately leads to increased productivity, job satisfaction, and employee retention.

## SOCIAL JUSTICE IN VIETNAM: REALITY AND SOLUTIONS

**Abstract:** *The issue of social justice is a fundamental issue of each era and has a great topical significance because it is posed together with human existence, associated with dreams and aspirations towards a nice and happy life. After all, the goal of economic growth is to serve people, the subject of development, fairly and progressively. Because, "Humans, ultimately mastering their social existence, are also thereby mastering nature, mastering themselves, and becoming a free man" (Marx & Engels, 1995, p.333). It is further confirmed in the United Nations Human Development Report (1995) when it says: "what does development mean without regard to human life?". The purpose of economic development, after all, is only a means to serve human development. It is people who create conditions, seize opportunities, and turn them into a driving force to realize their development goals, which in turn will promote socio-economic development. In the process of international integration, Vietnam has actively implemented policies to achieve social justice and has achieved certain results, contributing to improving the living standards of all people. There are certain limitations that need to be addressed to realize social justice in all of social life. The article analyzes the viewpoints and practices of implementing social justice in Vietnam, thereby proposing solutions to effectively implement social justice in Vietnam today.*

**Keywords:** *Social Justice; Social Development, Perspective; Practice, Vietnam*

### 1. Introduction

Social justice is a fundamental value that every society aspires to achieve. It has an essential role in creating stability and social development in each country. The history of human development shows that all social movements leading to uprisings of social classes originate from injustice in life and. Their goal is to overthrow the old regime to and create a new state that is more progressive, bringing justice and equality to every individual and society. On the contrary, in any community, when Social

Justice is well implemented in social relations, members of society feel that they are respected, and deservedly compensated. People will more voluntarily devote themselves to the common cause. Therefore, social justice is a basic value in life, it is also the goal, as well as the means and driving force of progress and social development in all countries.

Currently, countries around the world, including Vietnam, are strongly affected by the industrial revolution 4.0. In that context, the issue of implementing social justice becomes more urgent. Vietnam is a

---

Email: [nm.tri@hutech.edu.vn](mailto:nm.tri@hutech.edu.vn)

developing country, with a middle-income level, and people's living standards have improved markedly. However, the implementation of social justice still has limitations, such as low child income, an increasing gap between rich and poor, an upward rate of re-poor, and unsustainable implementation of social security, which harm negatively affected the goal of social justice socio-economic development goals. Therefore, raising awareness about social justice, so that "no one is left behind" is an urgent requirement for sustainable development in Vietnam today.

## **2. Research Questions**

The article focuses on clarifying the research questions, which is also the orientation in which the report conducts research:

- What are the results of implementing social justice in Vietnam?
- What is the well-implemented social justice solution in Vietnam?

## **3. Literature Review**

Regarding the topic of the article, there are significant works such as the Research Work on Economic Growth and Social Justice in Some Asian Countries and Vietnam which have confirmed that economic growth is a condition for reducing inequality, but the low level of inequality also encourages inequality and encourages growth. Therefore, the author analyzes the models as well as the lessons learned in some Asian countries, which are suggestive and referencing (Linh, 1998). Social progress - some urgent theoretical issues have been raised about the theory of movement, development, and progress, distinguishing the similarities and differences between these three concepts. In particular, the author has systematized typical views on social progress and standards of social progress in

the history of philosophy before Marx: from Heziot, Confucius, Plato, Aristotle, J.Vico, Henvetius, J. Russo, D. Didero, J. Condolences to G.V. Then Hegel went to Marx, Engels, Lenin, and Ho Chi Minh, combining them with some modern conceptions. At the same time, social progress is viewed from two angles: social and moral progress with socio-cultural progress (Chuan, 2000).

In the book On social progress in the market economy, the concept of social progress has been presented quite fully over the periods and some typical conceptions of the standards of social justice, the author also clarifies that the development of the market economy affects justice and social progress. (Vuong, 2004)

The concept and practice of fast-paced, high-quality sustainable economic and social development in Vietnam commented: "Economic theories have achieved only very limited success in describing the vivid and diverse real world of human development. No theory has yet been as successful as it promises to be. The repetition of general prescriptions (e.g., neoliberal structural reform programs) for the whole world, blindly adhering to a certain doctrine while ignoring individual objective realities of each country's social, political, and economic aspects, is an action that often has bad consequences. In each country, each person cannot blindly and mechanically follow any development theory but they must actively and flexibly decide and implement their development path according to the circumstances of the country, the historical tradition, and the identity of the nation, in line with the trend of the times. Only then can success" (An, 2005); "human is the central factor in realizing the combined goal" (Nga, 2007); Economic growth and social progress in the process of international integration in Vietnam. The author said: "Vietnam has made great achievements in realizing economic growth goes hand in

hand with social progress.” However, the contradiction between economic development and social progress is also very serious and harsh” (Tri &Hau, 2021).

In the article Development of social security in Vietnam: Current situation and solutions, the authors said that Development of the Social Security in Vietnam: Reality and Solutions, the authors argue that: “In the process of international integration, Vietnam has built a synchronous social security system, especially policies on job creation, minimum income guarantees for people; social insurance to compensate for the reduced income in case of illness, labor accident, old age; irregular and regular social assistance; providing basic social services in terms of health, education, preferential policies for people with meritorious services, etc. These are pioneering achievements in the implementation of Vietnam's Millennium Development Goals, which have been recognized and praised by the United Nations. However, the current social security system in Vietnam has not yet met the needs of society as policies have been promulgated a lot, but are not synchronized, and have not reached the hands of those who need support when implementing them declared in fact. The quality of public services is still low, and security measures to overcome difficulties in unusual conditions, such as the Covid-19 pandemic, are still delayed and have not yet ensured fairness, inclusiveness, and sustainability. The social security system in the new situation needs to clearly define development goals for the people, attach importance to social inclusion, and fundamentally change the perception of the position and role of communities, businesses, and regions' private sector in the pillars of well-being, reducing the burden of state subsidies and deepening international integration”(Tri, et al, 2022); "To maintain a stable macroeconomic environment on the basis of economic promotion restructuring associated with renewing the economic

growth model, improving productivity, quality and performance of the economy” (Tri, 2022).

In general, most of these works continue to clarify the roles, practices, and solutions for implementing social justice in countries around the world in general and Vietnam in particular, from which to conclude lessons learned.

#### 4. Method

Social justice is an early phrase appearing in political and social life. Historically, social justice has been mentioned since ancient times in different ideological forms: religious, cultural, and political. Interestingly, each form of ideology has a different conception of social justice. This demonstrates that the concept of social justice appeared quite early, in various form, and parallel with the development history of societies.

The issue of social justice has received more attention from the social sciences in recent centuries from the perspective of disciplines such as philosophy, politics, psychology, sociology, etc. each industry has a different interpretation of social justice. Within the framework of this article, we limit the issue of social justice from the perspective of Marxist philosophy.

In the Dictionary of Sociology of Nguyen KhacVien, two concepts are raised: Equity is the proportion between "dedication" and "enjoyment" in the condition that everyone has the same conditions and opportunities (this should remove inheritance privileges...). Another view holds that social wealth must be distributed according to the needs of each person so that all individuals are equal in material terms, etc (Vien, 1994, p. 43).

As for Marshal's Oxford Sociological Dictionary, social justice is expressed in many aspects. First, fairness is an exchange

that is equal in the rate of expenditure and income of all parties involved in the exchange. Second, distributive equity includes the unidirectional distribution of resources over rights, duties, or anything else among the entire recognized group of people. Third, procedural fairness, or procedures and mechanisms that are fair to all, also recognized that a due process that is fair and agreed upon by all can nevertheless lead to a distribution of results that some might consider unfair. Fourth, reward fairness involves fairness in specifying punishments, or levels of compensation, for being victimized. And finally, equity as equality can be equality of opportunity, equality of objective outcomes, subjective equality (equality of outcomes that takes into account public needs or values labour), positional equality (where rewards are distributed according to standard expectations to avoid feeling unjust), or parity (equality of individual contributions) (Marshal, 2010, p.108-109).

When referring to social justice, Ho Chi Minh wrote: "The people have obligations and rights at the same time" (Minh, 2011, vol.8, p.264). In the conditions after gaining independence, Ho Chi Minh always emphasized: "Our country is a democracy. How many benefits are for the people. How much power belongs to the people" (Minh, 2011, vol.6, p.232); "Our state today belongs to all workers. Therefore, workers, farmers, and revolutionary intellectuals need to realize that: Currently, our working people are the masters of our country, not employees of the exploiting class as in the old days. We have the right and enough conditions to build our own free and happy life. The working people are the collective owners of all material and cultural wealth and are equal in rights and obligations" (Minh, 2011, vol.13, p.66).

According to Ho Chi Minh, the purpose of building socialism is to constantly improve people's living standards and ensure fairness

and social progress. The goal of economic development is to raise people's living standards, to make people's lives more and more prosperous and happy. Material life, according to him, first deals with food, clothing, housing, and medical treatment. In other words, social progress is achieved when each person has more and more conditions for development; in which case, the prerequisite is to be the master of their destiny and that of their country, is to "make sure the people have enough to eat, enough clothing, more and more happiness, everyone can go to school, get sick but have medicine, if the elderly do not work, they can rest (...). In short, society is getting more and more advanced, the material is increasing, the spirit is getting better" (Minh, 2011, vol. 9, p.591). Such a society can only be socialist. He also affirmed that it is not only when economic conditions are improved that social progress can be realized, but it must be done when people's lives are still facing many difficulties.

Implementing social justice within the actual conditions of the country is always a pressing issue in social life. People will hardly satisfy all their needs as desired, especially when life is full of difficulties and deprivations people can readily accept it and try to find a way to overcome it, but they cannot accept social injustice caused by the unfair distribution situation.

By absorbing, inheriting, and developing theories on social justice along with summarizing practical experiences in our country and other countries in the world, Vietnam always asserts: "Associating economic growth with progress, social justice; promoting the human factor, taking people as the center; promoting the role of culture - the spiritual foundation of society, the goal and driving force of development" (Communist Party of Vietnam, 2021, p.99). To realize equality of development opportunities, our Party always emphasizes on the "dual" goal of social justice, both in

terms of economic efficiency and social efficiency, focusing on development goals. The XIII Congress of the Party not only emphasized the role of the State but also attached great importance to: "Promoting the role of social and socio-professional organizations participating in the formation and regulation of the public relations market economic system. Handle well the inadequacies of the market mechanism, ensure social welfare and security, national defense, security and protect the ecological environment" (Communist Party of Vietnam, 2021, p.133). This is also the basis for us to strive to soon complete the goals under the 2030 Agenda for Sustainable Development of the United Nations, emphasized by the 13th Party Congress: "Development for people, creating conditions for everyone, especially children, disadvantaged groups, ethnic minorities, and migrants to integrate, have equal access to resources, development opportunities and equitable enjoyment of social basic services. Continue to perfect and implement the policies of ethnic equality, solidarity, and mutual development" (Communist Party of Vietnam, 2021, p.150).

Along with a summary of the country's development process over more than 35 years of innovation in both theory and practice, the document of the 13th National Party Congress of our Party summarizes: "Associating economic growth with progressive implementation and social balance; promoting the human factor, taking the people as the center; promoting the role of culture - the spiritual foundation of society, the goal and driving force of development" (Communist Party of Vietnam, 2021, p.99). To realize equality of development opportunities, our Party always emphasizes on the "dual" goal of social justice, both in terms of economic efficiency and social efficiency, focusing on development goals. At the same time, Vietnam needs to strengthen social development management, ensure social

justice and sustainability in social development policies, especially social welfare, and social security; synchronously and comprehensively implement economic, progressive, social, and environmental justice goals, on that basis renew and rationally allocate resources to improve the efficiency of social development. Building and implementing institutions and policies for social development at the same time, as well as managing sustainable and harmonious social development. It is necessary to correctly forecast the trend of social restructuring in our country in the coming years to build social policies and manage social development according to the development conditions of the country; at the same time, harmoniously handle social relations, control social stratification, and promptly and effectively handle risks, conflicts, and social conflicts, ensure social order and safety, and protect the legitimate rights and interests of the people.

Thus, the essence of social justice is to liberate people and gradually realize people's lofty dreams and aspirations; bringing into play the dynamism and creativity of people in all areas of society, so that society is considered progressive and fair. In other words, social justice is both a standard of social progress and a condition for social progress to be realized. Social justice refers to the equality between people in a certain aspect, usually a matter of obligations and rights, between contributions and enjoyment. Social justice expresses human aspirations and is the goal and driving force of social development. Social justice is to be implemented in all fields (economic, social, cultural...) based on ensuring the equivalence between the creation and distribution of social benefits. Social justice is expressed in the following aspects: (i) in economic terms, social justice is considered as the ratio between the contributions of individuals and social groups to the production process and the contributions of social groups to the

production process. the enjoyment of production results - this is the most basic aspect of social justice; (ii) concerning the political and legal aspects of social justice, relating to and regulating issues of democracy, individual freedom, human rights, party leadership, and state management; (iii) regarding the socio-cultural aspect of social justice, relating to and stipulating issues of ethics, customs, practices, social stratification, and social security; the problem of opportunities for the creation and enjoyment of cultural and artistic achievements.

The article is made based on the worldview and methodology of Marxism, and the views of scientists and organizations in the world and Vietnam on social progress. The historical and logical method summarizes the fundamental problems, the dynamic trends of social progressive development, and the issues that need to be solved. At the same time, the article also uses a synthesis of specific research methods such as comparison, analysis, synthesis, induction and inference, data synthesis, etc. to serve the research and presentation of the article.

## **5. Results of implementing social justice in Vietnam**

Before innovate, the economy in Vietnam only existed in two forms of ownership by the entire people and by collective ownership; Private property must not exist. Since "Doimoi", Since "Doimoi", the fundamental change has been recognized in various forms of ownership, such as ownership by the entire people, collective ownership, individual ownership, smallholder ownership, and property ownership with private capital. Accordingly, the economy has many components with conditions for existence and development. The Party's great orientation on economic development sets forth the following

requirements: "Develop a socialist-oriented market economy with many forms of ownership, different economic sectors, forms of business organization, and forms of economic development distribution methods" (Communist Party of Vietnam, 2011, p. 73). In which, the subjects of all economic sectors are equal, cooperate and compete according to the law; the market plays a key role in effectively mobilizing and allocating development resources, which is the main driving force to release productive power; State resources are allocated according to strategies, master plans and plans in line with the market mechanism. The state's roles are orienting, building, and perfecting economic institutions, creating an equal, transparent, and healthy competitive environment; using tools, policies, and resources of the State to orient and regulate the economy, promoting production and business and protect the environment; and implementing social progress and justice in each step and development policy. The market economy has created equal opportunities for all members of society in accessing resources, actively choosing production, and choosing markets. Remove subsidies. All transactions related to resources and production results are subject to market laws; The State protects the property rights and legitimate interests of economic owners and ensures fair competition. Consumers are free to choose products. The relationship between producers and consumers is equal the price of goods is an agreement between the seller and the buyer. That is social justice in the market. As a result, the society's resources have been aroused and put into use, creating conditions to promote the growth of the economy by over 5.8%/year (period 2011 - 2015) and 6%/year (period 2016 - 2020) (Communist Party of Vietnam, 2021, p.8). It shows that Vietnam's economy has had outstanding development, openness, and high integration. That result has an important

contribution to Vietnam's extensive international economic integration and opening up. International integration is an important factor in promoting the development of Vietnam's economy.

The results of high and stable economic growth in Vietnam in recent years have created favorable conditions for the State to mobilize resources and solve social problems.

- About job settlement. Job creation is an important part of the socio-economic development strategy, contributing to the livelihoods of workers. With high economic growth, workers have more opportunities to create jobs and find jobs. The number of jobs increased from 29,412 million people in 1990 to 52.3 million people in 2012. In 5 years (2011-2015), the labor market has developed, creating jobs for about 7.8 million people, of which about 469 thousand people go to work abroad (Communist Party of Vietnam, 2016, p.238). Along with the process of creating jobs for workers, reducing the urban unemployment rate, and increasing the employment rate in rural areas. The unemployment rate in the age group in 1998 was 6.9%, decreased to 2.3% in 2015, and increased to 3.88% in 2020 (Communist Party of Vietnam, 2021, p.8) due to the impact of the pandemic. The Covid epidemic has seriously affected the production activities of many businesses, while according to the ILO in 2020, the number of people who lost their jobs increased to an unprecedented high (additional 33 million people lost their jobs) of the total number of people who lost their jobs. 220 million people and a global unemployment rate of 6.5% (Anh, 2020), making this the most severe crisis the global job market has experienced since the Great Depression recession occurred in the 1930s.

