N.V. Grizodub (2021) notes that the discipline "Life safety" is mandatory for university students. Considering the security situation in the world and in some countries and regions, an increase in injuries and a decrease in the general health of the population. The author substantiates the role and importance of the discipline "Life safety" in universities by the example of studying the topic "Health and biological foundations of safety". Since it is the biological hazards that arise in the modern world under the influence of environmental factors that require careful consideration to ensure a safe human life in various fields: educational, social, professional and others. the health of students as the most mobile stratum of society conditioned upon the development of a safe culture of life, a model of safe behaviour in society and in future professional activity.

Whether it is a separate building or a campus in a university, corporation or medical complex, there is a general requirement when it comes to shock absorbers that ensure the safety of life. This general requirement is proper installation, operation and maintenance, which is confirmed by the necessary checks and tests from the beginning to the end of the service life of the safety valve. When it comes to life safety dampers, the responsibility for installation, operation and maintenance is a reality that should be discussed in detail. Besides the fact that proper installation, inspection, testing and maintenance of dampers to ensure the safety of life is mandatory, this is a good business opportunity for many

engineering firms or service contractors (Liescheidt, 2018).

The article by M.H. Faber, J.D. Sorensen, T.A.C.W.M. Vrouwenvelder (2015) considers the question of choosing the right metric of risks related to life safety and health in the context of regulation, considering the effects of temporal and spatial scales for their consistent quantification and comparison between social sectors, industries and areas of application. The starting point is a summary of what is considered to be the basis for modern best practices in regulating life safety and health risks. After that, based on selected main examples from various fields of application, inconsistencies in the existing quantitative risk assessment of best practices in the context of regulation are identified and discussed. It is identified and explained that the principle of optimising solutions and the joint implementation of the principle of ultimate life saving does not make it relevant to assess individual life safety risks for specific people. The obtained absolute level of individual risk to the safety of life is also not subject to an assessment of acceptability. The authors emphasise that the main reason for the inconsistency of quantitative assessments and comparisons of risks stems from the fact that the current regulations partly relate to public activities, and partly to applied technologies; in some cases they consider the standpoint of individuals, and in others the effectiveness of the technologies used. In addition, the authors have shown that the commonly used averaging of individual risks over time and space can lead to unintentional masking of ineffective actions and applied technologies. Finally, the authors propose how it is possible to consistently and uniformly assess and compare the individual risk to life safety for different types of activities and technologies used.

R.S. Akhmadieva, R.N. Minnikhanov (2016) note that the study of the problem of life safety is important because it is necessary to develop each person's ability to identify and prevent hazards, and to ensure personal safety on the road. Thus, this article is devoted to the disclosure of the structural and substantive components of the management of the life safety system on the roads. The main approach in the study of R.S. Akhmadieva, R.N. Minnikhanov (2016) has become an integrated approach that allows us considering the safety of personal life on the road as a purposeful system capable of self-organisation and self-management for the safe behavior of participants in road transport relations. The article covers the essence of life safety on the road, the authors presented their components as an integrative system. The authors have identified subjective factors affecting the safety of life on the road (the duration and periods of change of road signals; the expected time of passage of a certain section of the path), mental states and individual characteristics of a person (health and mood); age characteristics; the level of theoretical and practical skills of a road user. The article also identified the structure of the educational road environment for children. The authors identified the peculiarities of their upbringing (Akhmadieva and Minnikhanov, 2016).

N. Uchida et al. (2018) notes that although life safety information systems on smartphones are widely used for disaster emergencies, there have been some problems with their use by people who do not know how to work or are injured. Thus, the study of N. Uchida et al.(2018) offers methods for detecting static bodily objects using a delay-resistant network for a life safety information system. In the system, sensors on smartphones automatically detect abnormal static situations based on the difference in time and position based on Monte Carlo methods with a Markov chain,

and emerging messages are automatically transmitted with message priorities. Moreover, these messages are transmitted to servers with a network resistant to delays. Then a prototype of the system is introduced and experiments on evaluating the effectiveness of the proposed systems are discussed.

M.-O. Chae's research (2014) is a study of the ways in which the key conditions of anxiety, impulsivity, scholarship of life safety practices, attitudes to life safety practices, interpersonal assistance and self-efficacy from the modification of maintaining Pender's health affect the practice of behaviour that ensures life safety in school-age children. The author notes that the sample included 489 pupils of grades 5 and 6 from five elementary schools in Seoul and four provinces of South Korea. The materials were analysed using schematic statistics, correlations, factor analysis and modeling of structural equations. The attitude to the practice of providing life security, interpersonal support, self-efficacy and impulsivity directly affected the practice of behavior providing life security. M.-O. Chae (2014) notes that anxiety did not have a direct impact on the practice of safe behaviour, but indirectly affected it. In this modified model, 52.0% of the practice of safe behavior was explained by the main factors. In conclusion, the author noted that it is necessary to simplify the practice of behaviour related to the safety of life in late childhood. The author notes that it is necessary to develop a positive attitude to the safety of life, and to reduce impulsivity and increase self-efficacy (Chae, 2014).

O.A. Leshchynska, V.M. Firman, V.M. Marych, Y.V. Ilchynshyn, Y.B. Velykyi (2021) note that one of the most important aspects of life safety is the use of appropriate means and measures to create and maintain healthy and safe living conditions and human activities both in everyday life and during emergencies. The human factor as a

factor of life safety can be the main source of danger. A person's readiness for responsible constructive behavior is formed conditioned upon the influence of the organisational culture of the enterprise, and the information space. The authors sought to explore the role of moral attitudes of young people and their readiness for constructive social interaction. Research by O.A. Research Leshchynska, V.M. Firman, V.M. Marych, Y.V. Ilchyshyn, Y.B. Velykyi (2021) was held in the 2019-2020 academic year on the basis of Lviv Polytechnic National University. A total of 570 respondents took part in the survey. The survey was conducted. Factor analysis revealed six factors. The authors found that the majority of students have consumer, authoritarian and destructive ideas, so their reactions to the actions of life safety specialists on the introduction of occupational safety technologies are reduced to formal observation (Leshchynska et al., 2021).

R.Sh. Akhmadieva et al. (2019) substantiated a noxological approach to determining mechanisms to counteract the risks of modern hazards. The key ideas of the noxological approach in the framework of their research are environmental protection and human life safety. Their research is based on methodological principles and leading ideas of environmental protection and human life safety, presented in the context of social ecology, the concept of sustainable development of environmental safety, in the ecological paradigm, in the coevolutionary paradigm, in environmental ethics. The authors have attempted to create a theoretical model of a noxological approach to countering the risks of modern hazards in the field of environmental protection and human life safety. The systematisation of the basic concepts of the noxological approach as an independent scientific direction is carried out; the regularities and sources of hazards are established; the taxonomy of hazards is

determined; the prototype of the hazard passport is substantiated. The authors note that their research can be used for universities, teachers and students. The study comprehensively and fully presents a model of the noxological approach to environmental protection and human life safety: the risks of modern hazards (Akhmadieva et al., 2019). Therefore, the safety of life has a social orientation, since it is connected with ensuring the protection of society from dangers, including from itself. At the same time, it has a social aspect associated with the danger that spreads in society and threatens people's lives and health.

## 5. Conclusions

It was determined that the society is currently in the process of forming a culture of safety in life. It is important to note that today this field of activity covers a wide range of people and different sectors of the economy. Life safety can be characterised as a science that studies hazards and ways to protect against them. It is an integral part of the system of state, social and defense measures taken to protect the population and economy of the country from the consequences of accidents, disasters, natural disasters and weapons of destruction of the enemy.

The impact of man-made risks disrupts people's daily lives, causes accidents leading to emergencies and catastrophes, including environmental ones. Currently, there is an alarming trend of increasing the destructive impact of natural hazards and processes. In the course of the study, it was determined that social practice indicates that a person violates the rules of safe behavior for several reasons. This is explained by the ignorance of the object of influence, the rules of safe behavior and ways of their application, the discrepancy between the physical and mental capabilities of a person to the requirements

of public practice. The basis for the emergence and development of social emergencies is the violation for various reasons of the balance of social relations, for example, economic, political, interethnic, as well as religious. These circumstances can be provoked by various factors causing social tension. It was determined that the tasks of the Belarusian Railways as a science include: identification of hazards, recognition and quantification of negative impacts on the environment; prevention of human exposure to certain negative factors; protection from danger; elimination of negative consequences of exposure to

dangerous and harmful factors; creation of a normal, that is, a comfortable state of the human environment.

It is important to summarise that the safety of life is one of the most important aspects of human life. A large number of researchers from different countries of the world are engaged in the study of LS. In the course of the presented study, the safety of life in the social and household spheres was considered. However, it is important to note that there is still a need to consider and study LS in other areas of human life.

## **CASE STUDY: REDUCING THE WASTE RATE BY USING PDCA**

**Abstract:** *Customer satisfaction is the key to success in all organizations, the global competition within the various manufacturing companies has led organizations to consider higher standards of competitiveness and develop advanced improvement strategies to satisfy the customer. Lean Manufacturing has proven to be relevant to improve performance in the process, it is considered one of the most recognized and effective tools for reducing costs and waste in order to improve customer satisfaction and implement continuous process improvement. This article describes the use of the PDCA approach (Plan, Do, Check, Act) in an automotive company whose objective is to reduce the waste rate in order to improve product quality. After defining the current state, measuring the rate of defects and setting the objectives to be reached, an analysis was made to detect the root causes, then actions were put in place to reduce the rate of waste and verify if the established objectives were reached. The use of the PDCA method plays a key role in improving product quality in order to achieve continuous improvement in the process.*

**Keywords:** *Lean Manufacturing, Quality, PDCA Cycle, Performance Improvement*

### **1. Introduction**

Continuous improvement is a fundamental culture to improve performance in all processes of the organization as well as for companies to remain competitive [1], [2]. In recent decades, companies seek to compete globally by improving quality, productivity and customer satisfaction [3]. The competition forces the different organizations to obtain relevant strategies in order to produce their goods in high quality, make the company more productive with less resources, there are different methodologies and approaches used to improve the quality in the company. Lean Manufacturing has proven to be relevant for the resolution of problems in the process and the continuous improvement of different companies [4],[5].

This article describes the concept of Lean Manufacturing and the PDCA cycle (Plan, Do, Check and Act). The Lean Manufacturing methodology is one of the most recognized and effective approaches worldwide to improve product quality and reduce various types of waste [6]. There are different tools and techniques of Lean Manufacturing [7] but this article focuses on the PDCA method in a cabling company to improve the productivity of the cutting process.

#### **1.1. Lean Manufacturing**

The concept of Lean Manufacturing was first implemented by Toyota Motor Corporation in the late 1950's named Toyota Production System [8]. It is used to eliminate waste to

improve the productivity of the organization [9]. The main objective of Lean Manufacturing is the continuous improvement and the elimination of non-value added actions and unnecessary steps in a process [10],[11]. This methodology can be applied in any industry and in all sectors of activity that are concerned with the search for financial performance [12] and it has become a dominant production strategy and a successful paradigm for manufacturing companies [13]. The main objective of Lean Manufacturing is to satisfy customers' needs and improve the organization's performance by identifying and eliminating different types of waste in the process. OHNO, the founder of the Toyota Production System, is recognized as the father of Lean Manufacturing, illustrated the categories of non-value added waste (also called Muda in Japanese) in companies [14], [15] represented as follows: Waiting, Overproduction of products, Inappropriate or unnecessary processing, Excess movement, Defective products, Excessive stock, Unnecessary transportation and Unused creativity [16]. Lean Manufacturing is based on principles for the proper implementation in the organization because it has become a priority for different organizations. These principles are: Value, Value Stream Mapping, Flow, Pull and Perfection [17]. Studies show that the Lean Manufacturing approach positively affects operational, economic and environmental performance [18],[19]. This concept gathers a set of tools and techniques to facilitate the detection of problems and their resolution in order to improve the quality, productivity and performance of the organization [20],[7], among these tools, we cite the PDCA approach [16].

### 1.2. The PDCA approach

PDCA is considered as a basic tool of Kaizen or continuous improvement, it has proven to be relevant in different industrial

processes[16]. At the beginning, this tool was implemented in Japanese companies and later on it was used by different companies [21]. The PDCA cycle is the acronym of Plan, Do, Check and Act [22], It is usually repeated monthly or weekly in industry, it is also called the Deming cycle which was developed from the cycle Shewhart [23],[24]. It is a method for developing improvements in the process [25]. The PDCA cycle is divided into four phases [26], [27]:

- Plan: Define and set the objectives to be reached, define the current situation of the process, propose corrective actions [23]. Each action can be supported by tools such as the Pareto chart, the Ishikawa diagram and Brainstorming.
- Do: To implement the action plan defined in the "Plan" step [28], tools can be used such as the action plan, benchmarking and the flow chart.
- Check: Check and test whether the established objectives have been achieved, Analyze the results of the actions implemented in the previous step [29]. Control charts and checklists can be used in this phase.
- Act: Develop methods to standardize improvements and return to the first "Plan" phase [30].

## 2. Case study

Plan:

The study was made in an automotive company and especially in the cutting area. This is the first step in the production process, the cutting area is equipped with automatic machines that serve to cut electrical wires according to the required lengths, strip them and then crimp them. The quality measurement factor in this process is the FTQ (First Time Quality), it is calculated by the following relationship:

$$FTQ = \frac{\text{Number of defects} * 1000000}{\text{Number of pieces produced}}$$

To fully understand the problem, the QOQCP method (Table 1) was used to

detail the project as well as a horned beast diagram (Figure 1) to illustrate the importance of the product and how this product meets the needs of its users.

**Table 1.** Defining the Project

- Who is concerned by the project?
- What is the project?
- Where?
- When ?
- How ?
- Why ?

- Cutting Departement
- The number of anomalies is high
- The cutting process
- During the cutting process
- Using the PDCA approach
- To decrease the FTQ+ Customer Satisfaction

**Figure 1.** Horned beast diagram of the cutting machine

**Figure 2.** Pareto chart of cutting machines

After identifying the problem, we tracked the FTQ for 4 weeks, according to Figure 2 and by the Pareto chart, we notice that the KOMAX machines have the highest FTQ rate, KOMAX is designed for cutting, stripping and crimping of small and medium section wires. Then a thorough analysis is made by the FMEA method (Failure Mode, Effects and Criticality Analysis) to identify all possible failures.

**Table 2.** FMEA of the KOMAX machine

Machine equipments	Function	Mode of failure	Causes	Effects	Actions
Straightening unit	Straighten the wires	Wheel malfunctions	Lack of lubrication of the wheels	Wire skating	Ensure compliance of parameters with the standard Lubricate the wheels
Cutting station	Cut the wires to the desired length	Badly cut wire	Problem with the cutting blades	Bad cut	Check and adjust the cutting blades and clean them Check the movement

					of the cutting arm
Seals station	Insertion of seals	Blocking	Lubrication of the seals Problem with the kit	Stopping the machine Having problems without a seal	Check that the seals are not oiled Adjustment of the Kit
Press station	Crimping wires with terminals	Variation of the cable position in relation to the terminal Locking of tools	Adjustement	Refusal of the machine: Absence of visual defect, Deformed terminals	Adjustment of the rectifiers Change of applicators Changing the tool
Control Unit	Top WIN	Blocking the PC	Error Manipulation	PC shutdown	Restarting the PC Reinstalling Top WIN

**Do:**

This phase consists in implementing the action plan detailed in the previous step associated with the elimination of the causes of the problems detected in the cutting area and especially the KOMAX machine. After the action plan was developed, the team assigned each person their task to ensure the successful execution of the proposed plan.

**Check:**

After determining the failure modes of the KOMAX cutting machines and implementing an action plan, it was verified whether the applied actions were able to decrease the defect rate. It is also necessary to check the different units by a preventive maintenance evaluation grid of the KOMAX machine to avoid anomalies.

**Table 3.** Preventive maintenance of the KOMAX machine

	Actions	M	S	N
Presse Station	Clean the blades of the tool			
	Check the fit of the tool blades and other tool components			
	Attach the terminal guide			
	Cleaning the crimping press			
Cutting Station	Check the movement of the cutting arm			
	Grease the cutting head and arm			
	Check and clean the cutting blades			
Seals Station	Cleaning the seal station			
	Adjusting the Kit			
	Before starting the seals, check that the seals are not oiled (lubricated)			
Rectification station	Checking the condition of the bearings (Wheels)			
	Checking the operation of the wheels			

	Wheel cleaning			
	Wheel adjustment			

Act:

We must act on the actions that are not achieved and that have not generated relevant improvements, so we must repeat the cycle to re-evaluate the intervention and obtain a continuous improvement in the process.

### 3. Conclusion

PDCA (Plan, Do, Check and Act) is a never-ending cyclical process and a powerful method for continuous improvement. This article presents a case study of the PDCA

method in an automotive company. The company was able to reduce the defect rate but this should not lead to stop the improvement of the cutting process. The next step should be the development of a new PDCA circle to improve the quality of the product. The PDCA cycle is considered a simple approach but it is effective in solving problems and achieving continuous improvement in the process. This tool is part of the Lean Manufacturing methodology which is a highly recognized approach to eliminating waste and improving the performance of organizations.

## SMART CLOUD BASED ECOLOGICAL SYSTEM FOR CONTACTLESS VEHICLE CLEANING

**Abstract:** *The rise in the overall standard of living leads to an increase in the number of used cars. As the number of cars increases, so do the maintenance requirements. As a result, the growth of vehicle washes is increasing. However, the issue of their economy comes up. The current literature sources present the following ecological and technical issue: how to determine and apply the best use of water and detergent on automated car washing systems while minimizing vehicle washing time. Thus, this paper tries to propose a ecological contactless vehicle washing smart system based on the application of cameras, programable logic units and cloud databses for high-quality vehicle washing, monitoring and optimal resources usage. Specifically, the proposed smart system for automatic contactless vehicle washing could be used for water flow regulation, detergent concentration regulation and for managing the process of determining the overall dimensions of the vehicle.*

**Keywords:** *vehicle washing system, Internet of Things, cloud computing, databases, automation*

### 1. Introduction

The majority of vehicle washing systems currently available rely on human labor. This type of car wash has a variety of flaws, including poor washing, lengthy wait times, and excessive water and cleaning product usage (Lalluwadia et al., 2017). To solve these challenges, a number of automatic car-washing systems have been created in recent times, based on the use of RFID-GSM (Vidyasagar et al., 2015), programmable logic controller (PLC) and SCADA ((Alphonsus et al., 2016; Lalluwadia et al., 2017), proximity sensors (Gaikwad et al., 2017).

However, in most cases the in process of car washing, systems used a fixed amount of water and detergent, regardless of the level of dirtiness of the car, which leads to an

ecological unoptimised waste of resources and larger costs. For vehicles with a low degree of soiling, the fixed amount of water and detergent used may be too high, which leads to their wastage and more difficult washing. On the other hand, for vehicles with a high level of dirt, it can be low, which leads to poor cleaning results.

In addition, in automated car washes that use the movement of the mechanical arm assembly and the jet or spray of water and detergent for cleaning and washing the vehicle, it is very important to correctly determine the overall dimensions of the vehicle being cleaned. It is a procedure that requires a significant amount of time spent in the vehicle washing process. An ultrasonic sensor is used to determine the length of the vehicle in automated car washes every time they enter, the application of which requires a

---

Corresponding author: Aleksandar Đorđević  
Email: [adjordjevic@kg.ac.rs](mailto:adjordjevic@kg.ac.rs)

certain amount of time. The ultrasonic sensor is located on the assembly of the mechanical arm, which, after the vehicle takes the washing position, determines its dimensions in the first pass around the vehicle. The ultrasonic sensor is connected to a PLC and transmits the dimensions of the vehicle to it. Based on the passed dimensions, the PLC device determines the further position of the mechanical arm assembly and defines the further movement around the vehicle being washed. The procedure is repeated every time the vehicle enters the car wash, requiring a considerable amount of time for each wash.

The aforementioned problems are the reason for the development of a system based on the application of cameras and a PLC with a hardware accessory for high-quality vehicle washing, and the desired characteristics with a number of additional advantages.

The proposed smart system for automatic contactless vehicle washing could be used for water flow regulation, detergent concentration regulation and for managing the process of determining the overall dimensions of the vehicle.

## **2. Literature review**

There are currently two basic types of car cleaning techniques in use. Car washing is a viable solution. The alternative is a mobile car wash service (Zhong et al., 2017). The first service is customer-driven, in which the consumer brings their vehicle to the store to be washed. Typically, a water line, a high-pressure spray pistol, and towels are all that is required to clean a vehicle. Hybrid design that combines automatic and manual car washers are used for a more complex, semi-automatic approach of cleaning automobiles. Time is the most major disadvantage of hand car cleaning. This is especially true during traffic congestion.

With the advent of Internet of Things (IoT) and car-to-car communication came the

"internet of vehicles" (Gerla et al., 2014), ushering in the age of the autonomous automobile. Elevator internet (Yang et al., 2016) is the result of the interconnection of elevators with the IoT, allowing for the first time to perform intellectualized elevator maintenance. The car wash sector is leveraging technologies from the IoT and big data to build a car wash cloud and terminal interface that connects cloud operators with car-wash shops, and car-wash manufacturer representatives with customers. The driver can take use of the automatic car-washing service at any time and from any location by visiting the nearest car-washing store. To put it simply, cloud operators are the ones in charge of building and maintaining the system. Manufacturers in response to various models will make functionality enhancements (Gerla et al., 2014). Safe, quick, convenient, and environmentally friendly automatic car washing service is provided by the shops, all of which have well-maintained car wash equipment.

The IoT as an emerging paradigm in ubiquitous computing built from the ground up on the internet (Wu, 2015), uses both wired and wireless networks to connect to the Internet. It achieves real-time, everywhere connectivity between things, objects, and people by employing synthetic mass sensors, an intelligent processing terminal, and global positioning system technology. When all is said and done, it achieves smart management and command. There is the widespread implementation of IoT applications like internet of vehicles, unmanned aircraft, automatic car washer (Gaikwad et al., 2017) and etc. Thus, has caused some to refer to it as the "third wave" in the global information business, following the computer and the internet (Zhong et al., 2017). This style of automatic car washing has a variety of specific uses, including a mass automatic car washer, video security cameras, access through mobile devices, and vehicle identification.

Therefore, in this age of the IoT, automatic car washing mode is not only an unavoidable consequence of technical progress but also a selling point. Thanks to the unified cloud platform, mobile terminals, video security cameras, and mass-produced automatic vehicle washers may all connect with one another. Meanwhile, transaction and client information is recorded. As a group, the merchants maintain their individual customers. Customers can have their vehicles cleaned at the most convenient location, regardless of where they are parked. This procedure ensures quality and lowers vehicle washing time. There will be fewer individuals hand-washing automobiles and more customers at car wash services. Different consumers can choose to retain the original, exquisite cleaning or inspection procedure.

In the paper by Vidyasagaret al. 2015, authors discussed the usage of a microprocessor to manage the automatic car washing process. They explained how to employ a wide range of IR sensors, RFID equipment, and GSM networks. A conveyer mechanism is used to move the car from the garage door to the garage worker's station. A sensor that can detect dust particles can pinpoint the area of the car where dirt has settled. A sprinkler and drying system are utilized to clean the car. In order to prevent unintentional car detection, RFID could be utilized in conjunction with GSM technology. Meanwhile, GSM could be used to keep customers updated on the cleaning status of their vehicles.

The electro-mechanical method for operating an automatic car washing was presented by Tejas et al. 2017. Automatic car washers use a device that raises parallel cars and moves forward to wash them. The vehicles are then washed in a sequence of foam water, soap water, and clean water. The vehicles are raised once more and positioned parallel to the ground. Mechanical assembly and electrical control make up the bulk of the system. The importance of PLC in operating vehicle washers is emphasized.

The paper by Sorkhabi et al., 2014 explains how a PLC is used in an automatic smart car washing. The smart car washing can automatically adjust its size to accommodate any vehicle. The dimensions of the vehicle are significant in adjusting various elements such as the position of the cleaning brush and the time duration. This automation improves speed, accuracy, productivity, and safety while decreasing washing time and cost.

### 3. System description

In view of the above, this paper tries to present a system for automatic car washing that can, by applying modern technologies, determine the optimal amount of water and concentration of detergent according to the degree of soiling of the vehicle body, while reducing the washing time. The mentioned issues were eliminated by the use of industrial cameras, ultrasonic sensors, a mechanical arm mechanism, a nozzle, a water tank, a detergent tank, a hose for water flow, a hose for detergent flow, a control valve for regulating the water flow and a control valve for regulating the flow of detergent that serve to inflow of water and detergent at the location where the vehicle is washed, and a programmable logic unit with a hardware accessory (Figure 1).

One of the cameras are used for vehicle identification through license plates. If the vehicle entered the car wash for the first time, the ultrasonic sensor is activated to determine the length of the vehicle. The information about the specific length of the vehicle is stored in the database, so that this information is automatically available every time the vehicle enters the car wash and its license plate is detected. The vehicle length information obtained from the database affects the control of the mechanical vehicle wash arm assembly, reducing the time required to determine the length using the sensor. Another camera records the dirty surface of the car and is used to determine the

level of dirtiness of the vehicle body. The information system is used to control the water and detergent flow valves based on the images formed by the cameras according to the degree of soiling of the vehicle body, so that the optimal amount of water and detergent mixture is sent to the mechanical arm assembly for washing the vehicle. Based on the level of contamination, it is possible to define the flow rate, the length of the open time or the number of active high-pressure nozzles. Therefore, the level of detergent and water usage is matched to the vehicle's soiling.

The cameras work via the GSM network, i.e. a sim card goes into it like a cell phone. Every SIM card has its own IP address, just like every computer. Through that IP address, you can see what is happening in the area where the camera is installed at any time from any computer that has access to the Internet.

When you connect to the camera, the camera sends a frame to your computer every 5 seconds. In addition, the camera has the possibility of connecting a motion sensor or a door opening sensor, whereby if someone enters the space where the camera is installed, it records a video length as long as it is set on the camera itself and sends it to you by e-mail or saves it on the memory card in the camera (Micro SD card is an accessory), and by connecting it to the camera, you can view the data stored on it. The camera has the ability to record on call, that is. by dialing the phone number that is in the camera, the camera records a video that is also saved on the memory card or sent to e-mail. This function is used if you do not have motion sensors and you suspect that something is happening in the area where the camera is placed and you do not currently have a computer near you.

Figure 1. Solution proposal for a smart car wash system

The software for monitoring and managing Smart automatic car washes was created using JavaScript and PHP scripting languages and the Arduino library for C and C# programming languages (Figure 2). The software consists of three main components. The first component is used to collect data from Smart automatic laundries and was implemented using the PHP scripting language and the Arduino library for programming languages C and C#. The second component is a database component in

which data is stored in the form of an object-oriented database, that is, in the form of JSON documents. The third main component is the user interface, which is implemented using the JavaScript open source library. The data is collected from the automated laundries using the first component and forwarded to the second component via the GSM module. The data is then stored within another component and can be used as a control trigger through the GSM module for sensors that will reduce the water flow through the

electric valve or reduce the flow time or reduce the number of active nozzles of the automated laundry. Finally, data on resource consumption can be displayed to users with

different privilege levels within the third component of the realized software solution, that is, the Corinthian interface.

Figure 2. Information system concept

It was established that after logging in the user via the login screen, which is a navigation screen in the background, based on privileges (limited number of functionalities), laundries that need to be monitored can be selected in the user part of the application.

The application allows the user to get a graphic display of the values of the following parameters for a time interval:

- 1- Number of washes
- 2- Water consumption (Parameter 1)
- 3- Consumption of shampoo or detergent (shampooing) (Parameter 2)
- 4- Wax consumption (waxing) (Parameter 3)

The selection screen for the level with administrator privileges provides additional features and functionality. The administrator

has privileges over the data of all users and the laundries available to them. At the prototype level, the functionalities that are available are related to the basic data of customers of laundromats, users of the system, laundromats with their location, car brands and models, color catalogs, etc.

The details of the physical scheme of the part of the database related to data storage of measured values of parameters such as used chemicals, used water, number of washed vehicles, temperature and pressure of automated car washes were defined. Tables of physical schemes contain basic data on the current values of the observed parameters, the time when the parameters were registered and the time of data entry into the database. Picture is attached for temperature and pressure Figure 3.

#	Name	Type	Collation	Attributes	Null	Default	Comments	Extra	Action

Figure 3. Information system database concept

Realization of the software component of automation of communication using the selected Arduino GSM between the Information System and the main PLC device at the location of the laundry was applied. The basic requirements related to monitoring the temperature using the GSM module and sending SMS messages with information about the temperature to the IS database at certain time intervals were determined.

A sensor is used to measure temperature, pressure, consumption of chemicals, etc. The functionality of the module is shown on the example of temperature. Example: If the measured temperature is higher than 50 ° C, an SMS message is sent to the specified number with the appropriate values depending on the location of the washing station. The values are translated into information that is comprehensible to the IS user (washing station owner) and the IS administrator, on the basis of which further decisions will be made.

## 4. Conclusion

The innovative part of the invention includes the installation of two cameras and a programmable logic unit with a hardware accessory: first camera, which is used to create photos for vehicle identification, and second camera, which is used to record photos with data on the dirtiness of the vehicle body, and a programmable logic unit PLC with a hardware accessory, which is used for storage of data on vehicle dimensions, vehicle identification based on license plates and to determine the level of vehicle dirtiness based on photos recorded by the second camera.

In view of the above, this paper presents an invention that was made as a system for automatic car washing that can, using modern technologies, determine the optimal amount of water and detergent concentration according to the level of soiling of the vehicle body, while shortening the washing time.

## THE ROLE OF INDUSTRIAL DESIGNER IN ACHIEVING THE GREEN ECONOMY THROUGH RECYCLING

**Abstract:** *The carrying capacity of the earth is in danger due to recent rates of consumption. Our environment is changing drastically because of the large rise in the trash production. As a result, waste management programs now heavily emphasize recycling positive environmental effects. The green economy offers a compelling paradigm for creating societies that are more socially inclusive, resource-efficient, low-carbon, and less harmful to the environment. Industrial design practice and research have spent a lot of time recently focusing on ways to maximize output and consumption to reduce harmful environmental effects. The green economy concept has lately gained favor as a means of achieving both environmental advantages and economic growth. Industrial design can promote the green economy by promoting resource recycling. Design from recycling must be considered to completely establish a green economy. The paper provides a list of considerations to take into account while designing products made of recycled materials.*

**Keywords:** *green economy; recycling; waste management; industrial designer*

### 1. Introduction

One of the major problems that nations struggle with while attempting to combat pollution is waste. All processes including the collection, handling, transportation, recycling, and storage of garbage are referred to as "waste management." Recycling salvageable materials aims to reduce the negative impact of rubbish on both human and environmental health as well as to protect natural resources. (Mihai, et al. 2021).

The pollution that emerges from the manufacture and use of products and services, particularly those that are mass-produced, is to blame for many environmental issues. Natural resources, many of which are irreplaceable, are used in the majority of products and services. The process used to

harvest raw materials from the soil might have an adverse effect on the environment around it. Energy is used during the manufacturing process, which also produces waste and is sometimes dangerous for products. Many products have a negative impact on the environment while they are used, and when they are eventually disposed of, they may lead to additional issues (Deniz, 2002).

In a green economy, investments from different sectors that lessen pollution and carbon emissions, boost resources efficiency and energy and halt the loss of biodiversity and ecosystem services are what essentially drive income and employment growth. This will call for a sharp rise in different sectors' investment that either improve and add to the planet's natural capital or lower

---

Corresponding author: Tamer Yousif  
Email: [Tameryousif10@yahoo.com](mailto:Tameryousif10@yahoo.com)

environmental shortage and threats. These industries contain renewable energy, low-carbon transportation, energy-efficient buildings, clean technologies, better waste management, improved freshwater supply, sustainable agriculture, and forestry, all of which are backed by changes to national policy, as well as improvements to global policy and the growth of market infrastructure (Ahmed, 2013).

One may argue that the green economy is a helpful tool for focusing sustainable development on its main drivers and the links between them in nature. Because it exists between public objectives and results, the green economy can be considered an "enabler" for sustainable growth. Sustainable development might arise from social objectives being met. There are connections among the "enablers" that have been highlighted, which represent just a few of the numerous elements needed to achieve sustainable development (for instance, the green economy needs sustainable urbanism as a basis and a partner process and depends on the value of natural capital). (Georgeson, et al. 2017)

The majority of people concur that a "green economy" entails safeguarding the environment by utilizing organic farming practices, renewable energy sources, and lowering hydrocarbon usage. For there to be a harmonious cohabitation between humans and the environment and to meet both groups' needs, the majority of green economy proponents concur. They also believe there is a connection between the economy and the environment (Mihai, et al. 2021).

Kim Ragaert 2020 applied a strategy of design from Recycling to develop successfully new products with a complex mixed plastic, called the Greentile (Ragaert, et al. 2020). According to Lucien Georgeson's 2017 research, in order to properly quantify the green economy and effectively track the "transformational green economy," it is necessary to move beyond

using GDP as the primary indicator of development (Georgeson, et al. 2017).

To carry out various circular economy strategies, such as waste reduction, recycling, remanufacturing, and reusing, Christian Spreafico and Daniele Landi 2022 investigate and analyze which product design methodologies—from routine design, industrial design, structural optimization, and systematic innovation—are most frequently used by experts designers and students. (Spreafico and Landi, 2022). According to Horodytska Oksana 2021, new recycling technologies are gladly being developed, researchers and stakeholders are aiming to maximize the circularity of plastics and lessen their environmental impact. High-quality applications must use recycled plastics to guarantee the greatest number of material life cycles possible. This helps the market expand and drives up request for recycled plastics (Oksana et al. 2021).

The objective of Lore Veelaert 2017 is to discover a methodological and practical foundation for creating recycled plastic waste streams that may be utilized in the next Design from Recycling project instances. By employing mixed recycled plastics as a starting point, this study sought to clarify the construction of a methodical approach that would hasten the design process (Lore et al. 2017). Mark Richardson 2011 set out to create a set of stronger upcycling rules that would work with the present primary design and fabrication (Richardson, 2011).

For Malaysia-specific important materials data, Al Amin Mohamed Sultan 2022 has successfully discovered 89 materials. Local governments, businesses, or other relevant stakeholders could utilize the knowledge to choose significant materials. Malaysia might use these findings as one of its strategic decision-making tools for determining which products to recycle first. (Sultan et al. 2022).

This paper aims to define the green economy's significance and the contribution

of recycling to it. The function of industrial designers in implementing green economy concepts is also important. This is done by recycling garbage and creating products out of leftover parts. This paper offers several factors that can help designers create designs made from recycled materials.

## 2. Waste over the world

2.01 billion tonnes of solid trash are produced globally annually, and, to be polite, at least 33% of that amount is not handled in an environmentally friendly manner. The average daily trash produced by an individual is 0.74 kilograms, however, this can range from 0.11 to 4.54 kg daily. Despite only making up 16% of the world's total population, rich countries produce around 34% of their rubbish or 683 million tonnes.

[World Bank].

By 2050, it is anticipated that there will be 3.40 billion tonnes of waste produced worldwide, more than tripling the rate of people growth. In general, there is a positive connection between waste generation and income level. In contrast to low- and middle-income countries, where it is anticipated to rise by 40% or more, the amount of rubbish produced daily per person in high-income countries would increase by 19% by 2050. By 2050, the amount of rubbish created is predicted to increase by 70% or 3.40 billion tonnes, more than twice as quickly as the rate of people's growth. This is caused by a number of variables, including people growth, the spread of urbanization, economic expansion, and consumer lifestyles and shopping habits. [World Bank].

**Figure 1.** Expected generation of waste, by region (tonnes in millions /year) [world bank]

Every year, humans produce millions of tonnes of waste, which is quickly becoming a major global issue. The need for governments to provide appropriate waste treatment and disposal services has never been stronger due to the enormous amounts of rubbish that are produced. Only 20% of waste is actually recycled annually, with the majority of it ending up in landfills. Particularly in

developing nations, waste is typically disposed of at hazardous open dump sites. Richer countries generate more rubbish than other countries, but they have better system for waste management to solve these issues (Tiseo 2022). About 30% of the world's waste products are to blame for the planet's continuous ecological problems and rapid climate change (Nandy et al. 2022).

As wealth rises, the mix of garbage changes, exposing various consumption patterns. High-income nations generate less dry trash that may be recycled, such as paper, cardboard, plastic, glass, and metal, which together account for 51% of total waste, as well as less food waste and organic waste, which together account for 32% of total waste. In low- and middle-income countries, respectively, 53 and 57 percent of the garbage produced is made up of food, and as economic development levels fall, the amount of organic waste rises. Less than 20% of the trash stream in low-income nations is recyclable. The waste streams are largely consistent throughout locations, except those that are correlated with income. All regions produce at least 50% of their waste as organic, except North America, Europe, and Central Asia, which produce more dry waste. [world bank]

### **3. Green Economy**

The global financial crisis of 2008–2009 acted as an ideal storm for the global rise of the green economy. The green economy seeks to make the world a better place. Reducing and preventing environmental risks can be achieved by lowering pollution and carbon emissions, improving energy and resources efficiency, protecting biodiversity and ecosystem services, remaining within the ecological boundaries of the planet, practicing environmental responsibility, and having a finite carrying capacity (UNDESA, 2012). Changing specific items to have a smaller environmental impact (Ceschin and Gaziulusoy, 2016).

In light of the repercussions of climate change, the world has been forced to take into account environmental standards in light of its economic ambitions. Accordingly, the world is moving towards the green economy concept, which depends on renewable energy or clean energy such as green nitrogen, and away from fossil fuels that increase carbon

emissions. Certain parts of the circular economy are included in the green economy, such as lowering material and energy consumption in the manufacturing process, recycling and reuse, and more sustainable supply chains. The circular economy is gaining traction in the EU and around the world as a way to boost wealth while reducing reliance on scarce natural resources and energy (Mihai, et al. 2021).

After a product's expiration date, it's dumped or delivered to a location that doesn't have a waste-accepting license. The majority of illicit dumping has occurred in developing or low-income countries. Illegal dumping is a severe concern since waste items, primarily from e-waste products, are recycled in these sites without any safety precautions. As a result, extra caution is required while recycling and handling the assembly or disassembly of spent consumables so that no harm comes to end-users or the environment. Waste management is now a top priority in order to protect and save our planet. There is no time for promises, rethinking, or debating; now is the time to work for sustainability (Nandy et al. 2022).