At the same time, awareness of vocational training, and the development of vocational education in the whole society and the people have had a dramatic change; the

position and role of the vocational education system in the national education system have been enhanced. Vocational education results have contributed to improving the quality of human resources. According to the latest report of UNDP (December 16, 2020), Vietnam is classified in the group of "high human development countries", ranked at 117 out of 189 countries; The human capital index (HCI) is second only to Singapore in Southeast Asia (World Bank Report, 2020).

Thus, Vietnam achieved the above results because the Party and State consider job creation as a priority direction in the realization of social progress, with the view that "Career is the root of people's livelihood".

- On hunger eradication and poverty reduction. Per capita income has increased continuously over the years, and people's living standards in regions, especially the poor have improved, so the poverty rate has decreased continuously at a high level in the whole country. Specifically, in 1993 the country had 58.1% poor households, by 2015 it was less than 4.5%, (particularly in extremely difficult areas, less than 30%) (Communist Party of Vietnam, 2016, p.110); the human development index (HDI) increased from 0.683 (in 2000) to 0.728 (in 2011), ranking 128/187 countries, in the upper middle group of the world; In 2011, our country completed 6/8 of the Millennium Development Goals (MDGs) which set by the United Nations for developing countries by 2015. Currently, Vietnam is implementing the Targeted Reduction Program. Sustainable poverty in the 2016-2020 period was strongly implemented, shifting from a single-dimensional approach to a multi-dimensional approach, focusing on the poorest groups and households. The rate of multidimensionally poor households in the whole country will decrease from 9.88% at the end of 2015 to less than 3% in 2020, on average in the period 2016 to 2020, it will decrease by more than 1.4%/year

(Communist Party of Vietnam, 2021, p. 43). The World Bank's Vietnam development report assessed: that Vietnam's achievements in hunger eradication and poverty reduction are among the most successful stories in the process of economic development.

- About social insurance. Vietnam considers social insurance work as one of the key tasks of the socio-economic development process, ensuring the rights and obligations of millions of workers. In recent years, based on stable economic growth, the number of participants in social insurance has increased rapidly, contributing to ensuring the safety of employees when facing risks in life. The rate of participation in compulsory social insurance, voluntary insurance, and unemployment insurance is increasing, contributing to ensuring safety when workers encounter risks in production. Currently, Vietnam continues to invest in building new and upgrading, expanding many hospitals, developing sea and island healthcare, and encouraging the development of non-public healthcare. People's types of insurance are increasingly expanding with diverse products. The subjects participating in social insurance, health insurance, and unemployment insurance are increasing day by day and enjoying the regimes and benefits by regulations. The number of people participating in social insurance reached more than 11.5 million. Health insurance coverage is over 90% of the population (Communist Party of Vietnam, 2021, p.65).

- Social assistance work has gradually shifted to a human rights-based, human-centered approach. The beneficiaries of social assistance were expanded, and the standard of social assistance was adjusted to increase, creating conditions and opportunities for the disadvantaged to stabilize their lives with the movements of "Muslim, Mutual Aid", "Fund for the poor", "Grateful return", "Drink water, remember the source" are held regularly and attract the response of many social forces, significantly

contributing to improving social security for all people, especially the poor and poor areas.

- On education and training. Developing education and training not only plays a role in promoting economic development but also affects people's basic development, ensuring equity and sustainable social progress. To create opportunities and conditions for children in poor households, ethnic minority children in disadvantaged areas, helpless children, etc. to access basic education, the Government has issued many policies on tuition waivers and reductions and other preferential policies. In recent years, education and training have grown in size, diversifying classes from preschool, and primary school to college and university. In 2000, the whole country reached the national standard on illiteracy eradication and primary school universalization by the end of 2010, and most of the provinces achieved lower secondary education standards. The rate of students graduating from high school in the 2016-2017 school year accounted for 97.94%; the national literacy rate of the population aged 15 and over is 95.1%; 100% of provinces and cities meet the standards of preschool education universalization (General Statistics Office, 2018, p.120). Thus, the implementation of social progress in education has been improved, especially in creating learning opportunities and conditions for ethnic minorities, remote and isolated areas, children of poor families, and children with disabilities, who have made remarkable progress. The education system has initially been diversified in terms of types, methods, and resources, gradually integrating with the general trend of world education. From an education system with only public schools and mainly of the formal type, there are now non-public schools, with many types of informality, open schools, and training methods from around the world distance, the method of training associated with foreign countries.

- The capacity of the system of medical facilities is consolidated and developed. As a result, people have easier access to medical services. In addition, medical facilities and equipment are also focused on investment, better meeting the people's medical examination and treatment needs... Vietnam is one of the few countries with a comprehensive health system that has been adjusted and organized widely to villages and hamlets; it has mastered many world-class high-tech techniques such as limb, heart, liver, and kidney transplants...; it controls many dangerous diseases, including Covid-19; and it proactively produces many types of preventive vaccines, most recently a vaccine against Covid-19...The average life expectancy of people increased from 62 years old in 1990 to 73.7 years old in 2020. In 2019, the development index Human development (HDI) of our country reached 0.704, belonging to the group with the highest HDI in the world, especially compared to other countries with the same level of development (Trong, 2021).

However, besides the above-mentioned outstanding results and achievements, "There are still signs of not paying due attention to ensuring socialist-oriented development; ... ensuring social welfare, implementing social progress and justice in the development of the market economy; the overall and synchronous development of regions, regions, and localities has not yet been ensured according to comparative advantages and to promote specific socio-economic conditions" (Communist Party of Vietnam, 2021, p. 108). Policies and laws are not synchronized; organization and management model; the effectiveness of social management still has many limitations and shortcomings. Poverty reduction is not sustainable; a part of the poor, poor communes have the ideology of dependence, looking forward to the support of the State. Education and health care in mountainous, highland, and ethnic minority areas are still

limited. Medicines, traffic, labor, and food are not safe. Crime and social evils are still hidden and complicated in many places. The principle of distribution by labor has not been thoroughly implemented; "Policies on salary, income, social insurance, health insurance, and social welfare are not effective; the benefits of the people from the country's development achievements have not been harmonized" (Communist Party of Vietnam, 2021, p.86). Although the unemployment rate in the working-age population decreased from 2.88% in 2010 to 2.5% in 2020, the professional and technical qualifications of Vietnamese workers are still weak in quality. There is a shortage in quantity, nearly 80% of employees are untrained (General Statistics Office, 2020, p.164), some part of laborers have been trained or are used in the wrong profession, they have to be trained to create new jobs that can work in enterprises, and there is a serious shortage of highly qualified technical workers and high-class service workers (finance, banking,...); the number of poor and unemployed is still high.

A selfish and self-interested lifestyle also began to form and has increasingly penetrated many strata of society. The lifestyle in favor of enjoyment, and living in a hurry is gradually destroying the personalities of many people, leading to many traditional values gradually becoming obsolete. Meanwhile, the crisis of trust is also a major obstacle to the establishment of social relations and the realization of economic and political goals. Along with that, sexual abuse, child abuse, and deviant behavior of students tend to increase; school violence is common among female students; a part of teachers and teachers have a decline in personality and morality, which adversely affects the image of the teaching profession... increasing the crisis of trust in society.

These limitations and inadequacies show that the implementation of social justice in

Vietnam is not synchronized, compatible, and in harmony with political and cultural development.

## **6. Solutions for social progress in Vietnam**

First of all, in macroeconomic policymaking, the relationship between economic growth and social justice must be harmoniously resolved, step by step, firmly and synchronously with both goals of economic and social justice. Continue to strongly affirm the need and importance of social justice implementation. From there, it serves as a solid basis for the formulation of the State's guidelines, policies, and laws on the implementation of social justice throughout the development process. Raising awareness among all levels, sectors, and the whole population about the relationship between economic growth and social security; especially in agencies that plan and implement socio-economic development policies. Do not let misconceptions in the planning and implementation of economic policies forget about the need to harmonize with policies to implement social justice.

Second, it is necessary to have a new mindset about progress and social justice in the new era. The implementation of policies to create equity in Vietnam in the past seems to be only on the "surface" and has not yet solved the root cause of poverty, the core of poverty is inequality of opportunities, thereby solving the problem. Necessary synchronous solutions have not been fully focused on and implemented. Therefore, in the coming time, besides continuing to implement subsidy programs and redistributing income, it is necessary to change the mindset in formulating measures to tackle the root of poverty to implement poverty reduction measures poverty reduction program progress, and social justice. To do this, the orientation in the coming time is: To promote comprehensive

development of human resources; improve the effectiveness and practicality of education and training; support the poor to participate in radiology services; labor market development.

Third, deal well with labor, employment, and income, ensuring the quality of people's lives. Job creation is one of the important policies of each country, especially for developing countries like Vietnam. Lack of work, no jobs, or jobs with low productivity and income will not be able to help people secure their lives and develop sustainably. Having a job and increasing income will help people be able to meet their legitimate material and spiritual needs, help them access good quality services, improve their status in society, and integrate with the surrounding environment. In that spirit, all levels and sectors need to promote social investment promotion, create more jobs, develop and perfect policies on wages and salaries, and fundamentally overcome irrationalities. In which, attaching importance to improving the quality of human resources; Vocational training and job creation for workers must be associated with socio-economic planning, economic development programs, occupations, and orientations for economic restructuring of each locality. Continuing to improve labor protection policies, and promoting labor export is an important solution in creating jobs, meeting practical needs, contributing to increasing incomes, and improving skills for workers' current motion.

Fourth, actively prepare necessary resources, which focus on mobilizing social resources in the implementation of social security to ensure social justice. When promulgating social policies, it is necessary to ensure material resources from the state budget and other sources for the implementation of such policies to create trust among people and all classes of society.

It should be clearly defined that the state still plays a leading role in organizing the implementation of social policies. It mainly focuses on building mechanisms and policies, to ensure minimum law enforcement and support. To maintain a good social safety net, the state must gradually reform the social security system toward socialization in order to reduce the burden on the budget and be suitable for socio-economic conditions. Mobilize humanitarian contributions of domestic and foreign organizations and individuals to participate in the implementation of social security programs.

Fifth, expand the scope and beneficiaries of social welfare in stages suitable to the level of socio-economic development. Vietnam is a developing country, the economy is not yet strong enough to deploy a comprehensive social welfare system, therefore, in the process of implementing the social welfare system, it is necessary to proceed step by step, prioritizing the implementation of the social welfare system for disadvantaged groups, the elderly, young children, the disabled..., then gradually expand the beneficiary group, accelerate and promote forms of socialization of social welfare activities. Experience in many countries with successful social welfare models shows that the private sector is a key force in creating social welfare funds while creating conditions for people to freely choose. Choose your form of protection.

Sixth, enlist international support. It is the material and spiritual help, the sharing of knowledge and experience to help countries facing difficulties in solving the relationship between economic growth and social security policies. To be able to enlist the help

of friends from international organizations. To do so, Vietnam needs to strengthen propaganda and promotion of foreign aid-seeking programs; use it for the right purpose as committed when receiving aid; publicity, and transparency in the use of international aid.

## 7. Conclusion

Implementing social justice is a correct and transparent policy of the Party in leading the country. The basic purpose of the social justice policy is to ensure people's living standards and socio-political stability. Implementing social justice is both a goal and a driving force for comprehensive human development, an important measure in realizing the country's sustainable development goals. In the process of international integration, Vietnam has achieved positive results in the implementation of socio-economic development policies to ensure social justice. However, Vietnam is still facing many difficulties in implementing social justice to reduce unsustainable poverty, the gap between rich and poor tends to widen; underemployment and unemployment are still increasing; The quality of social security services is still low and does not meet the needs of the people... With the proposed solutions, the author wishes to contribute to finding the right direction to well-implemented social justice in the community. In the coming time, towards the goal of "striving for the middle of the twenty-first century, our country becomes a socialist-oriented developed country" (Communist Party of Vietnam, 2021, p.112).

## DATUK KALAMPAYAN POLITICAL COMMUNICATION APPROACH AND ITS RELEVANCE TODAY IN SOUTH KALIMANTAN

**Abstract:** *Datuk Kalampayan's political communication research began with his contributions to the government of the Banjar Sultanate, such as the establishment of an advisory body to the Sultan, the establishment of a juridical institution known as Karakatan Qadhi as the forerunner of today's religious courts, the writing of fiqh books of worship in Malay at the request of the Sultan known as Kitab Sabil Al-Muhtaddin, as well as the construction of waterways in the fields of cultivation and agriculture in the 18th century. This study aims to analyze the political communication approach of Datuk Kalampayan in the Banjar Sultanate and its relevance today in South Kalimantan. Researchers used qualitative methods in this study, by digging up data through interviews with informants, according to their capacity; zuriat, members of the legislature/author of the book Sheikh Muhammad Arsyad Al Banjari and other sources, as well as decommentation data. The results of the research include the approach to political communication that runs harmoniously and synergistically; argumentative rational dialogue; strengthened his theory of symbolic interactional Mean in 1934; The political communication model that was carried out was: the bilhikmah political communication model, with characteristic values, including; strengthening the firmness of faith as the foundation of social, national and state life. upgrading yourself (science and charity), consistent coexistence, harmonious synergy. Do not make frontal criticism of the government, and always pray for the good of the government for the benefit of masalah. Prioritizing argumentative rational dialogue in conveying opinions, ideas and thoughts. Prioritizing togetherness, advancing regional development, and interacting by displaying good manners.*

**Keywords:** *Datuk Kalampayan, political, communication model*

### 1. Introduction

Research on Sheikh Muhammad Arsyad Al Banjari such as Bambang Subiyakto, in the dissertation of the Doctoral Program (S3) of

the Graduate School of the Indonesian University of Education Bandung (2015) examined the character values of social studies education. Hasanah (2019) explained the focus of his research is on proving the role

of moderate- ready Arsyad Al Banjari and that Banjar is very pliable and very open to new elements without losing personality, not rejecting cultural and artistic aspects of religion.

Buseri (2017) explained educational and spiritual and cultural research on the role of Sheikh Arsyad Al Banjari, Abd. Rochim Al-Audah (2019) in his dissertation at the Postgraduate Doctoral Program at Universitas Islam Negeri (UIN) Sunan Gunung Djati Bandung, the focus of his research lies on the Political Thought of Sheikh Muhammad Arsyad Al Banjari, and its Relevance for Legal Political Development. Wafa (2018) explained FISIP, Islamic University of Kalimantan Muhammad Arsyad Al Banjari, the focus of his research lies on the Thoughts and Work of Sheikh Muhammad Arsyad Al Banjari in the Perspective of Religious Communication. Meanwhile, Purnomo, (2010) focused his research on stakeholders and elaborated Thaib communication model (2019), His research focused on political communication reviewed from the perspective of communication science, political science, and Islamic communication, as Umar (2020) explained in the postgraduate thesis of Universitas Islam Negeri Alauddin Makassar focused his research on Ulama and Politics (Study of the Role of Ulama in Political Contestation in Polewali Mandar Regency), so in the research researchers clearly have no similarities in studying the work of Sheikh Muhammad Arsyad Al Banjari, because researchers look more at the aspect of political communication of Sheikh Muhammad Arsyad Al Banjari, so this research is very clearly visible the difference. His closeness to the Sultanate made it easier for him to communicate. Seeing the phenomenon in Datuk Kalampayan's closeness to the Sultan in interacting and communicating, shows that there is harmonious political communication. Mulyana (2013) said that communication in politics is a linear implementation in the

system.

The linear approach has an influence on the information of the political field, while the system approach is integrated into the stability and harmony of the political system. Both of these approaches constitute the reality of political communication as an orderly reality and therefore so easily foreseen (Iyansyah et al., 2021).

When viewed in the context of the relationship of political communication there is a desire for a person to conform to a communicator or other form of communicator emotionally can be satisfactory; so the communicator will prevail in his communication if he is able to attract the attention of the communicator (Effendy, 1993). This means that as a communicator as well as a mediator, he gives a thoughtful attitude (Wijaya et al., 2021).

The relationship of political communication can be seen from the aspect of interpersonal communication/interpersonal communication expressed by Mulyana (2004) as communication between people who face-to-face, allow everyone to respond directly.

Interpersonal communication or interpersonal communication is the delivery and reception of messages between communicators and communicants with immediate feedback and effects. From that, there are several communication components, including the source, message, receiving channel, and return. Interpersonal communication affects communication and relationships with other people. The message that is communicated, begins with oneself (Muhammad, 1995).

Interpersonal communication allows dialogical communication to take place. Dialogue is a form of interpersonal communication that shows the occurrence of interaction and communication in the form of functions as communicators or communicants in turn. This process occurs with mutual respect as human beings (Hidayat et al., 2021).

On the other hand, it can be seen that interpersonal communication is sometimes used to facilitate persuasive communication, which is a human psychological communication technique that is polite, flexible, and civilized. Thus, each communication actor will perform four actions, namely forming, conveying, receiving, and processing messages, the four actions usually take place sequentially, and the form of a message is interpreted as creating an idea or idea with a certain purpose (Habibah et al., 2021).