A key idea behind the "green economy" is the significance of accounting for the value of the environment in economic decision-making. Market prices can frequently provide deceptive information regarding the effects of economic activity on the environment and society, which results in production and consumption patterns that do not support the well-being of recent and future generations (EEA, 2011).

The green economy concept is guided by a few basic ideas. These recommendations support those putting the green economy concept into practice. In the lead-up to Rio+20, several groups published the green economic guiding principles. In that year, the UN Division for Sustainable Development investigated many sets of principles. Numerous ideas have been proposed to improve the understanding and use of the

green economy. The following is a list of the most prevalent principles of the green economy (UNEP);

- The green economy is a strategy for ensuring long-term sustainability.
- The green economy should provide good-paying jobs for the environment.
- The green economy is cost-effective in terms of both resources and energy.
- The green economy is mindful of planetary limits, ecological limits, and scarcity.
- The green economy promotes equality, justice, and fairness for all nations and generations.
- Ecosystems and biodiversity are safeguarded via the green economy.
- The green economy offers access to essential services, well-being, livelihoods, social protection, and poverty reduction.

#### **4. The impact of recycling on the green economy**

Recycling produces a win-win situation: on the one hand, it simplifies end-of-life treatment, and on the other, it ensures the availability of high-quality secondary raw materials. Design from recycling explores what design requirements are and to which extent new products may be produced from a current flow of recycled plastics (Veelaert et al. 2017). Although recycling is important, it's also important to make sure that products and materials are produced to be repaired, reused, and restored from the start (Lisitsa, et al. 2022).

Recycling industries are significant employers globally, employing roughly 1.6 million people globally. They handle more than 600 million tonnes of recyclables annually. With a \$200 billion annual revenue, the sector has already established itself as a major force for tomorrow's sustainable

development (Unido, 2019).

A green economy strikes a balance between social justice, environmental sustainability, and economic objectives. Recycling encourages a green economy in several ways, such as by increasing resource efficiency, minimizing the environmental effects of raw material extraction, creating employment opportunities, and guaranteeing a stable supply of necessary resources (EEA, 2011).

In general, during the past 20 years, definitions of the "green economy" have stayed the same. Internalizing externalities, improving material and energy efficiency, eventually disconnecting material and energy consumption from economic growth, converting to a circular economy, and transitioning to renewable resources are some of the key elements.

Recycling promotes the green economy, according to Visvanathan and Modak (2013), in a number of ways, such as the separation of resource use from economic growth, increased resource efficiency, a reduction in the environmental effects of raw material exploitation, the change to a circular economy from a linear one, and the creation of green jobs.

#### **5. The Designer's Responsibility and Role**

Designers have always been advised to consider how their work would affect the environment. The designer was in a strong position since they could think about environmental concerns while developing environmentally friendly processes and products. Additionally, growing public awareness is resulting in action in several nations. People, for instance, can express their feelings by modifying their preferences, adapting their behavior to accommodate recycling or energy efficiency, or adopting environmental considerations while making purchases.

Designers will have greater obligations than

ever before, both in terms of difficulty and importance. Designers already have to take into account a wide range of factors as part of the design process, including marketing, production, financial, and technological factors. Environment-related factors may be considerably more complicated than these. Because it might be challenging to be informed about all the environmental concerns that surround design decisions. Furthermore, it is challenging to locate comprehensive information on how environmentally friendly alternative materials and methods are (Deniz, 2002).

Nowadays, designers must get benefit from waste. This is through designing products from waste. These products will give benefits to users, decrease the negative environmental impact, provide job opportunities, and enhance people's income. Designers need considerations as guidelines to design products from recycling and achieve green economy principles. The considerations are as follows;

- Use of similar materials to reduce operations.
- Alignment between the form of the product, the used material, and the dimensions of the product to achieve user satisfaction.
- The product performs its function to the fullest.
- Utilize recyclable materials rather than non-recyclable ones.
- The product performs its function with the fewest possible number of parts and components.
- Use standard assembly joints for easy replacement.

## 6. Case Study

The environmental design course at October 6 University assigned a design project to its product design students. The pupils were instructed in various sustainability and green economy concepts and principles.

Implementing the consideration list is the project's aim. The pupils attempted to make use of rubbish by creating a lamp out of various unwanted parts, harming the environment and causing pollution.

The design project depended on I) researching recycling materials, using human measurements and standards, II) putting the design process into practice through idea sketches, using recycled materials, and assembly techniques, choosing the final design idea, and finally; III) implementing the 3D model.

## 7. The result

Students succeeded to design products from waste and unused items, figure (2). These products are aesthetical and Functional. The designs are considered ideas for Entrepreneurial projects, which will provide jobs and reduce poverty.

**Figure 2.** Students' work on different lamps

## 8. Conclusion

The products automatically become waste after use and are discarded in landfills by both the manufacturer and the consumer. The waste amount produced annually all over the

world has greatly expanded as a result of globalization and mass industry, inadvertently damaging our ecosystem. The limits of the linear traditional economic system have been reached. Nature's regenerating capacities are insufficient to address the issue of environmental protection.

These problems can be partially resolved by the green economy. The green economy strives to enhance energy and resource efficiency while lowering environmental risks, carbon emissions, and pollution. Design

serves as the dividing line between these opportunities and issues, and industrial designers are crucial to achieving the objectives of the green economy. This paper gives the industrial designer the guidelines considerations to design from recycling and transferring waste to products.

The product design students at October 6 University understood and applied the considerations list in the design studio. The students created different lamps designs from waste and different unused items.

## **ASSESSMENT OF DOMESTIC WASTEWATER MANAGEMENT PRACTICES IN ASMARA, CAPITAL OF ERITREA**

***Abstract:** The haphazard handling of wastewater (WW) is presently one of the biggest challenges facing Asmara, potentially crippling development undertakings in the near future. In order to overcome the issue, present research lays the foundation by providing a holistic understanding of current practices and regulating policies of managing domestic WW inclusive of the challenges, both at the household and municipal levels. This study also examined the safety of current practice of discharging WW directly into rivers flowing out of Asmara. In its endeavor to acquire primary data for analysis, 100 respondent quotas were divided proportionally according to populations of the 13 districts of Asmara. The graphical representation of the quantitative data rendered from the survey was drawn in Excel® and the findings of the study revealed that most of the respondents were moderately aware about WW management. The household activities of bathing, dishwashing, laundry, housecleaning and flushing generated averages of 17.13, 15.8, 16.85, 17.63 and 45.316 liters per day respectively. The wastewater generated was an average of 22.4 liters per capita in a day. By extrapolation, the domestic WW generated in Asmara was estimated at 9243.38 m<sup>3</sup>/day for the Asmara population of 421,651. The major wastewater challenges encompass population growth, infrastructural shortcomings and the ineffectiveness of the legal framework. Nevertheless, the study found the absence of robust sewer system and treatment plant to be the root causes for the improper disposal of WW in addition to the lack of technical guide lines and standards. Based on the findings, the study proposed a workable WW management model to tackle the issue in a sustainable way, such that the stakeholders work jointly to ensure proper wastewater policy adoption and enforcement*

***Keywords:** Domestic Wastewater, Management Model, Household Activities, Asmara City, Quantitative Assessment*

### **1. Introduction**

Domestic wastewater is generated due to everyday household activities and may be classified into grey water and black water.

Greywater encompasses WW from dishwashing, showering, laundry and other activities, comprises the bulk of the domestic WW production. It constitutes all the WW produced in the home except toilet waste

---

Corresponding author: Ramesh Babu Aremanda  
Email: [ramesh.nitrkl@gmail.com](mailto:ramesh.nitrkl@gmail.com)

[Ridderstolpe, P, 2004]. Black water, on the other hand is WW from toilets, which can contain feces, urine and harmful pathogens. Domestic WW therefore, must be regarded as a pollutant with a potential to adversely affect the environment and human health. Evidently, many microbial pathogens in domestic wastewater can cause chronic diseases with long-term effects such as degenerative heart disease and stomach ulcer [Paillard, D et al 2005]. Moreover, pathogenic bacteria forms that cause diseases such as typhoid, dysentery and other intestinal disorders may be present in domestic WW [Absar A.K 2006]. Domestic WW generation is ubiquitous in our everyday lives, deeming a broad and robust management scheme necessary to avoid detriment.

In the contemporaneous times, the world population is burgeoning at unprecedented rates, with cities and urban centers housing populations in the tens of millions. Whereas 30 per cent of the world population lived in urban areas in 1950, the proportion of urban dwellers rose to 47 per cent by 2000 and is projected to attain 60 per cent by 2030 [UN Report 2001]. Relative to these developments, the rate of domestic wastewater production has been on the rise, with adequate and proper disposal framework struggling to keep up with the pace. At a global level, appropriate wastewater treatment is still lacking in many countries as around 80% of wastewater produced is discharged into the environment untreated, causing widespread water pollution [WWAP 2017]. This problem is better addressed in developed countries as they possess the technology and legal framework to regulate the indiscriminate discharge of wastewater, whereas this mechanism is amiss in most developing countries, especially in Africa.

The importance of proper management of domestic wastewater is further obviated not only due to pollution and diseases caused by

improper disposal of domestic WW but also because of the need for economic use of water resources. Within developing economies today, water scarcity is an extremely common and prevalent issue. Millions of people live with insufficient fresh water [Howard K.W.F, 2003]. Currently, 2.2 billion people worldwide lack access to safe drinking water. Further, around 4.2 billion people lack access to safely managed sanitation service, increasing the risks of water born illness and making it difficult to maintain hygiene and sanitation practices [World Bank UN Report, 2021]. This is caused by polluted freshwater resources, overexploited groundwater resources, insufficient harvesting capacities in the rural areas, poorly constructed and maintained water supply systems, the high amount of informal water use, and insufficient technical and water management capacities [Mund]. Moreover, availability of water is diminishing due to competing demands from agriculture, mining and industry and from deteriorating water quality and climate change [Jacobsen, M et al 2012]. Proper management of domestic WW can play a role to alleviate the aforementioned causes for shortage of water.

The Global warming phenomena, at present, is causing increased occurrences of extreme events due to shifting temperature regimes. This in turn makes rainfall patterns erratic and disrupted. Uncertainty of rainfall patterns and associated shortages of water make the prospect of reclaiming wastewater, a low quality water resource even more appealing, especially in arid areas. Moreover, benefits of water reclamation and reuse are recognized as a method of preventing the pollution of surface and ground waters [Hespanhol, I 1992]. Reuse of WW is essential to reduce water stress in cities, promote consciousness, and reduce pollutants merging into water bodies. Treated WW can be utilized for multiple purposes such as being reused for crop and

landscape irrigation, groundwater recharge, or recreational purposes, depending on variable levels of treatment. In addition, treatment of WW, aside from enabling reuse of water simultaneously prevents potential harm, as WW contains many hazardous materials and if not disposed carefully, will lead to increased water pollution, potential problems in public health and ecological as well as socioeconomic impacts.

In consideration of the immense stakes wastewater handling has on the wellbeing of society, this study was conducted with the objective of exploring domestic waste water management at household level and municipal level in Asmara. A modular approach of study was adapted, taking a keen interest in the regulating policy as well as current wastewater management, within the framework of yielding sound and robust management models.

## 2. Area of the study

Asmara is the capital and most populous city of Eritrea, located in the highlands of the Central Region. It is situated on a rocky highland plateau, which separates the western lowlands from the eastern coastal plains and specifically has two types of prevailing climates, subtropical highland climate and cold semi-arid climate [CATBT 2020]. It has warm, but not hot summers and mild winters. Due to its high altitude at 2,325-metre (7,628 ft.), temperatures are relatively mild although it is not particularly far from the hotter surroundings in the country. This climate is characteristic of rainy, wet seasons and dry seasons. The long rainy season of the year extends from June until September while the short rainy season occurs from March until April. Asmara's climate is also characterized by drought.

Ambient temperature in the Asmara area is relatively cool (annual daily average of 16.4 °C) [EIA 2007]. the drainage network has a

naturally formed contours driven by gravity from east to west. Subsequently, the surface water from Asmara area drains predominantly to the West and Northwest. Some of the streams continue to flow beyond the Asmara area, eventually joining the Barka River in the West, the Mereb River in the South and the Anseba River in the North. The Mai-Bela and Sembel sewerage streams are both tributaries to the Anseba, making up the Northern and Southern drainage systems of Asmara respectively. Shortages in water supply occur in Asmara, due to the insufficient expanse of the tap system. The shortcomings in tap water supply is mostly covered by water trucks. Whilst there are no significant aquifers in the Asmara area, most groundwater is stored in localized shallow alluvial deposits near the streams Sembel and Mai Bela. Asmara is divided into 13 districts or sub-zones as shown in figure 2.

## 3. Methodology

Qualitative approach was considered more suitable for this study insofar as it will give a holistic description of the wastewater management mechanisms. Nevertheless, quantitative approach was not to be neglected in quantifying the amount of wastewater produced per capita and per household. The use of both primary and secondary data was employed in order to broaden understanding in this study. The primary data collected from the field was aimed at providing the necessary information about the extent of wastewater management deficits in Asmara. In that vein, the necessary primary data was obtained through questionnaires distributed to partially selected respondents in a survey, scheduled interviews with key officials of the government, captured images that reflected the situation on the ground and laboratory experiments to assess the wastewater characteristics. The necessary secondary data was obtained from records on wastewater

management, documents on wastewater related issues, literature (books, journals) and institutional reports.

**3.1. Data Collection and Interpretation**

In conducting the survey, one hundred households were involved in the study. Since the survey was carried out in the face-to-face method of data collection, all the participants filled and returned the questionnaires. Moreover, taking into account that women may have more knowledge of domestic wastewater production and way of management practices at household level than men, due to the handling of most domestic activities by the former, the sampling was gender conscious, such that out of all respondents, 55% were female and the remaining 45% male. As mentioned earlier, the study establishes sample of 100 respondents from different households of 13 Asmara administrative regions and in order to truly represent the population, sampling was done in proportion to population distribution of the districts.

The factors addressed in this questionnaire were availability of access to sewer system and most importantly awareness on conservative use of water and potential harms of improper wastewater disposal. Average family size in Asmara was taken as 5

members to a family according to the Administration of ZobaMaekel. Nevertheless, regarding the attainment of information on municipal administrative issues of wastewater and related laws and policy, qualified interviewees were considered from the relevant institutions; Ministry of local government and Ministry of Land, Water and Environment-from the department of water resource and environment. In depth Interviews were held in successive follow-ups in an effort to cover previously undiscovered topics.

The data from the questionnaires was coded into tabular representation after which graphical representation using Excel® was undertaken. Processing and analysis involved rigorous sorting of data. This entailed ordering of questionnaires and other field records for the purpose of subsequent processing and analysis. The questionnaires were numbered and arranged systematically with most of the questions designed as close ended. In order to set the stage for analysis, the answers were transcribed, grouped and coded depending on the topic. Subsequent data presentation was supported by use of pie charts as well as graphs.

**Figure 1.**Percentage make-up of the Asmara population according to sub-zones

Figure 2. Map of Asmara city with delineated districts

## 4. Results and Discussion

### 4.1. Overview of wastewater management in Asmara

The Asmara wastewater management model follows two approaches, use of onsite disposal facility, the septic tank (25 %) and connection to sewer system (64%) with the rest 11 % uncatered for [Umuhoza MFA 2010]. The septic tanks in Asmara, designed for private use of individual households, have a typical size of 22.5 m<sup>3</sup> which generally fills over an average period of 4 years. The septic sewage, after unsealing the tank, is disposed of by desludgers that dump it into the sewer stream north of the Adi Segdo village. As far as has been revealed, septic tanks seem to be a viable alternative to the high-cost construction of sewer system, intuitively speaking. Yet the performance-dependency of septic tanks on the soil type, or rather its permeability, disturbs the balance. For

instance, the rocky soil in Akria district, exhibits reduced water leaching, which leads to rapid filling. Moreover, the desludging process is undertaken when the customer estimates the tank is nearly full, a reasonably flawed estimate, so the desludging trucks are always in full demand and not readily available. This causes a conundrum as some tanks are emptied half-full and others, requiring Immediate desludging, have to wait, at the cost of disposing wastewater haphazardly. To further complicate things, septic tank users in Asmara report an unpleasant odor stemming from the collected waste, which may cause or contribute to the development of respiratory issues such as asthma. Groundwater pollution is also suspected in some areas. In general, people are satisfied when they are connected to the sewage network since septic tank usage would necessitate more follow up with more constraints as far as water consumption restrictions, sewage overflow and disposal tank servicing costs are considered.

The sewer system is composed of the northern sub-system, a combined type sewer system constructed during the Italian colonization era (1889-1941), and the southern sub-system, constructed and expanded over the last three decades. The northern sewer system, covering the central areas of Asmara, consists of open type stone masonry channels in some areas, where residents are reported to dump solid waste and defecate into the wastewater stream, which contributes to the high concentration at the exit. Nevertheless, the concentration of the exit stream tends to be lower during the rainy season, with flooding cases observed during heavy rains. This flooding phenomena, suspected to arise from insufficient tube sizing, is unique to the northern sub-system as the southern sub-system, being a separate type system, is equipped for separate channeling of rainwater and on top of that, can accommodate larger volumes of wastewater albeit requiring seasonal desilting. Another factor affecting the volume output of the southern sub-system is the wastewater originating from open channels in the sub-system leaching towards aquifers that in turn feed groundwater-irrigation activities. All in all, the sewer system in Asmara can be considered non-robust because of inadequacy in its coverage and the eventual flow of the wastewater stream into the Anseba river with zero treatment.

#### 4.2. Source and amount of domestic wastewater generation

As the study identifies there are five main sources for domestic WW generation namely, bathing, house cleaning, dishwashing, laundry and toilet flushing. The following numerical results were obtained from the questionnaire. The study found that, WW generated from toilet flushing is the highest, which needs due consideration to introduce good management simplest of which is

reusing WW from other sources.

Based on the above results, the daily average WW production per capita was found to be 22.4 liters. This level of WW production is considered satisfactorily low as compared to other African capitals. For instance, the domestic WW quantity in Kigali, Rwanda was 32040 liters /day in 2007 [Electrogaz et al 2007] to a population of 970,000 during that same period [MWW] giving a per capita generation of 33.03 liter per day. To determine the daily WW production of Asmara, the per-capita value was multiplied by the latest census as provided by the Administration of Zoba Maekel, and found to be,

$$412,651 * 22.4 = 9,243.3824 \text{ liters}$$

approximately equivalent to 9.2434 cubic meters per day.

#### 4.3. Wastewater management practices and disposal method at household level

This section of the study tried to explain different management practices at household levels, and the extent to which they are adapted in the population. It first addresses the WW reuse practices in each of the household activities. According to results of the survey shown in figure 4, 81% of respondent's reuse laundry WW for other purposes which makes for a high proportion of the households. On the contrary, WW originating from bathing and house cleaning that could have been reused is disposed in 96% and 57% of respondents respectively.

Of the sample respondents, 72% reported that their neighborhood is connected to sewer system, 24% use septic tank and the remaining 4% have no disposal services for their WW. Yet even serviced respondents disposed of wastewater in open areas mainly due to lack of awareness for those connected to sewer system or limited volumetric availability for the septic tank users. Disposal practices for each household activity are presented in the following figure. For

activities such as bathing, laundry dishwashing and flushing toilet WW are predominantly disposed of in the proper

manner, as per the respondents' mode of serviced disposal, septic tank or sewer system.

**Figure 3.**Amount of WW generated in liters per day for different household activities

**Figure 4.**Reuse practices for individual household activities

**Figure 5.** Disposal practices for individual household activities

**Figure 6.** Awareness of respondents toward specific and general health and environmental impacts

But in the case of housecleaning, although 96 % were serviced for wastewater disposal,

almost half of the respondents dumped the WW in open sites. This can be attributed to

lack of floor drains in most of the households or their personal reluctance.

The awareness of the population on the health and environmental impacts of improper WW disposal have a non-negligible influence on the handling practice. In view of that relation, the following results were obtained from the questionnaire. From the results, it can be deduced that the awareness on negative impacts of WW on general health and the environment is quite satisfactory. However, most of the public is not aware of the specific physio-chemical and biological toxicity which can be posed from wastewater. The formulation of WW guidelines and promulgation of laws must be followed by awareness creation in order to function. In this regard, the awareness level proves crucial so that people should abide by those laws and guidelines during their daily activities. As per this study, the awareness level remains alarmingly low with 87% reporting that they were not aware of laws and guidelines of WW management.

#### **4.4. Wastewater pollutant levels and impact on water bodies**

In Asmara the widespread use of septic tanks, unsanctioned dumping of WW in open areas and agricultural use of untreated WW have caused an alarming increase in the nitrates and salinity of groundwater as given in the table 1. In addition, recurrent leakages in the sewer system, attributed to improper siting, inappropriate choice of technology, faulty design, poor installation practices, poor operation, or inadequate maintenance may contribute to the phenomena. Groundwater contamination is not readily detectable as contamination does not occur visibly. Nevertheless, groundwater contamination is precarious because inadvertent use of surface water that has its flow basis on the contaminated groundwater is possible.

To determine the pollutant levels in the Asmara WW stream, sample were taken and

analyzed for different pollutant levels. The tests proved conclusively that the merging of WW stream into the Anseba river is undoubtedly a hazardous practice as pollutant levels exceeded by-far the acceptable levels for draining into rivers.

#### **4.5. Challenges to the effectiveness of the wastewater management system**

Concerning the challenges to the effective and eco-friendly functioning of the WW management systems in Asmara, the absence of a treatment plant tops the list. For wastewater to join water bodies, it must meet certain quality criteria based on hygienic standards. Wastewater prior to treatment is characterized by consistently higher levels of pollutants. Nonetheless WW streams in Asmara terminate into the Anseba river untreated.

The sewer systems in Asmara provide coverage for less than three quarters of the households in Asmara and are prone to frequent leakages due to old age and out-phased construction material, especially in the northern sub-system, where concrete piping is predominantly used instead of PVC. Over the years, access manhole covers have gotten buried during road construction and maintenance, making maintenance and upgrade of the sewer system a daunting task. Moreover, the wastewater department has shortage of qualified administrative professionals as well as experienced laborers reducing its duty performance capability. The absence of enough workers creates delays in maintenance and repair works.

Besides the old historic and planned housings, Asmara has some dwellings constructed without a master plan, making some un-sewered communities difficult to be added to the sewage network. Most of the unplanned settlements are densely populated, adversely influencing wastewater management in these areas.

#### **4.6. Proposed management Model**

A management model deemed suitable for the WW management of Asmara is the waste management hierarchy, or simply waste hierarchy.

The aim of the waste hierarchy is to extract the maximum practical benefits from products and to generate the minimum amount of waste.

**Figure 7.** Awareness of respondents toward existing policies

**Table 1.** Salinity and Nitrates levels in Asmara aquifers [15]

Place	Number of analysed aquifers		Amount of Salinity (>=2000) (mg/l)		Amount of Nitrate (>=50) (mg/l)		Level of salinity (mg/l)	
	Partial analysis	Complete Analysis	No	%	No	%		
			27	87	40	35.1	41	47.1
Asmara							<1000	21%
							1000-2000	44%
							2000-3000	17.5%
							3000-5000	12.3%
							5000-10000	4.3%
							>10000	0.9%

**Figure 8.** PH comparison of Asmara WW stream with WHO standard

**Figure 9.**Chlorides comparison of Asmara WW stream with WHO standard

**Figure 10.**TDS comparison of Asmara WW stream with WHO standard

The waste hierarchy is represented as a pyramid because the basic premise is for policy to take action first and prevent the generation of waste. The next step or preferred action is to reduce the generation of waste i.e. by re-use. The next is recycling which would include treatment. Following this step is material recovery and waste-to-energy transformation where energy can be recovered from processes. The final action is mere disposal, in wet lands without energy recovery. This last step is the final resort for waste which has not been prevented, diverted or recovered. The waste hierarchy represents the progression of a product or material through the sequential stages of the pyramid of waste management.

The WW minimization is the first of the sequential stages of WW management in the waste hierarchy, considering the infeasibility of total prevention. It involves redesigning products and changing societal patterns, concerning both consumption and

production of waste generation, to prevent the creation of waste. . For instance, the use of machines makes it possible to use less water as they provide more agitation and come pre- equipped with a drying faculty, which enables collection of potentially reusable WW which would otherwise have been evaporated while drying the clothes. Some other mindful practices are reducing time in the shower, turning off faucets during intermittent use, adjusting water levels to match the clothes washed in laundry machines and addressing dripping faucets swiftly. Technological solutions such as toilets with tank inserts that maintain flushing pressure as water level decreases or reduced-flow-rate showerheads that restrict flow rates also contribute to the minimization of WW production. A more recent innovation would be the use of hand-sensors that switch on faucets when the user places his hands below the orifice. All these aforementioned systems may mitigate the

production of WW.

Reuse of WW is the next stage of the waste hierarchy. It can be performed smoothly by matching the quality of the WW at hand, often by treatment, with the hygienic requirements of the water-requiring task to be executed. This can be carried out at the household level, for example, using dishwashing WW for flushing the toilet, or at institutional level, for instance, treating WW effluents to use for agricultural purposes, tantamount to recycling. This would involve a viable treatment system suited to the particular location. Herein Proposed to be suitable for Asmara is the waste stabilization pond, based on its simplicity, low energy consumption and minimal maintenance required. sunlight being it's main source of energy, the all year-round sunlight presents an excellent opportunity for high pollutant removal efficiencies. Regarding to running cost, stabilization ponds have advantage of very low operating costs since they use no energy compared to other wastewater treatment technologies but its demerit is that it is land intensive. With further extension of Asmara, there is a chance of potentially increasing the issues in future relevant to wastewater management. After building robust economic strength this treatment plant can be replaced by a chemically enhanced primary treatment and the land from the former stabilization ponds site can be repurposed for construction of buildings.

The last stage in the waste hierarchy is disposal. The WW or the recycle remnants thereof, must be disposed in an eco-friendly manner. A wetland is a distinct ecosystem that is flooded by water, either permanently or seasonally, where oxygen-free processes prevail. They are generally distinguished from other water bodies or landforms based on their water level and on the types of plants that live within them. Constructed wetlands are engineered systems that mimic natural sustainable solutions and use natural

functions, vegetation, soil, and organisms to treat wastewater. Constructed wetlands can possibly serve as disposal means for wastewater, yet they are usually only a follow-up to primary septic tank treatment and have difficulty removing pathogens. Furthermore, they are extremely land intensive and can process relatively low volumes of wastewater at a time. In the same vein, they are susceptible to disturbances including eutrophication, toxicity, acidification, salinization, sedimentation, aridification, flooding and vegetation removal. Ultimately, environmental disposal of wastewater is a practice that invariably harms the ecological stability as well as the human health, although the harm may be undoubtedly mitigated by such mechanisms as the use of wetlands. In conclusion, recycling via wastewater treatment is a more viable option for the safe disposal of wastewater on account of the environmental footprint.

## 5. Conclusions and Recommendations

With regard to wastewater generated, the study found that the per capita levels are quite low in Asmara. This is attributed to the high level of consciousness with respect to minimization of wastewater production, mainly manifested through reuse, which may be partially credited to the lack of consistent supply of water. Moreover, the awareness of the general public about the harms of irresponsible wastewater disposal was satisfactorily high. The WW generated is currently being majorly collected by the sewer system although a significant portion of the population still use the septic tank, while still some others dump outside. Sewer extension works are always in progress yet the sewer system still does not cover the whole of Asmara. Experiments were conducted to test the viability of Mai-Bella joining water streams, with conclusive

results of pollutant levels exceeding pre-specified standards. The situation requires remedying by the institution of a compatible treatment plant.

The recommendations as per the study have been classified as near-future and far-future implementable, in consideration of the required resources or infrastructure.

## 5.1. Recommendation for near-future implementation

- The speculation that excessive use of septic tanks is causing the observed groundwater contamination in Asmara needs to be investigated.
- Moreover, adequate monitoring measures and systems are required for existing treatment facilities to ensure that they comply with safe environmental standards.
- Widespread adaption and use of innovative Approach to minimize wastewater as expressed elsewhere in this document must be instituted to further reduce its generation.
- Equipment acquisition (such as vacuum trucks for desludging) and organization of training sessions to add momentum to and strengthen the maintenance and extension works of the wastewater department.
- Undertaking at least a small-scale rehabilitation and extension program for existing infrastructure to gradually cover the whole Asmara area, out-phasing septic tanks.
- Re-establishing the sewer manholes accessibility in order to allow for an appropriate diagnosis of the system. The analysis of results will allow to identify areas where improvements or rehabilitation works are needed (cleaning operation, pipe replacement or reinforcement, etc..).
- Policies must be drafted such that all stakeholders are considered. In addition, mature and workable technical guidelines must be created to facilitate implementation of laws and policies.
- The development of professionals and practitioners in wastewater management by government and educational institutions which would stimulate the adoption of appropriate wastewater management practice to monitor and supervise the wastewater management of the city.
- Construction of public toilets to serve unconnected areas within Asmara must be pursued. These public toilets will alleviate the problem of open defecation by the use of septic tank public toilets in unsewered areas.
- Immediate halting of the untreated wastewater-based agricultural activities through the institution of strongly prohibitive laws and extensive monitoring.
- Use of reclaimed wastewater for irrigation of agricultural lands should be developed. However, there needs to be a robust policy and legislation in place that gives regulation and control on the quality of wastewater to be used for agricultural purposes. Intending to further improve the awareness of the public in wastewater management by encouraging the participation and cooperation in sanitation and wastewater campaigns.
- Wastewater effluents are presently being discharged in the environment without treatment, a situation which is not sustainable

and requires urgent attention.

- Establishment of the waste stabilization pond treatment plant. For its area of construction, we propose it be in an extensive land at the northern part of Adi-Qonxi which is a low-altitude site that aids natural drainage. Provision of a sludge lagoon for the disposal of the collected sludge from on-site sanitation facilities in order to stop the over spilling of the collected sludge into the watercourse is also an inalienable task

### **5.2. Recommendation for far-future implementation**

- Inspection of the existing sewerage system and preparation of digitized drawings showing the different sections of the sewer lines with their main characteristics.
- Completion of the sewage system to cover the whole existing City and bond New areas
- Replacement of the waste

stabilization pond (WSP)

wastewater treatment facilities to the less land intensive mechanically and chemically enhanced primary treatment as the borders of Asmara city progressively swell.

- Installation of separated pipe lines or collection culverts for northern sub-systems to harvest rainwater.

### **Acknowledgements**

The authors are grateful to Ms. LidyaTeklehaimanot, of the Ministry of Land, Water and Environment, who directed data collection process and provided consistent mentorship throughout the project tenure. The authors also extend their gratitude to Mr. BahreselamSielu, HoD of Chemical Engineering at MCoET, for persistent support and guidance. Further, the authors convey their thankfulness to Dr.KahsayNeguse for providing assistance and cooperation whenever required.

## THE COMMUNICATION OF THE HEAD OF SEMANGAT DALAM VILLAGE ON DOMESTIC WASTE MANAGEMENT IN BARITO KUALA REGENCY

**Abstract:** *This research aims to analyze the communication patterns of the Head of Semangat Dalam Village on housing waste management in Barito Kuala Regency. to change people's behavior in carrying out waste management. Qualitative descriptive research methods, in the form of descriptive content analysis, with data collection techniques such as literature studies, Internet Searching, Field Studies (observation, interviews, documentation and literature studies) through the stages of data reduction, data presentation, drawing conclusions and verification. The research was conducted using the theory of Communication Management. The results of the study found that effective communication patterns can help leaders, such as village heads, to build good relationships by awareness of community behavior and attitudes in managing waste This can help achieve desired goals and provide benefits to the community as a whole, through understanding, pleasure, influence on attitudes, better relationships and actions such as language acquisition, means of communication, ability to think and a good environment.*

**Keywords:** *Communication Patterns, and Strategies, Village Head Communication Management*

### 1. Introduction

The implementation of good government will affect and determine good environmental management. Likewise, good environmental management will reflect the level of good governance and vice versa without good governance, it is difficult to expect good environmental management as well.

National development goals related to waste processing can be seen from two sides, namely the sustainable development side and the environmental sustainability side. In this context, Pancasila and the 1945 Constitution of the Republic of Indonesia became the main

foundation in regulating and developing waste management in Indonesia. Pancasila, there are values that support sustainable development, such as mutual cooperation, social justice, and diversity. These values can be applied in waste management by involving all levels of society and paying attention to social justice in the equitable distribution of waste management services.

Meanwhile, in the 1945 Constitution of the Republic of Indonesia, there is Article 33 which emphasizes the importance of the government in managing natural resources and the environment for the welfare of the people. Waste management is the

responsibility of the government to ensure a healthy living environment and equitable waste management services throughout Indonesia.

There are effective and efficient waste management efforts in order to maintain environmental cleanliness and public health based on Law Number 18 of 2008, regulated regarding waste management from upstream to downstream, starting from reducing waste sources, collecting, transporting, processing, and final disposal of waste. Waste management can provide dual benefits, namely maintaining environmental cleanliness and generating economic value such as processing organic waste into compost and non-organic waste such as paper, plastic, and metal can be recycled into new products

Research on the Communication Pattern of the Head of the Village Spirit in Housing Waste Management in Barito Kuala Regency, the basis or reference in the form of theoretical theories or findings through the results of various studies before it is very necessary and can be used as supporting data, researchers take steps to study several research results in the form of theses and journals via the internet.

Nanang Mizwar Hasyim (2019) The title of the research is Increasing the Independence of Panggunharjo Village through Development Communication, through qualitative-descriptive methods can produce a new perspective in independent village development. The most notable research finding is that social service programs (education, health, and economy) are well centralized through the effective and efficient management of BUMDesa. BUMDesa is the driving force of services because the income economically every year continues to increase so that this condition makes the village's income increase.

Syuaib Iman Mu'tamaddin, Noor Rachmat, Yusuf Ismail (2014), The title of the study is Communication Patterns in Waste Treatment

According to an Islamic Perspective (Case Study: Integrated Waste Disposal Site (TPST) Bantar Gebang Bekasi). In this study, two approaches were used as the basis, namely the phenomenological approach and the symbolic interaction approach using John B Watson's Behaviorism Communication Theory where data collection techniques, namely observation, depth interviews, and documentation. The results of the study show that of all the communication patterns described by the author and his activities, the more dominant in its application is mass communication. In this mass communication, the public understands more about waste treatment, because TPST administrators put up banners around jalan bantar gebang bekasi. so that the community around TPST can apply this communication pattern. teaches the values of caring for the environment organization tells by explaining the impact caused by not managing waste properly.

Titi Antin, Hermin Indah Wahyuni Dan Partini (2018) with the title of the research, namely The Dynamics of the Role of Waste Management Networks in Waste Literacy Communication. The method used qualitative method with data collection techniques such as interviews, observations, and focus group discussions with participatory communication theory. From the results of the study, it is known that the role of JPSM "AMOR" in waste literacy communication is as a facilitator between the government and the community and as an agent of empowerment through communication patterns at the macro and micro levels.

Tamrin Muchin and Sri Sudono Saliro (2020) . With the title of the research, namely The Role of Village Governments in Waste Management from the Perspective of Regional Regulation Number 2 of 2015 concerning Waste Management. This research method uses empirical research methods with a statutory approach, to obtain data, researchers conduct observations and

interviews with the village government, and the community using purposive sampling. The results of the study revealed that the role of the village government was in accordance with Article 11 of Regional Regulation Number 2 of 2015 concerning Waste Management. The inhibiting factors are community factors, facilities factors and village government factors.

Kaveri Kala a, ÿ, Nomesh B. Bolia a, Sushil, (2020) with the research title namely Waste Management Communication Policy for Effective Citizen Awareness. In this study, the Multinomial Logistic Regression (MLR) approach was suggested and applied to develop the right strategy. This research shows that the methodology proposed in this study can be applied to develop WMCP for any city around the world to generate actionable perspectives for targeted outreach. In particular, the evidence provided by the MLR model in the SDMC case study can help all stakeholders involved in the Waste Management Policy.

Marlinda Irwanti and Totok Prasetyo (2020) with the research title Environmental Communication Strategy in Efforts to Empower Communities to Process Domestic Waste. This research uses a qualitative approach with a case study method. This study uses the Strategic Impact & Assumptions Identification Method (SIAM) to determine the target audience for communication of Domestic waste disposal problems. This method uses a qualitative approach in assessing the feasibility of non-technical matters from an environmental problem about communication of environmental management of Domestic waste in the form of waste. The results showed that the Management of Domestic Waste in the form of waste into Biogas has been carried out by identifying the strategy of the environmental management audience through stakeholder analysis. To identify message strategies through priority and critical assumption keys and to determine

appropriate communication management strategies to address critical issues of affected entities.

Based on the National Waste Management Information System (SIPSN) website, Domestic are ranked at the top of waste sources with a figure of 40.78% in 2021, followed by commerce with 19.51% and the market with 15.97%. In 2021, in South Kalimantan, waste generation amounted to 782,592.38 tons / year and 34,660.04 tons / year or 94.96 tons / day for waste generation in Barito Kuala Regency (Source: SIPSN 2021) while the waste generation of Alalak District reached 16 tons / day (Source: Barito Kuala Regency Environmental Agency, 2022).

According to Kumalawati et al., (2016) in a journal entitled "Location Analysis of Temporary Waste Shelters in Alalak District, Barito Kuala Regency, South Kalimantan" that the ability of local governments in large and medium-sized cities in Indonesia to handle waste is still limited. The threat of poorly managed waste is one of the causes of increasing water, soil and air pollution and increasing the potential for flooding in urban areas.

Waste problems in general need to be handled seriously with appropriate and integrated techniques/strategies, operations and management based on the conditions and policies of each region. As stated above, this waste management problem occurs almost all over the world, including in Indonesia, especially Semangat Dalam Village which is one of the villages in Alalak District, Barito Kuala Regency, South Kalimantan Province Semangat Dalam Village, headed by a Village Head, has the most population in Kecamatan Alalak, which is estimated to reach approximately 16 thousand people, with so much population density that it causes existing social problems, one of which is the increasing fulfillment of housing needs for residents to live in.

The problem of the existence of increasing housing needs for residents is not balanced with the availability of public facilities, namely the provision of Landfills (TPS) in waste management, this has a bad impact on the performance of waste management itself if the provision does not meet the standards of quality and quantity of services, which then results in a culture of community behavior in handling waste that has the potential to occur is burning waste, hoarding garbage, and throwing garbage in any place.