In the process of interpersonal communication, of course, there is interaction in communicating and interaction in the dialogical, then in line with the Symbolic International theory of Goerge Heber Mead in 1934 by formulating through his book mind, self and society. This theory was later developed by Herber Blumer in three ways, namely, human behavior is influenced by the meaning they have about others, interactions are very important for the development and delivery of messages, and the meaning that a person has regarding various events or others can change over time (Arizal et al., 2021).

Datuk Kalampayan's persuasive communion with the Sultan can enable closeness and unite the Sultan with the people through communication-based on the ties of Islamic religious teachings/values, especially during the reign of Tahmidullah to Sultan Adam al-Wasikbillah, which has such a strong dimension. Religion and politics in their view are a unity of remembering (Shaddiq et al., 2021).

Then if we look at the context of the latest development in socio-political relations, political communication can also be seen from the theory of organizational/group communication, because it is related to the hierarchical line of political parties, so the management of political parties at the provincial or district/city levels that even the sub-district level cannot break away from the hierarchical line of the party, this is what

allows technical obstacles in the field why political parties at the provincial level and below it seems to have difficulty in conducting political communication, so often political parties cooperate with clerics in conducting their political communication (Kurniawan et al., 2021).

## 2. Research methods

The research was conducted with the focus of research researched with a qualitative type of research with a case study approach. Researchers will observe directly to the research resource persons how political communication in the Banjar Sultanate is carried out by Datuk Kalampayan so that they can better understand and get clear and accurate research information and data.

Qualitative research methods are based on postpositivism, where the researcher is a key instrument, data collection techniques are carried out triangulation, data analysis is qualitative, and qualitative research results emphasize meaning more than generalizations (Sugiyono, 2015).

In this study, researchers interviewed 14 informants, consisting of 4 people from the Datuk Kalampayan jury and 1 author of a book related to Datuk Kalampayan, and 7 people from political party administrators in South Kalimantan, and 2 academics. To choose the location where the existence of the information from the zuriat he is located in the city of Martapura, Banjar Regency. Meanwhile, the informant from the author of the book is located in Banjarmasin.

The data worked on from the object of this study is sourced from primary data; main data and literature relating to Datuk Kalampayan and some literature relating to political communication. In this study, the primary data source in the form of words was obtained from interviews with predetermined informants which included various matters related to the title of the study, namely the Political Communiqué of Sheikh Muhammad

Arsyad Al- Banjari (Datuk Kalampayan in the Banjar Sultanate in its application to Political Parties in South Kalimantan, which included the proximity of Datuk Kalampayan in the Banjar Sultanate, and Application of Datuk Kalampayan's Political Communication Model to Political Parties in South Kalimantan).

### 3. Results and discussion

There is nothing in the historical record that states that Datuk Kalmpayan ever made a criticism of the Sultanate government, let alone done it frontally, because he was of the view that while the government was running its system of government with the aim of achieving the benefits of mashlahah, it should be supported, and if it makes a mistake then give good advice and pray that the ruler is always in safety and wise in exercising his power (Shaddiq & Handayani, 2021).

According to informants from zuriat Datuk Kalampayan, namely Mr. Hatim, Mr. Fauzan, Mr. Zailani, and Mr. Defri, said that Datuk Kalampayan's closeness in the Banjar Sultanate was very clearly visible, especially since he was a child until adulthood lived in the Sultanate palace environment after being appointed as a child by Sultan Tahlilullah, even married by the Sultanate to Mr. Bajut, even studying at Haramain at the expense of the Sultanate, this made a deep impression on him (Joko et al., 2022).

Meanwhile, according to other informants both Suripno, Suwardi, Zulva, Hasanuddin, Firman, Lutfi, Irfan, Iqbal, Audah, and, Yuni also said that Datuk Kalampayan had a very remarkable affinity in the Banjar Sultanate, it was they asserted that it was life in the palace environment that was the important thing in the life journey of Datuk Kalampayan because it had been maintained by Sultan Tahlilullah from childhood to adulthood. which was then very harmonious and synergistic closeness with the Sultanate's government (Norrahmi et al., 2021).

Thus the life of Datuk Kalampayan in the palace environment became the main source of his closeness in the Sultanate of Banjar so that the interaction and communication of the Sultanate seemed so harmonious and synergistic with the Sultan's power and government so that it seemed easier and more comfortable in conveying his ideas and thoughts (Irpan et al., 2021).

It could be that when in the haramain he already had a grand design of thoughts with various ideas and ideas that would later be communicated to the Sultan after returning later, it was proven by various thoughts, ideas he communicated to the Sultan were always approved.

This is not only his brother as a Sultanate scholar, but he can position himself as a person who easily understands and understands the dynamics of life in the Sultanate, so he chose to live outside the Sultanate environment, and lived outside the palace, and the Sultan gave up and gave him up to live outside the palace by giving up a piece of land to be his residence which is now in the area within the fence Martapura.

His closeness in the Banjar Sultanate, not as a return for gratitude because he had been maintained by Sultan Tahlilullah from childhood to adulthood and married to a commensurate woman, was also given the scholarship to study haramain for 35 years, but his closeness in the Banjar Sultanate was based on faith and charity in the life of society, nation and state.

The closeness is based on the value of religion that binds the power of faith to unite in harmonious and synergistic relations in the life of the nation and state society, in line with the vision of Sultan Tahlilullah who agreed to him as a child, namely the application of Islamic law in the Banjar Sultanate.

That is, to unite life in society, nation, and state, it cannot only hold on to the strength of its humanitarian aspects which are based on the culture of the community but the continuity of life in society, nation, and state

is based on the solemnity displayed with the glory of morals, because the life of the nation and state is part of the ijtihadi shia in the fiqh of worship.

It could be that when in the haramain he already had a grand design of thoughts with various ideas and ideas that would later be communicated to the Sultan after returning later, it was proven by various thoughts, ideas he communicated to the Sultan were always approved.

This is not only his brother as a Sultanate scholar, but he can position himself as a person who easily understands and understands the dynamics of life in the Sultanate, so he chose to live outside the Sultanate environment, and lived outside the palace, and the Sultan gave up and gave him up to live outside the palace by giving up a piece of land to be his residence which is now in the area within the fence Martapura.

His closeness in the Banjar Sultanate, not as a return for gratitude because he had been maintained by Sultan Tahlilullah from childhood to adulthood and married to a commensurate woman, was also given a scholarship to study haramain for 35 years, but his closeness in the Banjar Sultanate was based on faith and charity in the life of society, nation and state.

The closeness is based on the value of religion that binds the power of faith to unite in harmonious and synergistic relations in the life of the nation and state society, in line with the vision of Sultan Tahlilullah who agreed to him as a child, namely the application of Islamic law in the Banjar Sultanate.

That is, to unite life in society, nation, and state, it cannot only hold on to the strength of its humanitarian aspects which are based on the culture of the community but the continuity of life in society, nation, and state is based on the solemnity displayed with the glory of morals, because the life of the nation and state is part of the ijtihadi shia in the fiqh of worship.

As for bridging the implementation of fiqh

worship (ijtihadi syiasi) it is to display good morals, because politics as a shiasi ijtihadi is of course political interaction and communication prioritizing civilized politics, not making it difficult for others or causing trouble to others, but civilized politics, always contributes to its ideas, ideas, and thoughts in supporting government and praying for his government always in blessings and safety, so that it can carry out its programs well, that way prosperity will be felt by its people.

Then the closeness of communication Datuk Kelampayan was consulted by Banjar seen from the interaction and communication carried out by Datuk Kelampayan in the Sultanate of Banjar which was so visionary with what he conveyed to the Sultan, strongly supported and corroborated his theory of symbolic interactional communication of Mead in 1934 through his book entitled *Mind, Self, and Society*, for Datuk Kelampayan had already practiced it in the Sultanate, with his ideas and thoughts that were his contribution at the time From the information obtained by the researcher that the role/work of Datuk Kelampayan in the Banjar Sultanate is very clearly visible, and shows the relationship between Datuk Kelampayan and the Sultan living side by side in contributing, not criticizing each other, the Sultan needs a scholar who always gives his advice and thoughts, while Datuk Kelampayan as a scholar also prays for the course of the Sultan's government, also gave various thoughts in the continuity of government in the Sultanate.

Among the character values, he has, among them, commitment and consistency in conveying the truth in the good according to Islamic teachings, having criticized the government/Sultan, always praying for goodness in the continuity of the Sultanate, being moderate to the Sultanate/government system by giving thoughts to the Sultan according to his function and duties as a cleric, the principle that the ulama and the government (umara) are side by side by side

with each other to contribute to each other benefit.

The values of character Datuk Kelampayan in the Sultanate of Banjar set an example to us today and in the future that the character is very important in displaying attitudes and personalities to anyone by prioritizing and displaying customs and ethics in interacting and communicating with others, consistency and commitment in being in giving thoughts on the frame of truth and goodness for the benefit of the benefit.

When we look at the contribution of Datuk Kelampayan in Sultanate of Banjar which is extraordinary in his work and role, this shows his closeness in the Banjar Sultanate in interacting and communicating with the Sultan of Banjar which is very meaningful in the continuity of the Sultanship of the Sultanate. As a figure of a cleric in the Sultanate, of course, his work and role are very strategic in carrying out political communication in the environment of the Banjar Sultanate.

The interaction and political communication of Datuk Kelampayan in the Sultanate of Banjar are inseparable from the various things he got in the midst of community life, because Datuk Kelampayan chose his life outside the palace environment so that he was willing to see firsthand what was faced by the community, besides he was also a cleric who was asked for his opinion by the community. From that reality, there was a sensitivity and concern that he ultimately communicated with the Sultan, as a manifestation of the attitude of supporting the continuity of the Sultan's rule.

The attitude of supporting the continuity of the Sultan's rule was then manifested by him in some of his ideas and ideas and thoughts that were conveyed to the Sultan, where, the idea, the idea (encoding) was a process of changing thoughts into communication.

In conveying the message to the Sultan (communicant), the face-to-face takes place with an argumentative rational dialogue until

the Sultan gets the result of the conversation and makes the main point of mind Datuk Kelampayan as important points, which then, the Sultan makes the communication process (argumentative rational dialogue as a thought (decoding), which then becomes a reciprocal relationship in the Datuk Kelampayan as a communicator and the Sultan as a communicant (on the contrary) and reached an agreement so that it was always agreed upon and even condoned by the Sultan.

It was told by informants from his zuriat, both Guru Hatim, Fauzan, Zailani, Defri, which Datuk Kalampayan's contribution to the Banjar Sultanate was extraordinary with his ideas and thoughts in the continuity of the Banjar Sultanate, which of course cannot be separated from the values of Islamic teachings. In carrying out the mission of broadcasting Islamic teachings in the Banjar Sultanate, of course, Datuk Kalampayan hoped to get the blessing of the Sultan of Tamjidillah II, so he saw that previously the Banjar Sultanate did not have a Crown Council, then he initiated his idea to form a Crown council in the Banjar Sultanate. Another roles was also narrated by informants from his zuriat, where the most famous is the Sultan's request to Datuk Kalampayan to make a book of fiqh worship in Malay and the request of course cannot be refused by him, he also fulfilled the Sultan's request, which is now known as the book/kitab of Sabil Al Muhtaddin, and prayed eternally falaq daulahnya, and still learned until now, it is not only in the land of Banjar and archipelagos, even in Southeast Asia and Africa.

In the economic field he made an 8 km long waterway, for the plant and chain which is now the aqueduct called the lord's river, in the constitutional field he proposed the establishment of a mufti institution/Sharia court, he also initiated to form the Constitutional Institution of the judiciary, which we are called the one named karapatan qadhi as the forerunner of the current Religious court. The mufti institution was led

by his first grandson named Mufti H. Muhammad As'ad Samai Mufti. H. Jamaluddin Sungai Singgah and the first qadhi were also led by his grandson named H. Muhamad Thoha which was recorded in the state gazette no. 689 of 1937 which recognized the qadhi Institution or Karapatan qadhi Institution as a State Institution by the Dutch.

While information from other informants both Suripno, Suwardi, Zulva, Hasanuddin, Firman, Lutfi, Irfan, Iqbal, and Audah, that the work and role of Datuk Kalampayan in the Sultanate is very meaningful in the continuity of the Sultanate because it is his ideas and thoughts that are the most important thing for the Sultanate, he has multi-dimensional science, both religious knowledge and public knowledge, so many initiations came from him both the formation of crown council as an advisory institution of the Sultan, mufti institution and Qadhi Institution (Karapatan Qadhi) as a judicial institution, Construction of an 8 km long water/irrigation canal known as Sungi Tuan, the establishment of the first pesantren hut in the field of education, as well as the writing of books, one of which was at the request of the Sultan to make a fiqh book of Malay-language worship known as the book of Sabil al Muhtaddin which until now people have learned.

By means of the information obtained by the researcher that the role/work of Datuk Kalampayan in the Sultanate of Banjar is very clearly visible, and shows that Datuk Kalampayan's relationship with the Sultan lives side by side in contributing, not criticizing each other, the Sultan needs a scholar who always gives his advice and thoughts, while Datuk Kalampayan as a cleric also prayed for the course of the Sultan's rule, also gave various thoughts in the continuity of government in the Sultanate. As interview with one of the zuriat Datuk Kalampayan Guru Hatim.

**Figure 1.** Interview of Researcher with Teacher KH. Hatim Salam/Zuriat 7th Datuk Kalampayan, taken on March 21, 2022 at 13.0-15.30 in his residence

The Sultan's blessing, as the political legitimacy of the Sultanate, is a form of the effectiveness of his political communication as a form of closeness Datuk Kelampayan in the Sultanate of Banjar, and as an output of this communication which is then returned to Datuk Kelampayan to follow up on the Sultan's blessing or request.

The Sultan's request for the grandfather of Kelampayan is a decree or a decision/order of the ruler of the Sultanate which is carried out as a duty given to the grandfather himself so that the blessing or request of the Sultan is a political decision of the Sultanate that can be a hold for the great-grandfather of the great-grandfather. It can be seen in the picture below.

The closeness of Datuk Kalampayan was the Sultanate of Banjar in conducting interaction and political communication to the Sultan, this happened according to interpersonal communication.

Interpersonal communication will run well if it is through the right approach. Interpersonal communication is the process of conveying messages between two people which is carried out face to face or face to face which allows direct feedback and the message is verbal or non-verbal.

**Figure 2.** Interpersonal communication model

Komunikasi Politik Datuk Kelampayan di kesultanan Banjar Gambar 1: diolah peneliti tahun 2022 Sumber : data Informan yang diolah.

Interpersonal communication is carried out in close proximity, communicators and communicants send messages directly and simultaneously.

Interpersonal communication is the interweaving of the process of conveying information, ideas, and feelings to others verbally or nonverbally in order to obtain meaningfulness so that others understand or change their attitudes, feelings and behaviors that occur in a society (Mulyana, 2005).

According to informants from the Datuk Kalampayan Zuriat, both Guru Hatim, Fauzan, Zailani, Defri, and Yuni said that Datuk Kalampayan's work in the Banjar Sultanate was very contributing, this certainly shows us that the relationship between beliu as a cleric and Sultan as a political power in the government is very harmonious and synergistic, although politically practically Datuk Kalampayan never involved and involved himself in the realm of political dynamics in the Sultanate, but he always gave his best in the continuity of the Banjar Sultanate also prayed for the eternal Sultanate of his rule.

Thenif we look at the current relationship between clerics and poltics, we know that together, it must be admitted that there is a part of the scholars who participate in politics practically, but not all scholars are that kind of. If we correlate it with the example of

Datuk kalampayan, then politics for the role of the cleric in the context of islamic proselytizing.

Politics as a means and medium of proselytizing towards the benefit of the good, so that the cleric in relation to politics can run harmoniously, the cleric in politics should not be in practical politics, but can give his thoughts as a contribution and pray that he can achieve the purpose of the mashlahah benefit.

Other informants Suripno, Suwardi, Zulva, Hasanuddin, Firman, Lutfi, Irfan, Iqbal, Audah and Yuni said that the cleric in relation to politics was not in the sense of having to enter practical politics, but for political parties it did not close the space for the cleric to enter the political party, in the context of being a party advisory panel to give its advice and thoughts to party cadres. Even political parties are currently always building relationships with clerics, so we hope that there will be synergy between political parties and ulama and harmonious relationships are established, and so far this is what has been done. If we terrorize Datuk Kalampayan's work in the Sultanate of Banjar, it is indeed as desired so that it can provide motivation in playing a role in politics, so that scholars are not dragged into practical politics.

Thus that the clergy and politics are important, but it does not mean that the cleric participates in politics, the cleric stays in his corridors by carrying out his duties and functions as the leader of the ummah, can give his political thoughts as a charge of proselytizing to political parties. Political parties also play a role in accordance with their vision and vision to achieve their goal that power is a way to achieve the benefits of benefit. As Suripno Sumas, legislative member of the PKB of the South Kalimantan provincial legislature, revealed in a research interview.

**Figure 3.** Researcher interview with Mr. H. Suripo Sumas, S.H., M.H., member of the South Kalimantan DPRD/PKB party, dated April 18, 2022 at 12.30-13.30 in commission room 4.

When we see Datuk Kalampayan's contribution to the Banjar Sultanate which is extraordinary in his work and role, this shows his closeness in the Banjar Sultanate in interacting and communicating with the Sultan of Banjar which is very meaningful in the continuation of the government in the Sultanate. As a figure of a cleric in the Sultanate, of course, his work and role are very strategic in carrying out political communication in the environment of the Banjar Sultanate.

Datuk Kalampayan's political interaction and communication in the Sultanate of Banjar cannot be separated from the various things he got in the midst of community life, because Datuk Kalampayan chose his life to be outside the palace environment, so he was willing to see firsthand what was faced by the community, besides he was also a cleric who was asked for his opinion by the community. From that reality, there was a sensitivity and concern that he ultimately communicated with the Sultan, as a manifestation of the attitude of supporting the continuity of the Sultan's rule.

The attitude of supporting the continuity of the Sultan's rule was then manifested by him in some of his ideas and ideas and thoughts that were conveyed to the Sultan, where, the idea, the idea (encoding) was as a process of changing thoughts into communication.

In conveying the message to the Sultan (communicant), with the face-to-face it takes place with argumentative rational dialogue until the Sultan gets the result of the conversation and makes the main point of mind of Datuk Kalampayan as an important point, which then, the Sultan makes the process of communication (argumentative rational dialogue is a thought (decoding), which further becomes a reciprocal relationship in the daktuk kelampayan as a communicator and the Sultan as a communicator and the Sultan as communicants (on the contrary) and reached an agreement so that it was always condoned and even condoned by the Sultan.

The Sultan's blessing, as *le gitimasi politik* Sultananan is an effective form of his political communication as a form of Closeness of Datuk Kalampayan in the Sultanate of Banjar, and As the output of this communication which is then returned to Datuk Kalampayan to follow up on the blessing or request of the Sultan.

The Sultan's request to Datuk Kalampayan is a decree or decision/order of the Sultanate ruler which is carried out as a duty given to Datuk Kalampayan himself, so that the blessing or request of the Sultan is a political decision of the Sultanate that can be a hold for Datuk Kalampayan.

According to Joseph A. Devito in the book *The Science, Theory and Philosophy of Communication* (Effendy: 59-60) that interpersonal communication is the process of sending and receiving messages between two people, or between a small group of people with instantaneous feedback.

Meanwhile, according to Weaver, interpersonal communication is defined as a dyadic or small group phenomenon which naturally entail communication about the self. Interpersonal communication as a phenomenon of interaction of two people or in small groups that shows communication in a natural and unpretentious way about oneself.

Effective communication is judged by the good delivery of messages from the communicator to the communicant. The characteristics of good communication according to Kumar in Wiryanto's book (2004:36) are; openness, empathy, supportiveness, positiveness, equality.

According to Suranto Rahmi; Interpersonal Communication Approach (2011: 114-118) there are four approaches in interpersonal communication. First, the informative approach is that the communicator only conveys information to the communicant with the aim that the communicant can obtain new information. Messages are conveyed repeatedly and are one-way in order to disseminate information. Second, the dialogical approach is a way of influencing and changing the views and attitudes of others openly. It is said to be open because both sides are equally willing to accept the views of both the communicator and the communicant. The characteristic of the dialogical approach is that there is a dialogue towards the process of sharing information, both parties are in an equal position. Third, a persuasive approach that aims to subtly change attitudes by means of persuading without force and without violence.

Persuasive is a complex communication process that individuals carry out using verbal and nonverbal messages in order to persuade or provide encouragement aimed at voluntarily changing one's attitudes and behavior. Fourth, the instructive approach is to emphasize the communicator's higher bargaining position where he gains legitimacy to govern, teach and even propose a kind of idea to the communicant. This approach is said to be coercive where communicators can coerce and sanction communicants. In general, a communication process is carried out in the hope of an impact or effect of the message conveyed by the communicator to the communicant.

In interpersonal communication, there are approaches that occur both verbally and non-verbally, these approaches, including:

## 1. Dialogical Approach.

Features of interpersonal communication with a dialogical approach are characterized by the presence of a conversation or dialogue. In this approach the communicator and the communicant are in the same position and on an equal footing, no one monopolizes the information. Dialogic demands the willingness of both parties to listen to the ideas or ideas of each.

Furthermore, in this approach, we seek and determine solutions from the right views and attitudes in understanding and responding to messages that are shared together. Communicators and communicants must have respect, trust each other and reward each other.

## 2. Persuasive Approach

The persuasive approach is a process of interpersonal communication in which the communicator conveys verbal and nonverbal messages to the communicant in order for the communicant to behave, acting as the communicator expects.

The persuasive approach is not difficult to apply well and can even bring the feeling of communicant into togetherness and family so that the communication process goes well and is effective. Among the Communicators and communicants have the same position and role so that the message/information conveyed is easy to understand and understand by both.

In interpersonal communication there is also a symbolic interactionism, in the theory of symbolic interaction seeks to describe how humans use language to form meaning, how humans create and present themselves, and how humans use symbols to create society by cooperating with others. This theory was then developed by Herbert Blumer by formulating 3 (three) premises, namely:

- Human behavior is influenced by the

meaning they have about others and various events;

- Interaction is essential for the development and delivery of messages;
- The meaning that a person has about various events or others can change over time.
- Symbolic intracensibility exists because the basic ideas in shaping the meaning that comes from the human mind (Mind) regarding the self (Self), and its relationships in the midst of social interaction, and aims to mediate, as well as interpret the meaning in the midst of the society (Society) in which the individual settles. A brief definition of the three basic ideas of symbolic interaction, including:

Mind is the ability to use symbols that have the same social meaning, where each individual must develop their mind through interaction with other individuals,

The Self is the ability to reflect on each individual from the assessment of the point of view or opinion of others, and the theory of symbolic interactionism is one of the branches in the theory of sociology that puts forward about the self (The-Self) and its outer world Society (Society) is a network of social relations created, built, and constructed by each individual in the middle of society, and each individual is actively and voluntarily involved in the behavior they choose, which ultimately leads humans to the process of taking a role in their society.

"Mind, Self and Society" is George Herbert Mead's most famous work (Mead, 1934 in West-Turner, 2008: 96), where the book focuses on three themes of concepts and assumptions that underlie symbolic interactions including: 1) The importance of meaning for human behavior. 2) The importance of self-concept 3) The relationship between the individual and society. First, on symbol interaction focuses

on the importance of forming meaning for human behavior, where in the theory of symbolic interaction can not be separated from the process of communication, because initially the meaning is meaningless, until finally it is constructed interpretively by the individual through the process of interaction, to create a meaning that can be mutually agreed upon.

Symbolic interaction is related to the relationship between individual freedom and society, where this assumption recognizes that social norms limit the behavior of each individual, but in the end it is each individual who determines the choices that exist in his social society.

In Datuk kelampayan's work in the Banjar Sultanate, it seems that when he was studying in Haramain at that time he had a mind that could contribute to the Banjar Sultanate in the continuity of the Sultan's government, because he always asked about the situation of the Sultanate and its people when there were Banjar people performing the Hajj. It could be that when in the haramain he already had a grand design of thoughts with various ideas and ideas that would later be communicated to the Sultan after returning later, it was proven by various thoughts, ideas he communicated to the Sultan were always approved.

The perspective of symbolic interaction in the political context (political symbolism) fundamentally departs from the assumptions about the two dimensions of human beings, namely humans as symbolists (man-the-symbolists) and humans as political people (man-the-political-being). The two are constant and interact inseparably.

In this context, politics is defined as the activity of distributing, maintaining, and exercising power within a social unit. Power itself, expressed in various relations characterized by domination and subordination, which occurs in all aspects in social relations. As a symbolic activity,

political activity begins when people interpret signs, gestures, and clues in meaningful ways. In Datuk kelampayan's work in the Banjar Sultanate, it seems that when he was studying in Haramain at that time he had a mind that could contribute to the Banjar Sultanate in the continuity of the Sultan's government, because he always asked about the situation of the Sultanate and its people when there were Banjar people performing the Hajj. It could be that when in Haramain he already had a grand design of thought with various ideas and ideas that would later be communicated to the Sultan after returning later, it was proven that various thoughts, ideas/ideas he communicated to the Sultan were always approved.

The Sultan's request to Datuk kelampayan to write a book of figh worship in Malay to be used as a religious guide in the territory of the Sultanate of Banjar, as a feedback from the intracampic intracampic in the process of political communication, which he inevitably fulfilled the Sultan's request by writing a book of worship figh for 2 (two) years, known as the Book of Sabil al-Muhtaddin.

In this context, the adab of intubating and communicating in society, nation and state by Datuk kelampayan emphasized the impression of language as part of the ethics of communication. The ethics of communication in poltics or in political communication is significant in equalizing thinking, so that communication becomes effective.

Datuk kelampayan, understanding this self-concept, it is not only understood that human beings are created not just individual beings and cultured social beings, but more than that the intended self-concept is to know oneself as a creation of God Almighty, so that by knowing oneself we will know the creator. Here he taught and practiced Tariqah Sammaniyah.

Obedience and submission to the Creator will demand oneself to noble morals, civility, by increasing faith and practicing it in all good

through positive works, then in political communication carried out in the dark and lateness in the Banjar dispute is based on Islamic values.

Faith and charity in the self-concept that is intended by the dark are the implimentation of morals as a bridge of life in inactivating and communicating with others, Faith as the foundation and charity is a real work as the implementation of the figh of worship, including political communication which is a shia ijthadi as part of worship.

Society or society is formed through coordinated interaction between individuals. According to Mead, the interactions that occur in humans occupy the highest level when compared to other creatures. This is due to the use of various kinds of significant symbols, namely language. Although sometimes humans respond automatically and without thinking to other human gestures, human interaction is transformed with its ability to form and interpret directly by using conventional symbol systems. Human communication has meaning in symbolic gestures and does not ask for an immediate response. Human beings must interpret each movement and determine their meaning. Since human communication involves the interpretation and assignment of meaning, it can happen when there is consensus in meaning. The meaning of symbols should be shared with other human beings.

Shared meaning always occurs through role-taking. To complete an action, the abuser must put himself in the shoes of others. Behavior is seen as social not only when responding to others but also when it has been incorporated into the behavior of others. Human beings respond to themselves as others respond to them and thus they share the behavior of others in an imaginer manner.

Society in the aspect of government power where Datuk Kelampayan views that the power of government in the Banjar Sultanate is based on the awareness to support the

government system of the Banjar Sultanate which has the style of an Islamic kingdom. Datuk kelampayan who has an understanding in the constitution does not question the form and system of his government, so the political communication he carries out is very strategic, this is in line with the thinking of Ibn Khaldun who offers a system of governance in government which is indeed very concerned about him.

Thus, Datuk is an expert in constitutional law seeing that the system of power in government cannot be seen by the state/kingdom, but the substance of his system of government that can achieve the benefits of mashlahah based on religious values embraced by its leader. The Sultan of Banjar at that time had a vision in the application of Islamic law, and his thoughts were also in harmony with the Sultan of Malay. So he wrote a book of fiqh worship in Malay and was later named the book of Sabil al-Muhtaddin, fiqh worship, at the request of the Sultan. The Sultan's request was stated in the introduction to the book of Sabil al-Muhtaddin, and at the end of the introduction to the book he prayed that the birth of banjar could be eternal.

In this study, the researcher found that his political communication model was Bilhikmah political communication, which emphasized the embodiment of the value of godliness which is practiced in the nobleness of behavior in deeds, whether acting, doing or acting which is summed up in noble morals.

With the determination of Datuk kelampayan on Islamic teachings, he practiced the political communication model he was consulted by the banjar Sultanate, namely the Bilhikmah political communication model, the bilqalam and bilkitabah communication model and the bilhal political communication model, which the political communication model as a manifestation of ijthadi shiasi, is part of the fiqh of worship.

The political communication model is based on the power of tawhid as its foundation in

managing the life of the nation and state, by prioritizing moral values in the implementation and management of the government, in line with the vision and mission of the Sultan by wanting the application of Islamic values in the life of the nation and state.

The continuity of the Sultan's rule was then understood that the manifestation of islamic teachings was the key to expediency in goodness, without which it was impossible for the benefits of mashlahah to be achieved by the government. Therefore, the intextuality of the Sultanate in interacting and communicating is always maintained in harmony and synergy between the two.

Bilhikmah's political communication, as a communication that prioritizes the ability of broad knowledge, and also respects and respects each other, by prioritizing nobleness and wisdom, full of wisdom, and fairness, in the process of communicating in the continuity of his interactions, both to the Sultan himself and the Sultanate community. Bilhikmah's political communication, which is full of Islamic values, cannot be separated from understanding the need to see the reality of society and the majority of the Sultanate of shafiiyah, the Bilhikmah he carried out has a strategic role in his political communication, so that the relationship between the dark and dark is so harmonious with the Sultanate, even maintaining the continuity of the Sultanate itself.

Bilhikmah's model of political communication puts things in place by thinking, trying to structure and organize in a way that is appropriate to the circumstances of the times by not being in agreement with God's laranagan. This foundation of al-hikmah is what Datuk kelampayan did in political communication in the Sultanate of Banjar, so that his ideas and thoughts and initiations can always be recognized and approved by the Sultan in the process of his political communication.

The Billikmah Political Communication Model is a political communication carried out by Datuk kelampayan in the Banjar Sultanate that refers to the verse of the Qur'an surah An- Nahl: 125 which means:

“Serullah (man) to the way of your Lord with wisdom (a true word that can distinguish between the truth and the bathil), and teach the good, and argue with them in a good way. In fact, your Lord, He knows better who is lost from His way, and He is the one who knows better who is guided (Hatta, 2009).”

The verse above explains that political communication is carried out in order to invite in truth and goodness based on the values of Islamic teachings with its fondassi is to strengthen aqidah (ketauhidan), with the abilities that must be possessed as a communicator, including;

First, the ability to upgrade oneself with disciplines, both religious science and general science, Second, Have superiority and toughness of attitudes and customs that do not harm others, Third, Ability to adapt in any situation and condition, Fourth, have visionary ideas and thoughts and fifth, Have a consistent commitment and ghirah/spirit in supporting the government in towards the benefits of mashlahah.

These five abilities as a self-concept that can be developed by always being in the understanding of the values of Islamic teachings, which make them besikap tawadhu, do not criticize the government (Sultan), but rather give his thoughts and always pray for the government (Sultan) in carrying out his government.

From some of the information obtained by researchers during the study, it was found that the political communication played by Datuk kelampayan had five roles that he carried out, including:

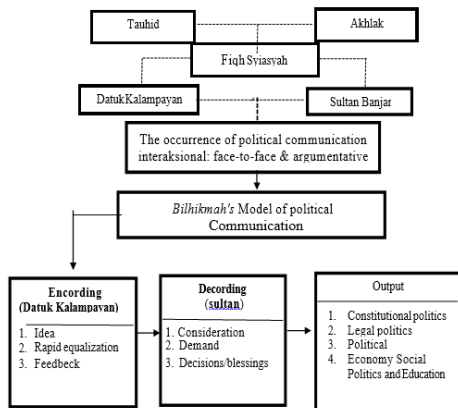

1. As an educator, namely establishing the first Islamic boarding school in the 18th century in carrying out educational functions. Through the bil qalam communication model, he

educated and taught the people and environment of the Sultanate to carry out the commands of Allah Swt. and stay away from His prohibitions. Therefore, the book of Sabil al-Muhtaddin was destroyed at the request of the Sultan keada he had to recite a book of figh worship in Malay, the statement of the Sultan's request was contained in the word of the author of the book of Sabil al-Muhtaddin. This aims to prevent people from deviant behavior from Islamic law in the Sultanate.

2. As an information straightener. There are three things that dai should straighten out through political communication bil qalam. First, information about the teachings of Datuk Kelampayan was in the Sultanate of Banjar. Secondly, information about his works or achievements who were a very productive person in those days and provided sprit of future generations. Third, as a writer, he was able to explore about the condition of society which is geographically very different from the geography in Haramain so that he adapted the teachings of Islam to the situation and conditions at that time, even what was very interesting about him was that information about Islam and its people was not manipulative and cornered Islam.
3. As a reformer, namely the dissemination of a renewal of the understanding and practice of Islamic teachings (Islamic reformism).
4. As a unifier, that is, to be a bridging that unites Muslims.
5. As a fighter, that is, a fighter, he preached the teachings of islam and tried to form a common opinion that encouraged the enforcement of islamic shia, rahmah li al- 'alamin.

In this context, the political communication model and darkness in the Banjar Sultanate, it can be seen in the picture below:

**Figure 5.** Political communication model and darkness in the Banjar Sultanate (source: Research Results made in 2022)

Political communication is based on faith and charity in order to strengthen the firmness of faith as the foundation of life in society, nation and state.