The provision of the TPS is the responsibility of the Developer to provide public facilities in accordance with South Kalimantan Regional Regulation Number 11 of 2019 concerning the Implementation of Housing and Domestic Areas, and is strengthened by the Regional Regulation of the Regent of Barito Kuala Number 6 of 2019 that "Everyone is prohibited from erecting buildings on spaces owned by roads, spaces owned by rivers, parks and green lanes".

According to the Head of Waste Management of the Barito Kuala Regency Environmental Service, Mety Monita in an initial interview with researchers on November 1, 2022, stated that waste management in Alalak District is classified as the most difficult where community residents are not aware of waste management and infrastructure in handling waste management is very limited such as Temporary Landfills (TPS).

The Alalak Subdistrict area only has two polling stations but previously had more polling stations on the side of the road, but along with the regulations, namely the Barito Kuala Regent Regional Regulation Number 6 of 2019, along the protocol road including the handling of Ambrol and all kinds of landfills while no TPS is allowed.

The impact of not being disseminated by TPS at certain points this causes many residents of the community who do not have awareness and are far from the TPS causing residents to be lazy to go to the TPS and throw a lot of garbage on the sidewalks of the protocol road,

and throw at wild TPS in the area around the housing, the phenomenon of waste generation in this housing complex is a problem that arises in waste management that has not been maximized.

Although Barito Kuala Regency already has Perda Number 3 of 2018 concerning Waste Management, such as article 57 paragraphs (1) to (5) which regulates sanctions for individuals, in reality there are still people in Barito Kuala Regency, especially Semangat Dalam Village, who throw garbage out of place.

According to the observations of researchers in the field, in Semangat Dalam Village, which has an area of 7.50 km<sup>2</sup> consisting of 53 RTs and there are approximately 40 (forty) housing complexes in the Semangat Dalam Village area, some of which do not provide public facilities or TPS, such as in Nur Sari Alam Complex Housing, Citra Permata Housing, Asyifa Perdana Mandiri complex and other housing, but researchers only found 1 (one) housing complex (Lyandra Housing) that provides Public Facilities such as TPS which is located at the entrance to the housing.

Researchers see the phenomenon in The Village of Semangat Dalam to the problem of phenomena such as limited public facilities as landfills, community culture that is not yet environmentally friendly, law enforcement that is not optimal, in this case communication is needed for a Village Government Apparatus as the main figure in the implementation of village government.

The village government apparatus as a communicator in this case the role of the Village Head as the main authority holder in village government needs to have innovative abilities and initiatives as policy stakeholders to change the mindset and boost awareness of the people of Semangat Dalam Village to create healthy environmental conditions, of course, it cannot be separated from the strategies and communication patterns used by the Village Head to his community.

As a leader at the village level, the village head has an important role in managing waste in his area. Village heads must be able to establish effective communication with the community to provide information and education on how to manage waste properly and correctly. In this case, the communication pattern carried out by the village head can provide public awareness in carrying out the effectiveness of waste management programs in Domestic areas.

## 2. Research methodology

The research in this study uses a descriptive-qualitative approach (qualitative research) to discuss the Communication Patterns of the Head of the Semangat Dalam Village on Waste Management in Barito Kuala Regency. Qualitative content analysis is simply a descriptive content analysis, which describes only the aspects and characteristics of a particular message or text. Qualitative content analysis here is in the form of words, sentences, or narratives that can be obtained through observation (Kriyantono, 2012: 196).

The use of the main method of case study research according to Robert K. Yin (2011:2) is to explain how the existence and why the case occurs. So that in case study research is not just answering research questions about the "what" of the object under study, but more thoroughly and comprehensively regarding "how" and "why".

The selection of resource persons or informants in this study is based on Purposive Sampling. Purposive sampling is a technique of retrieving a data source with certain considerations, a person or something is taken as a sample because the researcher considers that the person or something has the necessary information for his research. While Snowball Sampling is a technique of determining samples that at first the number is small then increases in size (Sugiyono, 2014: 120).

So, the criteria for the resource persons of this study are parties who know clearly or are involved in activities regarding the communication patterns of the Head of The Village of Semangat Dalam on waste management in Barito Kuala Regency. With details as:

**Table 1.** Research subjects processed in 2023

No	Informant Name	Capacity
1	Norman (N)	Head of Semangat Dalam Village as a stakeholder and policy official in Semangat Dalam Village, Alalak District, Barito Kuala Regency
2	Metty Monita (MM)	The representative of the Environmental Agency of Batola Regency who specializes in handling waste problems is the Head of Waste Management who is responsible for handling waste and reducing waste in Barito Kuala Regency
3	M. Sya'rawi (MS)	Alalak Sub-district, as an Official of stakeholders and policies in Alalak District, Batola District
4	Agus Suwani Isyra (ASI)	Community Leader/Chairman of BPD Semangat Dalam as supervisory official in the village government
5	Fauzi Noor (FN)	Community Leader/Chairman of RT 07, as an existing community institution that is directly related to the community
6	Aini (A)	Community Leader /Chairman of RT 06, as an existing community institution that is directly related to the community

No	Informant Name	Capacity
7	Supardi (S)	The Head of the Tabing Rimba Landfill Unit, an extension of the Batola Regency Environmental Agency, is the official responsible for distributing waste transportation to landfills in Barito Kuala Regency

### 3. Results and discussion

At a glance, Barito Kuala Regency, Barito Kuala Regency is one of the regency governments located in the province of South Kalimantan, Indonesia. The capital of the district is located in Marabahan. The district has an area of 2,996.46 km<sup>2</sup> and has a population of 318,044 (results of the 2020 Indonesian Population Census). Part of the Barito Kuala area is included in the candidate for the Banjar Bakula Metropolitan Area. Barito Kuala Regency borders the province of Central Kalimantan, precisely in the Kapuas regency, and its location is by the sea. Barito Kuala Regency, which is the capital city of Marabahan, is located in the westernmost part of South Kalimantan Province with boundaries: north of Hulu Sungai Utara Regency and Tapin Regency, the south of the Java Sea to the east is bordered by Banjar Regency and Banjarmasin City, while the west is bordered by Kapuas Regency, Central Kalimantan Province. Astronomically located at 2°29'50" - 3°30'18" South Latitude and 114°20'50" - 114°50'18" East Longitude. (Barito Kuala P. K.) Barito Kuala Regency was established on July 4, 1959 based on Law No. 27 of 1959 concerning the Establishment of Emergency Law No. 3 of 1953 concerning the Extension of the Establishment of Level II Regions in Kalimantan (Statute-Book of 1953 Number 9) as an Act with the capital marabahan.

#### Alalak Subdistrict

Alalak District was established before the formation of Barito Kuala Regency which used to be part of the Banjar Regency Kewedanaan, which had its capital in West Berangas Village until 2000, because in 2000

the District Office located in West Berangas Village moved to Handil Bakti Village occupying the Former office. Assistant Regent Barito Kuala, automatically now the capital of Alalak District is in Handil Bakti Handil Bakti Village and in 2019 occupies the New Office of Jalan Trans Kalimantan Km 11 RT 03 Handil Bakti Village. Alalak Subdistrict has an area of 106.85 km<sup>2</sup> divided into 15 village areas and 3 villages with berangas village as the district capital. Alalak subdistrict has administrative boundaries:  
 North : Belawang District  
 West : Anjir Muara And Mekarsari District  
 East : Mandastana District  
 South : Banjarmasin City

As the most populated sub-district in Barito Kuala Regency, Alalak District faces problems that are fairly complex compared to other districts. The population density of Alalak District reaches 60,603 people, with a male population of 30,946 and a female population of 29,657. Population growth is relatively high, especially the Handil Bakti area and its surroundings, so the acceleration of supporting infrastructure is very important to adjust.

#### Semangat Dalam Village

At the beginning of the formation of the Semangat Dalam Village in 1982, due to the expansion of the Semangat Bakti Village area. There was a division into 4 (four) areas, namely Semangat Bakti Village, Semangat Dalam Village, Semangat Karya Village and Handil Bakti Village with Village Regulation Number 01 of 1982. In general, Semangat Dalam Village is a village bordering 3 villages in the Alalak District, Barito Kuala Regency. Semangat Dalam Village is one of

the villages that has the most population among 15 villages in Alalak District. The general condition of The Semangat Dalam Village is described geographically and demographically as the village.

Semangat Dalam village is one of the villages in Alalak District located in the Southern part of the capital of Barito Kuala Regency. Located at -3.263517 South Latitude and 86 East Longitude with the following regional boundaries:

North, bordered by Mandastana District,  
East, bordered by Semangat Bakti Village,  
South, bordered by Banjarmasin City,  
West, bordered by Handil Bakti Village.

The area of Semangat Dalam Village is 7.50

km<sup>2</sup> consisting of 53 RTs, and – RW Semangat Dalam Village is at an altitude of 0.2 – 3 meters above sea level whose soil ability and fertility are affected by tides and are partially flooded and dominated by swamps. Overall, the area of Semangat Dalam Village is a relatively flat lowland area. Based on Village Administration Data, the number of administratively recorded population is 18,290 people. The details of the residents of Semangat Dalam Village, Alalak District, calculated based on the gender of the population from 2017 to 2022 can be seen in detail as shown in the following table:

**Table 2.** Total Population of Spirit Village in 2017-2022 (in Soul)

NO	Year	Population	Man	%	Woman	%
1	2017	1.189	624	50,67	565	49,33
2	2018	1.192	626	50,87	566	49,13
3	2019	14.753	7.604	51,54	7.149	48,45

### Waste Management in Barito Kuala

The new paradigm views waste as a resource that has economic value and can be used, for example for energy, compost, or for fertilizer. Waste management with the new paradigm is carried out with waste reduction and handling activities, waste is basically a material that is wasted or disposed of as a result of human activities and natural processes. Based on Law Number 18 of 2008 concerning Waste Management, waste management cannot be completed only by the government by collecting, transporting and disposing of waste to landfills only, but must be carried out in an integrated and integrated manner so that the Principles of Waste Management provide economic benefits, are healthy for the community and are safe for the environment, and can change people's behavior. Waste as a resource that has economic value and can be used, for example for energy, compost, or for fertilizer. Tabel 4 Target Pengelolaan Sampah Kabupaten Barito Kuala

**Table 4.** Waste Management in Barito Kuala

Tahun	Jawa	Total Sampah Ton/Tahun	Sampah yang terkelola Penanganan Ton/Tahun	Pengurangan Ton/Tahun	Sampah yang tidak dikelola Ton/Tahun
2017	293,808	37,533.94	18,016.29	3,588.24	15,929.41
2018	298,282	38,105.53	27,817.03	6,858.99	3,429.50
2019	304,248	38,867.64	31,094.11	7,773.53	-
2020	310,333	39,644.99	29,733.74	8,721.90	1,189.35
2021	316,539	40,437.89	29,924.04	9,705.09	808.76
2022	322,870	41,246.65	30,110.05	10,724.13	412.47
2023	329,327	42,071.58	30,291.54	11,359.33	420.72
2024	335,914	42,913.01	30,468.24	12,015.64	429.13
2025	342,632	43,771.27	30,639.89	13,131.38	-

To minimize the waste problem, there must be waste management from the source. Waste management is a systematic, comprehensive and sustainable activity that includes reducing and handling waste. Waste management needs to be carried out comprehensively and integrated from upstream to downstream in order to provide

economic benefits, be healthy for the community and be safe for the environment and can change people's behavior.

**Figure 1.** Graph of Barito Kuala Regency Waste Management Figure 1 Graph of Barito Kuala Regency Waste Management Figure 1 Graph of Barito Kuala Regency Waste Management

Waste handling includes sorting, collecting, transporting, processing, and final processing (landfill). Waste is basically a material that is wasted or disposed of as a result of human activities and natural processes. Waste management and management will be more complex and complicated with the increasing complexity of the type and composition of waste.

**Figure 2.** Handling and Reducing Waste in Barito Kuala Regency in 2018

Waste reduction includes restriction, reuse,

and recycling activities (Reduse, Reuse, Recycle / 3R) Waste Reduction at the source can reduce the burden of waste entering the final processing site (TPA) through public awareness to sort waste from home. Society has an important role because in essence waste is produced by the community itself.

The waste problem cannot be solved only by the Government. It is time as waste producers we help, even take responsibility for at least taking care of their own waste. The number of Domestic will determine the amount of waste produced. Waste management and transportation is a separate problem that is still difficult to overcome. If not handled properly, it will cause unwanted waste generation and will eventually pollute the environment. The community has an important role in Domestic waste management, because in essence waste is produced by the community itself. One of the things that the community can do to participate in managing waste and preserving the environment, is to abandon the old pattern of managing domestic waste such as throwing garbage in rivers and burning waste, by applying the 3R principle, namely:

- Reduce means that people can make less effort in producing waste, each shopping brings their own plastic from home, thus reducing plastic use.
- Reuse (reusing a product for the same purpose), that is, utilizing used containers that can be used such as gallons, used bottles or used cans.
- Recycle (recycling) to apply the principle of recycling, including by making compost from organic waste, pots from used plastics, or other creativity so that waste can be recycled and can be reused.

The amount of waste generation in Barito Kuala Regency is around 0.01412 million tons / year or around 80 tons / day with a fleet of 13 units of garbage transport trucks can only serve 10 sub-districts from 17 sub-

districts in Barito Kuala Regency.

**Figure e.** Waste Generation of Barito Kuala Regency

The condition of the Tabing Rimbah TPA UPT is currently in full condition (Overload) the amount of waste that enters every day is an average of 25 tons / day or equivalent to 40 M3 serving 10 districts in Barito Kuala Regency. Tabing Rimbah landfill cells built in 2012 have been utilized since 2014 the cell size of 80 meters X 60 meters is currently 12 meters high. To increase the height again endangers the safety of the machine operator.

In handling daily waste, currently utilizing the Banjarbakula Regional Landfill UPT in Banjarbaru. The PUPR Office has proposed adding new cell construction to the Directorate of Sanitation, Directorate General of Cipta Karya, Ministry of Public Works and Spatial Planning of the Republic of Indonesia and proposed a request for the construction of a new cell through the head of the South Kalimantan Regional Settlement Infrastructure Center.

The Communication Pattern of the Village Head is Enthusiastic in Managing Housing Waste.

Communication patterns are the way an individual or group communicates. The communication pattern in this paper is the way a group or individual works in communicating which is based on communication theories in conveying messages or influencing communicants. (Purwasito, 2002:96). We can illustrate this understanding of this pattern as when we are

going to make clothes. When someone is going to make clothes he will make a pattern or often called a pattern, this pattern is flexible and easy to change. This pattern will determine the shape and model of a shirt, then after going through several processes, finally from a shirt it will be visible and the actual model will be clearly visible.

From the illustration above, communication patterns can be understood from a communication that is flexible and easy to change. This pattern is strongly influenced by the symbols of the language used and agreed upon by a particular group.

One of the patterns used to describe the process of communication is the circular pattern created by Osgood with Schramm (1954). Both of these figures devote their attention to the role of the source and receiver as the main actors of communication. This pattern describes communication as a dynamic process, in which messages are transliterated through a process of encoding and decoding. Encoding is a translation performed by the source of a message, and decoding is a translation performed by the recipient of a message coming from the source. The relationship between encoding and decoding is the relationship between the source and receiver simultaneously and influencing each other, as shown in the drawing scheme. As a dynamic process, the interpreter in this circular pattern can double as the sender and receiver of the message. At the initial stage, the source serves as the encoder and the receiver as the decoder. But at the next stage the receiver serves as the sender (encoder) and the source as the receiver (decoder), in other words the first source will be the second recipient and the first receiver serves as the second source, and so on.

If in the mathematical communication pattern Shannon and Weaver in 1949 saw the communication process end after arriving at the destination then in the circular pattern Osgood and Schramm saw the

communication process of both the source and receiver in this pattern as having the same position. Because the communication process can start and end anywhere and anytime. From the research conducted, there are researchers' findings, including:

1. Providing understanding to the community, the Village Head communicates by giving advice on waste management in addition to that through community activity forums and religious and other activities. The Village Head directly conveys environmental awareness, this is considered effective because it reaches the target community directly.
2. The appeal given by the village head is an educational appeal. The role of the village head is as a facilitator, creating conducive conditions for the implementation of village development. As a facilitator in handling waste management, the government is engaged in the field of assistance to encourage progress in waste management in villages.
3. The influence of the Village Head on waste management in the Spirit of the Village has a very important role. The results of the interviews revealed the role of the Village Head in constantly reminding his residents to increase awareness of the environment through routine appeals to the community.
4. Researchers found that efforts to establish communication create good relationships with various parties that can make it easier for the Village Head to effectively manage waste with good and effective communication, it will be easy for an organization to achieve the desired goals.
5. Communication patterns created from communication actions can be

carried out directly and indirectly. Talking face to face, talking on the telephone, writing a letter to a person, group of people or organization are examples of direct acts of communication.

Likewise the village head. In spirit of taking action, the effectiveness of communication is measured by concrete actions, communication patterns have been carried out both directly and indirectly. By participating in mutual cooperation with residents, making appeals on social media and sending circulars to the Head of the RT to disseminate to the community. This is done solely for the accumulation of the communication process and involves the participation and participation of the community in efforts to manage waste in the Spirit of the Village.

Communication Management Strategy for the Village Head Enthusiasm to Change Community Behavior in Domestic Waste Management.

The function of public relations for the leadership of an organization in the community is to create "good relations" with the public, so that they have a good image of the organization concerned, in fostering a relationship of mutual understanding, continuity is needed.

The Village Head as the Leading Sector of a village must have relationship activities with various stakeholders (Local Government, Camat, Community Leaders and others) to establish good relations and cooperation with various parties with various forms of routine activities carried out, including in terms of management communicating in the program existing activity.

The concept of management from the perspective of communication science is essentially understood as a process of influencing others, suggesting that the ability to communicate well is not only something that is inherent in oneself, but as something that can be learned and developed.

This is in accordance with the spirit of the village head for the communication management strategy in accordance with the Theory of Communication Management according to Parag Diwan (1999) which says that communication management is the process of using various communication resources in an integrated manner through the process of planning, organizing, implementing and controlling the elements communication to achieve the set goals.

### 1. Planning

Planning in conveying messages through a combination of various communication elements such as frequency, formality, content and communication channels so that the message conveyed is easily received and understood and can change attitudes or behavior according to the purpose of communication.

The Village Head uses a communication management strategy with planning in waste management by utilizing existing stakeholder communication, namely submitting a proposal for assistance with garbage uncle carts, and in tune with the existing program at the Environmental Service, namely the Anjur Transport Program. In line with planning and carrying out effective communication means that the communicator and communicant both have the same understanding of a message. Therefore, in foreign languages people call it "the communication is in tune", that is, both parties communicating both understand what the message is being conveyed

### 2. Organizing

Organizing is the process of assigning tasks, allocating resources and organizing activities in a coordinated manner to each individual and group to establish a plan. The organizing function here includes assigning separate tasks to each party, forming sections, delegating and establishing lines of authority/responsibility and communication systems, as well as being organized.

From the results of the interview summary

regarding the planning strategy of the Village Head of Roh Dalam, namely carrying out an organizing strategy that must be carried out in waste management, namely the Village Head has a strategy to function the role of the village organization that is given authority and responsibility in waste management in the Village of Rohan Dalam, namely management will be carried out by the Agency Village Owned Enterprises "Joint Spirit" Internal Spirit.

According to Sherry R Arnstein (1969) quoted by Sigit (2013: 27) states that dividing the levels of community participation in development programs implemented by the government in 8 (eight) levels of community participation based on the power given to the community, one of 8 (eight) ) level, namely Partnership, Partnership means that it can be called working together, the Village Government treats the community as a work partner, jointly formulating and implementing work programs, especially in waste management in Rohan Dalam Village.

### 3. Implementation

The communication management strategy for implementation in waste management in terms of the process of directing and influencing activities in increasing public awareness requires a method or in this case using an Appeal either through Letters, outreach to each RT RT.

The Village Head's approach in influencing the community to make behavior changes with persuasive communication in socializing to residents has the aim of providing knowledge and providing appeals so that people have awareness in protecting the environment. According to Erwin P. Bettinghaus (1973) that this persuasive communication can affect one's thoughts and actions, the relationship of activity between the speaker and the listener where the speaker tries to influence the listener's behavior through the intermediary of hearing and sight. According to the researchers, the form of a

persuasive strategy is with waste management outreach activities, communicating by inviting and providing educational information but not forcing, but giving the intended audience a sense of comfort. A persuasive approach is an effective way to increase environmental awareness in society.

### 4. Controlling the elements of communication to achieve the goals set.

A community empowerment program will not run well if it is not managed properly, which should also be preceded by good planning. The planning referred to here must of course be participatory in nature, involving all relevant elements of society, especially those that will become the target group, must also include the problem identification process carried out with the community.

Management has certain goals and is intangible, because it cannot be seen, but the results can be felt, namely the realization of optimal activity output, personal satisfaction, better products and services, and reaching the target. Management includes activities to achieve goals, which are carried out by individuals who give their best efforts through predetermined actions.

The efforts and actions in question include knowledge about what must be done, determining how to implement it, understanding how to do it and measuring the effectiveness of the efforts made. Furthermore, it is necessary to establish and maintain an environmental condition and situation that provides economic, psychological, social, political responses and technical contributions and their control (Terry, 2009:10).

The control function assumes that effective leadership must be able to guide the activities of its members in a directed and deep manner. Effective coordination, thus enabling the maximum achievement of common goals. In carrying out the control function the leader can manifest through guidance, directing,

coordinating and supervising activities.

The strategy implemented in terms of control or control that has been carried out in participatory waste handling by the village community, the Village Head and his staff through communication forums to make it more effective.

The results of controlling or controlling become the basis for discussion of village meetings which are attended by the Village Consultative Body, community leaders, RT heads and community representatives as well as other relational parties.

Based on the discussion, to achieve an effective communication management strategy, several things that need to be considered include:

1. The village head must have good communication skills, both verbally and non-verbally.
2. The message conveyed must be clear and easily understood by the public.
3. Communication must be carried out regularly and consistently, so that messages can be conveyed effectively.
4. The use of appropriate media or modes of communication must be considered, depending on the context and communication needs.
5. Social factors such as community norms and values must be considered in managing communication.
6. The village head must build good relations with the community, so that the message conveyed can be accepted and trusted by the community.
7. The use of campaign strategies or other promotional media can help influence people's behavior and attitudes.

Based on the Communication Management Theory, communication management

strategies that can be carried out by the Village Head of Pesona in changing people's behavior in housing waste management include implementing effective communication management strategies in changing people's behavior. The village head can apply a deterrent effect in imposing sanctions due to littering, which is one way to increase community awareness and responsibility for the environment. The deterrent effect can be in the form of fear or fear that arises as a result of bad experiences or sanctions received.

Applying sanctions related to waste management, the Village Head must comply with applicable regulations, including local laws and regulations related to waste management in his area. Sanctions applied must be in accordance with applicable regulations and not contrary to human rights and the principles of justice. In addition, it is important to carry out outreach regarding these sanctions so that people can understand the consequences of littering behavior and feel more responsible for the environment around them.

Another strategy besides using a deterrent effect, the Village Head can also use a persuasive approach in the communication management strategy to change community behavior regarding waste management. The persuasive approach involves using polite, empathetic, and persuasive language to influence people's views and behavior. The Village Head can carry out environmental campaigns with a persuasive approach to motivate the community to behave better in waste management. This can be done by holding meetings with the community, utilizing social media or village websites, placing banners and posters in Domestic areas, and so on.

Utilizing mass media such as newspapers, radio, television and online media to campaign the importance of good waste management. The mass media can be an effective means of reaching a wider audience

and providing useful and persuasive information. The Village Head can collaborate with the local mass media to campaign for the importance of waste management and provide useful information on how to manage waste properly.

The Village Head can also take advantage of the power of social and cultural relations that exist in the community to change behavior related to waste management. The village community has its own characteristics and has a different value system and culture. Furthermore, the Village Head can take advantage of the values and culture that exist in the community to motivate them to carry out waste management properly. For example, it can carry out outreach through respected community leaders or organize activities that combine cultural values with waste management campaigns.

By implementing an effective communication management strategy, the Village Head can motivate and increase public awareness about the importance of good and sustainable waste management. This can help create a cleaner, healthier and more comfortable environment for rural communities.

#### **4. Conclusion**

Effective communication patterns can help leaders, such as village heads, to build good relationships with the community and influence the behavior and attitudes of the community in managing waste or in other contexts. This can help achieve desired goals and benefit society as a whole, through

understanding, enjoyment, impact on attitudes, improved relationships and action. To achieve an effective communication pattern for the Village Head, the communication approach adopted by the village head is very important in shaping the attitude of the villagers. A good and effective approach will help create positive relationships and build trust between the village head and residents.

The communication management strategy used by the Village Head to change people's behavior in housing waste management uses the process of using various communication resources in an integrated manner through the process of planning, organizing, implementing and controlling communication elements to achieve the goals set. In implementing an effective communication management strategy in changing people's behavior, the Village Head can apply a deterrent effect in imposing sanctions due to littering is one way to increase community awareness and responsibility for the environment. The deterrent effect can be in the form of fear or fear that arises as a result of bad experiences or sanctions received. Apart from giving strict sanctions, it is also important to carry out effective environmental education and campaigns to raise public awareness about the importance of keeping the environment clean. This can help people understand the negative impact of littering and motivate them to behave better.

## EPIDEMIOLOGIC IMPACTS OF WATER AND WASTE POLLUTANTS ON HUMAN WELL BEING. A CASE STUDY OF APAPA, LAGOS -NIGERIA

**Abstract:** Water quality, trace gas (SO<sub>2</sub>, CO<sub>2</sub>, and NO<sub>2</sub>), particulate matter (PM 10 as well as PM<sub>2.5</sub>), and effluents emissions were quantified at near cements and oil factories and nearby suburban areas within Apapa Lagos Nigeria. Results display that ambient air particulate matter PM<sub>2.5</sub> varies between 2.1 to 7.9 µg/m<sup>3</sup> and VOC (0.013 – 8.53 µg/m<sup>3</sup>), while CO and CO<sub>2</sub> was 100% and 30% respectively not within regulatory limits, consequently leads to asthma, coughing and difficulty breathing. Four out of nine sites investigated for noise effect were above WHO stipulated limits. While some parameters such as BOD and COD displays critical level for effluent scrutiny and conductivity, calcium, TDS, total hardness, Do and total alkalinity was also above clean water specification. Wastewater consists of spills and other water effects which produced pollutants such as soluble organic chemicals that deplete dissolved oxygen, anions, volatile materials and other heavy metals. Based on age, the greatest impact (52%) was seen in ages varying from 0 to 16 while that of the age set 16 to 60 was 45%. Curb of oil and cement particulate pollutants and requesting a buffer region between the cement and oil depots and neighborhood complemented with regulatory enforcement and persistent monitoring, should be a top precedence to the regulatory authority.

**Keywords:** Emission, Particulate, Combustible, Monoxide, Contagion

### 1. Introduction

Emissions of effluents, anions, metals, cations and particulates pollutants from industrial establishments are one of the key sources of environmental contagion (Gena et al. 2020; Deziel et al. 2020). Anions, gaseous emission and other metals such as SO<sub>2</sub>, Particulate matter (PM), Combustible gas (CHN), Carbon monoxide (CO), hazardous materials in contagion soils can be transported by wind, water, and other human

deeds with their resultant health impacts and effects on the environment (Everseen 2018; Fernando et al. 2021). Cement and oil factories have been reported to be a main source of various emission and air pollutants to the environs with numerous reports displaying higher concentrations of contagion around oil and cement factories.

Air quality is an appraiser of the appropriateness of air for breathing by animals, populace, and plants in terms of potential fitness impacts. Good outdoor air

quality is fundamental to human wellbeing (Jacquet et al. 2021; Haggerty et al. 2018). Averagely, a person gasps about fourteen thousands litres of air every day, and the presence of contagions in this air can harmfully affect public healthiness. Poor air quality has been ascertained in having somber effects on human fitness and wellbeing as well as the environment. Air pollution is implicated as the major cause of many environmental problems to include ozone layer destruction, acerbic rain, mercury contagion and global warming. Hygienic air is indispensable for sustaining the insubstantial balance of existence on the globe — not only human populace, but flora and fauna, water, foliage, shrubbery, and soil (Walsh et al. 2020; Luke et al. 2018). Air contamination isn't just an al fresco matter, but its enclosed spaces, for instances workplaces, habitat or schools can also be contaminated via contagions that have emitted through the outdoor and indoor sources. Furthermore, some categories of air contagion may be worse for indoors than outdoors, for instances chemicals discharged from synthetic textiles, cigarette, and fittings and home-use products (Berman et al. 2000; Biern et al. 2015). Contamination of the environment by particulates, effluents, metals and other pollutants is of major concern due to their toxicity and risk to environment and human life. Particulate and emissions toxicity seems to be dependent on exposure route, duration, dose and exposure frequency. For instance, when oil is explored in water sparse zones the water resources become strained. Off-shore oil exploration creates threats for the oceanic life whereas oil circulation and haulage will creates extreme hazard for the ecosystem in case of seep out or accidents (Abramson et al. 2010; Anderson et al. 2011). When oil spills-out transpires or when there is waste matter expulsion, it percolate into the soil and blend with underground water system. It has been ascertained that contaminated underground water takes scores

of years before it can be cure (Bongers et al. 2008; Brewton et al. 2013). Nonetheless this underground water move into brook, stream, rivulet and boreholes or wells which are the key sources of local water supply in the neighborhood which consequences are upsurge of water-borne sicknesses. This has disturbed the traditional rapport of the inhabitant within the oil-bearing enclaves. There is a discernible trepidation that instead of being the life-giver, these water scenarios have become sources of death, misery, and sicknesses (Buttke et al. 2012; Caress and Steinemann 2004; Carrasco et al. 2007; Cheng et al. 2011).

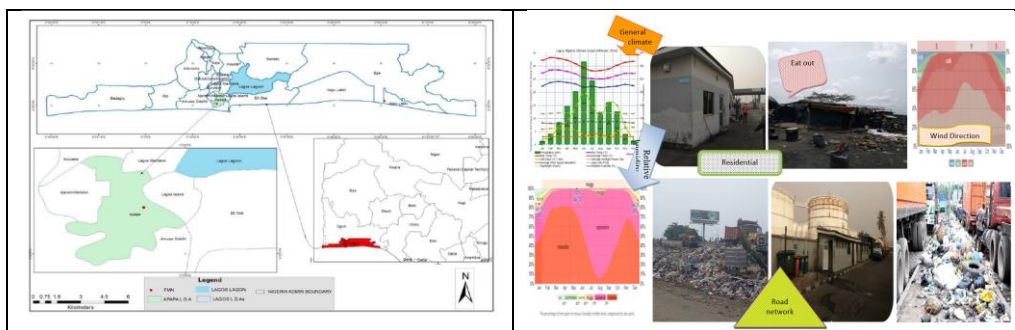

## **2. Materials and Techniques**

### **2.1. Region of Study**

Apapa, one of Local Government Area, Lagos State, which falls within the tropical savannah climate based on the Köppen climate categorization, as there's a momentous precipitation discrepancy between the humid and the arid season. The average temperature in January is 27°C (Figure 1 (a&b)). Temperatures in Lagos rarely get colder than 20°C, and rarely get hotter than 30°C. Temperature values are high throughout the year over the project environment. The temperature within the study location was between 32°C and 35°C. Because the project area has a tropical savannah climate, there are 2 different rainy seasons. The heavy rain season is between April and July, and the milder rain season occurs from October to November. A very brief dry season occurs in August and September usually called "August Break" and a long dry spell occurs from December to March. The rainfall between May and July averages over 300mm, while the average rainfall in August and September is only 75mm. In January, the average rainfall is only about 35mm. Relative humidity is normally in surplus of 80%, in particular the peak of the

wet period as shown in Figure 3. The standard yearly relative humidity is 84.7% and mean monthly relative humidity varies from 80.0% in March to 88.1% in June. This is understandable given the geographical location of Lagos and the fact that rain falls almost all the year round. The micro-climatic condition of the study area falls within the historical humidity of 66.2 – 90.9% peculiar to the Lagos area. The climate is influenced via two key trade winds – the warm, humid Southern-west trade winds during the rainy period and the Northern-east trade wind during the arid and grimy harmattan. The wind speed directions are synchronous to the

periodic attitude of the Inter-Tropical Convergence Region. During the wet season, the Southwest winds prevail, and during the dry season, the Northeast winds prevail as they sweep in the arid season. The wet season begins around April and ends around October. August is the coolest and also the windiest with a mean wind speed of 13km/h. Weather tracker a sophisticated multi-function environment monitoring instrument was utilized to measure key environmental condition such as altitude, temperature, wind speed, relative humidity, barometer pressure, density and wind chill. It can also measure wet bulb and heat index.

**Figure 1.** a) Study region, b) Climate and activities around its environ

## 2.2. Techniques

A pilot origin categorization and separation was carried out at the company and its environ in Lagos metropolis of Nigeria from July 2021 to October, 2022 for gathering of data on water attribute as well as composition, generation level and compliance rate of waste management.

### 2.2.1 Air Emission

Air emissions associated with the operations of the study zones are basically gaseous emissions and particulate matter. The sources of particulate emissions include the general

depot operations, loading and offloading activities and truck movement while sources of gaseous emissions within zones includes working losses, fugitive losses and generator operations, as well as operations of trucks. Therefore, Suspended Particulate Matter (SPM), Volatile Organic Compounds (VOCs), Carbon monoxide (CO), Sulphur dioxide (SO<sub>2</sub>), Hydrogen Sulphide (H<sub>2</sub>S), Oxides of Nitrogen (NO<sub>x</sub>), in the ambient environment were measured during the study. The in-situ ambient air quality measurements were carried out in line with regulatory requirement to ascertain outdoor air condition of the facility's environment.

### 2.2.2 Particulate, Gaseous Emission & Environmental Condition Level Measurement

Airborne particulates were collected from several sampling locations using a Bosean Airborne Particulate Counter. The dust monitor was zeroed and set at the run mode 15s. This is to directly measure the exact concentration of the air borne particulates in 1liter on air. The concentrations of the air borne particulates were then read off the

screen of the monitor. Sampling and Measurement for Temperature, Humidity was carried out using same Bosean Equipment (Figure 2). Noise Level was carried out using the Bosean Noise Level Monitor capable of measuring wind speed & wind flow, equipped with back-lit LCD dual display and a variety of choice of readings in km/hour, knots, or meters/second. These instruments like any other digital instrument is powered by a battery cell and is hand held.

**Figure 2.** Bosean; a) Airborne Particulate; b) Noise Level Monitor Counter; c) Multigas Monitor

### 3. Results and Discussion

#### 3.1. Air quality Outcome

##### 3.1.1 Sulphur(iv)oxide, Nitrogen Oxide and Carbon monoxide (CO)

Inhalation air with extreme concentration of NO<sub>2</sub> may infuriate airways in the human respiratory system, and within shorter time exacerbate respiratory sicknesses, for

instance asthma, with signs like difficulty breathing, coughing, or wheezing (Walsh et al. 2020; Gene et al. 2022). While, longer exposures to huge quantities of NO<sub>2</sub> might increase vulnerability to respiratory infections. The result of sampling at Apapa for the presence and concentration of Nitrogen -iv- oxide (NO<sub>2</sub>) were less than 0.01ppm thus within the NAAQS (FEPA 1991) stipulated limit of 0.113ppm, while all CO and 30% of CO<sub>2</sub> measured was above specified limits.

**Table 2.** Scrutiny Techniques and Some Health impact of Contagions

Parameters	Instrument	Techniques	Above Permissible Limit Health Impact
Sulphur IV oxide (SO <sub>2</sub> )	SO <sub>2</sub> Gas Alert test meter	Direct reading	Causes irritation of the respiratory tract
Particulate matter (PM)	Gas Alert test meter	Gravimetric	Causes catarrh, cough, lung infections and other respiratory diseases
Combustible gas (CHN)	Gas Alert test meter	Direct reading	Induces a despondent and depressed state
Carbon monoxide (CO)	CO test meter	Direct reading	Lessens the oxygen-carrying blood capability to damage of the central nervous system
Oxides of Nitrogen (NO <sub>x</sub> )	NO <sub>x</sub> test meter	Direct reading	Causes inflammation of the lungs but less toxic.
Noise	Noise Meter, Rion sound level meter NA model	Direct Reading	

**Table 3.** Outcome of Ambient Air Quality at Apapa Lagos

Sites	Parameters and Units

Not Within Limits (%)	0		100	0	0	30	0	0	-	-	-	-

The most important oxides of Sulphur are Sulphur (iv) oxide (SO<sub>2</sub>) and Sulphur trioxide (SO<sub>3</sub>), when SO<sub>2</sub> soften inside water vapour in the atmosphere/sky to create acids as well as interrelate with other gas plus particles to also generate particles identified as sulphates, which in turn have unsympathetic impacts on human healthiness and the ecosystem. The impacts of Sulphur (iv) oxide (SO<sub>2</sub>) are feel very swiftly, and most populace would felt the most awful signs within 10 - 15minutes, once breathing it in. Those people with asthma or any similar health issue or health condition are at high risk of developing problems after exposed to Sulphur (iv) oxide. Measurement for the presence of SO<sub>2</sub> at all sampled locations were less than 0.01ppm which is less than the NAAQS (FEPA 1991) statutory limits of 0.3ppm. The presence and amount of Carbon monoxide (CO) and CO<sub>2</sub> in the environment might be allied from sources such as; reprehensively vented appliances with hydrocarbon fuel sources. Outdoor vehicular hydrocarbon emissions, Boilers, heating systems, or other industrial sources (Anderson et al. 2011; Fernando et al. 2021). CO might thus louden or accumulate within buildings where there is derisory aeration. Measurement for the presence of CO at all sampled locations were less than 0.1ppm which is greater than the NAAQS (FEPA 1991) statutory limits of 0.03ppm.

### *3.1.2 Hydrogen Sulphide and Suspended Particulate Matter (SPM)*

Hydrogen Sulphide is a colorless, monochrome, combustible, tremendously hazardous gas with a “putrid egg” scent. It can be created by the cessation of animal/ or human being waste, for instance sewage as well as organic matter. When exposed at small quantities it triggers eyes irritant, upper respiratory system and its effects can be delayed. At moderate concentration it causes more irritation of the eyes and respiratory effects, headache, dizziness, coughing and vomiting while at higher concentration it

causes shock, convulsion, coma and potentially death. People with asthma may be at greater risk as a result of difficulty in breathing. Detection of Hydrogen Sulphide at all sampling point was less than 0.1ppm. Particulates are tiny solid or liquid particles suspended in air. Particulates such as dust, smoke, diesel soot and products resulting from burning can be emitted directly into the air. It might also be created via photochemical reactions, like polluting gases (Nitrogen plus Sulphur oxides). Particulates may have a short as well as long-term effect on human healthiness and the environment (Gene et al. 2022; Jacquet et al. 2021). These effects range from eye and throat irritation to chronic respiratory diseases to cancer. Fine particulates which are microscopic and less than 10 microns (PM<sub>10</sub>) are of greatest concern because of their ability to by-pass the body’s natural filtering system, and thus pose a threat to the respiratory system. The concentration of particulate matter (PM<sub>10</sub>) at all the sampled locations ranged from 5µg/m<sup>3</sup> at the Reception and Pump House to 12µg/m<sup>3</sup> at the Water Booster Pump which is within the NAAQS (FEPA 1991) permissible limit of 250µg/m<sup>3</sup>. Particulate matter (dust) is generated from general cleaning operations and movement of tanker trucks. Although the particulate levels measured show they are within permissible limits, however, depending on the duration of exposure, particulate emissions can impact negatively on workers’ health and exacerbate existing health condition e.g. asthma.

### **3.2. Noise Scrutiny Outcome**

Noise is mostly sound that is anti-information intensity of which usually fluctuates erratically with time. Noise is the term frequently used to describe unwanted sound, which impedes with the sensitivity of wanted sound and is probable to be physiologically damaging. Environmental noise is the accretion of all noise available in a precise environment. Exposure to noise is

correlated with numerous pessimistic health outcomes, based on the level of exposure and extent (Haggerty et al. 2018; Evensen 2018). Noise might prop up cardiovascular sicknesses, hearing loss, sleep turbulence, high blood pressure, as well as birth defects. The ambient noise levels within the facility were measured in some selected locations with the use of a Mastech Multi-Environmental Survey Meter as showing in Tables 4&5 and Figure 3. The highest noise value recorded was 89.9dBA at the site 2 (Generator House one) while the lowest was

57.2dBA at Pump House. The noise level at 4 sites sampled locations was found to be above the WHO 2007 and FME<sub>nv</sub> regulatory limit. High noise level could be injurious to employees' hearing ability if exposed for prolonged periods without adequate hearing protection. Exposure to high noise levels is implicated in increased stress levels and high blood pressure, insomnia, partial hearing loss etc. Noise levels were measured at a range no more than 3m from source (Deziel et al. 2020; Cheong et al. 2011).

**Table 4.** Guideline Limits

<u>WHO Limits 2007</u>		
Receptor/ Noise Level (dBA)	Daylight (7.00am-22.00pm)	Nocturnal (22.00pm-7.00am)
Built-up, Institutional & Education	55	45
Business, shopping, marketable, indoors, Outdoors and traffic region	70	70
<u>Berglund et al. 1999</u>		
Environ	Health Effect	Noise Level (dBA)
Indoors bedrooms	Speech intelligibility & moderate annoyance (daytime)	35
	Sleep fracas (Nocturnal)	30
Outside bedrooms	Sleep fracas window open	45
Outdoor, Living room	Serious annoyance (Night time)	55
	Moderate annoyance (day/ evening time)	50

Figure 3. Outcome of noise level scrutiny

### 3.3. Outcome of Effluent and hazardous materials

The analysis of effluent sample from the Oil Water Separator (OWS) showed that parameters such as Oil and Grease (0.04mg/l), Total Dissolved Solids (78.0mg/L) and Total Suspended Solids (0.11mg/L) were found to be within their stipulated regulated limits. However, parameters such as COD (48.2, 47.9 & 48.1 mg/l), BOD5 (11.4, 11.2 & 11.1mg/l), Ammonia (0.24, 0.23 & 0.23 mg/l), Turbidity (22.1, 22.3 & 22.4 mg/l) and Manganese (0.52, 0.51 & 0.53mg/L) were above their prescribed limits as stated in Guidelines for Noise, Industrial Effluent, and Gaseous Emissions Limitations (FEPA 1991). The pH of 6.8 indicates that the sample is slightly acidic and also within the stipulated regulatory limit of 6.5-8.5 (Tables 6 and 7a&b). Microbial analysis was also carried out on the raw water sample and the result for Salmonella was negative. Wastewater (effluent) from the region encompasses depot operations which arises from mixture of minor spills and water as well as wastewater from the laboratory, kitchen, equipment maintenance etc. can impact negatively on the environment if discharged directly to public

drains without treatment. The contagions in such wastewater might encompass soluble macrobiotic chemicals creating exhaustion of heavy metals, DO, suspended solids plus volatile materials, hydrocarbons, bases or acids (displayed as small or high pH). Though some depot's installed OWS works to skim out the oil from the water and ensure it is tested and treated before discharge. Hazardous materials within the study zone involve the storage of bulk quantities of petroleum products and in smaller quantities, chemicals such as foam, caustic, solvents, lubricants etc. Hazardous materials carrying, storage, and managing causes spills or other kinds of releases with potentially pessimistic effects on water, atmosphere, and soil resources. Besides, their combustibility and other impending hazardous physiognomies likewise present a threat of fire and blasts. Used/spent oil at some depots within the study zone is derived basically from maintenance operations of equipment and generators. The improper collection and disposal of used/spent oil will adversely impact the environment. Spilled oils on the floor can also cause slips and falls resulting in injuries if not properly cleaned and floors kept dry at all times.

### 3.4. Outcome of water attribute analysis

The outcomes of physico-chemical variables gotten from groundwater within project region (Tables 8 - 10 and Figures 4 - 6) indicated that the Conductivity (1094.0, 1695.0 & 1695.1 mg/l), Calcium (109.1, 108.9 & 109.2 mg/l), Ammonia (0.48, 0.47 & 0.49mg/l), DO (2.07, 2.06 & 2.07mg/l) and Total dissolved solid (847.2, 847.4 & 847.3 mg/l) values were high, indicating freshwater aquifer. The turbidity values (1.00 – 1.13 NTU) reveals that all the sampled

borehole was well within the standard for hygienic water criterion of 5 NTU. The pH values displayed neutral measured was because of the bicarbonate quantity with values within 30.0 – 500.0 mg/lCaCO<sub>3</sub> WHO limit. The carbonate alkalinity perceived in the sampling was very low. TD values of the groundwater samplings vary between 51.8 mg/L CaCO<sub>3</sub> as well as 48.6 mg/L CaCO<sub>3</sub>. Discrepancy between the TD values for the boreholes was awfully low, signifying recharge from the equivalent origin. Hardness in water encompasses calcium plus magnesium as the key constituents. For

instance, magnesium ions quantified in the groundwater varied from 39.7 – 39.8 mg/L respectively, Small phosphate, chloride, and sulphate amounts were seen in groundwater samplings compared to the WHO limits. Likewise, small anions quantities substantiate the airiness of groundwater from the research site. Sulphide and Nitrate ion was not perceived in the groundwater sampling. Oil and grease (O&G) were not detected within the facility area, two of the sample points were below instrument detection limit. Total hydrocarbon was not detected in the ground water samplings of the project influence zone. The origin can, however, be ascribed to biogenic instead of anthropogenic involvement since petroleum hydrocarbon correlated deeds was not seen in the region as at the period of this research. Heavy metals ascertained in the samplings displayed varied quantities with Cd having values of 0.02 mg/l in one of the points and not detected in the two other BH water sample. The concentration span of other metals are in the order of Cu < Pb < Zn < Ni < Mn < Fe. Zinc as well as copper displays concentrations beneath their maximum tolerable limits in hygienic water, whereas Pb, Cr, Ni, Fe, Cd, Hg plus Mn were available at extreme concentrations than intervention and target WHO criterion level. The happening and concentrations of these metals in the samplings imitate the general physiognomies of groundwater systems in nearly all parts of Nigeria. The microbial characteristic of groundwater samplings from the research region is presented that the total coliform, faecal coliform feecal streptococci and enterococci determined ranged from 1.9x10<sup>2</sup> to 2.0x10<sup>2</sup> cfu/100ml, 0.5x10<sup>2</sup> to 1.2x10<sup>2</sup> cfu/100ml, 0.29x10<sup>2</sup> to 0.82x10<sup>2</sup> and 0.43x10<sup>2</sup> to 0.57x10<sup>2</sup>cfu/100ml respectively, while no detection was recorded at GW2. Fungi are, however, not recorded in the

**Table 8. Outcome of Water Attribute**

sample, showing no growth. faecal coliform was not detected. For PAHs, It is branded that PAHs are comparatively intractable in soils, and some PAHs have been recognized as teratogens, carcinogens, or mutagens (Biern et al. 2015; Fernando et al. 2021). Further scrutiny through algorithm cluster produce 2 step with 28 input, for cluster quality between 0.5 – 1.0 was classified as good and 0 – 0.5 as fair water. Cluster A is greatly loaded with parameters like DO, Conductivity, Salinity and Ammonia, while Cluster B parameters are Turbidity, TDS and TSS. Cluster quality displays that Conductivity initial and final scrutiny was the highest (156mg/l), followed by TSM with value of 125.1mg/l at initial and slightly reduce to 124.85 at final scrutiny.

**Table 7b. Outcome of Effluent (Microbiological & others) from Oil water separator**

**Figure 6.** Cluster investigation outcome of some parameters scrutinized

The expulsion of produced water creates serious environmental threats to human and the ecosystems. Besides usage of technologies like high proficient halophile oil-degrading microbes in genetic treatment must be coalesce with membranes (SBR) genetic treatment systems for efficient management of generated water, since the Lagos (South-west Nigeria) crude oil is tart in nature and have heavy metals, The pipelines are creating serious problems via leaking, then causing substantial oil spills along the haulage line to the sea terminal at haven Nigeria necessitate appropriate monitoring plus maintenance. At the moment, most oil manufacturers re-inject created water or reclaim it for onshore wells at 98.0%. Conversely, 91.0% of created water from offshore wells is expulse into the deep-sea.

Table 11 and Figure 7 displays that the common health problems identified among the adult population were Malaria (23%), Upper Respiratory Infections (Cough, Catarrh, sore throats etc.) (27%), Typhoid (21%), Dysentery/diarrhea (22%), and Sores/injuries (7%). While among the children the most common health problems are malaria (27%), Dysentery/Diarrhoea (25%), worm infestation (6%) and Typhoid (23%), while Upper Respiratory Infections (cough, catarrh, sore throats etc. accounted for 19% Most of the diseases recorded are those that have been endemic in the communities since the inception of the communities apart from upper respiratory tract infection which is associated to mining activities, cement production and heavy vehicular movement in the area.

### 3.5. Health and Well-being in the Apapa Communities

**Figure 7.** Common Health Problems among the; a) Adult, b) Children Population

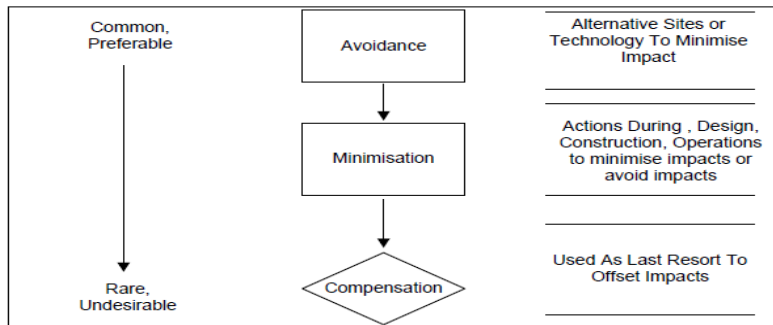

#### **4. Air, Effluent, Wastewater & Domestic Water Quality Management**

Secretion and air attribute monitoring programs afford information that might be utilized for assessing the efficacy of emissions management stratagems. The systematic planning of air attribute monitoring is vital to ensuring that the data gathered are ample for their wished-for rationales. The effluent and water attribute monitoring program that have tolerable resources and management overseeing must be created. Also elements such as: monitoring parameters (that indicate contagions apprehension, should encompass variables that are synchronized under the Standards for Noise , Industrial Effluent, and Gaseous Emissions Limitations and Environmental Guidelines for the Petroleum Industry in Nigeria acquiescence requirements), monitoring kind and rate of recurrence (monthly/quarterly effluent monitoring that will take into consideration the discharge physiognomies from the operation of the depots and any other area with more potential for spills), monitoring locations (effluent sampling positions should be located at the final discharge point from the Oil Water Separator, also process expulsion must not be diluted preceding or after treatment), data quality (application of nationally approved techniques for sampling gathering, preservation and analysis. Besides, sample must be carried out under or by trained individuals and test to be performed by accredited laboratories or by the entities allowed or expert for this rationale). Although opportunities for water savings in industrial processes are highly industry-specific, there are opportunities for water-use monitoring in the Apapa Lagos State. Thus the

indispensable elements of water management program should encompass: upgrade of treatment process to meet needs for domestic purposes e.g., handwashing etc.; classification, recurring measurement, and demo of principal flow within the region. This can be achieved through the installation of flow meters. Also constant similarity of water flows with functioning targets to ascertain where action must be taken to lessen water usage and water metering should accentuate zones with peak water usage (Luke et al. 2018; Deziel et al. 2020).

#### **5. Outcome of Mitigation**

Generally, where a structure is already on ground, the chances for impact averting are constricted and the main issue is how to curtail and reimburse for inevitable impacts. Conversely, these dissimilarities are not inflexible and chances for artistic mitigation must be hunted for at all phases of assessment and task management. The rudiments of mitigation are structured into a hierarchy of deeds (Figure 8) based on the principle of Avoidance, Minimize/Reduce, Remedy and/or compensate namely: Circumvent unhelpful impacts as far as possible via usage of precautionary actions; curtail undesirable impacts to 'as low as convincingly practicable' (ALARP) states. Likewise, main ethics for the usage of mitigation must be unswerving and to include: preference to avoidance together with preventive measures; choose realistic substitutes for the proposal as well as ascertain the preeminent practicable ecosystem preference; spot out modified measures to lessen each of the key impacts envisaged; apt environmentally reverberation and cheap; and use reimbursement or curative measures as a final remedy (Biern et al. 2015; Buttke et al. 2012).

**Figure 8.** Outcome of mitigation fundamental for Apapa

**Table 11.** Probability trends and impact consequences on Apapa populace.

CONSEQUENCE					INCREASING PROBABILITY				
					A	B	C	D	E
Severity	People	Asset Damage	Environmental Effect	Reputation	Never heard of in the industry	Has occurred in the industry	Incident has occurred in	Happens several times/year	Happens several times/year

3	Major Injury	Localised	Localised	Considerable			Medium Risk		
4	Single Fatality	Major	Major	National					
5	Multiple Fatalities	Extensive	Massive	International					High Risk

## 6. Conclusion

In the last decades, spill out from aging, ailing maintained or incapacitated pipelines have upsurge, and no clear inclination with respect to nosh-up, that is number of happenings or total of spilled-out oil. This scrutiny displays the secretion of effluents, particulates contagions and anions from Apapa, Lagos Nigeria. The outcomes flaunt that the presence and concentration of Nitrogen -iv-oxide (NO<sub>2</sub>) were less than 0.01ppm thus within stipulated limit of 0.113ppm, whereas 100% CO and 30% of CO<sub>2</sub> measured was

above regulatory limits. Similarly, the highest noise value recorded was 89.9dBA at the site Generator House one while the lowest was 57.2dBA at Pump House. The noise level at 4 sites sampled locations was found to be above the WHO 2007 and FMEnv regulatory limit. The concentration span of other metals arrangement are in the order of Cu < Pb < Zn < Ni < Mn < Fe. Zinc as well as copper displays concentrations beneath their maximum tolerable limits in hygienic water, whereas Pb, Cr, Ni, Fe, Cd, Hg plus Mn were available at extreme concentrations than intervention and target WHO criterion level.

Furthermore, the inhabitants of the shoreline regions disturbed by the spill-out are also indirectly or diametrically exposed to the oil chemicals are facing economic together with social consequences of the spill-out. For this reason, epidemiologic research that centered on threat appraisal must consider all the

variables ascribed to exposure of oil spills-out, no matter what the source, as these are indispensable for thorough appraiser of the possible impacts on human healthiness at various levels and also launch proper precautionary programs

## **THE INFLUENCE OF LEADERSHIP STYLE, WORK MOTIVATION AND WORK DISCIPLINE ON THE PERFORMANCE OF EAST RUMBAI SUB-DISTRICT OFFICE EMPLOYEES**

***Abstract:** This study aims to see the effect of leadership style, work motivation, and work discipline on the performance of the employees of the East Rumbai District office and the Pekanbaru East Rumbai District office. The population in this study were all employees of the Rumbai District and East Rumbai Pekanbaru, which amounted to 51 employees, did not use a sampling technique because in this study only a population of 51 employees was used. The data analysis used in this research is descriptive and quantitative analysis. The analysis method used is multiple linear regression equation. The results show that leadership style, work motivation, and work discipline have a positive and significant effect, this can be seen from the coefficient of determination ( $R^2$ ) of 0.652 indicating that 65.2% of employee performance at the Rumbai sub-district office and the Rumbai Timur sub-district office can be explained or caused by leadership style, work motivation and work discipline. In other words, leadership style, work motivation and work discipline have an effect of 65.2% on employee performance. While the remaining 34.8% is the influence of other factors outside of leadership style, work motivation and work discipline.*

***Keywords:** Leadership Style, Work Motivation, Work Discipline, Employee Performance*

### **1. Introduction**

The success of an organization to achieve goals cannot be separated from the factor (HR) of its human resources. Human resources are very strategic in organizations, meaning that humans play an important role in carrying out activities to achieve goals. For this reason, the existence of human resources in the organization is very strong. Humans

always play an active role in every organizational activity because humans become planners, actors, and determinants of the realization of organizational goals. This goal will not be realized without the active role of employees even though the tools of an organization are so modern.

Work motivation is a person's desire that causes the person to act. People act for one reason which is to achieve goals. So, work

motivation is a goal governed by goals. Work discipline is a process of rules that have been made in carrying out work, where work

discipline will make the measure of each individual in developing himself and the agency.

**Table 1.** District Office Employee Attendance Report

No	Tahun	Jumlah Pegawai	Jumlah Hari Kerja (dalam 1 tahun/orang)	Jumlah Hari Kerja Pegawai Pertahun	Jumlah Absen			Persentase (%)
					Alpa	Izin	Sakit	
1	2017	21	288	6048	3	7	10	0,050
2	2018	23	288	6624	5	5	7	0,075
3	2019	23	288	6624	6	8	13	0,090
4	2020	25	288	7200	5	11	9	0,069
5	2021	25	288	7200	9	8	13	0,125

That way the work environment is also a measure of success in an agency. the process of rules that have been made in carrying out work, where work discipline will make the measure of each individual in developing himself and the agency. That way the work environment is also a measure of success in an agency.

Based on observations in the field or preliminary pre-research interviews, from the data above, it can be seen that the number of sub-district employees at the end of 2017 was 23 people with the number of work results in 1 year 288 days with an attendance rate of 26 times, namely: 5 alpa people, 9 permit people, and 12 sick people with percentage results amounting to 0.075%. In 2018 the number of employees was 23 people with the number of working days in 1 year 288 with an

attendance rate of 26 times, namely: 5 alpa people, 11 permit people, 10 sick people with a percentage result of 0.075%. In 2019 the number of employees was 23 people with the number of working days in 1 year 288 with an attendance rate of 30 times, namely 8 alpa people, 10 permit people, 12 sick people with a percentage result of 0.120%.

In 2020 the number of employees was 25 people with the number of working days in 1 year 288 with an attendance rate of 28 times, namely: 7 alpa people, 8 permit people, 13 sick people with a percentage result of 0.097%. And in 2021 the number of employees is 26 people with the number of working days in 1 year 288 with an attendance rate of 31 times, namely: 6 alpa people, 11 permit people, 14 sick people with a percentage result of 0.080%.

**Table 2.** Report on the Attendance Rate of Employees of the East Rumbai District Office of Pekanbaru for 2017-2021

No	Tahun	Jumlah Pegawai	Jumlah Hari Kerja (dalam 1 tahun/orang)	Jumlah Hari Kerja Pegawai Pertahun	Jumlah Absen			Persentase (%)
					Alpa	Izin	Sakit	
1	2017	23	288	6624	5	9	12	0,075
2	2018	23	288	6624	5	11	10	0,075
3	2019	23	288	6624	8	10	12	0,120
4	2020	25	288	7200	7	8	13	0,097
5	2021	26	288	7488	6	11	14	0,080

Based on observations in the field or preliminary pre-research interviews, from the data above, it can be seen that the number of sub-district employees at the end of 2017 was 21 people with the number of work results in 1 year 288 days with an attendance rate of 20 times, namely: 3 alpa people, 7 permit people, and 10 sick people with percentage results amounting to 0.050%. In 2018 the number of employees was 23 people with the number of working days in 1 year 288 with an attendance rate of 17 times, namely: 5 alpa people, 5 permit people, 7 sick people with a percentage result of 0.075%. In 2019 the number of employees was 23 people with the number of working days in 1 year 288 with an attendance rate of 27 times, namely 6 alpa people, 8 permit people, 13 sick people with a percentage result of 0.090%. In 2020 the number of employees was 25 people with the number of working days in 1 year 288 with an attendance rate of 25 times, namely: 5 alpa people, 11 permit people, 9 sick people with a percentage result of 0.069%. And in 2021 the number of employees is 25 people with the number of working days in 1 year 288 with an attendance rate of 30 times, namely:

9 alpa people, 8 permit people, 13 sick people with a percentage result of 0.125%.

Based on observations in the field or preliminary pre-research interviews, in the table above, it can be seen that the performance assessment of employees of the RumbaiPekanbaru Sub-district office from 2017 to 2021 is in the good category with the following description, in 2017 the number of employees was 23 people with the number of performance assessments of sub-district employees 1784.8% and the average employee performance amounted to 77.6% with good categories. In 2018 the number of employees was 23 people with the number of performance assessments of sub-district employees 1767.09% and the average employee performance was 76.83% with good categories. In 2019, the number of employees was 23 people with the number of performance assessments of sub-district employees increased by 1801.59% and the average employee performance amounted to 78.33% with good categories. In 2020 the number of employees was 25 people with the

number of performance assessments of sub-district employees decreased by 1915% and the average employee performance amounted to 76.6% with good categories, and in 2021 the number of employees was 26 people with

the number of employee performance assessments increasing again, namely 2036.58% and the average employee performance amounted to 78.33% with good categories.

**Table 3.** Average Performance Assessment of Employees of the RumbaiPekanbaruSubdistrict Office

<b>No</b>	<b><u>Tahun</u></b>	<b><u>Jumlah pegawai</u></b>	<b><u>Jumlah penilaian kinerja pegawai</u></b>	<b><u>Rata-rata kinerja pegawai</u></b>	<b><u>Keterangan</u></b>
1	2017	23	1784,8	77,6	<u>Baik</u>
2	2018	23	1767,09	76,83	<u>Baik</u>
3	2019	23	1801,59	78,33	<u>Baik</u>
4	2020	25	1915	76,6	<u>Baik</u>
5	2021	26	2036,58	78,33	<u>Baik</u>

**Table 4.** Average Performance Assessment of Employees of the East Rumbai District Office in Pekanbaru

<b>No</b>	<b><u>Tahun</u></b>	<b><u>Jumlah pegawai</u></b>	<b><u>Jumlah penilaian kinerja pegawai</u></b>	<b><u>Rata-rata kinerja pegawai</u></b>	<b><u>Keterangan</u></b>
1	2017	21	1638	78	<u>Baik</u>
2	2018	23	1786,18	77,66	<u>Baik</u>
3	2019	23	1778,59	77,33	<u>Baik</u>
4	2020	25	1937,5	77,5	<u>Baik</u>
5	2021	25	1975	79	<u>Baik</u>

Based on observations in the field or preliminary pre-research interviews, in the table above, it can be seen that the performance of employees of the East RumbaiPekanbaru Sub-district office from 2017 to 2021 is in the good category with the

following description, in 2017 the number of employees was 21 people with the number of performance assessments of sub-district employees of 1638% and the average performance of sub-district employees of 78% with good categories. In 2018 the

number of employees was 23 people with the number of employee performance assessments of 1786.18% and the average performance of sub-district employees decreased to 77.66% with good categories, in 2019 the number of employees was 23 people with the number of employee performance assessments decreased again, namely 1778.59% and the average performance of sub-district employees was 77.33% with good categories. In 2020 the number of employees of 25 people with the number of employee performance assessments decreased again by 1937.5% and the average employee performance of 77.5% with good categories and in 2021 the number of employees of 25 people with the number of employee performance assessments increased significantly, namely by 1975% and the average performance of sub-district employees by 79% with good categories.

## 2. Library Review and Hypothesis Development

### 2.1. Understanding Leadership Style

Schermerhorn in Nurmansyah (2020: 163) leadership is the process of inspiring others to work hard to accomplish important tasks.

### 2.2. Leadership Style Indicators

- 1) Characteristic
- 2) Habit
- 3) Temperament
- 4) Character
- 5) Personality

### 2.3. Understanding Work Motivation

Motive or motivation comes from the Latin word "movere" which means the impulse from within the human being to act/ behave. The definition of motivation is inseparable from the word need "needs" or "want". Need is a potential in man that needs to be

responded to (Notoatmodjo;2013;114).

### 2.4. Work Motivation Indicators

Mangkunegara (2016:95) Indicators of work motivation are:

- 1) Physiological needs
- 2) The need for a sense of security
- 3) The need to feel belonging
- 4) The need for awards
- 5) The need to self-actualize

### 2.5. Definition of Work Discipline

Sherlie and Hikmah (2020:757) Work discipline is a constructive method of development for employees who have an interest that results in discipline being shown to the actions of non-persons. Broadly speaking, work discipline is an attitude, behavior, and actions according to the rules that have been applied from the company in writing / unwritten and if an employee has violated the regulations that have been applied, sanctions will be imposed.

### 2.6. Indicators of Work Discipline

Mangkunegara (2015:93) indicators of labor discipline as follows:

- 1) Punctuality comes to work
- 2) The accuracy of the hours of returning home
- 3) Compliance with applicable regulations
- 4) Responsibility in doing tasks
- 5) Punctuality in carrying out tasks

### 2.7. Definition of Employee Performance

Mangkunegara (2015: 67) performance is the result of work in quality and quantity achieved by employees in carrying out their duties in accordance with the responsibilities given. In an organization, performance has a great influence on the achievement of the goals of the organization.

**2.8. Employee Performance Indicators**

Government Regulation No. 46 of 2011 in Nurmansyah (2021: 114) Employee performance indicators based on the assessment of the State Civil Apparatus (ASN) on the SKP (Employee Work Targets) are as follows:

- 1) Employee Work Goals (SKP)
- 2) Work Behavior
- 3) Leadership

**3. Research Methods**

**3.1. Types of Research**

This research uses quantitative research methods with a descriptive approach.

**3.2. Object of Study**

This research was conducted at the Rumbai and East Rumbai Subdistrict Offices in Pekanbaru. The object of this study was employees of the Rumbai and East Rumbai Subdistrict Offices.

**3.3. Research Population and Sample**

The population in the study was 51 employees of the Rumbai District Office in 2021. Meanwhile, the sample in this study was 51 employees.

**3.4. Research Population and Sample**

In this study, researchers chose a saturated sampling technique. Where are the techniques and samples that the researcher uses as a whole, regardless of the sample on any basis.

**3.5. Sampling Techniques**

In this study, researchers chose a saturated sampling technique. Where are the techniques and samples that the researcher uses as a whole, regardless of the sample on any basis.

**3.6. Data Collection Techniques**

To obtain the data in this study, the following data collection techniques were used:

- 1) Interview
- 2) Documentation
- 3) Questionnaire

**3.7. Data Analysis Techniques**

The data analysis that the authors used in this study used quantitative analysis. Data analysis techniques in quantitative research use statistics. Inferential statistics, (often also called inductive statistics or probability statistics) is a statistical technique used to analyze sample data and the results are applied to the population.

**4. Results of Research and Discussion**

**4.1. Characteristics of Respondents**

	Watak	0,917	0,276	Valid
	Kepribadian	0,859	0,276	Valid
Motivasi Kerja (X2)	Kebutuhan Fisiologi	0,886	0,276	Valid
	Kebutuhan Rasa Aman	0,932	0,276	Valid
	Kebutuhan Sosial	0,920	0,276	Valid
	Kebutuhan Penghargaan	0,920	0,276	Valid
	Kebutuhan Aktualisasi Diri	0,875	0,276	Valid
Disiplin Kerja (X3)	Ketepatan Waktu Kerja	0,879	0,276	Valid
	Ketepatan Jam Pulang	0,884	0,276	Valid
	Kepatuhan Pada Peraturan	0,926	0,276	Valid
	Tanggung Jawab Atas Tugas	0,946	0,276	Valid
	Tepat Waktu Atas Tugas	0,892	0,276	Valid

Based on the diats table, it can be seen that the variables of employee performance, leadership style, work motivation, and work discipline have been declared valid. And from the table above the four variables in this study obtained the test results of the r value of calculating all statements > r table (0.276). This means that the measuring instrument used is valid and feasible to be used as research data.

#### 4.3. Reability Test

**Table 10.** Instrument Reliability Test Results

No	Variabel	Cronbach Alpha	Standar Reliabilitas	Keterangan
1	Gaya Kepemimpinan	0,938	0,60	Reliabel
2	Motivasi Kerja	0,945	0,60	Reliabel
3	Disiplin Kerja	0,945	0,60	Reliabel
4	Kinerja Pegawai	0,959	0,60	Reliabel

Based on the table above, it shows that the research instrument has passed the

requirements that have been required to be said to be reliable. Each of the values of the three variables > 0.60, which means that these three variables have met the reliable requirements. Thus the instruments in this study have been considered reliable.

#### 4.4. Normality Test

**Table 11.** Normality Test Results

Variabel	Shapiro-Wilk		
	Statistic	df	Sig
Gaya Kepemimpinan	0,964	51	0,119
Motivasi Kerja	0,967	51	0,164
Disiplin Kerja	0,960	51	0,087
Kinerja Pegawai	0,960	51	0,087

Based on the test results from Shapiro-Wilk in the table obtained significance values of 0.119, 0.164, 0.087, 0.087 > 0.05. Mardiatmoko (2020) explained that if a variable obtains a significance value of > 0.05, then the variable can be interpreted as

having passed the normality test. Thus, it can be interpreted that the variables above the regression model have met the assumption of normality.

#### 4.5. Multicollinearity Test

**Table 12.** Multicollinearity Test Results

Model	Collinearity Statistics	
	Tolerance	VIF
1 (Constant)		
Gaya Kepemimpinan	.493	2,027
Motivasi Kerja	.533	1,877
Disiplin Kerja	.600	1,666

Based on the table above, it is known that the variable VIF values are 2.027, 1.877, 1.666 <

10 and tolerance values 0.493, 0.533, 0.600 > 0.1. Ghozali (2016) explained that if a variable VIF value < 10 and a tolerance value > 0.1 then the data does not occur multicollinearity. Thus, the whole variable does not occur multicollinearity.

#### 4.6. Auto Correlation Test

**Table 12.** Autocorrelation Test Results ModelSummary b

Model	R	R Square	Adjusted R Square	Std. Error of The Estimate	Durbin-Watson
1	.807 <sup>a</sup>	.652	.630	3,532	1,863

#### 4.7. Heteroskedasticity Test

**Figure 1.** Heteroskedasticity Test Results

**Table 13.** Glejser method

Model	Coefficients <sup>a</sup>				
	Unstandardized Coefficients		Standardized Coefficients Beta	t	Sig
	B	Std. Error			
1 (Constant)	3.033	2.274		1.334	.189
Gaya Kepemimpinan	.096	.114	.154	.840	.405
Motivasi Kerja	-.133	.094	-.248	-1.409	.165
Disiplin Kerja	.008	.085	.015	.095	.925

Based on the table above, from the Glejser test, the result was obtained that each independent variable is insignificant to the residual absolute (0.405, 0.165, 0.925 > 0.05). Thus, it can be interpreted that there is no heteroskedasticity in the regression model of this study. The point of heteroskedasticity is

that there is a variant inequality of error for all observations of each variable free on the regression model.

#### 4.8. Multiple Regression Test

Based on the table above, the constant value

(a) is -10.784. The value of the regression coefficient of the leadership style variable is 0.868, the work motivation variable is 0.516, while the work discipline variable is 1.016.

**Table 14.** Glejser method

**5. Discussion**

**5.1. The Effect of Leadership Style on Employee Performance**

Based on the test results, it can be seen that the leadership style variable affects employee

performance significantly as seen from the t test where the t-count of 3.536 is greater than the t-table of 2.011 with a significant 0.001 smaller than 0.05 and with a coefficient value of 0.868. As for seeing the magnitude of the influence of leadership style on employee performance, it is to look at the values in the

beta table in the Standardized Coefficient column. The beta value for the leadership style variable is 0.355 or 35.5%.

### 5.2. The Effect of Work Motivation on Employee Performance

Based on the test results, it can be seen that the work motivation variable affects employee performance significantly as seen from the t test where the t-count of 2.941 is greater than the t-table of 2.011 with a significant 0.005 smaller than 0.05 and with a coefficient value of 0.249. As for seeing the magnitude of the influence of work motivation on employee performance, it is to look at the values in the beta table in the Standardized Coefficient column. The beta value for the work motivation variable was 0.249 or 24.9%.

### 5.3. The Effect of Work Discipline on Employee Performance

Based on the test results, it can be seen that the work discipline variable affects employee performance significantly as seen from the t test where the t-count of 4.485 is greater than the t-table of 2.011 with a significant 0.000 smaller than 0.05 and with a coefficient value of 0.460. As for seeing the magnitude of the influence of leadership style on employee performance, it is to look at the values in the beta table in the Standardized Coefficient column. The beta value for the leadership style variable is 0.1016 or 10.16%.

### 5.4. The Influence of Leadership Style, Work Motivation, and Work Discipline on Employee Performance

The results of his research stated that leadership style, work motivation, and work discipline affect employee performance. This can be seen from the results of the t test in table B, the highest value is found in the work discipline variable, which is 0.460 with a

significant value of 0.000, so it can be concluded that the work discipline variable that most affects employee performance.

From the test results, it can be seen that simultaneously independent variables against dependent variables are carried out by comparing the F-table with the F-count. The hypothesis is accepted if  $F\text{-count} > F\text{-table}$  and  $Sig < 0.05$ . The value of F-table at  $\alpha 0.05$  is 3.19. The F-count value is 29.333 with a significant value of 0.000. Then the F-value is calculated  $> F\text{-table}$   $29.333 > 3.19$  with a sig value of  $0.000 < 0.05$ . Thus, based on the results of such t-testing (hypothesis) it is proved that the value of F-count is greater than that of F-table. So it can be concluded that in this study the results of t testing (hypothesis) are acceptable.

## 6. Conclusions and Suggestions

### 6.1. Conclusion

Based on the results of the study, the following conclusions can be drawn:

- 1) The leadership style variable affects employee performance significantly, it can be seen from the recapitulation of respondents' responses about leadership style which shows that the trait indicator has the highest score with a score of 4.67.
- 2) The variable of work motivation affects employee performance significantly, it can be seen from the recapitulation of respondents' responses about work motivation which shows that the indicator of self-actualizing needs has the highest score with a value of 4.38.
- 3) The variable of work discipline significantly affects employee performance, which can be seen from the recapitulation of respondents' responses about work discipline which shows that the

indicator of punctuality to the workplace has the highest score with a score of 4.56.

- 4) The variables of leadership style, work motivation, and work discipline together affect employee performance significantly. With a significant rate of  $0.000 < 0.05$ . This shows that simultaneously, leadership style, work motivation and work discipline affect the performance of employees of the Rumbai District office and the East Rumbai District Pekanbaru office.

## 6.2. Suggestion

Based on the results of research that has been carried out, here are some suggestions that can be given:

- 1) Leaders must be able to manage the emotions they have well in order to

evaluate the work of their employees, assess the level of ability of employees to carry out their work, and reward outstanding employees.

- 2) The leader must pay attention to the basic and non-basic physiological needs of the employee. This is to ensure that the employee's work motivation and employee performance in carrying out their duties are not disturbed.
- 3) Employees must be able to manage their time well so that their time can be used massively,
- 4) Agency leaders should be fair and prudent so that employee performance improves and employees should be able to commit to work.
- 5) For subsequent researchers, it is necessary to add other variables that affect employee performance.

## **INFLUENCE OF ORGANIZATIONAL CULTURE AND COMPENSATION ON JOB SATISFACTION WITH ORGANIZATIONAL COMMITMENT AS INTERVENING VARIABLE AT PT. SOSRO MEDAN**

***Abstract:** Human resources (HR) are factors that play an important role in the activities of a company. In the business world, for example in the corporate business world, human resources, namely employees, are the main business drivers. Employees in a company will give the best for the company where they work. On the other hand, employees are looking for job satisfaction. Therefore, job satisfaction is a research topic that is always interesting to study because of its complex nature and produces various findings around the world. Job satisfaction is a positive attitude shown by the workforce towards their work, which arises based on an assessment of the work situation.*

***Keywords:** HR, organizational, culture, compensation, job*

### **1. Introduction**

According to Mangkunegara (2013), job satisfaction is a feeling of support or not support from employees related to their work and their condition. Meanwhile, according to Siagian (2013) said that job satisfaction is a person's perspective both positive and negative about his work. PT. SinarSosro Medan Indonesia, founded in 1974, is a packaged flavored beverage company that runs its business in producing several types of soft drinks, both fizzy and non-soda. PT. SinarSosro Medan produces its products which are distributed throughout Indonesia, some even abroad. This company employs many employees to support the work, especially the success of the company's mission of success. PT. SinarSosro Medan strives to create high value products that are expected to last and be liked by consumers.

As a large company in charge of producing and being responsible for the company's

products, it strives to provide the best both in terms of product quality, safe distribution and affordable prices, this commitment has been started since the company was founded in 1974. Various trainings, studies have been given to each employee to provide learning related to the company's work system, all of which are intended so that the company's products and work are completed so that satisfaction will be achieved. The satisfaction achieved is not only talking about customer satisfaction but also the satisfaction of employees who are employed.

As a product provider company, PT. SinarSosro Medan has been committed to ensuring that clients can focus more on carrying out their main business activities and achieving business efficiencies even before we start our services. This commitment began in 1974 and has become a corporate culture that focuses on client needs, and human resource development through basic learning, training, transformational education systems

Email: [siregarbas@upmi.ac.id](mailto:siregarbas@upmi.ac.id)

for our staff. In addition, employees must be serious in focusing their actions on their satisfaction. In relation to the importance of service satisfaction at PT SinarSosro Medan, employee job satisfaction also needs to be considered by the organization because an organization will run smoothly if all services contributed by individuals to the organization receive balanced attention and rewards.