1. Upgrading oneself with knowledge and charity, by consistently coexisting in harmony.
2. Do not make a frontal criticism of the government, and always pray for the good of the government towards the benefits of mashlahah.
3. Promoting argumentative rational dialogue in conveying opinions, ideas and thoughts.
4. Promoting togetherness to advance regional development
5. Interact with a good adab display.

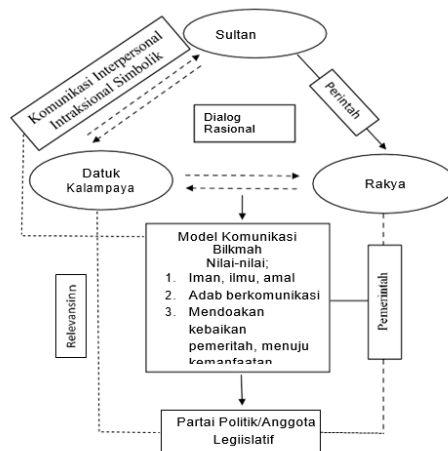

The value of the political communication model Datuk kelayaman in the banjar Sultanate can be seen in the figure below:

Datuk's model of political communication in the Banjar Sultanate The model of political communication in the Sultanate of Banjar at that time was very close to the value of Islamic teachings, this is due to the understanding and depth of knowledge that he

has both religious science and general science, so that his political communication model in the current context has characteristics and values that data are inherited and exemplified by us and the future. These values include:

The values of Datuk Kalampayan's Political communication model Bilikhmah's political communication, as a communication that prioritizes the ability of broad knowledge, and also respects and respects each other, by prioritizing nobleness and wisdom, full of wisdom, and fairness, in the process of communicating in the continuity of his interactions, both to the Sultan himself and the Sultanate community.

When there was a political dynamic within the Sultanate, indeed, Datuk kelayaman never involved himself in the matter, because he was very avoidant of practical politics, which of course would affect in carrying out the development of Islamic shia, so it was with this moderate attitude that he easily conveyed some of his thoughts as a contribution to the political communication he carried out.

**Figure 6.** Political communication model Datuk kelayaman in the Banjar Sultanate

Wisdom is practically meant to have something in its place. This wisdom is

divided into three types, namely: first, having a heart eye which includes, among others, the power of perception, intelligence, knowledge and wisdom. Second, knowing the justice of the threat of Allah Almighty, the certainty of His promises and the justice of the laws that are shari'a and the laws that apply to all His creatures. And thirdly, Giving rights to something in a sense: do not go beyond the limits, rush and delay time. Hikamh pays great attention to the three instructions above, namely by giving rights to every matter, namely the right of Allah Almighty with Shari'a and His destiny. If we go beyond the limit, procrastinating the time limit means that we are violating and violating wisdom. This is the so-called general decree on the law of cause and effect based on shari'a and destiny.

Al-Hikmah is an expression that contains truth and depth. Manaa in Indonesian is interpreted with the word wise, while the word wise in Indonesian contains the meaning of: Repair (make better) and avoid damage, Clever and strong in his memory, Always have a wise and sharp mind Wisdom is manifested into four things: manjerial prowess, discernment, clarity of mind, and sharpness of mind. Wisdom as a system that unites theoretical and practical abilities in political communication.

The political communication model of bill wisdom can be syar'i understood that what is done has validity in words and deeds, knows the right and practices it, wara' in dinullah, puts something in its place and answers firmly and appropriately, and can be an example to be imitated and exemplified by others, otherwise known as a role model.

With the demkian of Bilhikmah's model of political communication it puts something in

its place by thinking, trying to structure and organize in a way that is appropriate to the circumstances of the times by not being inconsistent with God's laranagan. This foundation of al-hikmah is what Datuk kelampayan did in political communication in the Sultanate of Banjar, so that his ideas and thoughts and initiations could always be and approved by the Sultan in the process of his political communication

#### 4. CONCLUSION

The proximity of political communication is crucial and strategic in the current regional development, so it is hoped that in carrying out the approach to political communication, it can certainly emulate what Datuk Kelampayan taught and practiced in the Banjar Sultanate, in order to achieve a harmonious and synergistic relationship between political parties-governments-communities. And it turns out that his approach to political Communication used his theory of symbolic intractional communication mean in 1934.

Bilhikmah's political communication model is expected to be a part that should be preserved as an asset of regional political communication that contributes to the government in achieving the goals of regional development.

The application of the values of political communication and darkness is expected to be carried out through government policies and political education to the community carried out by political parties by prioritizing political customs.

## LEADERSHIP IN A YOUTH MOVEMENT AS A TRANSFORMATIVE EXPERIENCE

**Abstract:** *This study discusses the social leadership of counselors in youth movements in Israel and its contribution to social engagement, both for themselves and the members of the movements. The study method is qualitative, in which six senior counselors (branch managers) from two major youth movements in Israel participated: The Scouts and Bnei Akiva. The study provides a glimpse into the world of youth in Israel who participate in youth movements. The study shows how the quality of leadership of the counselors, empowers and advances social goals and contributes to community engagement from which everyone benefits. The study can contribute to the field of education by perceiving the leader as both a teacher and an educator.*

**Keywords:** *Transactional leadership, transformative leadership, youth movement, social engagement*

### 1. Introduction

Leaders have a significant role in creating the state of mind that is the society. They can serve as symbols of the moral unity of the society. They can express the values that hold the society together. Most important, they can conceive and articulate goals that lift people out of their petty preoccupations, carry them above the conflicts that tear a society apart, and unite them in the pursuit of objectives worthy of their best efforts. —

J. W. Gardner, 1965

Perhaps more than anything, Plato's Allegory of the Cave (2017), illustrates the various aspects of leadership. In this allegory, prisoners are bound together in an underground cave, they face the wall, and behind them there is fire or sun, but they cannot see it and in fact, they cannot see anything, but shadows cast by people and animals that are walking outside the cave. One of the prisoners is released and he likens the release to being cured of ignorance. The process of release is lengthy and painful and

is accompanied by anguish until he can gaze on the light. The whole process is made up of dilemmas - if he had to look to the light, would he not want to escape from the suffering and the darkness? Would he not want to return to the old world, beyond the cave, a world that does not hold such suffering? Perhaps he will stay in this place of happiness and transcendence and just pity those he left behind, in the dark cave. And in this free world, will he feel a social and class disconnect compared to those in the cave, who, though they are in the dark, have a social interaction? According to Plato, there is no dilemma at all. The released prisoner goes back to the cave; however, he returns a different person. The process of going back to the cave is described as suffering, because what he saw as true all his life, when he was dwelling in the cave, suddenly seems to him a lie, after he has seen the light. But upon returning and faces the risk that he will be ridiculed or even killed by his mates. The sun, the source of good, is the divine spark, and the moral of the allegory is that the sun, the light,

---

Email: [astavros@gmail.com](mailto:astavros@gmail.com)

is the education. A person goes through a process of transcendence that symbolizes degrees of truth. And the truth of the allegory is revealed. He who comes out into the light, he who discovers the truth, he who passes through education, must go back, and try to elevate the whole community. The leader is an educator. Everyone has a goal, to increase the benefit of the community, in order for the community and all its members to be happy. Thus, leaders must first of all, find their light, their knowledge, and only then, turn to leadership. That is, it is not a matter of persecuting the governing, but of a commitment to the community. Commitment to the society that took him through the education process, in which he found happiness. The leader rewards the community by returning to the cave and educating the people. Since according to Plato, the leader's goal is not to command people to follow him, but to persuade them to follow him (Plato, 2017).

Naturally, youth movements serve as a platform for leadership development (WHO, 2020). This conclusion arises after summarizing studies' findings and after reading the movement training programs. It can be said that, in the youth movements, every member in the senior class, experiences leadership education. Even if they are not counselors, they are partners in an increasing involvement in society and community, partners in contributing to society and helping others. Thus, it seems that education for engagement and caring, which forms the basis of every youth movement, provides an opportunity for leadership for every senior member in youth movements (Even et al., 2016).

Daudi (2013) contends, that the art of leading others comes through the art of leading oneself. Thus, leaders are an example of doing. The research question then is how the leadership experience in a youth movement can shape the world of values, personal identity, and the social engagement of the

counselors.

## 2. Leadership

Wherever there is a hierarchical community, such as a workplace, a youth movement, a state leadership, and more, the "boss" is always a different person from everyone else (Bennet et al, 2015). It is usually a person with great self-confidence who radiates power and has a presence that has "filled the room". Such person is not always pleasant or loveable, but in most cases, it is an inspiring person. Scouller (2011) contends that a leader is a person who leads a particular group at a particular time. But leadership is a rather broad and multidimensional term to be conceivable. It is a particularly complex system of influences that greatly affect the way a group of people are organized and how they act. The larger the community and situation, and the environment in which the group is involved, the more complex the leadership is as a system. When leadership is addressed as a process, it is more understandable that leadership and a leader are not the same thing. Although the phenomenon of leadership has existed for many years in human relations, the definition of leadership has occupied many academic researchers. Stogdill (1974) argues that the word "leader" was already in use in the early 14th century and the word "leadership" first appeared in the early 19th century (Fairholm, 2002). The concept of leadership is controversial. Rost (1991) argues that "these attempts to define leadership have been confusing, varied, disorganized, idiosyncratic, muddled, and, according to conventional wisdom, quite unrewarding" (p. 99). However, many other researchers, continue their work in learning, defining, identifying, and developing leadership (Fairholm, 2002).

As there is no one definition for a leader, there is no one leadership model agreed upon by all. In every department and at every stage, there

must be people who can take a leadership action to make their part in the system work. People who are willing to adjust a systemic policy to the reality at the field level. Men and women who are not afraid to sound an alarm to the higher echelons that the new policy should be corrected or reversed (Gardner, 1990). When we want to separate leadership and management, Fairholm (2002) argued that one is "performing leadership" and the other is "performing management" and these are two different tasks. Bennis and Nanus (1985) clarified that managers are "routine masters" and they achieve efficiency, whereas leaders are "masters of change." They are influential, they are effective, or in the authors' view: "The manager does things right; the leader does the right thing" (p. 21).

Gardner (1965) argued that leaders play a significant role in creating the mindset that is society as a whole. They can serve as symbols of the moral unity of society, they can express the values that hold society together and most importantly, they can think and express goals that will lift people out of their petty pursuits, carry them over the conflicts that separate members of society, and unite them in another striving goal, worthy of their efforts. This statement sums up the importance we assign to leadership, since in order for leaders to be able to draw from morality and use their influence, they need to wrap people around collective goals (Antonakis & Day, 2018). An interaction between the leaders and their followers is the foundation upon which leaders instill in their followers a motivation that leads them to pursue their goals (Shamir et al., 2018). As a result, these leaders become role models (Schweitzer, 1984; Willner, 1984; Bryman, 1992) and their followers internalize the values and ideals with a sense of motivation and enthusiasm (Shamir et al., 2018), when the ability to inspire trust, is what allows leaders to motivate others for the cause (Bennis, 2010).

Is a person born to be a leader? The theory of the Great Man known also as the theory of

traits, holds that there are people who are born to be leaders and there are people who simply "don't have it." The Great Man theory born in the 19th century, holds that history can be largely explained by the influence of great people, or heroes, who were influential and incredibly unique, and by virtue of their natural qualities, such as superior intellect, courage, heroism, or divine inspiration, they had a decisive historical impact. The father of the theory is the philosopher Thomas Carlyle who stated that the history of what man has achieved in this world is in fact the history of the great people who have acted over the years. They were great leaders, and created models of doing and achieving, that all human beings aspired to achieve and do (de Vries & Cheak-Baillargeon, 2001; Halaychik, 2016; Harrison, 2018). In their book, "Leading minds: An anatomy of leadership", Gardner and Laskin (1995) proposed a cognitive approach to leadership by which, a leader is a person who influences a large number of people and in a sense, such people inherit certain qualities that make them more suitable for leadership. For example, traits such as extroversion, self-confidence, and courage are all traits that can be associated with great leaders (Grant et al., 2011). Gardner and Laskin (1995) discussed leadership in the light of the stages of human development and researched Gandhi, Napoleon, Margaret Thatcher, Martin Luther King and more. They concluded that the leader has an influence on the emotions and behavior of masses of people. In contrast, the behavioral theory holds that great leaders are created and not born. This can be seen as a reversal of the Great Man theories. This leadership theory, which is rooted in behavior, focuses on the actions of leaders rather than mental traits or inner states. According to this theory, people can learn to be leaders through teaching and observation (Derue et al., 2011). Proponents of this theory argue that anyone can be a leader and that leaders can be developed, and leadership skills can be learned (Di Giulioi,

2014).

There are many models of leadership. Two major models that stand out in their importance are transactional leadership and transformational leadership. The concept of transformational leadership, first coined by Burns (1978), speaks of transformative leadership that enhances the motivation, morality, and performance of followers through a variety of mechanisms. These include connecting the sense of identity and sense of self of the followers to the task at hand, and to the collective identity of the organization; to be a role model who simulates the followers; challenge them to take more ownership of their work, and understand the strengths and weaknesses of followers, so that the leader can delegate tasks to his followers that will maximize their performance (Burns, 1978). Bass (1985) expanded Burns' idea by explaining the psychological mechanisms underlying business design and leadership. Bass added to Burnes' first concepts to explain how transformational leadership can be measured, as well as how it affects motivation and performance (Bass & Avolio, 1995). The degree to which the leader is transcendent is measured by the mirror of his influence on his followers. The followers of such a leader feel trust, admiration, loyalty, and respect for the leader, and due to the qualities of the transformational leader, they are willing to work harder than expected. These results occur because the transformational leader becomes for his followers something more than a work for self-gain. Such a leader gives his followers a sense of mission, an inspiring vision and identity. The transformational leader motivates his followers through the transmission of ideals, intellectual stimulation, and personal concern. In addition, such leaders encourage their followers to come up with new and unique ways to challenge the status quo and change the environment (Bass, 1985; Bass & Avolio, 1995; Burns, 1978; Yukl, 1999).

Burns (1978), coined another term, "transactional leadership" and argued that transformational leadership and transactional leadership are reciprocal styles. Transactional leaders do not usually strive for cultural change in the organization, but they operate in the existing culture, while transformational leaders can change the organizational culture (Burns, 1978). Under this leadership there is an exchange and reciprocal relationship between the leaders and their followers and transactional leaders can cultivate the commitment of their employees through appropriate rewards and by recognition that translates into compensations, new initiatives, and ideas (Breevaart et al., 2014). Bass (1985) argued that transformational leaders emphasize the development of higher motivation and evoke positive motivation and emotions by creating and presenting an inspiring vision of the future, while transactional leaders rely on a clear system of contracts and rewards. Unlike Burns, Bass (1985) argued that leadership can be both transformational and transactional.

As such, Avolio and Bass (1994) introduced the full-range leadership - a concept that consists of transactional leadership, transformational leadership and a leadership style known as *laissez-faire* ("let do"). The novelty of this model compared to the other models, is that each leader has characteristics of different styles where the combination of these characteristics, the characteristics of the leaders and the dominance of a particular characteristic or trait, determine the effectiveness of the leader as well as the leadership style as perceived by his or her followers (Bass & Avolio, 1994). Today's leaders integrate the entire sequence, and they reap tremendous success in situations where others have failed (Stafford, 2010). A full-range leadership model operates on several principles. The first is an idealistic influence, referring to the charisma of a leader or the ability of a leader to be a role model for his followers. This is the emotional component of

leadership. The second component is leadership behavior. In general, the components determine whether the leader is perceived as trustworthy and respectful by his followers and whether they tend to try to emulate his behaviors and pursue common goals (Kirkbride, 2006). Another principle of a full-term leader is to inspire motivation among the followers as well as the question of whether the leader evokes an intellectual stimulus in his followers. They encourage their followers to be creative and innovative in solving organizational problems. These leaders do not criticize people who "come out of the box" and deviate from traditional organizational practices. Another factor is individual attention. That is, a leader who is attentive to the individual follower, gives advice and support and addresses the personal needs of each one of his followers, and thus, enables them to develop and realize themselves. This individual attention is typically translating into positive organizational outcomes based on the collective efforts of significant individual performance (Antonakis & House, 2013). Salter et al. (2014) found a significant association between moral maturity and inspirational and rewards leadership qualities, suggesting that leaders' communicative behaviors include both transformational behavior and transactional behavior and that both styles are needed to create effective leadership. We found an example of effective leadership in non-formal education as this study will show.