However, PT. SinarSosro Medan experienced several problems, namely the low level of employee attendance and high employee turnover rates. These problems are caused by authoritarian leadership style actors, top-down leadership decision-making, a work environment that often causes discomfort and poor communication patterns. So that employees can work with high morale, discipline, morale, and dedication with high commitment, there are many things that need to be considered, one of which is the need to cultivate a good organizational culture. In relation to the importance of service satisfaction, employee job satisfaction also needs to be considered by the organization because an organization will run smoothly if all services contributed by individuals to the organization get balanced attention and rewards.

Organizations in getting qualified employees must leave the policy of management practices that are intrinsic and functional, shift to new practices in the field of management that are more innovative, and adaptive in responding to a rapidly changing environment. Efforts to achieve the goals and survival of the company depend on the level of job satisfaction that affects the quality of work of the employees in it, increasing employee job satisfaction is the most serious management challenge so that the company's vision and mission can be realized.

A strong and rooted organizational culture will be able to make a significant contribution to organizational members in terms of a clear and straightforward understanding of a problem being resolved. Culture has a

significant influence on the attitudes and behavior of organizational members. There is a lot of evidence that illustrates that the success of an organization is due to its strong culture which makes the organization more confident and ultimately more effective.

In an era of globalization that is full of changes, changes which are often so fast and very difficult to predict but have a huge impact on the future of the organization, the presence of a flexible organizational culture is becoming increasingly relevant. The strategy in anticipating changes that will be carried out by an organization also needs to consider aspects of the culture that has existed so far, whether the designed strategy is in accordance with the existing values, or if the existing values are actually counter-productive for the organization in its journey.

## **2. Literature Review**

According to Robbins (2011) that organizational culture refers to a system of shared meanings held by members that distinguishes the organization from other organizations. This system of shared meaning, when examined more closely, is a set of key characteristics valued by the organization. According to Armstrong (2009) Organizational culture can be described as values, norms and artifacts accepted by members of the organization as an organizational climate that will influence and be influenced by organizational strategy, structure and organizational systems.

According to Slocum and Hellriegel (2011), Organizational Culture is values, represents, collective beliefs, assumptions and feelings about what things are good, normal, rational and valuable. Cultural value can be quite different from organization to organization. In some cultures, employees may care deeply money, but in others they may care about technological innovation or employee wellbeing. These values tend to persist over time, even when organizational membership

change. (Organizational culture is a value, symbolizing a collection of people with beliefs, assumptions and feelings about things that are good, normal, rational and valuable, cultural values can differ between other organizations. In the same culture employees are still trapped in financial needs, in other cultures some employees trying to innovate technological advances for a prosperous life. And the value of the strength of the organization can succeed, even though the members are always changing).

This is in line with Umam (2010) explaining that organizational culture is a value system that is believed and can be learned, applied and developed continuously. Organizational culture also functions as an adhesive, unifier, identity, image, brand, motivator, development that is different from other organizations that can be learned and passed on to the next generation, and can be used as a reference for human behavior in an organization that is oriented towards achieving goals. or the results/targets set. Robbins and Judge in Hanggraeni (2011) define organizational culture as a system of shared meanings held by members that distinguishes an organization from other organizations. Organizational culture is a pattern of organizational beliefs and values that are understood, inspired and practiced by the organization so that in the end the pattern gives its own meaning and becomes the basis for the rules of behavior in the organization. Culture performs a number of functions within the organization. First, culture has the role of setting boundaries; that is, culture creates a difference between one organization and another. Second, culture provides a sense of identity to organizational members. Third, culture facilitates commitment to something broader than one's self-interest. Fourth, the culture increases the stability of the social system. Culture is the social glue that helps hold the organization together by providing

precise standards of what employees should say and do. Finally, culture functions as a meaning-making and controlling mechanism that guides and shapes the attitudes and behavior of employees.

### 3. Research Method

This study uses the quantitative method. The population in this study are employees who work at PT. SinarSosro Medan, totaling 86 people. The data used in this study are data obtained from questionnaires and interviews with employees related to the variables studied. The variables studied for analysis are Organizational Culture (X1), Compensation (X2), Job Satisfaction (Y) and Organizational Commitment (Z).

### 4. Results & Discussions

#### Descriptive Analysis

##### 1. Characteristics of Respondents

The instrument used in this research is a list of statements (questionnaire). The total number of statements is 80 statements, namely 20 (Twenty) statements for the Organizational Culture variable (X1), 20 (Twenty) statements for the Competence variable (X2), and 20 statements for the Teacher Job Satisfaction Variable (Y) and 20 items for work commitment

Descriptive analysis in this study was obtained from distributing questionnaires to 86 employees at PT. SinarSosro Medan. The questionnaire contains a description of the respondents and answers to the statements given. Characteristics of respondents in this study were based on gender, age, education and years of service.

##### a) Characteristics of Respondents by Gender

**Table 1** Description of employees by gender

No.	Gender	Number of Employees	Percent (%)
1.	Male	27	31.39
2.	Female	59	68.60
	Amount	86	100

Source: 2021 Research Questionnaire

Based on table 1 above, that male employees are fewer in number than female employees who are used as research samples, this can be seen from the respective percentages, namely

men as much as 31.39% and women 68.60%.

b) Characteristics of Respondents Based on Age

**Table 2.** Employee description by age

No.	Age (Years)	Number of employees	Percent (%)
1.	26 s/d 30	3	3.49
2.	31 s/d 35	4	4.65
3.	36 s/d 40	47	54.65
4.	41 s/d 45	17	19.77
5.	> 45 years	15	17.44
	Amount	86	100

Source: Processed Questionnaire 2021

Based on table 2 above, that the employees of PT. SinarSosro Medan consists of 5 age classes, where the age group of 36 to 40 years is more than the other age groups, namely 46

people (54.65%).

c) Characteristics of Respondents Based on Education

**Table 3.** Employee Description by education

No.	Education	Number of Employees	Percent (%)
1	SMA/SMK	26	30.23
2	Diploma	4	4.65
3	S1	56	65.11
4	S2	-	-
	Amount	86	100

Source: Processed Questionnaire 2020

Based on table 3 above, it shows that more IS educated employees are compared to others. In a row, there were 4 diploma employees (4.65%), 26 employees with high school education (30.23%), and 56 graduates (65.11%).

of measuring what is to be measured) and the accuracy of a measuring instrument in carrying out its measuring function, which can provide an overview of the smallest differences between one subject and another. The validity test in the research conducted with the help of the SPSS 22 application. The following data is presented on the results of the validity test.

C. Validity and Reliability Test

1. Validity test

Validity comes from the word validity which means the extent to which accuracy (capable

**Tabel 4.** Questionnaire Validity Test Results

Source: Acquisition of research questionnaire data, 2021

From the statements filled in by the respondents with their respective responses, it was obtained that they were declared valid or suitable for use at the 5% (0.05) level.

### T-Test

The t-test was conducted to partially test whether the variables of Organizational

Culture (X1) and Competence (X2) partially or each had a significant effect on employee satisfaction at PT. SinarSosro Medan.

The test criteria are:

H0 : b1, b2 = 0, meaning that the variables of Organizational Culture and Competence partially have no positive and significant effect on the variable of employee satisfaction at PT. SinarSosro Medan.

**Table 5.** Partial Test Results (t-test)

Coefficients <sup>a</sup>											
Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Correlations			Collinearity Statistics		
	B	Std. Error	Beta			Zero-order	Partial	Part	Tolerance	VIF	
1	(Constant)	37,179	12,666		<b>2,935</b>	<b>,004</b>					
	Organization	,277	,147	,200	<b>2,889</b>	<b>,042</b>	,333	,203	,184	,849	1,178
	Competence	,341	,105	,343	<b>3,239</b>	<b>,002</b>	,421	,335	,316	,849	1,178

a. Dependent Variable: Job Satisfaction

Based on the test results in Table 5, it can be seen that the tcount value of the Organizational Culture variable is greater than the ttable value ( $2.889 > 1.98896$ ) with a significant level below 0.05, namely 0.042. the tcount value of the Competence variable is greater than the ttable value ( $3.239 > 1.98896$ ) with a significant level below 0.05, namely 0.002. Based on the decision making of the partial test in the regression analysis, it can be concluded as follows:

- 1) The organizational culture variable partially has a significant effect on employee satisfaction at PT. SinarSosro Medan.
- 2) Competence variable partially has a significant effect on employee satisfaction at PT. SinarSosro Medan.

**Simultaneous Significant Test (F-Test)**

This test is carried out to see whether all the

independent variables included in the model have a joint effect on the dependent variable. The test criteria are as follows:

$H_0$  :  $b_1, b_2 = 0$ , meaning that together there is no positive influence

and significant from the independent variable to the dependent variable.

$H_0$  :  $b_1, b_2 \neq 0$ , meaning that together there is a positive and significant effect of the independent variable on the dependent variable. The value of Fcount will be compared with Ftable.

The decision-making criteria are:

$H_0$  is accepted if  $F_{count} < F_{table}$  at  $\alpha = 5\%$  with 95% confidence level.

$H_1$  is accepted if  $F_{count} > F_{table}$  at  $\alpha = 5\%$  with 95% confidence level.

The value of ttable for  $\alpha = 5\%$  (0.05) and (3:83) = 1.98896.

**Table 6.** F-Test

ANOVA <sup>a</sup>						
Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	519,916	2	259,958	11,092	,000 <sup>b</sup>
	Residual	1945,294	83	23,437		
	Total	2465,209	85			

a. Dependent Variable: Job Satisfaction  
b. Predictors: (Constant), Organizational Culture, Competence

Based on Table 6, it can be seen that the results of the F-test simultaneously, then obtained the value of  $F_{count} = 11.092$  with a significance level of 0.000. While  $F_{table} = 3.11$ .  $F_{count} > F_{table}$  ( $11.092 > 3.11$ ) and significant level ( $0.000 < 0.05$ ). So it can be

concluded that the variables of Organizational Culture and Competence together have a positive and significant effect on the variable of employee satisfaction at PT. SinarSosro Medan.

Coefficient of Determination Test ( $R^2$ )

The coefficient of determination ranges from 0 to 1 (0 R2 1). If R2 is getting closer to number 1, it can be said that the variables of Organizational Culture and Competence have a big effect on employee satisfaction at PT.

SinarSosro Medan. This means that the model used is getting stronger to explain the influence of the independent variable on the dependent variable and vice versa.

**Table 7.** Data Determination Test Results

Model Summary <sup>b</sup>									
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics				
					R Square Change	F Change	df1	df2	Sig. F Change
1	,459 <sup>a</sup>	,211	,192	4,841	,211	11,092	2	83	,000
a. Predictors: (Constant), Organizational Culture, Competence									
b. Dependent Variable: Job Satisfaction									

1. R Square of 0.211 means 21.1%, meaning that the relationship between Organizational Culture and Competence on the variable of employee satisfaction at PT. SinarSosro Medan amounted to 21.1% which has a fairly close relationship.

2. Standard Error of Estimated means measuring the variation of the predicted value. In this study the standard deviation of 4.841 where the smaller the standard deviation means the better the model.

3. R of 0.459 or 45.9% indicates a relationship between Organizational Culture and Competence on the variable of employee satisfaction at PT. SinarSosro Medan and the

remaining 54.1% are explained by other factors not examined in this study.

**5. Conclusion**

Therefore, that the relationship between Organizational Culture and Competence on the variable of employee satisfaction at PT. SinarSosro Medan amounted to 21.1% which has a fairly close relationship and a relationship between Organizational Culture and Competence on the variable of employee satisfaction at PT. SinarSosro Medan and the remaining 54.1% are explained by other factors not examined in this study.

## **THE INFLUENCE OF ORGANIZATIONAL CULTURE ON EMPLOYEE PERFORMANCE MEDIATED BY JOB SATISFACTION AND ORGANIZATIONAL COMMITMENT**

***Abstract:** The purpose of this research is to explain the role of job satisfaction and organizational commitment in reducing the impact of organizational culture on employee performance. As many as 125 people who work at startup companies in Yogyakarta are included in the sample population of this study. The analytical tools used include path analysis with the Structural Equation Modeling (SEM) approach implemented in SmartPLS 3. The results show that organizational culture has a beneficial and substantial influence on happiness. Organizational culture has a significant and positive effect on employee productivity, as well as a positive influence on organizational commitment. Then, both job satisfaction and organizational commitment have a positive and significant effect on worker productivity. Employee job satisfaction may somewhat weaken the impact of organizational culture on worker productivity, and vice versa for employee organizational commitment and dedication. As a result, it is very important for business leaders to pay attention to, and cultivate, employee job satisfaction and organizational commitment so that corporate culture can increase worker productivity.*

***Keywords:** Organizational Culture, Job Satisfaction, Organizational Commitment, Employee Performance*

### **1. Introduction**

Organizational culture is a set of shared beliefs and practices that serve as a daily reference point for top management, guiding decision-making among employees and directing their actions towards achieving company goals (Antonakis & House, 2013). It is possible to judge an organization's culture as successful if it has an effect on a high-energy state. Organizational values that are actively practiced are more likely to influence employee productivity (Antonakis & House, 2013).

The low level of worker productivity also affects job satisfaction. If an employee or worker is not happy with the job they are doing or the responsibility assigned to them, that happiness is not hard to see. Compensation elements, whether in the form of salaries, commissions, or bonuses, are often associated with job satisfaction. Several researchers (Bakker and Demerouti, 2017) have found this.

Strong employee dedication to the company is a major factor in shaping the character and behavior of employees while working there. The organization's dedication points employees in the right direction so they can

start their jobs and see immediate results. Employees who have a strong sense of loyalty to their company are more likely to show up to work each day with a positive attitude, provide quality hours, and leave the company on good terms. Possible actions to increase worker productivity through employee commitment include retaining high-potential workers in each department (Kim et al., 2019).

Individual productivity is measured by the results they produce in accordance with the standards that apply to their field of work. The term "productivity" refers to the measurable results of an organization's efforts over a period of time. Effort can be defined as the result that a person obtains according to the applicable measures for sustained effort at one's workplace (Yong et al., 2019; Paillé et al., 2014)

By definition, organizational culture includes the values, beliefs, attitudes, and practices that drive the day-to-day operations of the organization (Miska et al., 2018). Because culture has such a strong effect on employee productivity, understanding it can help business owners and managers make good decisions for the company as a whole, not just when it comes to following rules and procedures. Employees' belief in upholding organizational culture has a multiplicative effect on efficiency in carrying out their duties (Arayesh et al., 2017).

Employee satisfaction at work can be defined as an emotional state that results from a positive view of one's responsibilities and the rewards one receives from completing those responsibilities. Another school of thought argues that job satisfaction is the outpouring of employees' feelings about their work, so that it has an impact on the direction of organizational development (Khavayet et al., 2018). The term "job satisfaction" refers to employees' emotional reactions to their working conditions. Feelings of liking or disliking the tasks and responsibilities assigned to someone can have a significant

impact on job satisfaction. This can be seen from the employees' proactive approach to their responsibilities and the workplace environment (El-Jardali et al., 2009).

Organizational dedication is a factor that can affect performance. The level of employee dedication to the company affects how hard they work to help the company achieve its goals (Yan et al., 2019). Organizational loyalty, or "commitment," is a state of mind in which a worker identifies with the goals and values of the company he or she works for (Sukanebari et al., 2020).

Worker productivity is the result of intentional management of activities that have an impact on organizational productivity. (Chatterjee et al., 2020). In general, employee productivity is a measure of the success an organization or business has achieved through its operations. Work results that can be achieved by individuals or groups within a company in accordance with their authority and responsibility in order to achieve organizational goals in a lawful way, do not violate the law, and do not conflict with morals and ethics (Karim et al., 2007). Employee satisfaction is a subjective state of mind about one's work that depends on various factors, including the nature of the work itself, the quality of colleagues, the amount of salary received, and other material and psychological considerations (Chatterjee et al., 2020).

The business world is increasingly competitive, especially for companies that focus on the digital realm, such as startups. Startup businesses in Indonesia are growing at an astounding pace every day. Due to increased accessibility, the number of active internet users in Indonesia continues to grow. This is evidenced by survey data from Penyedia Jasa Internet Indonesia (APJII) regarding Indonesia's Internet penetration in 2022, which states that the number of internet users between 2021 and 2022 is 210.026.769 out of a total population of 272.682.600 Indonesians with an increase of 77.02 %. The

dominant behavior of Indonesian users is using mobile/tablet devices that are connected to their internet (APJII, 2020). Digitalization is seen as a powerful intervention into business matters associated with modernization efforts throughout the organization that affect all structures, systems and processes within a company. Not only that, digitalization is also defined as sustainability to meet current and future needs (Nikmehr et al., 2021). This presents a great opportunity for startup CEOs to expand their business. Startup founders no doubt want to make their services as accessible as possible to all internet users, whether that means simplifying the purchase and delivery of services or products. The widespread availability of smartphones running the Google Android or Apple iOS operating systems has the potential to increase people's internet usage. Therefore, companies on a global and national scale are more interested in expanding their operational network. One of the businesses he is interested in is a startup in Yogyakarta.

Based on in-depth interviews with several employees at a startup company in Yogyakarta, we heard that low levels of emotional connection between co-workers who prefer to work alone over those who prefer to work together and the issue of fair compensation are contributing factors to the labor shortage. From job satisfaction. Employees with minimum UMP size requirements in their province are expected to provide substandard results. Users, whether that means simplifying the purchase and delivery of services or products.

In addition, some workers have expressed concern about organizational commitment, citing problems such as absenteeism caused by the use of sick leave and the fact that overtime pay is only provided three times a month as examples of problems they have experienced. have with the organization. If it occurs three times, we'll assume that the fourth delay did not occur. This is considered

to have a negative impact on employee productivity.

Several workers have pointed out that the phenomenon related to organizational culture is related to managers not paying enough attention to their employees, and this is something that has also been highlighted by other employees. It is important to pay attention to the obligations and responsibilities of employees to ensure that they feel valued. This can be achieved in a number of ways, including keeping lines of communication open with colleagues, for example. Workers need their boss to give them inspiration and motivation to get back their joy for their work and to increase their production rate.

There are a number of important factors that contribute to job satisfaction, the first is having a job that allows you to use your skills and receive feedback on how well you are doing, and the second is how comfortable you and your co-workers are. Being in your workplace, both personally and professionally, and the third is how easy it is to do your job. The first factor is having a job that allows you to use your skills and receive feedback on how well you are doing. (Robbins, 2018).

*H1: Organizational culture has a positive effect on job satisfaction.*

The extent to which an organization is able to increase the productivity of its workforce is directly proportional to its level of success in achieving the goals it has set for itself. When it comes to determining whether an organization's culture is effective or not, one can see whether it has an influence on a high-energy state or not. Religious observance at work may be beneficial because it has been shown to increase productivity at work (Riyantini, 2021).

*H2: Organizational culture has a positive effect on employee performance.*

The organization's management structure is greatly influenced by its organizational culture, which consists of values and concepts

shared by all members of the company. The dominant culture of an organization is closely related to the level of commitment shown by its employees towards the company. A set of guiding ideas or assumptions that employees adhere to when carrying out their responsibilities towards this company is what is referred to as organizational culture. (Ramezan, 2016).

*H3: Organizational culture has a positive effect on organizational commitment.*

Worker satisfaction, or job satisfaction, is the result of the relationship created between the worker and his environment, whether the setting is conducive to happiness and productivity or not. Satisfaction in one's work life conveys a sense of fulfillment to one's superiors. High levels of worker satisfaction have a positive effect on productivity, helping organizations move closer to their goals. (Citrawati, 2021).

*H4: Job satisfaction has a positive effect on employee performance.*

Employees with organizational commitment will show respect for the company, pay attention to its goals, experience emotional identification with its mission, and work to overcome personal obstacles, all of which will have a positive impact on productivity. (Sitio, 2021).  
*H5: Komitmen organisasi berpengaruh positif terhadap kinerja karyawan.*

*H5: Job satisfaction mediates the positive influence of organizational culture on employee performance.*

*H6: Organizational commitment mediates the positive influence of organizational culture on employee performance.*

Utilizing technology-based facilities and infrastructure (hardware, software, useware) to collect, store, back up, transmit data using the internet is very necessary. Technology can be used to implement a work culture by implementing a flexible work arrangement, where employees can work anywhere and anytime, so that employees can manage the flexibility of how they work but remain productive (Fatonah et al., 2022).

Fatonah et al. (2022) collects data to determine the strength of a variable using qualitative analysis, and the priority is knowing the conditions and entities between variables to understand a phenomenon by connecting between variables and determining the degree of relationship between these variables. There are 4 variables, namely: the variable Work Culture (X1), Competence (X2), and Information Technology (X3) as independent data, and Employee Performance variable (Y) as the dependent data obtained through interviews, questionnaires, observation, and reference studies (according to figure 1).

**Figure 1.** Employee Performance Conceptual Scheme

Fatonah et al. (2022) explained that it is necessary to test the validity by measuring the

effectiveness of a questionnaire. Testing the reliability to measure a questionnaire which is

an indicator of a variable. Conduct a normality test to determine the distribution of data in the data group, multicollinearity test to detect how far the relationship and influence between variables with independent data. Conduct a heteroscedasticity test to determine the variance of the variance of the residual one observation with another observation using the correlation model. Then analyze multiple linear regression to find out how big the independent variables are Work Culture (X1), Competence (X2), and Information Technology (X3), and Employee Performance variables (Y). Do a partial test, proving whether there is a relationship between the variables Work Culture (X1), Competence (X2), and Information Technology (X3) on the Employee Performance variable (Y) to show how much influence each of these independent variables has in explaining variations in the independent variables. Finally, test the Coefficient of Determination to measure how well the model explains the variation in the dependent variable.

## 2. Literature review

### 2.1. Job Satisfaction

"Job Satisfaction" is the attitude of workers towards work related to the work environment, co-worker relationships, rewards for services received at work, and other elements both physical and psychological, as stated by Teck-Hong & Waheed (2011). According to Zendejdel (2013), the goal of everyone employed is to get satisfaction from their place of work. The level of satisfaction experienced by workers in their jobs is anticipated to have a significant influence on their level of output by their managers. Managers need to be aware of the procedures to be followed to generate job satisfaction in their employees. Any conversation about satisfaction at work, also known as "Job Satisfaction", that takes

place within an organization will likely involve efforts to improve the attitudes and behavior of employees as they work to increase productivity. In addition to the use of modern equipment which is a direct consequence of technological advances, personnel performance is another component that must be considered to ensure business success in achieving its goals in industry 4.0 (Fadilurrahman et al., 2021). Employees who are dissatisfied with their jobs contribute to an environment that is detrimental to everyone involved, at both a professional and personal level. Dissatisfaction with one's job can result in hostile behavior or, conversely, reflect a desire to withdraw from the social environment and isolate oneself. Both of these results are possible. For example, adopting a withdrawal mentality from the workplace, supporting disruptive behavior such as boIo, and taking other actions intended to avoid disrupting the operations being carried out by the business are all possible ways of doing this.

Aggressive types of behavior such as sabotage, intentionally creating wrongdoing at work, obstructing authority, and even engaging in strike activities are examples of this type of behavior. According to the research shown earlier, worker satisfaction is an important factor to think about in relation to worker productivity, whereas worker dissatisfaction is often associated with high workload and stress. Employees who report high levels of dissatisfaction with their jobs are more likely to participate in acts of misconduct at work such as sabotage or other types of misconduct.

According to Bloisi et al (2007) indicators of salary or wages, namely:

- Pay Rate.
- Payment Structure.
- Determination of Individual Pay
- Payment Methods
- Payment Controls

According to Indradevi's research findings (2012), intrinsic motivation influences job

satisfaction and performance, job satisfaction affects productivity, and organizational culture influences all three. Contributing in a way that will enhance the impact of corporate culture on the levels of job satisfaction and productivity experienced by employees. According to the results of Remi et al (2011), organizational culture, intrinsic motivation, and organizational commitment all have a direct influence on employee productivity. Employee productivity is not positively affected by corporate culture; however, motivation at work, job happiness, and leadership all have a beneficial effect on employee productivity according to findings (Worlu & Chidozie, 2012).

**2.2. Organizational Commitment**

According to Meyer & Parfyonova (2010), employee organizational commitment can be seen as a measure of their readiness to continue working at the same company in the future. Employees' belief in the company's vision and goals, their readiness to strive to complete tasks, and their desire to continue working there are all strengthened by employees' repeated commitment to the organization. Organizational commitment, as defined by Cohen (2007), is a factor that determines how a person identifies with an organization and becomes loyal to the goals of the organization. It can be concluded that employee commitment is shown when workers are willing to place the needs of the organization above their own and make a

**Table 1.** Description of Respondents' Characteristics (Source: Data processed with SmartPLS 3.0 by Researchers, 2023)

<b>Gender</b>	<b>Amount</b>	<b>Percentage (%)</b>
Female	44	35
Male	81	65
<b>Amount</b>	<b>125</b>	<b>100</b>
<b>Age</b>	<b>Amount</b>	<b>Percentage (%)</b>
18-20	35	28
21-30	48	39
31-40	23	18
41-50	10	8
>50	9	7
<b>Amount</b>	<b>125</b>	<b>100</b>

substantial contribution to achieving the company's goals that have been set. This conclusion is based on the opinion of a number of experts.

**3. Research methods**

This research is an example of the type of research known as explanatory study. Since all 125 workers in the Yogyakarta-based Startup Company business incubator were eligible for sampling, there was no need to choose too small a sample size. Interviews, questionnaires, and field visits are several approaches that can be used in the data collection process. This research seeks to answer the question, "How does organizational culture influence job happiness, worker productivity, loyalty to the company, and other factors?" by checking this and related questions. To determine the validity and reliability of the findings, further analysis of the questionnaire data will be carried out with the help of SmartPIS 3. It is determined that each question in the survey is valid and reliable after the correlation coefficient value is at least 0.30 and Cronbach's Alfa value is at least 0.60.

**4. Results and discussion**

To get an overview of the profile of the respondent (employee), the following is a description of the employee's characteristics.

Education	Amount	Percentage (%)
Senior High School	78	62
Diploma	18	14
Bachelor	29	24
<b>Amount</b>	<b>125</b>	<b>100</b>

The loading of indicators must be greater than 0.5, the Composite Reliability (CR) must be greater than 0.8, and the Average Variance

Extracted (AVE) for each building must be greater than 0.5 so that the research comes to the conclusion that the construction is valid. Table 2.

**Table 2.** Model Size Results (Source: Data processed with SmartPLS 3.0 by Researchers, 2023)

Construct	Indicator	Outer Loading	Composite Reliability	AVE
Job satisfaction	KK1	0.817	0.882	0.592
	KK2	0.836		
	KK3	0.812		
Organizational Commitment	KO1	0.732	0.857	0.675
	KO2	0.774		
	KO3	0.859		
Organizational culture	BO1	0.793	0.912	0.614
	BO2	0.759		
	BO3	0.847		
	BO4	0.746		
	BO5	0.719		
Employee performance	KNK1	0.725	0.838	0.634
	KNK2	0.785		
	KNK3	0.824		
	KNK4	0.785		
	KNK5	0.839		
	KNK6	0.716		

Based on Table 2, it is recommended to use the outer loading indicator with a value between 0.71 and 0.85. Composite Reliability (CR) values varied from 0.838% to 0.912%, and all were greater than 0.80, which indicated that the research model was reliable. CR values range from 0.838% to 0.912%. The AVE values found were all

more than 0.5 and ranged from 0.592 to 0.675; This shows that the data collected has good quality overall. When evaluating the discriminant validity of a model, it is necessary to check whether the value derived from the standard deviation of a stable variable is greater than the average.

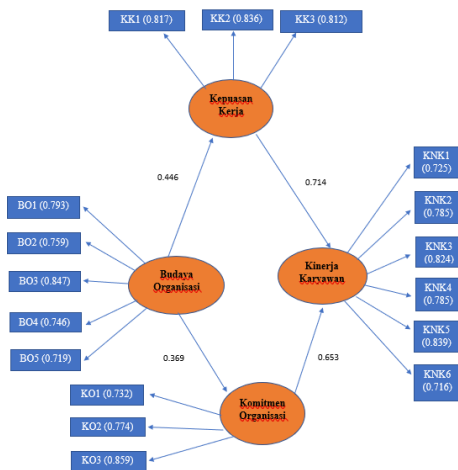

**Table 3.** Correlation between Latent Variables (Source: Data processed with SmartPLS 3.0 by Researchers, 2023)

Construct	Job satisfaction	Organizational Commitment	Organizational culture	Employee Performance
Job satisfaction	1.000	0.683	0.446	0.714
Organizational Commitment	0.683	1.000	0.369	0.653
Organizational culture	0.446	0.369	1.000	0.564
Employee performance	0.714	0.653	0.564	1.000

**Table 4.** Root Value of Average Variance Extracted (AVE) (Source: Data processed with SmartPLS 3.0 by Researchers, 2023)

Konstruk	Average Variance Extracte (AVE)	$\sqrt{AVE}$
Job satisfaction	0.597	0.774
Organizational Commitment	0.672	0.816
Organizational culture	0.604	0.774
Employee performance	0.628	0.786

If the value (AVE) is more than 0.5, then the test can be considered to have a high level of discriminant validity. The average value in Table 5 is more than 0.5, which indicates that the methodology used in this study is appropriate. The figure presents the results of tests carried out in the internal mode.

**Figure 2.** Structural Mode

The structural model was analyzed using R-

**Table 6.** Path Coefficient (Source: Data processed with SmartPLS 3.0 by Researchers, 2023)

Correlation Between Variables	Path Coefficient	T Statistic	P values	Information
Organizational Culture on Job Satisfaction	0.446	6.187	0.000	Accepted
Organizational Culture on Employee Performance	0.282	4.468	0.000	Accepted
Organizational Culture Against Commitment	0.369	5.124	0.000	Accepted
Job Satisfaction on Employee Performance	0.393	6.417	0.000	Accepted
Organizational Commitment to Employee Performance	0.286	4.364	0.000	Accepted

The effect of organizational culture on worker productivity is statistically significant (p

square for the dependent construct, t test and the significance of the coefficients.

**Table 5.** Results of the Coefficient of Determination Test (Source: Data processed with SmartPLS 3.0 by Researchers, 2023)

Construct	R <sup>2</sup>
Job satisfaction	0.216
Employee performance	0.623
Organizational Commitment	0.137

In table 5 it can be seen that the R square value of employee performance is the largest with a value of 0.623 and the smallest on the organizational commitment variable of 0.137. The principle used to test the hypothesis refers to the value shown in the output path coefficient shown in Table 6.

From Table 6 it can be concluded that organizational culture has a significant effect on job satisfaction (p < 0.05). These findings indicate that organizational culture has a positive effect on employee job satisfaction. This finding is consistent with the findings of Silverthorne, (2004), MacIntosh & Doherty, (2007), and Egan et al., (2004), who found that a set of organizational values has a positive effect on job satisfaction.

0.05). This result shows that organizational culture influences worker productivity. This

finding is consistent with the research of Johnson et al., (2016), Łukasik, (2018) and Kucharska & Bedford, (2020), who found that a set of organizational values has a positive effect on a measure of employee productivity.

The value of organizational culture on organizational commitment is 0.000 0.05. These findings indicate that organizational culture influences employee dedication to the company. This finding is in line with the findings of Asi et al. (2021) and Ependi et al. (2021), who found that organizational culture has a positive effect on the level of commitment.

Employee satisfaction with performance has a p-value of 0.000 > 0.05. The findings show that job satisfaction has a positive effect on worker productivity. This finding is consistent with the findings by Ravid et al., (2019), Backhaus, (2019), and Yost et al., (2018) who found that job satisfaction has a significant effect on worker productivity.

Organizational commitment to employee performance has a p-value of 0.000 0.05. These findings indicate that organizational

commitment has a positive effect on worker productivity. This finding is consistent with studies by Winston (2008) and Tolentino (2013), all of whom found that organizational commitment has a positive effect on worker productivity.

Table 8 shows the results of the mediation analysis of the relationship between organizational culture and worker productivity; The t-statistic is greater than the t-table value (4.237 > 1.96), indicating that job satisfaction moderates the positive influence of organizational culture on worker productivity. The mediation function that has the strongest correlation with job satisfaction is the partial mediation function.

As shown by a statistically significant positive relationship (t-statistic > t-table, or 3.217 > 1.96) between organizational commitment and worker productivity, organizational culture has a positive effect on worker productivity. The function of the media supported by organizational commitment is mainly that of a partial mediator.

**Table 7.** Path Coefficient (Source: Data processed with SmartPLS 3.0 by Researchers, 2023)

Correlation Between Variables	Path Coefficient	T Statistic	P values	Information
Organizational Culture -> Jobs Satisfaction -> Employee Performance	0.174	4.243	0.000	Accepted
Organizational Culture Organizational Commitment -> Employee Performance	0.109	3.217	0.000	Accepted

## 5. Conclusion

According to research findings, organizational culture seems to have a positive effect on employee satisfaction variables, a positive effect on worker productivity, a positive effect on employee commitment, a positive effect on job satisfaction, and a positive effect on work commitment. In addition, job satisfaction

appears to have a positive effect on worker productivity. Emphasizing the role of job satisfaction and organizational loyalty as a form of "partial mediation" as a means of reducing the positive effects of organizational culture on employee performance can serve as a means of "partially mediating" those effects, which can mitigate those effects. organizational culture on performance both directly and indirectly.

## A STUDY OF THE IMPRESSION OF REWARDS AND RECOGNITION ON EMPLOYEE JOB SATISFACTION: A CASE STUDY OF MYANMAR ZARLAYATHA DISTRIBUTION COMPANY

**Abstract:** Among all the resources an organization owns, human resources play the most critical role. To make a successful organization, management has to commit to continuously satisfying employees. Satisfied employees take risks, think creatively, and care about customers' satisfaction for achieving organizational goals. The study's primary goal was to look at how rewards and recognition affect job satisfaction among employees of Zalaryathar distribution Co., Ltd. The analysis of the research results was analysis on various theories from the ground of Human Resource Management. In order to determine the degree of employee job satisfaction, the study looked at the impact of extrinsic rewards like income, bonus, promotion, and commission. Additionally, the study looked at how intrinsic rewards like appreciation and recognition affect how satisfied employees are at their jobs. The study adopted a descriptive research survey. For this research study, a sample size of 250 employees has been selected, which represents 20% of the total population. The data for this study were collected primarily through close-ended questionnaires. In this study, Stratified random sampling has to be utilized for administering with and examining the groups within the population. In detail, disproportionate to using Stratified random sampling to pick the employees, top management, middle management, and first-line management because some startups are small. Theoretical and managerial implications, recommendations, and limitations for future research have to be further research references. In this study, data were running with SPSS (Statistical Package for Social Sciences) version 20 for data operation and study. Correlation analysis brings forward to explore the most significant factors which affect the employee's job satisfaction. The study examines those rewards and recognition had a positive correlation with employee job satisfaction of Zalaryathar distribution company. The study suggests that organizations can achieve their objectives and mission through employee job satisfaction with effective reward and recognition systems.

**Keywords:** Human Resources Management, Rewards, Recognition, Job satisfaction, Performance

## 1. Introduction

According to Pattersen, Warr, and West (2004), a happy employee is a productive employee, and harmonizing their satisfaction level and considering thoughtful topics also becomes apprehensive for organization performance and improvement purposes (Muna et al., 2017). A highly competitive business environment lets the organizations address the job satisfaction of employees. Due to the tough pandemic situation, employers have to exchange the way of treating the employees through which they believe that the more satisfied employees contribute their products and services during this rigid period (Ju et al., 2020). Good employers want their organization to create the best place for employees by letting them value proposals, building a good reputation as an employer by making sure promises to employees (Editor-in-chief et al., 2018). The compensation reward system is making employee satisfaction by getting benefits for the organization through employees who can contribute the best quality, high productivity, less attrition and in addition that can create the service orientation in addition free from violation (Martono et al., 2018). Myanmar Zarlayathar Distribution CoLtd was organized in March 2016 in Yangon, Myanmar. In the beginning, the initial business of this company was Mercury Light Distribution since November with just three trucks that could only operate in Yangon. After many years of hard work and flexibility, Myanmar Zarlayathar Distribution has become one of the nationwide distributions in the country. The company intends to offer customers a scale of operations, regional diversity, effective sales force, and leading multi-channel networks. The significant issues of employee satisfaction with higher performance need to enhance service quality, broader coverage and set the required skills. Overcompensated employees perform better, while undercompensated workers grow

disgruntled and respond by delivering subpar work (Armstrong 2003).

## 2. Objective

The aims of the study are:

- i. To determine the impact of extrinsic rewards on Myanmar Zarlayathar employees' job satisfaction
- ii. To evaluate how intrinsic rewards affect job satisfaction
- iii. To assess the degree of job satisfaction among Zarlayathar employees in Myanmar

## 3. Research Question

The following research topics served as the study's basis:

- i. How the influence the extrinsic rewards on employee job satisfaction of Myanmar Zarlayathar employees?
- ii. How do intrinsic rewards affect job satisfaction?
- iii. What is the job satisfaction level of Myanmar Zarlayathar employees?

## 4. Literature Review

Companies are trying to gain a competitive advantage by using different strategies for getting results of highly competitive pressure like shaping the correct application of skills and expertise to a satisfied employee with many benefits and rewards more intimate with their organization than other competitive organizations (Vijayakumar & Subha, 2013). The relation between rewards and recognition is significantly associated with employee engagement and standard commitment for the organization (Martono et al., 2018). A reward system turns positive results for the organization to employee retention and attractive wage schemes through having

enough impact on the organization (Wickramasinghe&Sajeevani, 2018). (Froese et al., 2019) recommended that systematic rewards create job satisfaction then eliminate attrition rate, because Human Resources Management needs to focus strategically on it for workforce retention purposes.