## 2.1 Youth Movements

Youth movements constitute a non-formal education framework in which an organized and systematic activity operates outside the formal education system in order to receive defined educational goals such as the acquisition of knowledge and skills, leisure education and recreational activities or ideological education. The activity provides

unique patterns of education for different groups in the population. This pattern is characterized by a unique code whose main characteristics include free choice regarding participation or leaving an activity, interaction based on equality, and peer supervision, i.e., supervision through advocacy and persuasion instead of prohibition. This unique education method operates on the basis of adaptation to participants and courses of action that are appropriate to the goals (Mendel-Levy and Artzi, 2016). One of the major contributions in the field of non-formal education is voluntary activity. Volunteering experiences in general are defined as perceptions that are characterized by a sense of personal well-being that results in satisfaction and a sense of empowerment. Studies conducted in the field indicate that when volunteering is interesting and challenging, require responsibility and characterized by accomplishments, the volunteers will be satisfied. A study by Magen (1997) found that adolescents who were engaged in volunteering, described experiences of intensified happiness and a high sense of coherence as well as their aspirations for life indicated a stronger desire for personal commitment, compared to adolescents who did not engage in volunteering. Thus, the engagement of adolescents in social activities is of great importance. The sense of being able to help others, be effective in states of distress and serve as a source of support and hope with the ability to devote time and internal resources to realizing worthy social values, act as empowering factors for adolescent and their personal identity, sense of meaning in life, personal discovery, and ability to be more open and capture moments of true happiness (Gross & Goldart, 2017; Magen, 1997).

Into this niche, youth movements enter. According to the Israeli Ministry of Education, youth movements have an important place in the establishment of the

State of Israel and continue to contribute to youth and society in a wide range of issues including strengthening love for the country, self-fulfillment, encouraging coexistence, tolerance, reducing social disparities, fostering leadership, democracy, responsibility, and social engagement. In 2015, there were 13 youth movements in all sectors of the population in the Israel (Even, 2014; Ministry of Education, 2016). Youth movements emerged in the early 20th century and are a tool for instilling ideologies for youth (Minkov, 2010) which holds a built-in worldview. The youth who participate in such activities, come by choice and according to their ideological perception. One of the important aspects in youth movements is the principle of "youth educating youth." The training programs train the youth to be young counselors (Ministry of Education, 2009). Generations of active leaders and citizens are being trained in youth movements. The movements, thanks to the structure and the connection between counselors and groups, constitute a fertile paradigm for the experience and practice of the youth in tasks that require responsibility, initiative, and leadership (Even et al., 2016).

## **2.2 Youth Movements and Social Engagement**

In the delicate seamline between childhood and adulthood, youth movements play an important role in the maturation process of youth into adults with values and a sense of social engagement; In our time, dominated by technological innovations and online communication, youth movements offer another alternative - a human encounter "as before" and joint and empowering group action. The youth movements in Israel transmit and educate the values, each in accordance with its ideology. All this, with practical experience: the youth themselves lead the various activities in the youth movements - activities that invite members in

movements with diverse experiences, as well as an opportunity for personal development and expression of personal skills (Shemer, 2013).

Studies on youth volunteering around the world, found that volunteering is a beneficial experience and has significant developmental implications for adolescents. According to studies, adolescents who volunteer and are socially involved in settings such as youth movements, feel happier and more optimistic and also have greater self-confidence than their peers who are not active in the youth movements (O'Connor, 2011; Smith et al., 2010; UN Volunteers, 2017 ). A comprehensive study found that volunteer youth were better integrated into society, had higher self-control, and had a significantly lower tendency to engage in activities of a criminal nature (Shemer, 2013).

## **3 Method**

The research method in this study is the qualitative research method. This method is based on the assumption that the best way to show human experience is by a narrative. The qualitative paradigm is appropriate for the current research since it seeks the essence of the human experience and the central meaning that underlies it. This approach focuses on understanding the meaning of the experience for the people who participate in it. The experience of the study participants is the subject of this research, and therefore, the author explores them in the framework of these concepts. In other words, in terms of the meaning that ideas and actions have for the study sample during their period as senior counselors (branch managers) (Shkedi, 2007). This research does not attempt to give key answers to "what", "where", "when", but addresses the "how" and "why", which helps understand the internal leadership processes of the former counselors who participated in the study (Denzin & Lincoln, 2011).

### 3.1. Sample

The study population includes six participants who were formerly branch managers from two major youth movements. Three were former branch managers of the Scouts in Haifa and three were branch managers of Bnei Akiva in Jerusalem. All currently between the ages of 25-30 and were senior counselors between the ages of 21-25.

### 3.2. Research Instrument

The research tool is a semi-structured in-depth interview consisted of 8 questions.

### 3.3. Research Design

The study was conducted via Zoom. The author reached out to the participants through mutual friends and relatives. Before conducting the interview, the author had a "small talk" with the participants, explained to them the meaning of the research and its contribution and emphasized that the research was conducted in the mirror of leadership while paying attention to the value structure of their experience as youth counselors. The reliability of the study was maintained by condensing the study in quotations (Shaked, 2007).

The analysis of the data is done by coding the findings, sorting, and filtering out unnecessary or similar findings. The data were then collected and divided according to key themes (Shaked, 2007).

## 4 Results

### 4.1. Coping with organizing and organization

The experience provides an opportunity to discover the assertiveness inherent in the participants and their ability to build an organization while tackling challenges and identifying problems.

S.:

"When I first came to run the branch, I realized that the current staff of counselors was not active and did not contribute to the members. Therefore, I fired all of them and mobilized all the resources to recruit a new team of counselors."

During the challenging role, the participants often worked under conditions that were far from optimal. This can be seen from S. experience when he encountered a difficulty that every organization goes through and that is high employee turnover. S. solved the problem in a creative way and with the help of organizational and leadership ability.

The counseling experience is mainly a personal connection for the senior counselors themselves. The personal connection is significant to the success of the goals.

A.:

"You feel that you are a meaningful person and have a built-in desire that the youth will love you and make you feel a part of them."

It seems that the participants perceive the personal connection as important.

One of the important principles of leadership is to be attentive to the followers. It was evident that the participants showed great deal of consideration.

M.:

"On Tuesdays I would arrive at the place, relatively early, and organize it to create a good atmosphere for the members."

### 4.2. Personal Engagement

One of the components of a leader is the ability to set a personal example. The counselors acted to engage and set a personal example.

R.:

"I would greet everyone and make sure that each one of the members is with their counselors and they are collaborating as well."

Part of setting an example is not demanding from others what you are not willing to demand from yourself. From S., we can learn how he implemented that theme.

S.

"I decided to take on all the tasks associated with the group, and entrust counselors, to cope solely with recruiting members since it was important for us to get as many youths as possible to actively participate in the movement's programs. Therefore, I performed many tasks which are ordinarily under the responsibility of my team, to make sure that they would be free to concentrate on the young members."

#### **4.3. Leadership**

It is evident that one of the things that guided the participants is the desire to lead also out of a personal sense of mission.

Y.:

"I felt that I would and could continue with this line, out of a sense of mission and efficiency."

It is clear from D. that he sees himself as a leader and his role as a senior counselor enabled it.

D.

"I have something in me that really likes to take part and be responsible, lead, be the one who drives processes and things."

The senior counselors organized the members for social activities in the community.

Y.:

"On one occasion I initiated a task that involved all of the members and the junior counselors and that is garbage collection from all over the city. We received large garbage bags from the municipality. All the members participated and wore the movement uniforms holding big, orange bags. They managed to sweep to the task, passers-by and after a while it was no longer possible to differentiate between members and local

residents. They all worked together to clear the streets from garbage. In the meeting that followed, all the members wanted to talk about was how much they felt empowered by the garbage collection initiative.

It is evident that this framework, of education for values in after school hours, contributes to the empowerment of the youth. The study participants talked about values of community and giving as their values shared between unity and society, in which they see supreme and inclusive values.

A.:

"The value of unity is a value without which, no group can exist. There must be brotherhood among the members of the movement in order for us to move forward and act."

An important value that constitutes one of the goals of the youth movements is community. Participants internalized this value, which gave them social tools of containing and observation.

Y.:

"In terms of values, it is the ability to be a part of a community, a population that is diverse, to rejoice in it, to love it, to move forward together with it."

In addition, the participants also expressed social values of giving.

G.:

"Starting with the junior counselors and the senior counselors, where they don't give, there is nothing there."

And they also received social values of action.

D.:

"We performed all kinds of volunteer activities and created initiatives that their essence is act for the sake of the other, especially to show the children (members) that they don't live only for themselves."

These values of volunteering and giving to others, contribute to the empowerment of the

contributors themselves.

## 5 Discussion

When we refer to the counselor as a leader, as we do in this study, we can see how the quality of the leaders is reflected in their role. Bennis and Nanus (1985) argue that a leader is a "master of change" and indeed, the research participants appear to have been agents of change during their counseling experience in youth movements. This experience allowed them to discover the assertiveness inherent in them and their ability to build an organization when faced with challenges they had not been prepared for before. Gardner (1990) argued that a leader is a person who adjusts systemic policy to the field and that he or she, warns of flawed policies and solves problems. The participants encountered situations in which they were required to make organizational changes, such as replacing the entire counseling team.

Gardner (1990) also argued that the leader has a role to play in creating a mindset in society as a whole. The counselors were able to increase their population through unification and formation. They managed to sweep the junior counselors after them, as Antonakis and Day (2018) argued, that one of the important things a leader needs is to involve people around collective goals. It is evident that this is reflected in the behavior of the participants. One of the important things that defines a leader according to Bass (1985), is the ability to set a personal example. In doing so, the leaders empower their followers, in this case, both the junior counselors and the members, while setting a personal example. One of the participants said he arrived earlier, taking on a load of chores and tasks to make it easier for the junior counselors. This serves as a personal example and as asserted (Bass, 1985; Bass & Avolio, 1995), such behavior inspires and invokes action among the followers. According to the study

participants, one of the things that came up was their personal engagement with the members of the movement. A transformational leader is a leader who communicates personally with his or her followers. It is also evident from the participants' words that they aspired to be loved by their followers. Not only did they inspired the junior counselors to do what they wanted them to do, but they wanted these actions to be conducted out of will and warmth. These are basically the principles of transformational leadership (Bass & Avolio, 1995). When the leader instills motivation and enthusiasm in his and her followers, the followers emulate their leader's values and ideals (House, 1988). The study participants empowered the junior counselors and members and instilled in them a trust that they followed them and their tasks, all of which are the marks of transformational leadership (Erkutlu, 2008), and by doing so, they were able to bring their followers to success.

In terms of value, we can see how the experience empowered the participants. They felt that they had been given a lesson for life, which added to their personal identity. Gross and Goldart (2017), contended that when volunteering is interesting and challenging, the volunteers act out of a sense of worth and giving. This value can be seen in the narrative of the participants who described the variety of values they received from the movement, the value of giving was one of them and they instilled this value in their followers as well. By doing so, a sense of ability and competence was created in them (Gross and Goldart, 2017).

In terms of social action, Magen (1997) found that involvement in volunteering indicates a stronger desire for personal commitment. It is evident that the research participants have a deep commitment. Gross and Goldart (2017), argue that adolescents' involvement in social activity is of high importance because the sense of helping others and the sense of self-benefit, act as empowering factors and the

consciousness of personal identity. Magen et al. (1992) found among young people from low socioeconomic neighborhoods, that when they were motivated by the desire to contribute and help others and when they were actually involved in doing so, their sense of self-worth increased and their sense of coherence was strengthened and with it, the ability to experience life to a more fulfilling and happier levels.

More recent studies also demonstrate the contribution of civic engagement among adolescents. Callina et al. (2014) researched the term Hope among adolescents in various contexts. Adolescents' sense of hope was found to be woven from all sets of life, including their contribution to the community and society. McBride et al. (2011) researched youth volunteer programs in Latin America and the Caribbean and concluded that volunteering enables youth to take on significant roles that contribute to their development.

It can be concluded that the study participants, in retrospect, were aware of their power and strengths and the fact that they can attest to themselves today that they have moved things, led and driven processes, indicates high awareness and growth as a

result of the process.

### 5.1. Limitations of the Study

Since this is a qualitative study that was conducted on a small sample, it is naturally not inclusive. In contrast to quantitative research, none of the answers to the interview questions were identical to each other. Because this is a completely subjective view of the participants, each question had answers as the number of participants, which sometimes made it difficult to find a connecting line in some of the questions, and sometimes required deepening the meaning in order to make the analysis continuous and non-schematic. To overcome this problem the author focused on analyzing findings that directly relate to the research question.

**Acknowledgment:** I would like to thank the former senior counselors who participated in the study and administered their time with joy and love and out of a desire to share their experience. I would like to thank all of the youth movements in the State of Israel for their blessed work and for the challenges and goals they pose to the youth which contribute to their empowerment and social engagement.

## **CREATED AND REALIZATION OF A DEMOGRAPHIC POPULATION MODEL FOR A SMALL CITY**

**Abstract:** *Using a mathematical model of the system dynamics of the demographic process in the work, an assessment of the impact of the housing construction industry on the future population was obtained it was revealed that the share of occupied plots for housing construction is a leading indicator in ensuring stable reproduction of the demographic process both in urban agglomerations and small towns countries, for example, the city of Kossy, Akmola region of the Republic of Kazakhstan.*

**Keywords:** *Mathematical model; System dynamics; Demographic process; Population; Housing construction industry*

### **1. Introduction**

It is known that work (Balabanova et al., 2021; Gnap et al., 2018; Low et al., 2020; Sterman, 2000) is devoted to comprehensive studies of obtaining systemic solutions to the problems of the demographic situation of the city's population, but today many authors conducts comprehensive and in-depth analyzes of the issue methodology and use more modern technologies, in particular, among them, we note that the work (Avdeev & Troitskaya, 2021) revealed features and factors of demographic dynamics in the Kyrgyz Republic. Meanwhile, the current socio-demographic situation in the Kyrgyz Republic is analyzed as a research complex of the article, in particular, the problems of natural population growth, internal mobility and international migration are analyzed as the main components of population dynamics. The authors of the article, on the basis of demographic trends in the republic, in particular, judging by census data and current statistics and based on the study of the situation of the population, estimate the features of the age-sex structure of the

Kyrgyz population and the increase in the rate of aging, as well as the population's settlement in cities and its urban centers justified the opinion of the concentration and evaluated the impact, in particular, justified the need to regulate the process of urbanization and the measures to attract internal migrants. Indeed, an analysis of the demographic dynamics in the Kyrgyz Republic has shown several interrelated problems and challenges arising from the rapid growth of the population and changes in its age structure and requiring urgent social and economic policy measures. As a result, the analysis of the dynamics of demographic growth in the Kyrgyz Republic revealed that a number of problems and difficulties are occurring that require urgent state regulatory measures from the society within the socio-economic situation caused by the rapid growth of the population and the change in the proportion of its age structure. As a result, on the example of the two largest urban agglomerations of the Republic, the cities of Bishkek and Osh, the massive departure of working-age residents, especially young people (labor migration),

<sup>1</sup> Corresponding author: Seyit Kerimkhulle  
Email: [kerimkhulle@gmail.com](mailto:kerimkhulle@gmail.com)

the growth of the retirement-age population, and the uneven distribution of residents around the city are the tasks of today's activities.

Further, in the article (Conti et al., 2021) validation studies were conducted for residents of nursing homes in England. The aim of this work is to explore a new methodology based on the association of unique identifiers of the home address of the elderly with the registration data of patients in primary health care, allowing to routinely identify residents of nursing homes in health care data. And the obtained estimates of diagnostic efficiency, although showing a slight false-negative rate (21.98%), emphasize a significant true negative rate (99.69%) and positive predictive value (99.35%), as well as a satisfactory negative predictive value (88.25%). This leads to the conclusion that validation gives confidence in the reliability of the new address matching method as a viable and general alternative to manual address matching.

In conclusion, we note that in (van Dalen & Henkens, 2021) received a consensus and disagreement were found among demographers on population problems and climate change. As a result, climate change was found to be at the top of the list of demographic concerns, but that their sense of urgency to act against global warming was not consistent with their belief that population policy could be crucial in reducing CO<sub>2</sub> emissions.

## **2. Literature review**

The positions of researchers on the problem of assessing the financial and economic ties of the industry's impact on the demographic process are diverse the article (Nwogu & Okoro, 2021) assesses mortality in lived person-years and the remaining life expectancy of adults in developing countries.

In the work (Arpino & Tavares, 2013), using the data obtained from the Eurostat Database and European Value Surveys of the last period, the estimations of birth trends for the population of Europe with or without changes in latent dependency values were given. As a result of their special focus on Spain, Italy and Southern European countries, in particular, they are treated as a homogeneous group with the same "traditional" values and demographic behaviors than the Scandinavian countries, which are considered to be typical and similar. However, it is shown that the latent dependency values for the countries of Italy and Spain are not very similar. It was also shown that similar values at the country level with respect to TFR (Total Fertility Rate) vary significantly at the regional level. Of course, it is clear that the demographic analysis carried out at the regional level will play a very important role in order to better understand the changes in the birth rate of latent dependency values. Within the framework of demographic analyses, it is proved that the latent dependence occurring in the recent trend of childbearing is related to value dynamics, in particular, the highest growth rate of TFR (Total Fertility Rate) is related to individualism relationship and personal autonomy and children, as well as simultaneous growth in regions phenomenon occurs. The article also substantiates the McDonald's theory with empirical evidence of the increase in the demographic trend of child birth and the occurrence of gender balance in market and family-oriented public institutions.

An article (Vanella et al., 2022) concludes that the low birth rate in industrialized economic countries leads to a decrease in the death rate of the population in the country, and it is true that this, in turn, puts the country's social security system under severe pressure. The aging of the population depends mainly on the long term of

retirement requirements and the conditions of entry of pensioners into the labor market. It is clear that the problem of forming adequate forecasts of the future structure of the population by age category poses a threat to the stability of the social security system, which is paid for the introduction of reform measures or further improvement. The article presents a probabilistic approach to forecasting the number of pensions in Germany until 2040. The model considers trends in population development, labor force participation and early retirement, as well as the implications of pension reforms. Principal component analysis is used to manage the high degree of complexity in forecasting trends in old age and disability pension claims arising from age and disability pension benefit rates, the overlap between different age groups and gender. For example, time series methods allow adding autocorrelation of time series of pension rates to the model. Monte Carlo simulation is used to determine future risk. This is an important feature of the model, because the future development of the population and, ultimately, the pension requirements and the resulting financial burden are highly stochastic. As a result, in the median trajectory between 2017 and 2036, the number of old-age pensions is projected to increase by about 5 million, and the number of disability pensions will also increase by 2036. These projections take into account the increase in the legal retirement age. As part of the 2007 pension reform. However, a moderate decline can be expected after the mid-2030s. Especially in the medium-term perspective, it clearly shows the need for further reforms.

The dynamics of population growth is usually autocorrelated: the amount of population growth is positively or negatively correlated with the amount of previous growth. This (Pilowsky & Dahlgren, 2020) study found that autocorrelation increases

the risk of extinction due to "inertia" that prolongs the deviation of positive populations toward decreasing growth rates. However, the level of life-cycle autocorrelation transition has not yet been fully analyzed. At the same time, a stochastic matrix with known autocorrelation values for each matrix element was developed with the colored noise R program to generate population growth projections. At the same time, long-term demographic data on the number of 25 inhabitants in the COMADRE and COMPADRE databases were used to analyze and model their stochastic dynamics. These results revealed a wide range of autocorrelation relationships across species, populations, and life cycle stages. It was found that the interclass number of period residents in the matrix strongly affects the autocorrelation of the growth rate. In addition, reproductive transitions in population growth have negative autocorrelation than survival transitions, and in matrices dominated by positive autocorrelation, there is a higher risk of extinction, and it was argued that the type of transition in population growth is not related to the color of the noise. In conclusion, the results of the study show that population growth is autocorrelated with life cycle exchanges, even population growth of the same species varies. Also, the R program for colored noise is recommended for autocorrelation analyzes of structural demographic indicators of population growth.

This article (Mulder et al., 2022) explores the existing associations between migration and labor market rates in the widely studied countries of Northern and Western Europe and the United States. To do this, the researchers used a sample of labor market participants from the Attitudes and Expectations Regarding Mobility survey conducted in Spain in 2019. As a result, it was found that, firstly, the probability of

becoming a professional is higher for women who have migrated than for those who have not migrated. Second, women who live close to family are less likely to be unemployed or find temporary work than those who do not, but none of these associations were found in men. Third, that living close to the family is consistent with the notion that the close family can protect women, from precarious positions in the labor market. Fourth, that migration differs from previous results for Northern and Western Europe and the US, which indicate that migration benefits men.

This article (Mulder et al., 2022) discusses migration as a way to enhance professional careers. However, especially in Mediterranean countries, labor market outcomes may also depend on local family resources. For example, it examines how labor market outcomes for men and women differ between (1) migrants and non-migrants and (2) those living close to and far from family. With the help of an in-depth study of migration trends and the labor market in Northern and Western Europe and the United States, he emphasized the important role of living in the environment of close people within the family, more than in other contexts. Indeed, a sample of labor market participants was described by analyzing the results of the survey "Attitudes and Expectations About Mobility" conducted in Spain in 2019. In particular, among the immigrant women group, it was shown that immigrant women are more likely to be professionals. However, the odds of being unemployed or in temporary employment were lower for women living close to family, but no association was found for men. The finding of living close to family is consistent with the notion that close family may protect women in particular from precarious positions in the labor market. The finding on migration differs from earlier findings for Northern and Western Europe and the United States, suggesting that migration is

particularly beneficial for men. It is also possible that this difference is specific to a low-migration context, but data limitations clearly prevent firm conclusions.

This article (Paquet et al., 2021) emphasizes the importance of assessing the contribution of demographic parameters in population growth to changes in population growth in order to understand why populations change. Integrated population models (IPMs) offer the possibility to estimate the contribution of demographic parameters to population growth for which no data are clearly collected – usually immigration. Such demographic parameters are often cited as important drivers of subsequent population growth. However, the accuracy of the assessment of their change over time, and therefore their contribution to the change in the population growth rate, is not fully studied today. Indeed, when estimating the contribution of immigration in the process of demography with the help of IPM, it is necessary to determine the potential biases and their dependence on the IPM parameter, the formulation of subjects, the level of temporal change of immigration, the sample and the demographic size, in order to determine the magnitude and quantitative cause of possible biases. Empirical data on populations with known immigration rates were also used, for example: the soya sheep *Ovis aries* and the Mauritian kestrel *Falco punctatus* with zero immigration and the Scandinavian gray wolf *Canis lupus* with near-zero immigration. In immigration scenarios with zero variation (proportion of variance attributable to immigration = 63% for the restricted formulation and real sample size) and wild populations, the IPM greatly overestimated the contribution of immigration to changes in population growth. true numbers of immigrants were zero or close to zero (eg, kestrel 19.1%-98.2%, sheep 4.2%-36.1%, and wolf 84.0%-99.2%). Although estimates of the

immigration share in the Immigration Survey became more accurate with increasing temporal variation and sample size, it was often not possible to distinguish accurate estimates from data with high temporal variance and overestimates from data with low temporal variance. A good estimate of the contribution of immigration may require larger imprecise sample sizes. To reduce the risk of overestimating the contribution of immigration (or any additional parameter) to the IPM, the following are recommended: (a) look for evidence of changes in the contribution of immigration to population growth before examining it, (b) model the data for comparison and compare the simulations to real data, and (c) Where possible, accurate immigration data should be used.

The aim of this work (Tiwari et al., 2020) is to forecast India's population by the end of the current century, and also to study the year when the number of young people per capita in India's population is structurally the highest. The authors compared the age structure of the population in 2001 with the structure of 2096, for example, based on the model of distribution of the population according to age characteristics. Also, the most popular method of population projection, known as cohort component method, was used in this study to estimate the population of India. For this purpose, the population at every five-year interval is used with valid forecasts of a certain level of birth and death, so this method is called a dynamic demographic projection model in the scientific literature. Meanwhile, Age Specific Fertility Rate (ASFR) for different years was derived from NFHS-3 and 4 to predict new arrivals. According to the study, India's population will begin to decline by the middle of the present century. However, it can be seen that the total population in 2021 is almost the same as the total population in 2001, but one interesting thing is that the age structure of the two

populations is opposite. According to the research, in the future, the number of women of old age (70+) will be more than the number of men of old age (70+).

### 3. Methods and main results

To construct a mathematical model of the demographic development of the population of a small town, the mathematical theory of differential-difference equations (Kerimkhulle & Aitkozha, 2017) and models of the system dynamics of complex objects (Sterman, 2000) are used. And for the implementation of which algorithms, program codes in the AnyLogic software (AnyLogic, 2022) were developed and result-oriented computer experiments were carried out to reveal the hidden relationships between the values of the input indicators: initial population size, immigration and emigration rates, average life expectancy, household size, fertility rate reproductive women and outputs: population, newborns, deaths, emigration and immigration.

In this regard, in this paper, a demographic model of the systemic dynamics of the population is considered in order to reveal the hidden dependencies between the input parameters and the result-oriented output data of the demographic situation of the inflows and outflows of the population of the small town of Kosshy, Akmola region of the Republic of Kazakhstan.

#### 3.1. Mathematical model of the population

Let  $t = 1, 2, \dots$ , – forecasting time periods, year, then to construct a mathematical model of the population in the demographic process of a small town, the following are used:

– first-order difference scheme equations to ensure balanced population growth –  $Population_t$ , and stability between inflows:  $Immigration_t$  – immigration numbers,  $Births_t$  – births number and population

outflows: Emigration<sub>t</sub> – emigration numbers, Deaths<sub>t</sub> – deaths numbers:

$$= \text{Immigration}_t + \text{Births}_t - \text{Emigration}_t - \text{Deaths}_t;$$

$$\frac{d(\text{Population}_t)}{dt} = \text{Immigration}_t + \text{Births}_t - \text{Emigration}_t - \text{Deaths}_t; \quad (1)$$

– initial population, – PopulationInitial:

$$\text{Population}_t|_{t=0} = \text{PopulationInitial}; \quad (2)$$

– immigration numbers, – Immigration<sub>t</sub>, which is determined through the population, – Population<sub>t-1</sub> and the number of attracting population inflows due to housing of the previous period, – AttractionDueToHousing<sub>t-1</sub> with the immigration rate, – ImmigrationNormal:

$$\begin{aligned} \text{Immigration}_t &= \text{Population}_{t-1} \\ &* \text{ImmigrationNormal} \\ &* \text{AttractionDueToHousing}_{t-1}; \end{aligned} \quad (3)$$

– births number, – Births<sub>t</sub>, which is directly proportional to the population of the previous period, – Population<sub>t-1</sub> with proportional coefficient, Fertility – fertility of reproductive women:

$$\text{Births}_t = \text{Fertility} * \text{Population}_{t-1}; \quad (4)$$

– emigration numbers, – Emigration<sub>t</sub>, which is determined through the population of the previous period, – Population<sub>t-1</sub> with the immigration rate, – ImmigrationNormal:

$$\begin{aligned} \text{Emigration}_t &= \text{EmigrationNormal} \\ &* \text{Population}_{t-1}; \end{aligned} \quad (5)$$

– deaths numbers, – Deaths<sub>t</sub>, which is directly proportional to the population of the previous period, – Population<sub>t-1</sub> with proportional coefficient, 1/AverageLifetime – inverse of the average life expectancy of the population:

$$\text{Deaths}_t = \frac{\text{Population}_{t-1}}{\text{AverageLifetime}}; \quad (6)$$

– attraction function value attractionDueToHousingLookupTable population inflows due to housing, – AttractionDueToHousing<sub>t</sub> from the ratio of households to the number of houses, – HouseholdsToHousesRatio<sub>t</sub> according to the given lookup table:

$$\begin{aligned} \text{AttractionDueToHousing}_t &= \text{attractionDueToHousingLookupTable} \\ &(\text{HouseholdsToHousesRatio}_t); \end{aligned} \quad (7)$$

– the value of the ratio of households to the number of houses, – HouseholdsToHousesRatio<sub>t</sub>, which is directly proportional to the population, – Population<sub>t</sub> and is inversely proportional to the number of houses, – Houses<sub>t</sub> with proportional coefficient, 1/HouseholdSize – inverse of the household size of the population:

$$\begin{aligned} \text{HouseholdsToHousesRatio}_t &= \frac{\text{Population}_t}{\text{Houses}_t * \text{HouseholdSize}}. \end{aligned} \quad (8)$$

**Figure 1.** Input parameters, output data and computer implementation of a mathematical model of the demographic situation for a small town in the AnyLogic software [12]

### 3.2. Computer implementation of the population model

Let the input data of the parameters be given:

- PopulationInitial, – the initial value of the population size of a small town with an interval of acceptable values [30 000; 100 000] people, in particular PopulationInitial = 10 000 people;
- AverageLifetime, – average life expectancy with an interval of acceptable values [50; 80] years, in particular AverageLifetime = 67 years;
- Fertility, – fertility rate of reproductive women with an interval of acceptable values [0.01; 0.1] or from 1 % till 10 %, in particular Fertility = 0.03 or 3 %;

- EmigrationNormal, – the rate of normal emigration of the population with an interval of permissible values [0.05; 0.15] or from 5 % till 15 %, in particular EmigrationNormal = 0.07 or 7 %;

- ImmigrationNormal, – the rate of normal immigration of the population with an interval of acceptable values [0.05; 0.15] or from 5 % till 15 %, in particular ImmigrationNormal = 0.1 or 10 %;

- HouseholdSize, – average number of people in a household with an interval of acceptable values [2; 8] people, in particular HouseholdSize = 4 people.

Then the computer implementation of the mathematical model of the population (1)-(8) makes it possible to obtain the following results

of the output data – values, simulation, and visualization of the results of computer experiments:

- Population<sub>t</sub>, – population growth with 50 thousand by 434 thousand 510 people (see Fig. 1, «S» shaped curve (a)),
- Births<sub>t</sub>, – increase in births number with 1 thousand 500 by 13 thousand 35 people (see Fig. 1, «S» shaped curve (b)),
- Deaths<sub>t</sub>, – increase deaths numbers with 746 by 6 thousand 485 people (see Fig. 1, «S» shaped curve (c)),
- Emigration<sub>t</sub>, – increase in the number of emigrants with 3 thousand 500 by 30 thousand 415 people (see Fig. 1, (d) – «S» shaped curve),
- Immigration<sub>t</sub>, – increase immigration numbers with 5 thousand 401 by 24 thousand 68 people (see Fig. 1, curve (e)),
- AttractionDueToHousing<sub>t</sub>, – decrease in the coefficient of attracting population inflow due to housing with 1.073 or 107.3 % by 0.554 or 55.4 % (see Fig. 1, curve (f)),
- HouseholdsToHousesRatio<sub>t</sub>, – increase in the ratio of households to the number of houses with 0.897 or 89.7 % by 1.528 or 152.8 % (see Fig. 1, curve (g)).

#### 4. Discussion

Finding an effective solution to alleviate the burden faced by mental health services is critical today. In this regard, the work (Makanjuola et al., 2022) proposes an evaluation the Emotion Mind Dynamic (EMD) service. SROI analysis is theory of change at the program level to establish how inputs (e.g., costs, staff) translate into outcomes (e.g., number of clients) and then into outcomes that matter to clients affected by the EMD service (for example, improved mental well-being). The Welfare Assessment will quantify and evaluate outcomes using two sets of values. The mixed-method approach SROI collects quantitative and qualitative data from questionnaires and interviews with former EMD clients as well as new clients, executing a blended online learning program. A study result

was obtained to analyze the SROI of a socially prescribed lifestyle coaching program aimed at improving mental well-being and resilience. It is shown that the EMD lifestyle education program can create positive coefficients of social value. It also provides an EMD online blended learning program that compares: personal and blended online for improving mental well-being and self-efficacy through participation in this innovative lifestyle coaching program.

A study (Tiwari et al., 2022) examines of seasonal cycles and permanent migration on inequality in rural India. The authors apply a counterfactual method to estimate income, and the results show that seasonal migration is a strategy of the poor, as opposed to permanent migration, which involves more affluent migrants. Further, using Gini decomposition and aggregate regression, it is found that seasonal and permanent intra-group migration reduces intra-group migration and inter-group inequality, while seasonal cycle migration increases the number of poor and improves the situation of the poorest relatively. It was also noted that the impact of the migration process is consistent with the U-shaped pattern of migration in the permanent category and further downward trend of migration in the seasonal category.

The article (Agadjanian & Nedoluzhko, 2022) investigates the feature in fertility between minorities and majorities in Western countries with low fertility, usually a common issue on the cultural characteristics of minority groups and on the socioeconomic disadvantages associated with minority status. However, the establishment and operation of ethnic complexes outside the Western world are often at odds with the standard Western model, and therefore can influence fertility preferences, behaviors, and outcomes. As a result, the authors, analyzing the ethnic variability of completed and desired fertility in the multi-ethnic transitional environment of Kyrgyzstan, where ethnic groups and their ethno-linguistic parts are characterized both by different stages of the demographic trend, and by different positioning in socio-economic and political terms.

Based on data analysis, the work (Chen, 2022) made a few attempts to assessment of the level of education of women on fertility in China, indeed, author noted that more educated women have higher fertility, but it remains unclear whether education obviously affects female fertility. Here, the time and various aspirations of women for higher education are seen as exogenous sources of increasing the level of education of women in China. Thus to a study based on the data value of China (2010-2012), an increase in the amount of women with higher education adds 10% to the amount of newborns. Also, for each additional year of women's education, the amount newborn children is added with a probability of 0.14%, and to having one child by 3% and to having two or more children by 4% increase. The positive effect of education is due to the causes of occurrence: first, education does not lead to middle age at an early age; second, among ever-married women, education increases their need for children.