(Jamal Ali & Anwar, 2021) introduced that there should be teamwork of professionals spin in arranging good rewards and motivation factors of business importance. (Kim & Lee, 2018) showed that every employee should organize the route to measure the productivity of each employee through compensation for increments and rewards. The overall reward strategy is relevant to the entire employee proposal and is critical to the attractiveness and appeal of the organization (Bwowe&Marongwe, 2018). (Megia, 2016) suggested that polishing strategies combined into that culture of organization meantime managers should identify the needs of employees in building the reward systems. Organization commitment to job gives a sense of accomplishment on rewards and motivation have decided on the balancing of performance and its employee satisfaction (Jehanzeb et al., 2012) (Vijayakumar & Subha, 2013) (Ahmad et al., n.d.) and by enhancing the satisfaction to employees for organization need to handling the rewards tools properly. In addition, good rewards are much effective for the organization, and employees' similarly poor rewards systems are ineffective and do not improve employee performance (Park & Sturman, 2016). (Park & Sturman, 2016). Maintaining the long-term requirements of setting an organization goal of job satisfaction is a combination of a proper rewards system and adequate resources (Jr, 2016). (Milikić&Došenović, 2020) also showed that the intrinsic rewards attract job satisfaction among employees. The changeling of an organization is to motivate the employees' satisfaction through fairness and openness on rewards and recognition (Akafo& Boateng,

2015). Management accepted that reward and recognition are thoroughly linked to employee motivation (Zeb et al., 2009). The way of providing the rewards and recognition towards the best employee is a kind of appreciation through inspiring to the employees long-term retaining for the organization (Kountur&Prameswari, 2020).

#### 4.1. Extrinsic Reward

One of the most efficient ways of promoting influential rewards for employees is an extrinsic reward. (Mutembei, 2019) concluded that financial compensation is playing a vital role in job performance in government hospitals. Motivation may play a key role in current using the extrinsic incentives society and pointing the importance of targeting to beliefs on stakeholders (Murayama et al., 2016). Many findings explained that increasing the annual salary is one of the consideration factors for the professional employee getting the better performance for the organization.

(Ndijuye&Tandika, 2019) mentioned that the impact of employees getting poor attitude received from the source of low pay by the organization. (Location, Location, Location – It Even Boosts Satisfaction - IMPACT Group, n.d.) stated that even if the organization provided the incentives, recognition program, swag, and bonuses to the pursuit of employees' satisfy it remains a challenge for finding extrinsic balance and the balance of staff gift of happiness is according to the personality of the employee(Khan et al., 2017). (Lim et al., 2019) concluded that the differentiation of motivational approaches to individual and organizational harmony and personal harmony received well-deserved and extrinsic rewards for job satisfaction. In addition, extrinsic rewards mention that monetary and non-monetary benefits provided to the employee represent the motivation of employees through workplace

creativity (Malik et al., 2019). Behavioral recognition also distinguishes that extrinsics can vary depending on the three rewards of value, information, and regulatory (Malek et al., 2020). The extrinsic incentives were the main factors to the background of a community framework and service motivation to the employee for the organization (Kroll & Porumbescu, 2019). In contrast, extrinsic satisfaction is defined as working conditions that affect employee attitudes and actions. In conclusion, (SULISTIYANI, Endang; UDIN; RAHARDJA, 2018) extrinsic rewards are also associated with knowledge sharing and creativity through interim leadership.

#### **4.2. Basic Salary**

Mutembei (2019), found out that basic pay as a form of financial compensation is the reimbursement that is acknowledged as a wage or salary and paid to an employee for the performance of their specific job responsibilities. (Nzelum et al., 2019) found that salary rates increase proportionally as the satisfaction rate increases. According to (Al-Ali et al., 2019), job satisfaction significantly improves job performance representing a higher salary. (Nzelum et al., 2019) conclude that the salary rate improves in direct proportion to the portion of satisfaction increases. Lower remuneration is one of the sources of employee dissatisfaction as well as it is a consideration based on the performance, experience, knowledge, and expertise of an individual (Atefi et al., 2016). One of the strengths of good compensation management depends on the number of wages or salaries per employee (Bharat, 2016). Improving the employee welfare plan makes them more satisfied with individual income and feel less pressure as deserved for them (Ree Joppe De, Muralidharan Karthik, Pradhan Menno, 2017). The consideration factor for companies to hire and retain high-quality employees to a certain level of a job

where s/he reaches an employee also has to continuously maintain on reaching a level of performance (Akhtar et al., 2017). The monetary incentives distributed with a merit logic depend on employee performance when they are a stimulus for the next level of evaluation (Ponta et al., 2020).

#### **4.3. Bonus**

According to annual performance, bonus pay is typically given out each year (Nyberg et al., 2016), which occurs three or four months after the fiscal year-end at the annual meeting (Healy, 1985). (Brockner et al., 2006) explained that employees with advanced capability last projects to alter their effort or behavior by boosting their output in order to benefit from performance-based payments. According to (Muse Ali Geelmaale, 2019), if employee performance is apparent, firms may use direct bonuses and prizes based on performance. Individual incentives, such as sizable bonuses, are also frequently unexpectedly unsuccessful at boosting worker morale and productivity (Anik et al., 2013). Bonus targets provide highly accessible information that can be easy to manage when given to the manager to meet the previous goals (Voußem et al., 2015). By linking salary and performance, bonuses increase the high performers' perception of equality and justice and reduce the desire for movement (Park & Sturman, 2016).

Bonus and awards provide one consideration not only on external financial rewards but also on the recipients then retention bonuses will be an effective tool to reduce employee attrition (Law, 2016). In addition, (Pohler & Schmidt, 2016) bonus-qualified managers may be motivated the hire the suitable, but may not have the capacity or resources to do so consistently. (Ingsih et al., 2020) concluded that it is necessary to improve for increasing the bonuses and the quality of the workplace environment should conclude by organizational commitment. (Ingsih et al.,

2020) found that job satisfaction mainly impacts through compromise of the organizational commitment is a great play to increase Bonus consideration. The relationship between manager and employee when using performance-based incentive. The organization may need to take care of the importance of an annual bonus based on the performance incentive but, (Ludwig et al., 2016) it may need to care about exceeding the previous target amount.

#### 4.4. Promotion

(Kim & Lee, 2018) explained that after years of work, employees are more likely to focus on promoting better than on pay and prefer sufficient opportunities for career advancement. (Ndijuye&Tandika, 2019) concluded and gave an opinion that the strategy of enhancing the employee performance through regular promotion to the employee for the organization to enhance the productivity. Promotion-focused workspaces make it easier to interact with the work performance (Lichtenthaler& Fischbach, 2019). A promotion is when a person moves up the corporate ladder and works with support from the supervisor/manager. The impact of these factors depends on the individual (M. Z. Ali & Ahmed, 2017), in addition to capacity building, job promotion, and job satisfaction affect the performance for the organization (Razak et al., 2018). Job satisfaction is significantly and favorably impacted by promotion is one of the partial effects on job promotion and impact itself (Tasman et al., 2021). The staff promotion was still required to be in charge for a few but not for all (Zulfikar et al., 2018). However, improving salary and benefits structures is also one of the supporting factors for job satisfaction (Sivalogathan, 2017). (Chen et al., 2006) stated that an equitable promotion system was partly vital for the employees to focus on fairness correctly.

#### 4.5. Commission

Basic pay, which includes perks, promotions, profit-sharing, salary, bonuses or commissions, and fringe benefits, was not ideal due to external compensation(A. Ali, 2019). (Ude, 2012) explained that commission is natural with salespeople; the commission was incentive reimbursement based on a percentage of total sales. It is to create the competitive advantage to consider the benefits of human resources to change the organizational environment increasing the efficiency of products or services in the marketplace (Chygryn et al., 2019). The organization should be committed to the employee through providing service commission should pay its employees positively for the competencies rather than just the experience alone (Chepkwony, 2014). (Mallin&Pullins, 2009) made an effort to demonstrate how the relationship between the sales environment and commission pay serves as a performance-based incentive for a salesman. As a result, the rationale and distribution of financial incentives depend on employees' performance and the motivation for the next evaluation period (Ponta et al., 2020). The organization also treats the sales commission as a control to ensure company success on the employee is a variable (Authors, 2017). (Chepkwony& Jomo, 2014) found out and suggested that the commission was involved in the development of rewards and related to the recommended staff benefit for the job satisfaction. One of the compensation packages of employee satisfaction that makes an organization effective is commission-based pay which is directly proportional to the total sales for the organization (Adom, 2018).

#### 4.6. Intrinsic Reward

Intrinsic rewards actively produce the best product or service at their work itself to a distinct physical or another form of reward

(Wickramasinghe&Sajeevani, 2018). The management is the influential motivator, by itself is no longer enough – intrinsic rewards are essential to employees in today's atmosphere (Trust, 2019). Intrinsic rewards should be established in accordance with the differences of characteristics associated with work performance (Authors, 2006). A person who is intrinsically motivated will work on a matching problem because it is enjoyable to do so, or he will solve a problem because it is difficult to solve and he feels good about himself after doing so (MuseAliGeelmaale, 2019). (MuseAliGeelmaale, 2019) concluded that intrinsic rewards have an important helpful connection with employee performance and employee motivation. Intrinsic rewards enhance the professional skills and commitment within the organization because it creates a sense of satisfaction related to the original psychosomatic needs (Kalhorro et al., 2017) and in addition working itself through personal achievement (Ayomikun, 2017). Another intrinsic motivational point of view is one of the behaviors that require employees to have the ability and self-determination to interact with the working environment (Shao et al., 2017). On-the-job service intrinsically not only enhances the personal qualities of employees but also motivates them through a passion for the environment (Afsar et al., 2016).

#### 4.7. Recognition

The good practices on Human Resource Management policies through getting recognition to employees is mostly maintaining the employee motivation that organization can get more productivity and the creativity of highly viable environment (Reddy, 2020). The academic staff valued recognition as the most motivating aspect and benefit as the least motivating factor, according to (Negash et al., 2014). Numerous research have looked into the idea of staff

incentive and recognition schemes and their impact on employee performance, according to Ndungu (2017). Recognition is a cost-effective method for enhancing a routinely required activity and offering a sizable pool of top performers, according to (Bradler et al., 2016). Employee appreciation can be extremely successful and motivating while costing the firm next to nothing to implement, according to (Luthans, 2000). In addition, the employee recognition program is one of the general considerations and is one of the saving financial terms of creating another type of reward to motivate employee performance (Afsar et al., 2016). Employee recognition is related to human justice of organization has responsibility for employees generally having their own without discrimination and emphasizing the concept of equality employees working in the same organization (Masri& Suliman, 2019). Employee recognition at work is to emphasize particular actions and routines that boost output and boost financial performance (Andriotis, 2019).

#### 4.8. Appreciation

Appreciation is one of the precious things from a powerful God (Crofford, 2016). Nowadays the business community is required to fulfill the promises of an organization to succeed in affiliate business. A committed and devoted employee base is playing an important role (Varma, 2017). (Abdullah et al., 2016) found out that studies on employee recognition indicate that the IT sector is largely confronted with the relentless growth of many of its qualified employees. For most managers, navigating the professional goals of generation Y could be a challenging task. Therefore, businesses must create policies and procedures that recognize generation Y's need for rapid career advancement (Chawla et al., 2017). According to Sahl (2017), acknowledgment and appreciation are crucial for faculty

happiness in general and, ultimately, for employee contentment with the institution as a place to work. Bradler et al. (2016), found out that the implication of management suggests that the recognition is efficient on cost-effectiveness but added value in good performance employees. Employee behaviors that lead to positive outcomes should be strengthened as an effect from an organizational positive point of view (Bawa, 2019). In addition, (Crystalee Webb Beck, 2016) recognition comes up from social standing and appreciation. Management is required to provide the following expert and responsibility of employees to appreciation based on required motivations or promotion for providing both beneficial for the organization (Putro&Havidz, 2019) and it is very difficult for employers to maintain a stable and successful operation (Asamoah et al., 2014). That is the reason the development and implementation of talent and knowledge management to implement strong skills management of awards and recognition and sharing in social media is also required (Fojt, 1995).

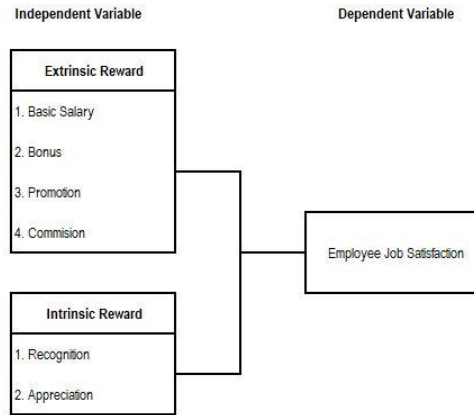

#### 4.9. Job Satisfaction

Al-Ali et al. (2019) , Research demonstrates that job satisfaction significantly affects job performance. Retaining qualified and skilled employees are challenging for the competitive business environment for the organization. (Ali, 2019) introduced that human resource policies can have positive and negative effects on employee motivation and job satisfaction. If employee feel that the human resources policies and practices are satisfactory, they will be sufficiently

motivated to meet the goals and objectives of the organization. In addition, job satisfaction is a consideration in employee satisfaction (Ndijuye & Tandika, 2019). Terera & Ngirande, (2014) concluded and recommended that job satisfaction is also apparent in the retention of staff; it must come to the employees. The rewards factor of staff motivation programs is mainly effective to employee satisfaction (Danish & Usman, 2010). If an organization is not caring about employee satisfaction, the importance of unfaithfulness, increased absences, and the number of accidents from employees would affect the organizational goal (Fujimoto et al., 1981). A well-established employee reward is treasured for the daily performance of employees' activity to work hard for the organization's effectiveness including the career path for the employee (Sajuyigbe, A.S. OlaoyeBosede. O (Mrs.), 2013). Depending on the organizational goal and economic condition, creating the importance of the reward system should be transparent (Murphy, 2015).

#### 5. Conceptual Framework

The conceptual framework proposes the following interrelationships: extrinsic reward took an independent variable with four sub-dimensions: basic salary, bonus, promotion, and commission. The intrinsic reward used as an independent variable with two sub-dimensions: recognition and appreciation; employee job satisfaction is the dependent variable. The following figure shows a conceptual framework diagram (1).

**Figure 1.** The conceptual Framework

## 6. Research Methodology

The objectives of this research are to describe the impact of the two variables (Extrinsic Rewards and Intrinsic Rewards) on the employee satisfaction of the Zalaryathar Distribution Co., ltd in Myanmar. Quantitative approaches were utilized in the study to assess the effects of rewards and recognition on employee work satisfaction. In order to determine the link between variables, data were also analyzed using inferential statistics like regression and correlation.

### 6.1. Population and Sampling

The population is the entire group we are interested in, and from which we want to infer or draw conclusions. In other words, it pertains to everyone who the study was intended to generalize about (Jackson, 2008). All 1261 of the company's employees make up the study's population. Employees at the company's headquarters in Yangon were the focus of the researcher's data collection efforts. According to Hair et al. (2010), a target population is a predetermined set of individuals or things that can be questioned or watched in order to gather the necessary data structures and information. The stratum of the target demographic was staff, first line management, middle management, and top management. Disproportionate Because some

strata are small, stratified random sampling was utilized. Stratification is used to lessen standard error and give some variance control (Oso, 2009). Disproportionate sampling decisions are made when a particular stratum or strata are either too small or too large, or when there is suspected to be more variability within a specific stratum (Sekaran, 2003). This study collected data from 250 employees working in the head office at Yangon.

## 7. Questionnaire

The main technique of gathering data is through a questionnaire, and open-ended questions were included. All conceivable responses or pre-written response categories are included in the closed-ended questions. The questions are presented, and respondents are prompted to select their response. In quantitative research, this kind of inquiry is used to generate statistics (Kumar, 2005). A questionnaire was divided into two sections and the first section is to describe the characteristics of respondents. The second section describes employee job satisfaction based on reward and recognition. A questionnaire with a five-point Likert scale was given to respondents (strongly disagrees, disagree, neutral, agree, and strongly agree).

## 8. Data Collection Procedure

The researcher has distributed 250 questionnaires to employees working in the Yangon head office of Zalaryathar distribution Co., Ltd. The researcher requested the Human Resources Management department to deliver the questionnaires. In this study, a researcher requested the Human Resources Management department to participate and deliver collecting questionnaires. All questionnaires are a contribution to employees through the heads of the various departments. The survey period for questionnaire distribution and data collection was within August 2021. In research questionnaires, motivating and assuring respondents for anonymity and confidentiality were introduced. There are a number of 250 questionnaires that were delivered to the respondents. However, only 216 questionnaires were returned. In total 34 returned questionnaires were rejected because 4 copies had multiple responses, 30 were incomplete.

## 9. Limitation of the Study

The study was only conducted in Yangon, Myanmar due to time and resource constraints. Although there were other branch offices of Zalaryathar Distribution in the cities of Myanmar, the research was limited geographically. The study focused on the Zalaryatha distribution company operating in Myanmar. Therefore, generalization has not to be across other companies, industries, and regions. The researchers have chosen two independent variables. There may be other variables and factors that might be affecting the employee's job satisfaction. However, there is still left to explore the impact on employee job satisfaction for some variables.

## 10. Data Analysis

In order to start the analysis process, the data

gathered from the questionnaire and secondary sources were methodically organized. Data analysis is the process of reviewing the information gathered during an experiment or survey and drawing conclusions and inferences (Kombo& Tromp, 2006).

### 10.1. Demographic Characteristics of the Respondents

The demographic data for gender shows that out of the 216 respondents who replied to the questionnaire distributed, there were 120 male and 96 female. Table (1) shows that the male respondents are more than female respondents regarding the percentage, male 55.6%, while female respondents were 44.4%. From the table below the gender balance in Zalaryathar was not fairly distributed. The sample population mainly dominated with the age of under thirty years of respondents covering 58.3% followed at the age group of 30-40 years (26.4 %). Between the ages of 41 and 50 years is 12.5%. The rest of the respondents are under the age category of over 50 years (2.8 %). The data indicated shows Zalaryathar distribution organizing with young employees. The majority of graduated respondents were (56.9%) to 31.0% were high school level in terms of education response. According to the data below, 11.1% of respondents had a diploma, and 0.9% were master holders. It may show most of the respondents have better educational backgrounds. The study discovered that 57.9% of respondents were staff, 20.8% were supervisors, 13.9% were managers, 5.6% were general managers when 1.9% were directors. It denotes that the majority of the study's respondents were staff level.

**Table 1.** Background information of respondent

Variable	Item	Frequency	Percentage (%)
Gender	Male	120	55.6
	Female	96	44.4
	Total	216	100.0
Age	Less than 30 years	126	58.3
	30 To 40 years	57	26.4
	41 To 50 years	27	12.5
	Over 50 years	6	2.8
	Total	216	100.0
Job Position	Staff	125	57.9
	Supervisor	45	20.8
	Manager	30	13.9
	General Manager	12	5.6
	Director and above	4	1.9
	Total	216	100.0
	Educational qualification	High School	67
Diploma		24	11.1
Graduate Degree		123	56.9
Master Degree		2	0.9

Ph D	0	0.0
Total	216	100.0

### 10.2. Reliability score of variables

A survey, test, observation, or measurement procedure that consistently produced the same results across trials is what reliability is defined as in the extension (Babbie, 2004). Cronbach's Alpha is used to determine the degree of consistency in this study. Found out that to be above 0.7 for all the constructs in this study. An appropriate level of internal reliability is indicated by a value of 0.7 and higher (Hair et al., 2003). The following table (2) presents Cronbach's alpha values for the research instrument.

**Table 2.** Reliability statistics

Variable	Numbers of items	Cronbach's alpha
Independent variable		
Basic Salary	5	0.71
Bonus	4	0.73
Promotion	6	0.8
Commission	5	0.83
Recognition	4	0.87
Appreciation	5	0.77
Dependent variable		
Employee Job Satisfaction	6	0.82

### 10.3. Descriptive Statistics of the variables

The mean and standard deviation was analyzed and presented in the following table 3. The table's illustrative statistical data indicate that the mean value of basic salary is 4.13 with a standard deviation of 0.49378. Most of the respondents agreed that the statements indicate the basic salary pay has

the highest value for the mean score. The standard deviation of basic salary is a little low which means variability of the responses on basic salary is lesser. The average level of job satisfaction among employees was 3.92, which is the second-highest mean value (standard deviation: 0.51375). This value shows that the employees' overall job satisfaction is higher than average. Additionally, according to the scores for the factors, appreciation has a mean value of 3.91 and the third-highest mean value with a standard deviation of 0.61685. The lowest mean value is 3.27, which is for the promotion.

Employee Job Satisfaction	2	4	3.92	0.51375
---------------------------	---	---	------	---------

**Table 3.** Descriptive statistics

Variable	Minimum	Maximum	Mean	Std. Deviation
<b>Independent variable</b>				
Basic Salary	3	4	4.13	0.49378
Bonus	2	5	3.75	0.52594
Promotion	2	4	3.27	0.47257
Commission	3	4	3.61	0.6823
Recognition	1	5	3.31	0.7841
Appreciation	1	5	3.91	0.61685
<b>Dependent variable</b>				

## 11. Correlation Between Variables

The relationship between many factors the determination of a link between the dependent and independent variables is conducted by correlation analysis (Cooper & Schindler, 2014). The correlational findings for the variables are displayed in the following table. Positively strong correlation was found between the base pay and job satisfaction ( $r = .742$ ,  $p .01$ ). Bonus and job satisfaction revealed a positive and moderately correlated connection ( $r = .665$ ,  $p .01$ ). Additionally, there was a moderate association between job satisfaction and promotion ( $r = .417$ ,  $p .01$ ), which was favorable. Similar to this, there was a moderately favorable association between the commission and job satisfaction ( $r = .593$ ,  $p .01$ ). Recognition and job satisfaction revealed a positive and weakly correlated connection ( $r = .393$ ,  $p .01$ ). The association between job satisfaction and appreciation was substantial ( $r = .713$ ,  $p .01$ ) and positive. According to the findings, there is a strong relationship between basic pay and job satisfaction. However, the relationship between recognition and job satisfaction is the weakest.

**Table 4.** The correlation between variables

Variable	JS	BS	B	P	C	R	A
Employee Job Satisfaction (JS)	1						
Basic Salary (BS)	.742**	1					
Bonus (B)	.665**	.504**	1				
Promotion (P)	.417**	.492**	.421**	1			
Commission (C)	.593**	.526**	.341**	.672**	1		
Recognition (R)	.393**	.421**	.441**	.516**	.332**	1	
Appreciation (A)	.713**	.452**	.613**	.487**	.557**	.542**	1

## 12. Conclusion

Distribution companies are operating on the concepts of just in time, data accuracy, good customer feedback, and operational effectiveness. In order to keep going on these concepts, satisfied employees are necessary for every sector of the operation. Retaining skills and a high-performance workforce are challenging today's human resource management. This study looks into the attitudes of workers at the Zalaryathar distribution company toward rewards and recognition in the workplace. The research's findings support the notion that extrinsic rewards and employees' job satisfaction are positively correlated. Additionally, there is a favorable correlation between intrinsic reward and job satisfaction among employees. The strongest correlation and best link are between basic pay. To increase job satisfaction, management have to think about synchronizing the base pay. Additionally, management recognition is crucial for boosting motivation and job satisfaction. Appreciation is the second highest correlation with job satisfaction in the finding. This means that the level of

satisfaction is improved when an employee does a certain good job and his management and coworkers admire and appreciate his work. Management should adopt new appreciation practices and shape culture to improve job satisfaction for stabilizing operation performance. Management should build a reward strategy in line with the organization's core values to improve the job satisfaction of employees who implement the organization's success.

**Acknowledgment:** My direct supervisor, Prof. Dr. Amiya Bhaumik, and co-supervisor, Dr. Midhunchakkaravarthy, both of Lincoln University College in Kuala Lumpur, Malaysia, have my sincere gratitude for providing me with this learning opportunity. My colleagues and superiors gave me advice and backed my proposal when I was preparing my paper, helping me to finish it. Second, I want to express my gratitude to Dr. DivyaMidhunchakkaravarthy's deputy dean for her generosity and support. Lastly, I want to express my gratitude to Myanmar Zarlyathar Co. and the management for supporting the data gathering procedure and approving the research.

## **THE EFFECT OF JOB SATISFACTION, EMPLOYEE LOYALTY, EMPLOYEE COMMITMENT ON LEADERSHIP STYLE IN STARTUP COMPANIES**

**Abstract:** *Using SmartPIS 3.2.9, researchers in the scientific community test their theory. One hundred workers employed by a service company in Yogyakarta were randomly selected to take part in this study. The researcher used the method of collecting until I by utilizing the side frame I ing. The series of validity and reliability tests were applied, respectively, to the Outer and Inner I modes of the SEMPI S research system. These tests are the research instruments used here. method to examine the data using route analysis and descriptive analysis. The following is a list of results that can be found in this research: The following assertions cannot be relied upon: (3) Employee commitment does not affect the leadership style of a leader; (1) Job Satisfaction has no effect on Leadership Style; (2) Employee loyalty has a big influence on Leadership Style; and (1) Job Satisfaction has no effect on Leadership Style.*

**Keywords:** *Job Satisfaction, Employee Loyalty, Employee Commitment, Leadership Style*

### **1. Introduction**

Intr Leadership style shows several forms of conceptualization, including how to delegate, make decisions, and how to participate in an organization for corporate goals. Somech (2005) defines leadership as someone who can make decisions together or show influence for togetherness within the organization so that they can determine where superiors and subordinates are positioned through the hierarchy. Thus, the focus of management has become the division of powers and structured decision-making. A leader's decision-making has been studied as a formal strategy to be directed to the group, where, in unimportant matters, group participation is considered relevant and influences group decisions (Mohammad et al. 2021). Participation in decision-making leads to increased social capacity, with decision

quality affecting employee motivation, quality of work life, work environment, and professional training in successful organizations (Chan 2019; Ghaffari et al. 2017; Lumbasi et al. 2016). Odoardi et al. (2019) state that organizational and individual outcomes are influenced by participatory decision making and this influence can be associated with the level of employee loyalty augmented. Decision quality is enhanced through employee participation in the decision-making process, as this helps supervisors develop insight into the core issues in problem situations. Several studies (Lythreatis et al. 2019) argue that this involvement increases the tendency of employees to follow managerial decisions with loyalty. Leaders value employees' opinions and perspectives and seek their input and suggestions (Rana et al. 2019; Khassawneh and Abaker 2022). Furthermore,

---

Corresponding author: Dodi Setiawan Riatmaja

leaders motivate their employees to develop learning through information acquisition, sharing, and connecting as well as seeking new opportunities (Benoliel and Barth 2017). Past and current research on leadership in organizations has discussed how the impact of leadership on employee job satisfaction (Shahab and Nisa, 2014), the influence of leadership on employee loyalty (Ntusikazi, 2017) and employee commitment (Alkahtani, 2015) to companies in industries that different. Most of the research on employee commitment through leadership has been conducted in large companies, but researchers assert that the development of companies should be seen differently from large organizations because they believe that in order to gain a deeper understanding of the culture within a company, a more unique approach is needed as a leader. (Szczepeńska and Kurowska 2016). Therefore, after a comparison of various leadership approaches, Long et al., (2016) discussed that there is a relationship between employee commitment to the organization and organizational leadership. Zafar et al. (2014), however, argues that increasing employee loyalty involves certain critical factors such as how employees feel when they think about their job, their perception of the organization they work for and their expectations of their job. Nidadhavalu (2018) tested Job Satisfaction as a variable for various forms of leadership and concluded that Transformational leadership has greatly influenced Employee Job Satisfaction. This long-established investigation has been refined at large-scale organizations, as there is a belief that SMEs, in contrast to large enterprises, need more assets to build a proper human administration framework.

In this ever-changing era, it is hoped that all companies, especially those engaged in the media and communications sector, will grow to be prosperous and expansive so that they can continue to operate effectively. To grow into a successful business, you want leaders

who are able to devise and execute plans that will produce the desired results. A business must have a leader, but it must also have access to reliable and knowledgeable human resources. It is critical for companies to recruit and retain skilled workers if they are to maintain their competitive advantage in today's rapidly changing corporate environment. Where, in the midst of unprecedented media developments, the potential to maximize morale and staff happiness can be found. In a service company in Yogyakarta, the problem is a lack of employee satisfaction and a lack of dedication to organizational success. Both of these factors contribute to a lack of productivity. Therefore, the management of service companies in Yogyakarta must pay attention to this matter: as a result, the company's performance becomes less good, and it is difficult to find competent staff.

## 2. Literature review

### 2.1. Leadership Style

Higher management leads may impact lower management's capacity to achieve their goals. It is possible to think of a leader's style as the pattern of action they make and the set of guiding principles that determine how they behave and the choices they make as a leader. In addition, the approach one takes to influence other people's actions is referred to as their leadership style. A person's level of success as a leader can be assessed, at least in part, from the extent to which his leadership style is able to motivate followers (Depitra, PS & Soegoto, 2018; Mattayang, 2019; Siti Nur Aisah, 2020; Suriyana, 2021).

The leadership style is I ah behavior which shows individuals who try to influence other people's behavior. A leader must adopt and use a leadership style that is good and right so that his influence can be felt by his subordinates or his children. The way a leader directs his team may influence the extent to

which the leader is able to inspire and encourage those who work under him. In accordance with (Sudirno & Utama, 2017).

There is an expectation that business leadership will have an advantage over its subordinate employees to motivate these employees to work harder towards company goals and maintain a high level of loyalty to the organization as a whole (Habib, et al., 2022). In running a business, the success or failure may be partly determined by looking at the leadership style of those in charge of the organization. It is the manager's responsibility to ensure that all tasks that fall under his jurisdiction are completed or progress is made. Take an example: (Batubara, 2020; Heriyono et al., 2021; Pujianto & Evendi, 2021; Sudiantini & Saputra, 2022; Sunarto, 2021). The speed of decision making, the ability to inspire those around them, the clarity of their communication, their connection with authority, and their willingness to take responsibility for the results of their actions are five indicators that can be used to determine style a leader according to Hasibuan and Meiyayu (2017). These are five factors that can be used to determine the style of a leader. This is in line with the research of Komariyah et al. (2021) titled "The Influence of School Head Leadership Style and Achievement Motivation on the Work Productivity of Kindergarten Teachers in Patebon District, Kendal Regency", which found that the leadership style of school heads has an effect on teacher output. Meanwhile, the research conducted by Utarindasari and Sitogata (2021) with the title "Analysis of the Influence of Leadership Style on Employee Motivation and Productivity" found that leadership style did not significantly influence the number of jobs done. Essay on an organization (Komariyah et al., 2021; Utarindasari & Silitonga, 2021; Zufrie, 2019).

Several researchers, such as (Mahaputra & Saputra, 2021), (Anas, 2020), and

(Mahaputra & Saputra, 2021), have studied various leadership styles (Sudiantini, 2020).

## 2.2. Job satisfaction

A productively optimistic outlook or emotional satisfaction in one's job can be considered as an important component of job satisfaction. Depending on how a person evaluates their previous job security experience and the tasks they have performed, a worker's job satisfaction can make them feel happy or positive. Job satisfaction, which translates to "worker satisfaction", is a favorable attitude toward the work being performed, and stems from the findings of an investigation into the work environment that apply to a particular activity. The results of this assessment instill a sense of satisfaction and pride in having contributed to the achievement of important goals related to this body of work (Latifah et al., 2020; Priansa, 2016a; Shaddiq et al., 2021; Suriyana, 2021).

Satisfaction at work, also known as job satisfaction, can be considered as a problem that affects the motivation and discipline of workers when they work. The feelings of satisfaction mentioned above in one's job extend to various kinds of interpersonal relationships, such as those with managers and co-workers, as well as with one's place of work, duties, and responsibilities. According to Priansa, there are a number of different metrics that can be used to measure job satisfaction. This metric includes 1) communication about work; 2) strong leadership; 3) effective organizational management; 4) development of results related to work; 5) supportive colleagues; and 6) a clear measure of success in work (Priansa, 2016).

However, according to Yuwono who was referred to by Spector at Badriyah, there is evidence that a person is satisfied with his profession (2015: 241). These benefits include financial compensation,

opportunities for advancement and recognition, adherence to business policies, and the development of friendships with other I employees.

There have been many studies conducted on the topic of job satisfaction in the past, such as (Sianipar, 2019), (Saputra & Mahaputra, 2022), and others ( Andrian et al., 2021).

**2.3. Employee Loyalty**

One way to evaluate employee commitment to their employer or organization is to see how diligently they try to do their job as well as possible for the employer or organization. According to the investigative findings of Va I entino and Haryadi (2016).

Following are the subcategories that make up employee loyalty: 1 ) Employee loyalty towards an organization or company ; 2) the loyalty of employees towards the leadership; and 3) employee loyalty to certain assignments. However, according to Jun Cai and Shin, there are signs of employee loyalty (2006). Mora I honesty and fortitude ; perseverance in the face of adversity ; self-sacrifice; the desire to take responsibility ; integrity and moral fortitude in the face of persecution.

In the past, several academics have looked at the topic of employee loyalty. Some of these studies are I'ah Anas (2019), Saputra et al. (2022), and (Sianipar, 2022).

**2.4. Employee Commitment**

According to Sopiah (2008: 155), commitment can be defined as a condition of being loyal to an organization and being ready to make additional efforts to help the group achieve its goals. When an employee gets what they want from their employer, their work motivation increases, and they experience fewer negative effects that arise when their job is challenging but their salary doesn't meet their needs, both of which can negatively impact an ability. Employees to

stay motivated at work. (Chantica Ange I iza, Ange I iza, Chantica, & Ange I iza, 2022). According to Kaswara and Santoso (2008), there are still markers of employee commitment. These signs are as follows: Improving one's abilities, as well as one's Self-Control, Accountability, and Loyalty. Previous research on employee commitment has been carried out by many researchers, such as (Pangkey et al., 2019) and others (Iksan et al., 2022).

**Figure 1.** Conceptual Framework

**3. Research methods**

In depth interview and quantitative research methods were used in this research (library research). Doing a study I iteratur on I ine, with Goog I e Scho I ar and Mende I ey as main sources, with main emphasis on theory and interdependence of journal factors is recommended. The need to display or evaluate large amounts of data is one of the most important reasons for conducting quantitative research. After the categorization of data into numerical forms is complete, this study aims to conduct trials of data collection methods using questionnaires.

I Path Analysis mode and Structura I Equation Mode I (SEM) based on Partia I analysis I east Square (PIS ) which was carried out with the SMARTP IS 3.2.9 program, this research tests the assumptions. A sample I method was applied, and 100 workers from service firms in Yogyakarta were randomly selected for this study. Testing the validity and reliability for the exterior (estimation) and inner (structural I) modes of SEMPI S derivatives there are several research techniques used in this

special investigation. Data analysis technique using descriptive and path analysis.

## 4. Results and discussion

### 4.1. Results

The discussion of this study will focus on the topic of human resource management. The debate will consider background material, problem statements, theoretical investigations, conceptual frameworks, and previous relevant research:

#### 1. Test of Validity and Reliability

Validity testing is the process of creating an environment in which one can accurately reflect the interdependence of a measure or analyze the findings of the instrument. When there is a match between the information obtained from the research and the events that actually occurred in the places studied, the research findings are considered reliable. According to the findings of a number of researchers (Hernikasari et al., 2022), this is indeed the case.

Dependability testing is a very useful method that has gained wide acceptance as a viable option for use in data collection. As stated oleh Hernikasari et al (2022).

the validity and reliability tests of the study are shown in Table 1 below. Bottom line: the following examples:

**Table 1.** Outer Model (Cross Loading Validity Discriminant)

Indicators	Variables			
	Job Satisfaction	Employee Loyalty	Employee Commitments	Leadership Style
EC3	0.176	0.203	1.000	0.253
EL3	0.187	0.478	0.082	0.162
EL4	0.158	0.0987	0.203	0.667
JS1	0.686	0.137	0.307	0.149

JS2	0.869	0.153	0.019	0.227
LS2	0.235	0.648	0.269	0.980
LS4	0.246	0.624	0.227	0.987

If we look at table I above which displays these I ai cross readings, we can draw the conclusion that the cross I loadings associated with certain indicator items I are greater than those associated with variable I I ain. Comparable to variable I Employee Commitment which has I ai cross- I loading I is greater than variable I Job Satisfaction and Employee Loyalty, as well as Leadership Style. Consequently, the findings of this examination are accepted on a biased basis towards certain groups.

**Table 2.** Composite Reliability

Variables	Composite Reliability	Description
Job Satisfaction	0.785	High Reliability Iity
Emp Ioyee Ioya I ty	0.727	High Reliability Iity
Emp Ioyee Commitment	1.000	High Reliability Iity
I leadership Style I e	0.992	High Reliability Iity

Based on table I above, it shows that the variables I Job Satisfaction, Employee Loyalty, Employee Commitment and Leadership Style have these results which can be stated as high reliability.

#### 2. Evaluate I Structural Mode I ( Inner Mode I )

Evaluation of structural mode I in SEM with PIS was carried out in the R Square test (R 2 ) and the Q-Square Test (Q 2 ) to I a I I ui estimated the path coefficient.

#### Determination Test (R-Square)

In this study, the analysis aims to assess whether there is a magnitude of the construct of endogenous variable I to exogenous

variable I against the results of the tests that have been carried out.

**Table 3.** Inner Mode I ( R-Square Test)

Variable I e	R Square (R <sup>2</sup> )	Adjusted R Square
I leadership Style I e	0.457	0.432

Based on table I above, it shows that the endogenous variable I (Leadership Style) with an I ai R Square value of 0.457 means that the variable I job satisfaction (X1) I oyalty (X2) and commitment (X3) is able to explain the level of leadership style (Y) of 45.7%. Where 54.3% is influenced by o I eh variable I I ain who was not te I it.

*Q-Square Test (Q 2 )*

The Q Square test refers to the value I ai Goodness of Fit (GoF) Index, based on the value I ai Stone Geisser Q2 criteria. If ni I ai Q Square is above 0, then it can be said that the research mode I built has predictive reliability, whereas if I a ni I ai Q-square < 0 (no I ), then it shows that the mode I lack predictive response. (Ghozali & Hengky, 2015).

**Table 4.** Inner Model (Q-Square Predictive Relevance)

Variables	Q Square (Q <sup>2</sup> )
Leadership Style	0.426

Based on the results of data processing, the I eh value was obtained in Q 2 on the Leadership Style variable I of 0.426 which was measured using the processed measurement using the Smart PIS 3.2.9 application, so that this was obtained I ai Q-Square as follows:

$$Q\text{ Square} = 1 - (1 - Q\ 2) (1)$$

$$Q2\ \text{Leadership Style} = 1 - (1 - 0.426) = 1 - 0.574 = 0.426$$

Based on the results of the above calculations, it can be seen that the value of I ai at the Q Square of the Leadership Style is 0.426. The I ai value shows the percentage of this research, namely the contribution of the Variable I Leadership Style (Y) is I ah of 42.6%. Meanwhile, the other 57.4% of the first results were outside of the first results of this research. This can be stated that the research can be stated to have good goodness of fit.

After I have carried out the test, it is continued by carrying out significance testing or bootstrapping which gives a significant value of I ai for each indicator of the dependent variable I construct namely Job Satisfaction, Employee Loyalty and Employee Commitment which can be seen in the image below:

**Figure 2.** Outer Model

3. Analysis Result of Hypothesis Test

The output R-Square, Parameter Coefficient, and T-Statistics are used in hypothesis testing, which is carried out using the findings of the Inner Mode I test. It is possible to judge whether a hypothesis should be accepted or rejected by looking at the significance I ai that exists between the chains, the T-statistics, and the probabilities I ai values. In this particular investigation, a T-statistic greater than 1.96 is used as a general principle. With a significance threshold of p 0.05 (5%), and a statistically significant positive I ai for the beta coefficients, the I result is I ah as follows.

**Table 5.** Hypothesis Testing

<i>hypothesis</i>	<i>Variables</i>	<i>T Statistics</i>	<i>P Value</i>	<i>Description</i>
H <sub>1</sub>	Job Satisfaction -> Leadership Style	1,375	0.177	No effect and not significant
H <sub>2</sub>	Employee Loyalty -> Leadership Style	10,058	0.000	Influential and significant
H <sub>3</sub>	Employee Commitment -> Leadership Style	1,483	0.153	No effect and not significant

Based on table 5 above, it can be interpreted that:

Hypothesis 1 is rejected where  $t_{\text{statistic}} 1.375 < 1.98$  and  $p_{\text{value}} 0.177 > 0.05$  means that job satisfaction has no effect and is not significant on leadership style.

Hypothesis 2 is accepted where the  $t$  statistic is  $10,058 > 1.98$  and  $p_{\text{value}} 0,000 < 0,000$  means that Employee Loyalty has a positive and significant effect on Leadership Style.

Hypothesis 3 is rejected where the  $t$  statistic is  $1,483 < 1.98$  and  $p_{\text{value}} 0.153 > 0.05$  which means that employee commitment has no effect and is not significant on leadership style.

## 4.2. Discussion

### *The Effect of Job Satisfaction on Leadership Style*

There is no correlation between the degree of employee happiness and the leadership style adopted by the company. Leadership Type Has Less Influence on Employee Happiness at Work When the company's management does not need to take certain actions related to Leadership Style with variable Job Satisfaction indicators, namely: Awards and Promotions. two different types of employee rewards that are possible in Indonesian. Rewards are a kind of praise given to staff employees who have worked the hardest, while Promotions are when jobs with a higher rank in the organization are given.

### *The Effect of Employee Loyalty on Leadership Style*

Loyalty on the part of workers has a positive and significant impact on the way leaders lead. To develop employee loyalty through charismatic leadership, company management is required to perform the following tasks: Employees who have contributed their time, energy, and creativity for company goals must be recognized in two different ways: 1) employee dedication, where appreciation is shown; and 2) get promoted, where someone whose initial job is honest, fair, and effective is given a higher position in the company. The employee should be thanked in both ways.

### *The Effect of Employee Commitment on Leadership Style*

The commitment of the employees does not significantly influence the leadership style. because there is no positive benefit from increasing employee commitment to the leadership style. O I uh because of that, the company's management team does not need to take extra action to change the leadership style of its workers. This is because the employee engagement indicator that is subject to I with Employee Commitment is used to assess employee commitment. The first is referred to as "dissip I in", where organizational rules must be obeyed. The second is referred to as "capacity building", in which a person must develop his skills and knowledge in order to be able to compete in the sector of his choice.

## 5. Conclusion

C Based on the hypothesis of the research results I above and the discussion, the researchers determine the following conclusions:

First of all, the level of happiness at work has little effect on leadership style. This illustrates that the leadership style does not change regardless of the amount of money or benefits earned by employees to achieve the desired level of job satisfaction (measured by

the Job Satisfaction Scale ).

Loyalty on the part of workers has a positive and significant impact on the way leaders lead. This shows that a leader who has a high level of employee loyalty also has a high level of leadership quality.

The level of dedication shown by employees is not important and has nothing to do with leadership style. This shows that the restrictions imposed by corporations do not affect the way workers handle their work.

## LIAISON BEHAVIOR IN IMPROVING EMPLOYEE PERFORMANCE: THE CASE OF FINANCIAL INSTITUTIONS IN INDONESIA

**Abstract:** *This study examines the relationship between employee engagement and goal orientation towards competence and the relationship between competence and employee performance in financial institutions. Questionnaires were given to several financial institutions in Aceh, North Sumatra, and Riau. Selection of financial institutions as a place for distributing questionnaires, based on the similarity of their business products. The similarities such as mortgage marketing, multipurpose, and investment. These three regions are the most central provinces and have high levels of trade in western Indonesia. The sampling technique was carried out purposively based on specific criteria for the respondents. Partial Least Square carried out the data analysis technique. This study provides recommendations on practices and policies in producing employee productive work behavior in improving organizational performance. Another unique aspect of this research is that employees need to think and act out of the box to increase their competencies to become superior employees. As a result, employees still get high ratings from the leadership.*

**Keywords:** *employee involvement; goal orientation; competence, employee performance*

### 1. Introduction

The world of work today has changed both in the nature and form of the work done. These changes occur due to innovation, knowledge development, and increased competition (Brown et al., 2003; Nilsson & Ellström, 2012). Today's world of work is characterized by the emergence of complexity, uncertainty, and insecurity (Kalleberg & Vallas, 2017).

In the face of today's dynamic state of the world of work, the organization seeks to be precise in managing its human resource practices. This is due to the practice of human resource management as a strategic tool in

improving organizational performance by increasing the knowledge, skills, and abilities of employees (Bates & Chen, 2004; Clardy, 2008). These three aspects, if appropriately managed, can create organizational excellence (Sengupta et al., 2013).

The practice of human resource management has undergone a paradigm shift in the last decade. Human resources are currently required to support achieving organizational goals (Armstrong & Baron, 2005). Achievement of goals is done by aligning the activities and strategies of the organization (Holbeche, 2016).

---

Corresponding author: Budi Alamsyah Siregar  
Email: [siregarbas@upmi.ac.id](mailto:siregarbas@upmi.ac.id)

To create alignment of human resource activities with organizational strategy, a working system based on the high performance of employees has emerged (Takeuchi et al., 2009). High-performance-based work systems emphasize creating strategic alignment with external needs to improve employee behavior, attitudes, and abilities that increase organizational excellence (Miao et al., 2014).

This article has the scope of human resource management to fill research gaps in explaining the relationship between behavior in improving employee performance. This study places the relationship between employee engagement, goal orientation, and competence to improve employee performance.

Based on the results of previous studies, empirically, there are still various research results explaining the impact of human resource development on performance in organizational analysis (Thang et al., 2010). The results showed that human resource management practices effectively increased employees' motivation, knowledge, attitudes, abilities, and skills in influencing work behavior (Shin et al., 2018).

However, the results of studies that explain the practice of human resource management in encouraging work behavior are rare (Liu et al., 2017). This is because some of the existing studies provide discussion on aspects of personality (Jafri et al., 2016; Pan et al., 2018), work climate (Hunter et al., 2007), organizational culture (Martins & Terblanche, 2003), and leadership (Gu et al., 2015; Liu et al., 2012).

Having superior human capital is the hope of the organization in winning the competition. Various ways have been done to obtain superior human capital, including the employee recruitment process (Delery & Roupni, 2017; Molloy & Barney, 2015), training and capacity development (Crook et al., 2011; Delery & Roupni, 2017). However,

in practice, the work implementation gives preliminary results (Crook et al., 2011). Therefore, it is an essential task of the organization to create human excellence that supports the organization's goals.

This article provides a discussion on employee involvement in encouraging employee work behavior. The expected work behavior of the organization is an increase in organizational performance arising from increased employee performance. Kim et al. (2010) explained that organizational performance is influenced by employee performance at work (Esteban-Lloret et al., 2018).

Employee involvement is a construction of motivation characterized by the emergence of enthusiasm, dedication, and absorption (Schaufeli et al., 2002). Enthusiasm, related to energy and mental endurance at work, is marked by a willingness to invest time and effort in work. Dedication explains the involvement of employees in work with the emergence of inspiration, pride, and high enthusiasm. Absorption can be interpreted in the aspect of employee concentration in carrying out work. The practice of employee involvement is a management approach that encourages employees to achieve overall organizational goals (Benson et al., 2013). This participation, in turn, encourages more complicated and more responsible work behavior (Ghitulescu, 2013; Yang, 2012).

The findings of this research phenomenon agree with (Crook et al., 2011) that human capital will impact the organization if employees possess competencies. Therefore, this article aims to examine the factors that can encourage employee competence at work. This study places employee engagement and goal orientation as predictors of driving employee competence on performance as a driving factor.

This study, enriching the literature, improves performance in several ways. First, the diversity of employees, such as education,

gender, has a role in employee performance (Østergaard et al., 2011). However, this diversity may be more suitable in the context of performance in the financial sector where face-to-face negotiations with customers (SUMA & BUDI, 2021). Second, this study closes an existing research gap in exploring human resource management practices by examining engagement and goal orientation. Third, this study views that to create organizational resilience during the current COVID-19 pandemic, an active role for employees is needed in creating business sustainability. This study examines the model based on empirical data from financial institutions in Indonesia.

The definition of employee involvement, Kahn (1990) says as employee self-utilization in carrying out work with an emphasis on physical, cognitive, and emotional aspects. Another definition explains that employee involvement is related to expressing employees' attitudes in accepting work roles (Christian et al., 2011; Harter et al., 2002; Rich et al., 2010).

In work, employees have a goal orientation to be achieved to show their abilities. The definition of goal orientation itself is explained by Schunk (2012) as a form of work behavior that is based on goals and focuses on achieving work performance (Maehr & Zusho, 2009). Meanwhile, Pintrich et al. (2003) describe goal orientation as an integrated pattern of individual beliefs that explain the reasons for engaging in work (Ames, 1992).

## 2. Literature review and hypotheses

This study provides a discussion on aspects of employee involvement in the implementation of work in the organization. Employee engagement is a new notion in organizational behavior and has been researched interest in recent years. This attraction arises because

employee involvement affects the company's overall performance. This is because employee engagement is defined as a high emotional connection that employees feel towards their organization. As a result, these feelings influence employees to exert more significant effort in doing their jobs (Fisher, 2010; Wallace et al., 2016). The grand theory of employee engagement is motivation. Motivation is defined as a process related to the formation of intensity, direction, and individual persistence in achieving goals (Pinder, 2014).

### 2.1. Employee engagement and performance

The concept of employee engagement was introduced to employee corporate relations, which is significantly related to the employee's emerging need for opportunities conducive to learning in organizations (Vigoda-Gadot et al., 2013). Employee involvement, related to the level of commitment to the organization and its values. When an employee is involved, he/she realizes his/her responsibility in business goals and motivates colleagues to achieve organizational success.

Based on the results of previous research, there are differences of opinion in the study of the impact of employee involvement on performance. First, research shows a significant effect of employee engagement on employee performance (Anitha, 2014; García et al., 2019). Second, employee involvement has no significant effect on employee performance (Qi & Wang, 2018).

*H<sub>1</sub>*: Employee involvement has a positive and significant effect on performance

### 2.2. Goal orientation and performance

Goal orientation is conceptualized as

attributes and traits of employees in a relatively stable form (Colquitt & Simmering, 1998; Payne et al., 2007). Several studies show that goal orientation changes the life stage transitions of organizations and employees (de Lange et al., 2010; Duchesne et al., 2014).

Based on previous research conducted by Van Yperen and Orehek (2013), the title Goal Achievement in the workplace: conceptualization, prevalence, profile, and outcomes. The results of his research indicate that the willingness of employees to achieve work goals fosters motivation that affects the achievement of their performance.

*H<sub>2</sub>*: Goal orientation has a positive and significant effect on performance

### **2.3. Employee engagement and competence**

Research on the impact of employee involvement on the achievement of organizational success is now starting to be more widely carried out than before. This is because organizations are currently required to create an influential employee role in winning the competition and achieving goals (MacLeod & Clarke, 2009; Xanthopoulou et al., 2009). Shuck and Wollard (2010) explain the importance of employee involvement, namely as a form of cognitive, emotional state that encourages the emergence of employee behavior directed towards achieving organizational goals. In their research, Medhurst and Albrecht (2011) say that engagement is positively related to organizational citizenship behavior, performance, psychological well-being, and efforts to improve abilities (Alias et al., 2016; Shuck et al., 2011).

*H<sub>3</sub>*: Engagement has a positive and significant impact on competence

### **2.4. Goal orientation and competence**

Goal orientation theory suggests that individual goal orientation regulates affective, behavioral, and cognitive motivational processes (Dweck, 2002). Individuals have a strong orientation, view competence as a malleable quality, and pursue the goal of increasing competence (Button et al., 1996; Dweck & Leggett, 1988). They attribute setbacks to inadequate efforts or ineffective strategies. This is because they attribute failure or setbacks to a lack of their abilities; they tend to choose more manageable tasks or exert less effort (Chen et al., 2000; Dweck, 1986; Dweck & Leggett, 1988).

Radosevich et al. (2004) meta-analysis showed that the adequacy of one's ability is not always dysfunctional (M. Wang & Takeuchi, 2007). Previous research showed different results. First, the results indicate that goal orientation significantly affects competence (Chughtai & Buckley, 2011; Gong et al., 2017; Latham et al., 2016). Second, the results indicate that goal orientation does not affect employee competence (Fang et al., 2019).

*H<sub>4</sub>*: Goal orientation has a positive and significant impact on competence

### **2.5. Competence and performance**

Bell (2007) explains that competence, as a form of ability, is needed to complete work effectively. Competence is a form of capacity owned by employees that serve as human capital in achieving goals. Hameed and Waheed (2011) explains that competence relates to aspects of knowledge, skills, and character employees possess in doing work.

Becker and Huselid (2010) said that human capital is a set of knowledge and productive

abilities possessed by employees. Previous research shows that employee competence has a significant effect on improving performance (T.-Y. Kim & Kim, 2013; Rahimić et al., 2012; Y. Wang & Haggerty, 2011).

*H<sub>5</sub>*: Competence has a positive and significant effect on performance

### 2.6. The effect of competency mediation variables on performance

The concept of employee involvement is applied to employees to focus on participating in organizational activities. Hackman (1980) explain that employee involvement is closely related to job design given to employees by placing a lot of autonomy and decision-making authority. This activity aims to foster the meaning and responsibility of employees towards work. Employee engagement can occur effectively if employees have the same understanding of decisions, act on them, and access various information sources needed to take practical actions. There are opportunities to increase knowledge that aims to develop effectiveness in work, and there is an appreciation for its improvement. Work achieved (Wallace et al., 2016).

Based on previous research shows that there is a significant influence between employee engagement on performance through competence (Wallace et al., 2016; Zatzick & Iverson, 2011). Based on the description above, the hypotheses proposed in this study are:

*H<sub>6</sub>*: Employee involvement affects performance through competence

### 2.7. Concept of achieving goals

Based on the concept of achieving goals, it is explained that employees who have goals at

work have a dominant focus on developing competence and work results (Fang et al., 2019). This is following the opinion expressed by Dweck (1986) that performance-oriented employees will be more concerned with proving themselves and avoiding failure. In other words, performance-oriented employees will try to pursue the best evaluation results from work done.

Goal orientation is an approach to the ability of employees to define, approach, experience, and respond to the conditions to be achieved in the workplace (Van Yperen & Orehek, 2013). Ames (1992) says that goal orientation is a fundamental goal regarding goal behavior for achievement. In work, employees have an important goal to be achieved career achievement. Career success achieved by employees is a shared responsibility with the organization. This is because employees' success ultimately contributes to organizational success (Ng & Earl, 2008).

Based on the results of previous studies, there are differences in results in explaining the effect of orientation on performance through competence. First, the results of research that show that there is an influence of goal orientation on performance through competence (Osagie et al., 2018; van Dierendonck & van der Gaast, 2013). Second, research shows no significant effect (Fang et al., 2019). Based on this description, the research hypotheses are:

*H<sub>7</sub>*: Goal orientation has an impact and is significant on performance through competence

## 3. Methodology

In answering the problems that have been stated above, survey activities were carried out in this study. Through the survey, questionnaires were distributed to all

employees of four financial institutions in three regions of the Indonesian province, namely Aceh, North Sumatra, and Riau. The selection of the four financial institutions that became the object of research was due to the similarity of the business activities carried out. The similarities are the marketing of homeownership loans, multipurpose loans, and business loans.

In total, the total population of employees from the four financial institutions is 275 employees consisting of the departments of marketing, finance, general affairs, and credit collection. Determination of the sample in this study, using purposive sampling method with criteria including employees who work in the marketing department and permanent employees. Based on the predetermined criteria, the researcher finally distributed the questionnaires by visiting directly according to the agreed schedule.

Finally, the researcher distributed a total of 175 questionnaires to employees based on the suitability of the number of each employee in each financial institution. A total of 175 questionnaires were distributed, 165 were completely filled out, which could be processed and analyzed. This study uses four variables, namely employee involvement, goal orientation, competence, and performance. The indicators/questionnaire items used are based on:

1. Employee engagement (EE) measured at the individual level consists of 6 items adopted from Mackay et al. (2017) (e.g., actively participates in meetings discussing work improvement; employee activity assessment is always carried out; involved in providing suggestions for improving work in workgroups; management actively holding meetings to discuss organizational development; bonuses are given based on work performance; employees have responsibility for the work given).
2. Goal orientation (GO) consists of 6 items, adopted from Elliot and McGregor (2001) (e.g., hope to gain broader knowledge; understanding in the field of work; belief in gaining knowledge from work done; necessity to be able to fully understand the work; ability to show a professional attitude; belief in having more performance than coworkers).
3. Competence (Com) consists of 5 items, which were adopted from Spencer et al. (2008) (e.g., job responsibilities in accordance with the competencies possessed; employees are required to show the best value of work competence; work roles are in accordance with the competencies they have owned; integrity assessment of the implementation of the work as a reference; the existence of training provided to improve competence).
4. Employee performance (EP) consists of 5 items, which were adopted from Williams and Anderson (1991) (e.g., involvement in the implementation of work; level of job completion; level of fulfillment of job responsibilities; ability to meet formal requirements in doing work; level of concentration in completing the work).

The instrument for measuring respondents' answers uses a 5-point Likert scale (scale 1 = strongly disagree, up to a scale of 5 = strongly agree). To consider the causal relationship in the model developed above, data analysis was carried out using the component-based structural equation modeling technique, the partial least squares method (PLS) developed by Wold (1973). The results of the validity and reliability test concluded that all items and variables were valid and reliable. The results of the Goodness of Fit (GoF) model in

this study have also met the requirements.

## 4. Result

### 4.1. Characteristics of respondents

The results of data processing showed that the total number of Man employees was 99 employees (60%), and Woman employees were 66 employees (40%). Based on the education level of employees, 28 employees with Diplomas (17.0%), 113 employees with Bachelor's degrees (68.5%), and 24 employees with Master's degrees (14.5%). Meanwhile, in the credit business activities of financial institutions, the results showed that 59 businesses were oriented to small and medium business loans (35.8%), oriented to large companies' loans were 106 businesses (64.2%). Meanwhile, based on assets owned by financial institutions, it shows that financial institutions with assets of 3 Billion are 46 institutions (27.9%), assets of 5 billion are 90 institutions (54.5%), and those with assets of > 5 billion are 29 institutions (17.6 %). The following table 1 below will be explained in detail.

In the next stage, the researcher conducted a cross-analysis based on the characteristics of the respondents. The results of data processing, it was found that there were 16 Man employees with Diploma education (9.70%), having Bachelor's degrees as many as 67 employees (40.61%) and 16 employees holding Master's degrees (9.70%). Meanwhile, for Woman employees who have a Diploma degree, as many as 12 employees (7.27%), having a Bachelor's degree as many as 46 employees (27.87%) and who have a Master's degree as many as eight employees (4.85%).

The results of data processing by linking gender to business characteristics show that the number of male employees who market credit to small and medium enterprises is 26 employees (15.75%), and to market credit to

large companies is 73 employees (44.25%). Meanwhile, the number of female employees who market credit to small and medium enterprises is 33 employees (20%) and 33 employees in large companies (20%).

Based on the number of assets owned by financial institutions, it shows that the number of Man employees for 3 Billion assets is 36 employees (21.82%), for 5 Billion assets as many as 44 employees (26.70%) and for assets > 5 Billion as many as 19 employees (11.58%). Meanwhile, for Woman employees, there are ten employees for 3 billion assets (6%), 5 billion employees for 46 employees (27.90%), and ten employees for assets > 5 billion (6%). Data processing by comparing education to business characteristics shows that employees with Diplomas market SME business loans as many as five employees (3%) while marketing loans to large companies as many as 23 employees (13.94%). Employees with a Bachelor's degree market credit to SME as many as 47 employees (28.50%), and too large companies as many as 66 employees (40%). Meanwhile, for employees with a Master's degree, credit is targeted at SMEs as many as seven employees (4.26%), and in large companies as many as 17 employees (10.30%).

Based on data processing, by comparing the level of education to the assets of financial institutions. The results of the analysis show that there are 16 employees with Diploma degrees with assets of 3 Billion (9.70%), with assets of 5 Billion financial institutions as many as nine employees (5.45%) and with assets > 5 Billion as many as three employees (1.82%). Employees who have a Bachelor's degree, with assets of 3 Billion as many as 17 employees (10.30%), with assets of 5 Billion as many as 74 employees (44.85%), and with assets > 5 Billion as many as 22 employees (13.33%). Finally, there are 13 employees with a Master's degree with assets of 3 Billion (7.88%), with assets of 5 Billion as many as seven employees (4.24%), and assets > 5

Billion as many as four employees (2.43%).

#### 4.2. Validity and reliability test

Hair et al. (2006) mentions that all constructs have size errors, even including variable indicators. Therefore, it is necessary to test the theoretical construction of each variable empirically. The variable indicator is said to be valid if it has an outer loading value  $> 0.5$ . Meanwhile, the indicator is said to be reliable if it has a composite reliability value  $> 0.7$ .

Based on the results of the validity, it shows that the employee engagement (EE) variables all indicators are declared valid. For the goal orientation variable, 4 (four) were omitted because they were invalid. For the competency variable, 1 (one) indicator is not valid. Meanwhile, for the job performance variable, 3 (three) indicators are not valid. The following is in Table 2, an explanation of the results of the validity and reliability tests.

**Table 2.** Respondents Characteristics

Variable	Outer Loading	Remarks
<b>Employee Engagement (EE)</b>		
Actively participates in meetings discussing work improvement	0.917	Valid
Employee activity assessment is always carried out	0.903	Valid
Involved in providing suggestions for improving work in workgroups	0.898	Valid
Management actively holding meetings to discuss organizational development	0.917	Valid
Bonuses are given based on work performance	0.904	Valid
Employees have responsibility for the work given	0.887	Valid
<b>Goal Orientation (GO)</b>		
Necessity to be able to fully understand the work	0.863	Valid
Belief in having more performance than coworkers	0.933	Valid
<b>Competence (COM)</b>		
Employees are required to show the best value of work competence	0.910	Valid
Work roles are in accordance with the competencies they have owned	0.904	Valid
Integrity assessment of the implementation of the work as a reference	0.924	Valid
The existence of training provided to improve competence	0.921	Valid
<b>Employee Performance (EP)</b>		
Involvement in the implementation of work	0.929	Valid
Level of job completion	0.914	Valid

After testing the validity of the indicators, the next step is to perform a composite reliability test. As a requirement in the composite reliability test, the composite value of the latent variable is  $> 0.7$ . Based on the test results, it was found that the composite value of variable reliability  $> 0.7$ . So it can be concluded that the questionnaire used in this study was reliable and consistent. Following Table 3, the results of the composite reliability test will be explained.

**Table 3.** Composite Reliability Test Results

Variable	Composite Reliability	AVE
Employee Engagement (EE)	0.953	0.837
Goal Orientation (GO)	0.964	0.818
Competence (COM)	0.918	0.849
Employee Performance (EP)	0.893	0.808

### 4.3. Inner model tests and hypotheses

The internal model or structural model used in this study is then evaluated based on the parameter value of the path coefficient of the relationship between latent variables (see Figure 1).

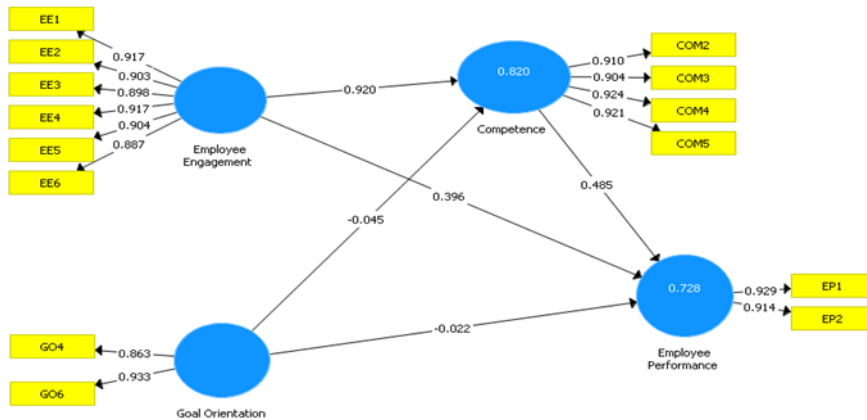

Figure 1. Path Coefficient and Hypothesis Testing

After testing the suitability of the model, it is possible to test the hypothesis. The basic hypothesis is made by comparing the magnitude of the t-table with the t-count at alpha 0.05 (5%) = 1.96. If the t-table is smaller than alpha 1.96 then the hypothesis is not accepted or rejected, and conversely if the t-table > 1.96 then the hypothesis is accepted or there is a significant effect between the two variables. The test results of the inner model in Table 4 show that all the relationships between the inner variables are significant at 0.05. This means that all hypotheses are accepted.

Employee Involvement (EE) has a significant effect on Employee Performance (EP) with a path coefficient of 0.396 and a value of  $t = 3.765$  (significance 0.000 less than 0.05). Employee Engagement (EE) will encourage an increase in Employee Performance (EP) The first hypothesis is accepted. Goal Orientation (GO) has no significant effect on Employee Performance (EP) with path coefficient -0.022 and  $t$  value = 0.460 (significance 0.645 greater than 0.05). Goal Orientation (GO) does not encourage an increase in Employee Performance (EP) The second hypothesis is rejected. Employee Involvement (EE) has a significant effect on

Competence (COM) with a path coefficient of 0.920 and a value of  $t = 52.790$  (significance 0.000 less than 0.05). Employee Involvement (EE) encourages an increase in Competence (COM) The third hypothesis is accepted. Goal Orientation (GO) has no significant effect on Competence (COM) with path coefficient -0.045 and  $t$  value = 1.316 (significance 0.189 is greater than 0.05). Goal Orientation (GO) does not encourage an increase in Competence (COM) The fourth hypothesis is rejected.

Competence (COM) has a significant effect on Employee Performance (EP) with a path coefficient of 0.485 and a value of  $t = 4.646$  (significance 0.000 less than 0.05). Competence (COM) will encourage Employee Performance (EP) The fifth hypothesis is accepted. The next step is to test the hypothesis of the indirect impact of the mediating variable Competence (COM). First, the predictor variable Employee Engagement (EE) has a significant effect on Employee Performance (EP) through Competence (COM) with a path coefficient of 0.446 and a value of  $t = 4.607$  (significance 0.000 less than 0.05). Employee Engagement (EE) drives Employee Performance (EP) through Competence (COM) Hypothesis six

is accepted. Second, the predictor variable Goal Orientation (GO) has no significant effect on Employee Performance (EP) through Competence (COM) with path coefficient  $-0.022$  and  $t$  value = 1.252

(significance 0.211 greater than 0.05). Goal Orientation (GO) encourages Employee Performance (EP) through Competence (COM) Hypothesis seven is rejected.

**Table 4.** Inner model test result

Hypo thesis	Path	Original Sample (O)	Sample Mean (M)	Standard Error (STERR)	T Statistics ( O/STDEV )	Sig.
1	EE -> EP	0.396	0.398	0.105	3.765	0.000
2	GO -> EP	-0.022	-0.020	0.048	0.460	0.645
3	EE -> COM	0.920	0.920	0.017	52.790	0.000
4	GO -> GOM	-0.045	-0.046	0.034	1.316	0.189
5	COM -> EP	0.485	0.482	0.104	4.646	0.000
6	EE -> COM -> EP	0.446	0.444	0.097	4.607	0.000
7	GO -> COM -> EP	-0.022	-0.022	0.018	1.252	0.211

## 5. Conclusion

The results of this study prove that employee engagement behavior can improve employee performance which in turn improves the organizational performance of financial institutions. Financial institutions are fully aware that currently, they are required to create employee effectiveness and efficiency. This is due to the impact of the COVID-19 pandemic, which has affected income. Therefore, to be able to cover expenses, it is necessary to select the best employees who can help the organization.

Based on the description above, the selection of the best employees by the organization is also strict. As the basis for the assessment is the magnitude of the performance impact generated by the employees themselves. Therefore, the role of employees in work engagement is needed by the organization. The results of this study, as well as strengthen the findings of previous studies that employee involvement can improve employee performance (Anitha, 2014; Yang, 2012).

However, different results were obtained that goal orientation has no effect on employee performance (Lim & Shin, 2020), and on

employee competence (Fang et al., 2019). These results indicate that when changes in responsibilities and work environment affect the goals to be achieved.

During the current uncertain COVID-19 pandemic, financial institutions have shifted their focus to the aspect of collecting customer installment payments rather than selling credit. This change eventually causes employees to become confused and pessimistic about the achievement of their personal goals. This usually happens when marketing employees successfully process credit, customers receive sales incentive money.

However, the current difficult situation has resulted in financing institutions making efficient spending of incentives. As a final impact, it causes a decrease in employee goal orientation in doing work. There is no impact of goal orientation on performance and competence because employees experience a high level of stress from the given workload (Fang et al., 2019). So that finally raises the behavior of employees who are not motivated in doing work.

As a result of changes in business strategies carried out by financial institutions, it requires employees to be able to improve their

competencies. In this study, it is shown that employee competence has an effect on the performance produced by employees. In other words, these results agree with research conducted by (T.-Y. Kim & Kim, 2013; Rahimić et al., 2012; Y. Wang & Haggerty, 2011). This also shows that competence aims to form superior human capital owned by financial institutions (Becker & Huselid, 2010).

The advantage of human capital owned by financial institutions is the ability of employees to carry out new roles and responsibilities from the work they do. As explained above, the current business strategy carried out by financial institutions is trying to obtain customer installment payments. Therefore, employees are expected to have the ability to negotiate, seduce and control customers to be able to make loan installment payments on time.

In building the competence of employees who are ready to change jobs, it is necessary to have the desire of employees to be involved in work. It is intended that the involvement of employees in work will provide additional knowledge of employees on other aspects of work, in this study, where employees of the marketing department are required to be able to collect customer credit. Collecting customer credit itself is not the responsibility of the initial marketing department. However, due to the COVID-19 pandemic, where marketing is low, and customer credit arrears are high, employees are directed to the billing sector. On the other hand, these activities will

have an impact on the emergence of competence from within employees through additional knowledge (Wallace et al., 2016).

This research contributes to strengthening theory and science about the need to bring up targeted employee work engagement behaviors, strengthening competencies, and creating an increase in employee performance behavior in the face of the COVID-19 pandemic so that ultimately it can improve the business performance of financial institutions. Effectiveness in the management of human resources must be directed at achieving organizational goals.

This research also provides practical implications for the assumption that creative and innovative employees are essential and needed by organizations in winning the competition. This is because employees who can effectively optimize their competencies will be unique, rare, and valuable to the organization. Employees carry out this effort in order to survive and obtain more value than other employees. The need for financial institutions to have superior and skilled employees is a challenge for employees to prove the quality of their behavior in carrying out their work. This is inseparable from the assessment of employees' work based on the achievement of the resulting performance. Leaders of financial institutions must also create support for employees to increase the desired work results. In the end, the work of these employees will impact the viability of the financing institution in the future.

## **PRODUCTIVE WAQF EMPOWERMENT MODEL CONTRIBUTION BY THE WAQF AGENCY INDONESIA SOUTH KALIMANTAN AGAINST THE DEVELOPMENT OF WAQF**

***Abstract:** Waqf is a source of state income with great potential to empower the Islamic economy. The contribution of the productive waqf empowerment model cannot be separated from the supervision of the Indonesian Waqf Board. Supervision at the provincial level is supervised by the Provincial Indonesian Waqf Board as an independent institution in charge of empowering the productive waqf. In this study, the supervisory process carried out by the Indonesian Waqf Board in South Kalimantan is focused on the contribution of the productive waqf empowerment model by the Indonesian Waqf Board, South Kalimantan to the development of the Islamic economy. The purpose of this research is to find out how the contribution of the Indonesian Waqf Board and the implementation of the empowerment model applied by the Indonesian Waqf Board to the Islamic economy. This is a descriptive research with a sociological and normative approach. The technique in collecting data was through observation, interview, documentation and triangulation with the determination of informants through purposive snowball sampling. The results of this research showed (1) the model of waqf for the development of building in the form of development of facilities and infrastructure, and (2) the model of waqf for business development including in the sectors of agriculture, livestock, and business units. Those two models were then related to the management including investment management and management of the distribution of benefit distribution of productive waqf. The Management of Indonesia Waqf Board, South Kalimantan was by implementing the Human Resources empowerment with the supervision to the Nazhir based upon the law of waqf, sharia economic system, and waqf administration or entrepreneurship. Those managerial processes cannot be apart from the leadership factor. The supervision was carried out through direct supervision by the staff of BWI, South Kalimantan and the Ministry of Religion to supervise the wealth of productive waqf. Thus, the empowerment and management of waqf in South Kalimantan were in line with the vision and mission based upon the Islamic values. It aims to create an independent economy and welfare for people.*

***Keywords:** Contribution, Implementation, Productive Waqf Model, Islamic Economics*

### **1. Introduction**

Waqf has the meaning of a gift, by holding back the original ownership (taḥbisul aṣhli) and take advantage of universal or general validity. The meaning (taḥbisul aṣhli) is to hold a waqf item that is not inherited, sold, donated, pawned, leased and so on. This utilization is based on a waqf contract (wāqif) without considering rewards or benefits.

While wa kaf literally means stopping, holding back, or being silent. This is illustrated by the parking area called māuqif because it is a place for vehicles to stop to perform worship at the mosque or it can also be qiyaskan by Padang Arafah as māuqif where pilgrims stay to stand before carrying out the requirements of the pilgrimage. Technically sharia, waqf is an asset allocated for the benefit of the people where the substance or principal is withheld, while the benefits may be enjoyed for the public interest.

The practice of waqf was known before the advent of Islam, many places of worship were built on vacant land which were then managed and the proceeds were used to pay for maintenance and fees for those who take care of the places of worship. This practice is well known in countries such as Egypt, Rome and Germany which have made waqf beforehand. Egyptian Country, The second King Ramses made use of the "Adibus" place of worship, which had a very large area. This culture introduces that the person who manages the assets left by the deceased (inheritance), the distribution of the proceeds is given to the family and their descendants, so that those who manage it can take part of the property but the main assets may not become the property of anyone. This endowment also developed until Islam came and ran based on Islamic teachings until finally endowment became known in Indonesia.

The history of Indonesian waqf has a duty in the development of social, economic and cultural activities of Islamic society. Waqf as a regulatory instrument in terms of education

in all fields of science. Because waqf has succeeded in building economic empowerment facilities for welfare or maslahah for the community. Meanwhile, Islamic economics is one way of economic development, and a legal action that is institutionalized and practiced in Indonesia. Along with the times, waqf institutions have been institutionalized very rapidly. The development of waqf from time to time is not supported by formal regulations that regulate it, so far the practice of waqf is only guided by traditional fiqh books which have been used as the foundation by classical society. Along with developments, waqf regulations and institutions were established for government intervention. The presence of this legislation is a new change in waqf, and makes progress.

Law No. \_\_ 41 of 2004 concerning waqf has made changes in the development of Indonesian waqf to be more advanced, developing, of course, by obtaining a strong and solid legal basis. Establishment of the law on waqf as the goal of Muslims who have been working on waqf issues, for academics and practitioners. There are many new things which in the previous laws and regulations have not been regulated very systematically, and logically one of them is about immovable or movable waqf assets.

The formation of the Waqf Law in a structured, systematized manner in management and implemented by the Nazir who is in charge of carrying out the waqif mandate (who gives waqf). An example is a piece of land. Then, over time, many economic actors changed the classical view of waqf before it developed meaningfully from the literal meaning and the technical meaning related to the existence of the "eternity" of the main element (substance) where it must stop, may not be sold or transferred to other than the interests of the people who mandated by waqif to nazir waqf. This is based on the understanding and meaning of waqf itself.

The Indonesian Waqf Board (BWI) was

formed by the government as a manifestation of implementing Law Number 41 of 2004 concerning waqf and Government Regulation no . 42 of 2006, which the presence of BWI in article 47 to promote and develop waqf in Indonesia. Meanwhile, BWI's task is to develop waqf management in Indonesia in a more professional and productive direction so that waqf is truly able to make a positive contribution to the country's economy.

The waqf property will benefit the message of Islam. Waqf in Islam is something that is circumscribed, because it is one of the actions to get the pleasure of Allah SWT. This is as Allah swt. said in QS Ali-Imran / 3:92.

أَلَنْ تَتَالَوْا الْبِرَّ حَتَّى تُنْفِقُوا مِمَّا نَح

"You will not get virtue, before you spend some of the treasures that you love. And whatever you spend about it, verily Allah knows . "

Another argument that forms the legal basis for waqf is QSAI-Hājj/22:77.

أَمْؤُوا أَرْكَعُوا وَاسْجُدُوا يَا أَيُّهَا الَّذِينَ

"O you who believe, bow down, prostrate yourself, worship your Lord and do good, so that you may be victorious . "

The development of the waqf empowerment model in a professional manner is marked by the many potentials of productive waqf for the benefit of human welfare. Productive waqf is a waqf object or property whose principal remains is that the waqf is not directly used to achieve its goals, but is developed first to produce something and is useful (productive) and the results are distributed or used according to the purpose of the waqf, such as endowments of land to be used for farming , water to sell the water and others without removing the land.

Productive waqf is not something new, but so far the implementation has mostly been on

immovable waqf objects and their allocation has been more for the benefit of mahdhah worship , such as mosques, prayer rooms, Islamic boarding schools, cemeteries. Economically, waqf is expected to be able to build productive assets through current investment and production activities, to be utilized for the results for future generations and continue to benefit the general public.