The article (Diter et al., 2021) aims to highlight school-related determinants on children's life satisfaction and its variation across social classes. Indeed, in fifty years, the topic of child has attracted attention in political and academic debates. These multiple determinants of children's life satisfaction, their relative importance cultural context, include consideration of the school environment for children's subjective well-being and the achievement of a positive education. It was also noted that the well-being influenced by the school environment, the quality of children's relationships with peers and teachers at school, participation them of children. Thus, based on

the French part of the Program for International Student Assessment (PISA) 2015 (n = 4804), the authors defined a two-stage inequality expression. It is first shown that class differences influence of children will have both a school environment and relationships with peers and parents that increase their levels of life satisfaction. Further, it is noted that social inequality also manifests itself when studying of school-related factors on life satisfaction of children. School bullying, anxiety, and parental involvement in school seem to affect children differently depending on their social background.

## 5. Conclusion

Thus, studying the demographic model of the systemic dynamics of the population of the small town of Kosshy, Akmola region of the Republic of Kazakhstan, a latent relationship was revealed between the input parameters and the output data of the indicators of inflows and outflows of the population as the share of occupied lands for housing construction, which is a leading indicator in ensuring stable reproduction of the demographic process.

Based on the results of the study, an assessment was made of the impact of the housing construction industry on the future population of such outputs as population, newborns, deaths, emigrants and immigrants.

## LIFE SAFETY IN THE HOUSEHOLD AND SOCIAL SPHERES

***Abstract:** The issue of ensuring the safety of life is becoming more and more urgent. Society is beginning to understand that the further development of mankind and technological progress require that everyone has the highest level of knowledge and culture in this field. The purpose of the presented research is to study the safety of life and to consider the safety of life in the household and social spheres. The methodological basis of the research is based on a combination of various general scientific methods of scientific cognition. This study used methods of information analysis and synthesis, the comparative method, and the method of induction and deduction. At the final stage of the study, the method of analysing scientific literature relevant to the subject of the study was used. Life safety (LS) can be characterised as a science that studies hazards and ways to protect against them. It is an integral part of the system of state, social and defense measures taken to protect the population and economy of the country from the consequences of accidents, disasters, natural disasters and weapons of destruction of the enemy. In the course of the study, it was determined that social practice indicates that a person violates the rules of safe behavior for several reasons. First of all, this is explained by ignorance of the object of influence, the rules of safe behavior and ways of their application, the discrepancy between the physical and mental capabilities of a person to the requirements of public practice. The practical value of the presented research lies in the fact that it can be used by both theorists and practitioners in the process of studying the safety of human life in the household and social spheres.*

***Keywords:** Hazard Identification; Anthropogenic Factors; Habitat; Emergencies*

### 1. Introduction

The issue of ensuring the safety of life is becoming more and more urgent. Society is beginning to understand that the further development of mankind and scientific and technological progress presuppose that everyone has the highest level of knowledge and culture in this area. Gradually, there is a need to organise targeted continuous training

of citizens on the basics of safe behavior to reduce the negative impact of the so-called human factor in all spheres of life (Akhmadieva and Minnikhanov, 2015).

Currently, society is in the process of forming a culture of safety in life. Today, this field of activity covers a wide range of people and different sectors of the economy. The practice of analysing and statistical data of operational reports of the Ministry of

Emergency Situations and other ministries shows that the number of people killed as a result of fires, material damage and, in general, human and natural emergencies is decreasing (Sexton et al., 2016). However, from time to time there are discrepancies between the production potential and the constant growth of social needs, which become more complicated from year to year. For example, the planning of large cities leads to the destruction and degradation of natural ecosystems. The creation of new sectors, intensive technological renewal of the basic sectors of the economy, and an increase in the number of enterprises require an adequate system of protection against man-made disasters of any origin (Syropoulos, 2020). Life safety (LS) can be characterised as a science that studies hazards and ways to protect against them. It is an integral part of the system of state, social and defense measures taken to protect the population and economy of the country from the consequences of accidents, disasters, natural disasters and weapons of destruction of the enemy. The main goal of the Belarusian Railways as a science is to protect people in the technosphere from negative dangers (impacts) of anthropogenic and natural origin, achieving comfortable or safe living conditions (Shershneva et al., 2019).

The impact of man-made risks disrupts people's daily lives, causes accidents leading to emergencies and catastrophes, including environmental ones. Currently, there is an alarming trend of increasing the destructive impact of natural hazards and processes. Despite all the specifics of situations in specific countries and regions, they are determined by population growth, the concentration of population and material values in relatively limited territories, and the changing nature of the genesis of natural disasters (Zagrebin, 2017). By invading nature and creating ever stronger engineering complexes, humanity is creating a new,

extremely complex system, including the technosphere, the patterns of development of which are still unknown. This leads to increased uncertainty in the functioning of the technosphere, the entropy of its processes, the danger of man-made disasters, large-scale accidents in industry, energy, transport, pollution of the biosphere with highly toxic and radioactive waste, which threatens human health (Kristowski et al., 2018). The tasks of the LS as a science include: identification of hazards, recognition and quantification of negative impacts on the environment; prevention of human exposure to certain negative factors; protection from danger; elimination of negative consequences of exposure to dangerous and harmful factors; creation of a normal, that is, a comfortable state of the human environment. Human security in a broader sense is a state of complete physical, social and spiritual well-being determined by internal (heredity, physical and mental health) and external (natural, anthropogenic, technogenic, social environment) factors (Sexton et al., 2016).

It is almost impossible to avoid most natural situations. However, there are a number of dangerous natural phenomena and processes that can prevent negative development. This can be achieved by taking measures to prevent hail, premature avalanches and spills of mud lakes formed by blockages of mountain rivers. Measures to prevent such situations may also include localisation or suppression of natural sites of infection, vaccination of the population and livestock (Kristowski et al., 2018). The organisation of security in various spheres of socio-economic development of the state needs qualitative development of aspects of pedagogical activity. This work will create such a concept as the "paradigm of life safety". Only in this way, or even better, a step forward, can the safe life of the country's citizens be ensured (Sexton et al., 2016).

The purpose of the presented research is to study the safety of life and to consider the safety of life in the household and social spheres.

## 2. Materials and Methods

The methodological basis of the research is based on a combination of various general scientific methods of scientific cognition. This study used methods of information analysis and synthesis, the comparative method, and the method of induction and deduction. At the final stage of the study, the method of analysing scientific literature relevant to the subject of the study was used. The method of information synthesis was used in the study. Synthesis is the process of joining or combining previously disparate things or concepts into one whole or set. Synthesis is also a method of combining the whole from functional parts, unlike the analytical method, this method involves dividing the whole into functional parts. The study also used the method of information analysis. Analysis is the process of dividing a complex topic or object into smaller parts to gain a broader understanding of the presented topic or object. Using the methods of analysis and synthesis of information, it was considered what the social sphere includes. It was determined that the social sphere includes: educational and educational institutions, medical institutions, cultural institutions, sports institutions, institutions that provide social services, catering establishments, organisations that provide utilities, passenger transport, and institutions that provide communication services.

Comparison can be characterised as a logical technique necessary in any cognitive activity: at different stages and at different levels, regardless of the subject. Comparison can be used as a special research method only if the comparison procedure requires special training and special organisation. Such a need usually arises when comparing

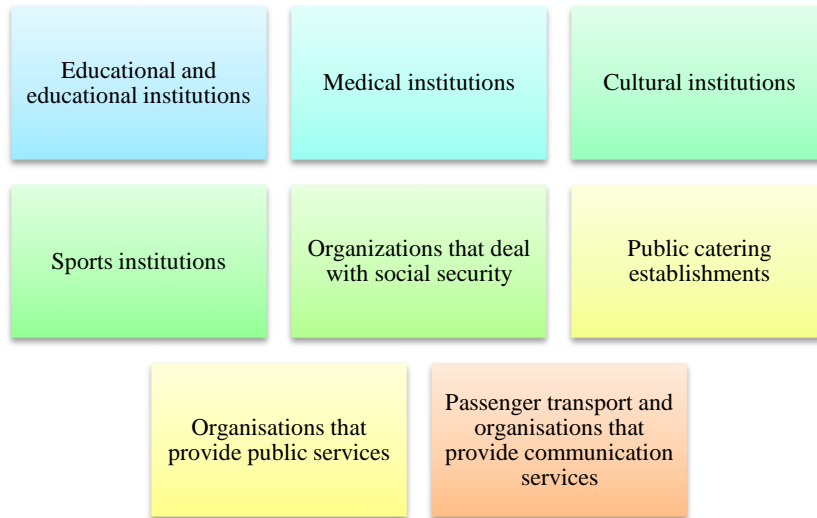

complex objects and phenomena that are characterised by a large set of very different characteristics. The experience of comparative law shows that based on the comparative method, it is possible to solve not only scientific and educational, but also important applied tasks. The methods of induction and deduction were also used in the study. The inductive method is a method of research and presentation in which there is a transition from the observed concrete facts to the allocation of principles, general provisions of the theory and the definition of patterns. Deduction is a method of thinking, the result of which is a logical conclusion, the truth of which is guaranteed by the truth of the assumption. With the help of induction and deduction methods, it was determined that the impact of man-made risks disrupts people's daily lives, causes accidents leading to emergencies and catastrophes, including environmental ones. At the final stage, an analysis of the scientific literature was carried out. The analysis of scientific literature is an accessible research method, but also the most demanding. This method requires certain skills of working with literature: the ability to take notes, group material in accordance with the work plan. The main purpose of analysing literary sources is to collect scientific data on the topic under study, consider the prospects of research and formulate a working hypothesis. When analysing literary sources, various works of researchers were considered. In the process of analysing literary sources, the studies of scientists from different countries were considered. All the studies considered were aimed at studying the problem of human life safety.

## 3. Results

In the course of his life, a person constantly faces dangers and extraordinary events, very diverse and related to natural, man-made,

environmental, social and other phenomena and processes. The social sphere is a set of industries, enterprises, organisations that are directly related and determine the way and standard of living of people, their well-being. The social sphere covers the entire

sphere of human life, from the conditions of his work and life, health and recreation to social, class and national relations (Kristowskiet al., 2018). Figure 1 shows what the social sphere includes.

**Figure 1.** Social sphere of life

Thanks to numerous organisations, the social sphere of public life thus provides people with working and leisure conditions, takes care of physical development, health and education. Everyday life is an unproductive, unprofessional sphere of human activity. This can also be called a way of life. The process of satisfying a person's material and spiritual needs characterises the way of life, satisfaction of needs leads to new needs, thereby outlining the development of the next human life, and consequently, the way of life (Skripnuket al., 2019). The household sphere prepares a person for social activity. This creates a special type of social relationship. Social and household relations create relations between people for the production and consumption of public goods. For society, the household sphere is the definition of the level and properties of the life of individuals. This also determines

the social stratification in society, so the household sphere of life is closely related to the property stratification of society. The practice of dangerous and emerging emergencies shows that up to 85% of all cases of their occurrence are related to human activity and arise for social reasons (Kristowskiet al., 2018).

Dangers, extreme and emergency situations are very diverse. They can be caused by natural disasters that cause natural disasters; environmental, related to imbalances in human activity and the environment; man-made accidents resulting from accidents and catastrophes in the industrial sector, transport, communication systems; social, related to public disputes and others. These extremely dangerous phenomena and processes are directed at society, that is, at specific people, public and state structures

and the environment (natural, industrial, social, etc.), outside of which society simply cannot exist. Conditioned upon this, they need not only to know, be able to identify, anticipate, but also to protect themselves from them, that is, to prevent, localise, neutralise, stop and, if necessary, eliminate (Skripnuket al., 2019).

In the social sphere, a dangerous situation, as in other spheres of life, a real event, a process that can harm people, society and the state is possible, including their well-being, destroy natural, material and spiritual things. A social threat is always meaningful, filled with specific content, and in the case of a clearly formulated dangerous situation, it often acquires a certain legal characteristic, which is often fixed in regulatory legal acts (Bolbocean and Tylavsky, 2021). Protection from social threats is the most important function of state and public structures. It consists primarily of preventive measures aimed at eliminating these dangers. In addition, it is necessary to properly train a person who can adequately act in dangerous situations: psychological, informational, legal, security, etc. In the process of training, it is necessary to adopt behavioral models that consider specific situations (Sokolovet al., 2018). Social emergencies can be characterised as limited situations in a confined space, which are the result of dangerous conflicts and conflicts in social relations, which may or may not lead to human casualties, harm to human health or the environment, significant material losses or destruction (Akhmadieva, 2015).

The basis for the emergence and development of social emergencies is the violation for various reasons of the balance of social relations, for example, economic, political, interethnic, as well as religious. These circumstances can be provoked by various factors causing social tension. Such factors include unemployment, corruption, crime, riots, terrorist acts, government crises, inflation, food problems, social unrest,

domestic nationalism, locality and others. The long-term influence of these factors on chronic physiological and mental fatigue of people, severe extreme conditions such as depression, suicide, etc. (Kristowskiet al., 2018).

There are a lot of social dangers. These include various forms of violence, including legalised (wars, armed conflicts, terrorist acts, riots, repression), crimes (banditry, theft, fraud), substance abuse (alcohol, drugs, medicines, cigarettes), suicide and much more that can harm human health and life (Akhmadieva, 2015). A special place in human security is occupied by such social factors as the level of well-being, general culture, service culture, living conditions, habits, moral and emotional characteristics. The socio-political environment is of great importance for its security, namely, the state and its institutions (legislative, executive and judicial authorities, self-government bodies, public administration bodies, ministries), public structures (political parties and organisations), trade unions, public organisations, family, citizens. All their actions must comply with the current legislation and be based on a balance of interests of the individual, society and the state, and their mutual responsibility for security (Sokolovet al., 2018).

One of the most important aspects is ensuring the safety of people from crimes (premeditated murder, violence, interference with the health and dignity of the individual, robbery and theft of personal property and documents, physical and psychological terror) related to threats, intimidation, extortion and other forms of human exploitation, influence, including informational and psychological (use of mass media) and psychophysiological (hypnosis, psychotropic drugs) (Skripnuket al., 2019). Social practice shows that a person violates the rules of safe behavior for several reasons. This is explained by the ignorance of the object of influence, the

rules of safe behavior and ways of their application, the discrepancy between the physical and mental capabilities of a person to the requirements of public practice. Such disorders can also be permanent (lack of coordination, insufficient concentration of attention, non-compliance with social requirements) and temporary (fatigue, deterioration of health, disability, depression, stress, intoxication) (Akhmadiyeva, 2015).

These causes cause danger and threats. Preventive measures in the first case include advertising (propaganda) of safety rules and training people based on them; in the second, training and practicing safe behavior skills; in the third, social control, professional selection, medical examination. Experience shows that a person and a social environment is a complex interaction of a person with different components of his social environment. To ensure their mutual security, it is necessary to prevent hazards and threats and prepare all elements of the system for action in dangerous situations (Kristowskiet al., 2018).

#### 4. Discussion

For a more extensive consideration of the concept of "life safety" and the study of life safety in the household and social spheres, it is necessary to consider the research of other authors. The article of S.N. Krivorotenko (2019) is devoted to the theoretical and organisational and managerial aspects of human interaction with the environment, protection of the environment and society from the negative effects of various hazards (natural, man-made and social origin), which allows developing effective measures to eliminate their causes, creating living conditions in the "Human Environment" system. The concept presented in Krivorotenko's research is intended to generalise and use various methods and tools to ensure the safety of life and environmental protection necessary for human functioning

in various environments: domestic, industrial and non-industrial, living and inanimate nature, emergency situations and other environments, and contributes to the development of the idea of the inseparable unity of effective professional activity, social interaction, harmonious spiritual and physical development.

The article of D.V. Smirnov (2017) presents the results of a study of didactic support for the development of functional literacy of schoolchildren in modern conditions on the thematic component of safe life. Analysis of contradictions in the development of functional literacy in the field of safe living and health in modern conditions: family and social institutions. The author identified the essence of the formation of functional literacy as the corresponding minimum content of education, its core in the field of a safe and healthy lifestyle. The procedural specificity of the leading type of activity is shown, the content and form of which depends on the specific historical conditions of the child's development. Based on the results of research and experimental activities, the author considers a typical situation when the knowledge and skills of safe behaviour of students and adults violate the basic rules of safety and health. The possibilities of creating behavioural models that ensure unconditional compliance with safety in the social and natural environment when implementing a system-activity approach are presented. The necessity of creating an informal socio-cultural environment for teaching and educating the younger generation based on the method of trial and error in various types of activities, obtaining social experience in socio-professional exams is substantiated.

The article of E.I. Zagrebina (2017) examines the relevance of the problem of complex security in the context of the combined action of various types of threats and dangers, including one of its components, namely, the security culture.

The author considered the organisation of the discipline "Safety of life" and its content, considering the complexity of the presentation. An example of a practical task in which it is necessary to apply knowledge to ensure comprehensive human security. The author has formed a unified competence for bachelor's degree programs as a result of mastering this discipline.