This utilization is carried out through waqf management through two models; namely traditional management models such as āriyah , ištibda, Iyadāh, and ijarātain , and institutional management models such as murabaha , ištīṣna , ijarah, and mudārabah models. This method develops based on a system of Islamic economic principles and develops in the management of waqf, namely through the management of production quotas, cooperation shares, waqf object bonds, monopoly shares, and loan bonds. Meanwhile, from the waqf development management system, it must be carried out professionally by managers of several aspects, including institutional aspects, financial aspects, and human resource aspects. The targets achieved in waqf management include targets for the benefit of religious, educational, social facilities, and for the benefit of business facilities based on waqf objectives.

The development of waqf in Indonesia is increasingly sticking out, this can be seen from the increasing number and objects of waqf assets, including land, money, and others, which are spread across several parts of Indonesia. The data shows that waqf land is always developing, in 2010 there were 415,980 waqf land objects in Indonesia, in 2013 there were 435,395 land objects, with an area of 414,246.429 hectares of waqf land in Indonesia. Meanwhile, cash waqf moves in 2010 were started by the Cash Waqf Movement which was intensified by the Indonesian Waqf Agency (BWI) with a capital of 2 billion rupiah, until 2015 the money was collected at 185 billion. This

increase is a great potential and an extraordinary asset, and becomes a new pillar in the community's economic development. According to data owned by the Ministry of Religion in 2018 AD, the wealth of waqf land in Indonesia is very large in number, namely 435,765 location points with an area of 4,359,443,170 M<sup>2</sup> of which 287,608 locations have been certified and around

148,160 have high economic potential. The magnitude amount things waqf, in particular land And building become very opportunity big for economic development \_ people in the future g. Data from the directorate of waqf of the Ministry of Religion in 2010 in BWI annual reports throughout Indonesia, including waqfs that have just used the Waqf Pledge Deed (AIW) and are also

**Table 1.** Data Potensi Wakaf berdasarkan BWI Tahun 2018 (Lanjutan, Source: BWI, 2018)

Province	Location	Wide	Certified	Not Certified	%Certified Wakaf Land
1 Nanggroe Aceh Darussalam	27,416	1,333,233,627,26	12,245	15,171	45
2 West Java	70,749	116,662,017,81	45,401	25,348	64
3 South Kalimantan	8,772	110,208,613,54	7,271	1,501	83
4 Riau	7,897	978,448,625,81	2,761	5,136	35
5 West Nusa Tenggara	11,793	83,060,488,00	7,635	4.158	65

This data shows that the largest number of waqf land locations is the province of West Java, but in terms of area of waqf land, the dominant one is the province of South Kalimantan. This percentage of waqf land has great potential in the development of productive waqf because of the wide area of waqf land.

By having great potential this was conveyed by the President. This issue is seen from the waqf potential of South Kalimantan Province, there are around 8772 locations of unproductive waqf land with an area of approximately 110 208 613.54 square meters and around seven thousand square meters are certified. The latest information stated that at the inauguration ceremony of BWI South Kalimantan for the 2018-2021 period it was stated that the waqf in South Kalimantan of 90201 waqf points had not been used which had great potential, for the regional area of Kalimantan and the Chairman of BWI South Kalimantan. Mr. Fadly Manshur stated that with the formation of BWI, it is hoped that the productive economy will increase as a result of empowering productive waqf. Empowerment of waqf is of course able to see what contribution is made by the South

Kalimantan Indonesian Waqf Agency, and what implementation has been implemented as a support for the development of waqf. Of course, with the development of waqf, several empowerment models carried out by BWI South Kalimantan are a role model that will become the center point for the potential development of waqf in Kalimantan. From the potential and the model that is carried out as a contribution and implementation, this will make an empowerment, so the writer is interested in writing in a research title "The Contribution of the Productive Waqf Empowerment Model by the Indonesian Waqf Board of South Kalimantan Province to the Development of Waqf".

## 2. Theoretical Framework

Then the researcher takes several theories that support researchers in conducting research.

### 2.1. Waqf concept

The word waqf comes from Arabic with the connotation وقف يقف وقفا which means to stop or stand. Waqf is also known as الحيس which comes from the verb حبس يحبس حبسا which

means to keep people away from something or imprison it. Then this word developed into *حبس* which means donating wealth for the sake of Allah.

In terms of language, waqf means holding. Meanwhile, according to the term *syara'*, is holding something that is eternal substance, to be taken advantage of for the good and progress of Islam . Withholding an object whose substance is eternal, meaning that it is not sold and is not given away nor is it inherited, but is only given as charity for its benefits.

Waqf in the science of *tajwid* implies stopping reading, either onwards or to take a temporary breath. According to the rules, a reader cannot stop in the middle of a syllable, it must be at the end of a word at the end of a verse so that the reading is perfect. The definition of waqf in the sense of staying in place is related to staying at Arafah on the 9th of Zulhijjah when performing the pilgrimage. Without standing at Arafah there is no pilgrimage for a person.

There are several definitions of waqf, including:

According to the Shafi'i and Hambali schools of thought, a person withholds his wealth so that it can be utilized in all areas of benefit while continuing to perpetuate this wealth as a *taqarrub* to Allah swt.

According to the Hanafi school, holding property so that it becomes the law of Allah SWT, then someone who donates something means that he relinquishes ownership of the property and gives it to Allah so that it can provide benefits to humans permanently and continuously, may not be sold, donated, or inherited . .

The Maliki school of thought is giving something that benefits from assets, where the principal assets are permanent or sustainable for the ownership of the beneficiary even for a moment.

According to Imam Abu Hanafi , it is withholding property in the possession of waqf and giving charity, the results of which

can distribute the benefits of these assets to those they love. Based on this definition from Abu Hanifah , the property is under the control of the waqf person ( waqif ) as long as he is still alive, and can be passed on to his heirs if he dies either to be sold or donated.

Waqf according to *syara'* terms according to Zainuddin Al-Malibary is "Restraining property that allows it to be utilized accompanied by the immutability of the object by deciding the classification in its custody of the manager who is allowed to exist".

Waqf according to government regulation no. 28 of 1977 is a legal act of a person or legal entity which separates some of his assets in the form of owned land and institutionalizes them forever. For the purposes of worship or other public purposes in accordance with the teachings of Islam.

From this definition it can be concluded that waqf is one of the types of gifts, but only the benefits may be taken, and the objects must remain intact. Therefore, assets that are eligible for waqf are assets that cannot be used up and generally cannot be moved, such as land, buildings and the like. Mainly for the public interest. For example for mosques, prayer rooms, Islamic boarding schools, orphanages, public roads, and so on.

In article 215 paragraph 1 of the compilation of Islamic law, it is stated that waqf is a legal act of a person or group of people that separates part of their property and institutionalizes it forever for the benefit of worship or other public purposes in accordance with Islamic teachings. The legal source of waqf in the Qur'an is not very clear but has the meaning of "giving property" unlike zakat. But the legal basis in the Qur'an regarding waqf is related to QS Al-Hājj: 77, QS Āli Imrān: 92, QS Al-Bāqarah: 261 , QS An -Nahl: 97 and QS Al-Bāqarah verse 282. The verses above mention a variety of worship which can cover many things and can even include daily activities to seek the pleasure of Allah SWT with orders to do

worldly and spiritual virtues, both those based on revelation and values that are in line with sharia objectives, both in the form of laws and regulations. These laws and traditions and customs and verses also explain when and how a person's property will be useful, namely by spending the assets he likes (including endowments).

As for one of the hadiths of Rasulullah SAW, namely :

أصاب عمر أرضاً بخيبر فأتى النبي صلى الله عليه وسلم يستأمره فيها فقال يا رسول الله إني أصبت أرضاً بخيبر لم أصب مالا قط هو أنفس عندي منه فما تأمرني به قال إن شئت حبست أصلها وتصدقته بها قال فتصدق بها عمر أنه لا يباع أصلها ولا يبتاع ولا يورث ولا يوهب قال فتصدق عمر في الفقراء وفي القربى وفي الرقاب وفي سبيل الله وابن السبيل والضيف لا جناح على من وليها أن يأكل منها بالمعروف أو يطعم صديقاً غير ممتول فيه قال فحدثت بهذا الحديث محمداً فلما بلغت هذا المكان غير ممتول فيه قال محمد غير متائل مالا قال بن عون وأنبأني من قرأ هذا الكتاب أن فيه غير متائل مالا

"Umar got a piece of land in Khaibar then he went to the Prophet Muhammad saw. to ask for guidance on how to manage it, he said: "O Messenger of Allah, I got a plot of land in Khaibar, I have never obtained wealth that is better than this, what is the suggestion in this regard? He said: if you like it, you hold the land and you give the benefits of it. So Umar donated the produce of the land on condition that the land could not be sold, bought, inherited or donated. Umar donated the proceeds to the poor, relatives, to free slaves, jihad fisabillah, for provisions for people who were on their way and for guests' meals. The person who takes care of it may eat some of the produce in a good way and may feed his friend in moderation." (HR Muslims) .

Although basically the mujtahid imams differed in their views on waqf institutions, all of them agreed that forming a waqf institution required pillars and conditions for waqf.

## 2.2. Indonesian Waqf Board

The Indonesian Waqf Board (BWI) was established as a manifestation of the mandate outlined in Law Number 41 of 2004 concerning waqf. The presence of BWI, as explained in article 47, is to promote and develop waqf in Indonesia. For the first time, BWI Membership was appointed by the President of the Republic of Indonesia, in accordance with Presidential Decree (Kepres) No. 75/M of 2007, which was stipulated in Jakarta on 13 July 2007. Thus, BWI is an independent institution to develop waqf in Indonesia, which carries out its duties free from the influence of any power, and is responsible to the community. BWI consists of an Executing Agency and The Advisory Council is chaired by one chairman and two vice chairmen who are elected from and by the members.

The implementing agency is the executor of the task, while the Advisory Council is the supervising element of BWI's task implementation. The number of members of the Indonesian Waqf Board consists of at least 20 (twenty) people and a maximum of 30 (thirty) people who come from elements of society. (Articles 51-53, Law No.41/2004). Members of the Indonesian Waqf Board are appointed and dismissed by the President. The task of BWI is that representatives of the Indonesian Waqf Board in the regions are appointed and dismissed by the Indonesian Waqf Board. Members of the Indonesian Waqf Board are appointed for a term of 3 (three) years and can be reappointed for 1 (one) term of office. For the first time, appointment of membership The Indonesian Waqf Board is proposed to the president by the minister. The recommendation for the appointment of the membership of the Indonesian Waqf Board to the President is to be carried out by the Indonesian Waqf Board. (Articles 55, 56, 57, Law No.41/2004).

In accordance with Law no. 41/2004 Article 49 paragraph 1 states, BWI has the following duties and authorities:

- a) Provide guidance to na dzir in managing and developing waqf assets .
- b) Managing and developing waqf assets on a national and international scale.
- c) Give approval and or permission for changes in the designation and status of waqf assets.

In paragraph 2 of the same article it is explained that in carrying out its duties BWI can cooperate with both Central and Regional Government agencies, community organizations, experts, international agencies and other parties as deemed necessary. In carrying out these tasks BWI pays attention to the suggestions and considerations of the Minister and the Indonesian Ulema Council, as reflected in article 50. Regarding the task of fostering na dzir , BWI has taken several strategic steps, as stated in PP No.4/2006 article 53, includes:

- a) Preparation of operational supporting facilities and infrastructure for na dzir good waqf individuals, organizations and legal entities.
- b) Preparation regulation, gift motivation, gift facilitation, coordination, empowerment and development of waqf assets.
- c) Provision of facilities for the Waqf certification process.
- d) Preparation and procurement of AIW forms, both immovable and immovable waqf or moving objects.
- e) the regions to carry out guidance and development of waqf to na dzir according to their scope.
- f) Providing facilities for the entry of waqf funds from within and outside the country in the development and empowerment of waqf.

The strategy for realizing the vision and mission of the Indonesian Waqf Board is as follows:

- Improving the competence and

network of Indonesian waqf bodies, both nationally and internationally.

- Make regulations and policies in the field of waqf.
- Increasing public awareness and willingness to donate waqf.
- Increase Nazir's professionalism and trustworthiness in the management and development of waqf assets.
- Coordinating and fostering all nazir waqf.
- Ordering the administration of waqf assets.
- Supervise and protect waqf assets.
- Collect, manage and develop property waqf on a national and international scale.

### 2.3. Empowerment of Productive Waqf

Productive waqf requires empowerment with a pattern or model of empowerment and good management in fulfilling the objectives and benefits of productive waqf. This is a management goal is to string together the process of planning, strategic, managing resources and asset development.

Empowerment will not be separated from productive waqf organizations with a model of collecting, managing and distributing benefits. However, in general an institution implements an initiative and flexible method. This method is a combination of collection which aims to :

- Gather D ana

Raising funds is a collection of the most basic goals. The funds here are waqf funds, operating funds, waqf management, goods or services that have material value. The purpose of raising funds is the first thing in management. This activity is a collection that fails and does not generate resources, so that the institution will find it difficult to continue to maintain the continuity of its program.

- Increase Donor/ W akif

The second purpose of collection is to add

wakif . Nadzir who does the collection must increase in number. To be able to increase, there are two ways that can be taken, namely by adding a new donation or wakif . Among the two most relative things in increasing the amount of donations from each wakif.

- Improving or Building Institutions \_

Activities carried out by a Non-Governmental Organization (NGO), either directly or indirectly will affect the image of the institution. Collection is the front line that conveys information and interactions will shape the image of the institution in the general public. Everyone who evaluates the institution, which ultimately shows the positive attitude or behavior of the institution. This goal is a positive image, support and sympathy will flow automatically to the institution, so that there are no difficulties in finding waqif.

- Gathering Sympathizers/ Relations and Supporters

Groups that interact with collection activities by Waqf Management Organizations or Non-Governmental Organizations. they have a positive impression and sympathy for the institution. However, it could be that at that time they did not have the ability to provide funds to the institution as a donation. Such groups then become sympathizers and supporters of the institution even though they do not become wakif directly. Such groups are taken into account in collection activities. The purpose of this collection in groups is as an informal network that is very profitable in gathering activities.

- Increase Donor Satisfaction

Increasing donor satisfaction is satisfying wakif . This goal is the highest and most valuable long-term goal, which was performed as a technical in the days. Waqif

satisfaction greatly affects the value of donations that will be given to the institution. They will donate their funds to the institution positively to others. In addition, a satisfied wakif will become a natural collection worker (unsolicited, appointed and unpaid). Because the collection function interacts more with the waqif , automatically the collection activities must also aim to satisfy the waqif .

Empowerment of productive waqf can be implemented in various ways. Productive categories that can be carried out include: collection methods, investment, investment, production, partnerships, trade, agribusiness, mining, industry, technology development, building construction, apartments, flats, supermarkets, shops, offices, educational facilities, businesses -Businesses that do not conflict with sharia.

In the context of developing productive waqf, there are two models of financing productive waqf projects, namely the business development and building construction models. This model is the development of productive waqf as follows:

1) *Business development waqf model*

In 2006 the productive waqf empowerment model in the business sector of agribusiness, animal husbandry and small industry began to be considered. This interest is because the wheel of the national economy is growing. And for Indonesia itself, it has two very large natural resource potentials, so these are several economic endeavors and models for developing waqf and empowering productive waqf.

However, in empowering waqf in the field of business, several things need to be considered, namely, productive waqf management requires objective selection of businesses to make the right technology as selling power in society. Guarantee from the entrepreneur that the business will not have a negative impact on the surrounding environment. There is a marketing model. And the need for moral commitment, namely compatibility between business behavior and

its social implications, business behavior includes, professionalism, honesty, transparency and trustworthiness

2) *Waqf Model Development -- building --*  
The development of waqf in Indonesia and other countries is very different and not significant. However, recently the development of waqf has been carried out a lot. In Egypt, for example, Al-Azhar University carries out its activities using waqf funds. The university manages buildings or companies on the Seuz canal, and this campus only takes the proceeds for educational purposes. In Qatar and Kuwait, waqf funds have formed office buildings. This area was leased and the result was the empowerment of waqf funds, Islamic educational institutions such as Sal-Azhar University in Cairo, Zaitunniyyah University in Tunis, and Madaris Imam Lisesi in Turkey and have developed and are able to survive until now. They do not only rely on development funds from the government, but also endowments as a source of financing for all administrative and academic activities.

#### **2.4. Development of Waqf**

The development of waqf in Indonesia is currently growing, this can be seen from the many additions that have occurred in the number and objects of waqf assets. The recap of waqf land that occurs from year to year certainly has significant additions, this makes a waqf development. Of course, these numbers continue to increase every year, proving that waqf assets have great potential. This potential certainly makes a resource for highly developed economic development and plays a major role in the economy. This economy is also associated with the development of waqf making this utilization useful for public activities in the economic, social and religious fields. So that makes this potential develop from various kinds of empowerment. This empowerment certainly makes a development of waqf from various

models that occur, this includes productive waqf and economic development. For example, waqf and social responsibility, talking about waqf will talk about the economy, from cemeteries to business centers and counting waqf as a pillar of the Islamic economy. This development makes waqf development part of economic development. This development makes waqf in the modern era have waqf rules or policies through a set of positive laws. So that the formulation process looks at the potential and organization of waqf both in the interests of Muslims in general. So with this interest, of course, many productive waqf empowerment institutions encourage formal institutions or foundations to empower productive waqf.

#### **3. Research Methods**

In order for this research to run well and obtain results that can be accounted for, this research requires a certain method. The method of preparing this thesis is as follows: The type of research used is field research which can be called empirical research. Research done intensively, in detail and in depth on a particular object by studying it as a case with the intention of seeking a study of empirical data found in the field, which in this case is the productive waqf empowerment model at BWI South Kalimantan.

This study uses a sociological approach. The sociological approach referred to here is a study that focuses attention on community interactions. This approach aims to see how the social and cultural factors of the community or are affected by productive waqf either directly or indirectly.

In this study, researchers used triangulation to test the validity of the data used. Researchers chose to use triangulation techniques sources and methods. Where triangulation of sources refers to researchers' efforts to access more varied sources in order to obtain data regarding the same issue. The reason for using source trigulation is because source

triangulation is in accordance with the needs of researchers who want to test the reliability of data by checking the data obtained, then the data is described, categorized, and analyzed so that a conclusion is created. The triangulation used is to compare the results of interviews that have been conducted with documents in the form of reports on the implementation of productive waqf in one period and missions from BWI-South Kalimantan and researchers went directly to several areas to see first-hand the conditions of the productive waqf.

This is done what happened in the report of the Indonesian Waqf Board with the field that happened. For example, researchers went directly to several areas including the City of Banjarmasin with research at the Jami Mosque and the Hasanuddin Majedi Mosque. Banjar Regency with the Ushuluddin Tambak Hanyar Islamic Boarding School, Hulu Sungai Utara Regency Rakha Amuntai Islamic Boarding School, Langgar Al-Ikhlas Kota Baru, At-Taqwa Binuang Mosque in Tapin Regency, and the Great Mosque of Syuhada Tanah Laut.

#### **4. Research Results and Research Analysis**

##### **4.1. Productive Waqf Empowerment Contribution by BWI South Kalimantan**

The contribution made by the South Kalimantan Indonesian Waqf Board is as a supervisor and mentor. Supervisor here is as controlling to ensure that the actual activity is as planned. This supervision is of course an implementation to ensure that all systematics are planned, organized and executed based on the implementation that occurs. Systematics in this supervision is of course related to the empowerment of productive waqf as a function of supervision carried out by the Indonesian Waqf Board for nadzirs to evaluate the achievement of goals and targets

for activities carried out in the development of productive waqf.

Meanwhile coaching or leadership is a process of directing and influencing activities related to the work of group members or the entire organization. While the supervision carried out by the South Kalimantan Indonesian Waqf Board is to take leadership in implementing the coaching process and providing motivation to nadzirs who are recruited so that they can work effectively and efficiently in achieving waqf goals. Then, provide routine assignments and explanations regarding the work and policies set.

From the contribution of the South Kalimantan Indonesian Waqf Agency to the development of productive waqf presents an interactive process of productive waqf management functions. The productive waqf management function carried out is supervision in ensuring that productive waqf management achieves waqf goals and objectives. Then what is done in coaching or leadership is directing, influencing and motivating nadzir to carry out the tasks that have been implemented.

The productive waqf empowerment contribution is carried out based on the duties and authority of the Indonesian Waqf Board. This contribution can then be carried out based on the productive waqf empowerment model in collaboration with the Ministry of Religion. The South Kalimantan Waqf Board hereby makes a major contribution every year in the field of nadzir coaching which is overseen by the productive waqf management and empowerment division. Meanwhile, the coaching carried out by the South Kalimantan Indonesian Waqf Agency is to provide guidance to several waqf places that already have waqf certificates.

##### **4.2. Productive Waqf Model in Indonesian Waqf Agency South Kalimantan**

Waqf is basically an " economic corporation", with activities containing elements of future

investment and developing productive assets for future generations in accordance with the purpose of waqf, either in the form of services or utilizing the results directly. The development of waqf which continues to be engaged in is an utilization of the results of investment units. Investment is a main goal in economic development, property owned by a person to form production capital that is capable of producing benefits and can be used universally or in general. Islamic economics is related to waqf in terms of investment, namely distribution to them by the waqif in the waqf pledge.

Economically, waqf is a development paradigm from productivity in an investment activity for their benefit based on the pledge made by the wakif. Thus, the results or products of waqf assets can be divided into two parts. First, direct waqf is a waqf property that produces services in the form of goods for direct consumption by people entitled to waqf, such as hospitals, schools, orphanages and settlements. Second, productive waqf which is managed for investment and production of goods and services that are permitted according to sharia . In this case, capital (waqf assets) is invested and distributed to those in need.

The new model in waqf management today is a potential development of productive waqf management as an investment in various companies either by contact or leasing. The model concept used in this productive waqf is the concept of the waqf model of management for the development of the Islamic economy by applying the productive waqf development model.

nadzir welfare principles , and transformation and responsibility principles. Seeing this, of course, an implementation of waqf can be implemented properly. This is of course a productive waqf that can be empowered with rapid development. This development is of course in the productive waqf empowerment model implemented by the Indonesian Waqf Board implementing the waqf empowerment

model including: (1) the building construction waqf model which includes the construction of hospitals, mini markets, ATM centers, shops, shophouses, multipurpose buildings, nest wallets, boarding houses, mini gas stations; and (2) a productive waqf model for business development which includes rice fields, plantations, tent rental, animal husbandry, and fisheries. Of these two implementations, of course, it is associated with contributions from the South Kalimantan Indonesian Waqf Board.

### *1. Productive Waqf Model for Building Construction*

The implementation of the productive waqf model carried out by the South Kalimantan Indonesian Waqf Agency in building construction is the construction of buildings that are on waqf land and then developed in the empowerment of productive waqf. Empowerment is of course building buildings with business and trading units which are used as tools for empowering waqf. Empowerment of waqf building construction models is dynamic in nature which is beneficial in developing the pace of development. Of course, the pace of development in the implementation of the waqf empowerment model in South Kalimantan is one of the influences of the productive waqf empowerment model which utilizes waqf land and then builds buildings that have benefits and can be productive.

The South Kalimantan Indonesian Waqf Agency in empowering productive waqf provides annual supervision in the field of building construction . Binuang, Tapin Regency.

### *2. Productive Waqf Model for Business Development*

The introduction of the productive waqf model in 2005 in the fields of business in the rice fields, plantations, livestock and fisheries sectors. Looking at this business, of course, many wheels of the national economy are driven in this field. Indonesia is very well known for its two potentials which have

enormous natural resources in the fields of agriculture or rice fields, and fisheries so that these two natural resources can certainly break the national economic needs of the people. Whereas South Kalimantan, in terms of this potential, certainly has great potential in empowering waqf in the field of fisheries, of which twenty productive waqf empowerments have 5 places empowered in this field. This is based on a very effective environment in the development of fisheries. The South Kalimantan Indonesian Waqf Agency in empowering productive waqf provides annual supervision in the field of business development. The South Kalimantan Indonesian Waqf Agency and the South Kalimantan Ministry of Religion provide assistance and guidance to a place that is considered capable of developing productive waqf, one of which is the Rakha Amuntai Islamic Boarding School. North Hulu Sungai District.

The implementation of the productive waqf empowerment model implemented by the South Kalimantan Indonesian Waqf Agency is of course implemented based on what has been done based on seeing the existing regional potential by implementing based on the vision and mission of the South Kalimantan Indonesian Waqf Agency for economic development efforts. Because of this, the waqf developed is part of economic development, with stages including planning, organizing, human resource development, leadership and supervision as well as with several empowerment models. With the main goal of creating waqf developments that continue to increase and produce an independent or protection economy.

#### 4.3. Analysis Empowerment Models Productive Waqf by BWI-South Kalimantan on Waqf Development

Looking at the results of the analysis of the contribution of the productive waqf empowerment model carried out by the

Indonesian Waqf Board of South Kalimantan, it can be seen from some of the data attached in table 4.2 which is linked to scheme 4.3 of managing productive waqf to the economy and then describes the supervisory strategy carried out by the Indonesian Waqf Board with basic values Islamic economics.

Supervision is one of the contributions made by the South Kalimantan Indonesian Waqf Agency by providing annual education and guidance to places that serve as models for empowering productive waqf. From this, of course, an implementation can be carried out with a productive waqf empowerment model which is supervised by the South Kalimantan Indonesian Waqf Agency and given guidance in empowering productive waqf.

This implementation certainly makes it an analysis in empowering productive waqf in which there are several rules that can be carried out based on the supervision strategy implemented by the Indonesian Waqf Board within the basic values of Islamic economics. As explained below:

- First rule

هُوَ مَا أُوجِبَ عَلَيْهِ عَلَى تَأْسِيهِ

" The law of origin in a transaction is the willingness of both parties to enter into a contract, the result will be enforced by the contractual agreement . "

This rule is the first rule associated with one stage of empowerment, namely leadership in a management. In this case, the head of the South Kalimantan BWI must be a figure, but in terms of obstacles in this empowerment, namely the role of actors who are very much needed to advance the empowerment of the waqf. Because based on the potential of waqf owned only a few are empowered, this is an example for other places to be empowered. 126 A leader in this case, of course, must be sincere and pleased with his decision as a nadzir and give up his life to develop the potential of waqf . This regulation is of course a function and authority of the leader not only to be administrative in nature, but also to

maintain Islamic values in his leadership. Several things can be taught from actors to nadzirs in management, for example conducting nadzir training and educating managers. This is a provision in developing waqf empowerment, and this training provision is of course also an example for other places.

- Second rule

الأصل صحة العقود والشروط 7 12

"Basically (all forms of transactions) in muamalah dah (permitted) and in the contract the (agreed) provisions apply."

This rule is associated with a planning stage of organizing forms and human resources (HR). This is an agreement contract that applies in planning and organizing must be based on a contract.

A plan is of course formed by the manager or caretaker to go hand in hand with the wakif's mandate that has been agreed upon in the contract. This planning is good in the short or long term which has been calculated by the investment and profit results. This profit will be used for two sectors, both the economic and social sectors, education which is spelled out in the implementation of waqf. for example this is for business development, the estimated profit from this result is to fulfill the wakif's mandate in the agreement.

With regard to physical organization, the model of empowerment in the form of a building or a business unit will not be separated from the expectations of the wakif. For example, if the wakif wants a place for business empowerment and other activities, of course the building is managed as much as possible to support other developments. This is exemplified in one of the places in the At-Taqwa Binuang Mosque where in addition to a minimarket business or this business a hall is built which is used for community activities. This community activity is free of charge provided that the community can look after, care for and protect it. 128

Not only physical organization, HR

organization is also needed, for example considering the quality of personnel in the placement of organizational composition in waqf management. This placement is based on SK BWI that is based on the benefit and purpose of empowerment.

- Third Rule

الأصل في المعاملات الإباحة إلا ما دلّ الدليل على تحريمه 129

"The law of origin in all forms of muamalah is permissible unless there is an argument that forbids it . "

This third rule is of course based on the mission of BWI-South Kalimantan, which is to develop the economy through waqf. Of course, this development or empowerment can be carried out in various ways, one of which is productive waqf.

Productive waqf has actually been regulated in the Qur'an and Hadith . However, the development of its practice demanded the ijthad of the majority of scholars, so that variations of waqf began to emerge, one of which was the productive waqf. This is shown in productive waqf transactions which are media in the development of muamalah transactions to support the regional economy. Of course, this transaction can be carried out based on no argument that forbids it and runs according to Islamic rules.

- Fourth Rule

لا تتم الهبة ولا تملك إلا بالقبض 131

"Not perfect 'aqad tabbaru' (gift) except after being submitted, (before being asked has been given)" .

This rule is associated with the stage between planning and organizing. Before waqf funds are further organized, it must be ensured that there is a sincere handover by the wakif to the na dzir . This handover is of course an item that becomes an object as a sign of the goods being handed over and a form of trust to the nadzir so that the management and empowerment of productive waqf is carried

out optimally, while the nadzir is obliged to follow the provisions of the wakif as long as it does not violate the conditions.

e. Fifth Rule

فِي كُلِّ الْمَعَامَلَاتِ وَمَنْعُ الظُّلْمِ وَمُزَاعَاةُ مَصْلَحَةِ

"The origin of every muamalah is fair and the prohibition of doing injustice and paying attention to the welfare of both parties and eliminating harm."

The fifth rule can be related to the stages of empowering human resources (HR), organizing finance, and supervising. With regard to human resource development, of course, a Nazir or in this study, BWI as supervisor of empowerment routinely oversees various aspects. This aspect is for example the legal basis of waqf, the Islamic economic system, waqf administration, and other related materials. With so many waqf potentials in South Kalimantan, of course, people can take advantage of this potential, and can be empowered.

These results indicate that coaching is not only related to law and administration, but also the Islamic economic system which is the embodiment of an Islamic economy that requires fair and good behavior to achieve masalahah. This is also the aim of maintaining the trust of wakifs and paying attention to the benefits of empowering productive waqf for the regions.

Regarding the financial organization of BWI South Kalimantan, financial management is of course with the main methods, namely collection management, investment management, and distribution management. Financial management begins to be carried out in a neat and orderly manner, the neatness of records can be carried out by minimizing the possibility of unjust financial storage and causing harm.

This rule relates to the supervision stage. Supervision of the management of productive waqf is carried out for administrative oversight, the performance of nazhir or BWI management, and financial management.

133,134,135 Supervision becomes control to guarantee and ensure that there are no saving practices that can reduce benefits and cause harm.

Based on the explanation of these principles, the productive waqf empowerment of BWI South Kalimantan in general has followed the principles of Islamic economics. The principle of Islamic economics refers to the principles of muamalah fiqh, especially those related to productive waqf. This linkage is based on the vision and mission of BWI South Kalimantan in general as a basis for planning, organizing, productive waqf empowerment models, human resource development, leadership, and supervision to achieve an independent economy in harmony with economic values.

## 5. Conclusion

From this explanation, in the contribution of the productive waqf empowerment model by the Indonesian Waqf Agency in South Kalimantan to the development of waqf, there is supervision from the institution on the development of the Islamic economy, so the researchers draw the following conclusions:

1. The contribution of the productive waqf empowerment model by the Indonesian Waqf Agency in South Kalimantan to support the Islamic economy is of course based on the model used. This is based on productive waqf management carried out by management, including planning, organizing, managing human resources, leadership and supervision. Productive waqf planning by the South Kalimantan Indonesian Waqf Agency is certainly a productive waqf that is neatly designed and arranged to achieve the vision of BWI South Kalimantan, namely the realization of an economy that is independent and beneficial to society. Supervision is provided based on waqf law, sharia economic system, and waqf administration or entrepreneurship. In addition to planning, of course, the management process cannot be

separated from the leadership factor. BWI South Kalimantan not only provides supervision but also provides annual education to nazirs or mosque managers.

2. Implementation of supervision of the South Kalimantan Indonesian Waqf Board with the aim of organizing from the physical and human resources (HR) side. This physical organization produces several models of empowerment, including (1) the waqf model for building construction; (2) The waqf model for business development. This model is implemented based on the vision and mission

of the South Kalimantan Indonesian Waqf Agency. The implementation of the Indonesian Waqf Board in South Kalimantan is an oversight of the models applied in empowering productive waqf. Then the implementation of the productive waqf empowerment model by BWI Kalsel in this case saw the development of the two models based on the vision and mission which are based on Islamic values. All government processes run in an orderly and structured manner so as to produce a protective or independent economy.

## **PLANNING OF DA'WAH IN THE DIGITAL ERA**

***Abstract:** This study aims to analyze the planning of digital era da'wah, which focuses on the implementation of digital era da'wah plans, where technological advances in the digital era are unavoidable in global civilization. The research methodology used is qualitative with a phenomenological approach in describing the research, through observation, interviews and, through documentation, through primary data sources from respondents and secondary data as supporting data. The results of this study, in the can that Advances in science and technology in the field of information and communication technology can clearly support Islamic da'wah in the digital era, so planning for digital era da'wah is very meaningful and crucial in delivering da'wah at this time and in the future. Da'wah planning in the digital era then becomes strategic, where in this study it was found that the Da'wah Formula (Recipe) for Preachers in facing challenges in the Information and Communication Technology Era is a character possessed by da'wah cadres, undoubtedly lighter and easier to face challenges and obstacles in the Information and Communication Technology Era. Da'wah cadres and all da'wah activities will be stronger and accepted by the community, in presenting the various virtues that are expected by the people, nation and state. Apart from that, it can also package da'wah messages in the digital era, carry out digitization of da'wah through websites, and maximize da'wah videos in the digital era, so this shows that planning da'wah in the digital era is a reference for preaching.*

***Keywords:** Model, Da'wah, Digital Era of Information Technology, Communication*

### **1. Introduction**

Islam is a religion of da'wah, meaning a religion that always encourages its adherents to always be active in carrying out da'wah activities. The progress and setbacks of Muslims are very closely related to the da'wah activities they carry out. Da'wah is obligatory for every Muslim in all its forms. Conveying the teachings of Allah and His Messenger to others (al-Maidah: 67), by

carrying out all His commands invites all mankind to do good and forbid doing evil (Ali Imran: 104). Either by giving washingiyah or advice or by fighting to uphold Allah's religion (at-Taubah: 88). On the contrary, the doom will descend on anyone who is reluctant to carry out da'wah activities (al-Maidah: 79).

This is in accordance with the Word of Allah in the letter of Ali 'Imran verse 104 which reads: "And let there be a group of people

---

Corresponding author: M. Irpan  
Email: [irpanleska@gmail.com](mailto:irpanleska@gmail.com)

among you who call for virtue, instructing those who are good and forbidding those who are evil, they are the lucky ones." (QS Ali Imran: 104). In addition, it is also mentioned in the Qur'an Surah al-Maidah verse 67 which reads: Meaning: "O Messenger, convey what has been sent down to you from your Lord. And if you don't do (what was ordered, it means) you don't convey His message. Allah protects you from (disturbing) humans. Surely Allah does not guide the disbelievers." (QS al-Maidah: 67).

From these verses it is explained that every Muslim is required to convey the message of Islam to all mankind by calling for good and forbidding evil, jihad, giving advice and so on. The religion of Islam functions as a mercy and blessing for all mankind, so Allah revealed this religion as a complement to the previous religions which cover the basic aspects of the world and the hereafter, which can guide humans to inner and outer happiness in this world and the hereafter. All of this can be achieved, one of which is with the existence of da'wah. Da'wah is an integral part of Islamic teachings that must be carried out by every Muslim. This obligation is reflected in the concept of amar ma'ruf and nahi mungkar; namely an order to invite people to carry out positive-constructive behavior while at the same time inviting them to leave and distance themselves from negative-destructive behavior. This concept contains two meaning implications at once, namely the principle of struggle to uphold the truth in Islam and efforts to actualize the truth of Islam in social life in order to save them and their environment from damage (al-Fasad).

In essence, Islamic da'wah is the actualization of the faith (theology) which is manifested in a system of human activities of the faithful in the field of society on a regular basis to influence the way people feel, think, behave and act on the plane of individual and sociocultural reality in order to strive for the realization of Islamic teachings in all aspects

of life. by using a certain method. Given the function and role of da'wah which is so important and decisive, the meaning of da'wah and everything related to it must be understood correctly and correctly, in line with the provisions of the Qur'an, the Sunnah of the Prophet and the Nabawiyah sirah which contain instructions on how to carry out da'wah. , so as to produce individuals who are istiqamah and tough; and gave birth to an order of life in an Islamic society. The community as the object of da'wah or the target of da'wah is an important element.

Therefore the problems that occur in society can be studied as well as possible before moving on to actual da'wah activities. As a provision for da'wah for a preacher or preacher, he should equip himself with some knowledge and experience that is closely related to the problems faced by the community itself. Besides that, da'wah also seeks to build a more qualified Islamic society (khairu ummah) which is fostered by the spirit of monotheism and the height of Islamic values. (Asmuni Syukir, 1983; 65) The purpose of da'wah in general is to save humanity from the valley of darkness and bring it to a place where which is bright from the misguided path to the straight path, from the valley of polytheism with all forms of misery to monotheism that promises happiness. (Awaluddin Pimay, 2005; 8).

Da'wah of Islam in the digital era is not free from various obstacles and challenges it faces. So that the da'wah of Islam will face various very complex and complicated problems. Today, at least the challenge of Islamic da'wah is related to the excesses of globalization and the reality of religious plurality. The rapid progress of science and technology has transformed human civilization from agricultural to industrial culture and then to the information and communication age. Vocabulary and at the same time a weapon that is so significant and determinant in the current era of globalization is the sophistication of information and

communication technology. Through information and communication technology networks in the era of globalization it continues to spread to all corners of the world. So that the reality of the world today with all its diversity, inequality and irony has become the nation's socio-cultural barriers and obscures the country's geographical boundaries. In the digital era where everyone can get and do something very easily and quickly. Maybe in the era before the invention of electronic media existed, that person needed various books and references in the form of books. Meanwhile, in this digital era, people just have to look for something they want on an internet site. All the necessary information will appear with the various models. The digital era is the peak where everything that is instant (fast) can be enjoyed by the public. A da'i (mubaligh) can preach through various media, both electronic and print media such as television, radio, YouTube, newspapers, magazines, bulletins, and others.

Sometimes I think that it's not only artists who want to appear on television, but preachers can too. In this era they get a comfortable behavior, a sense of peace because of the existing facilities. In general, da'wah carried out in a taklim assembly in a surau, mosque or prayer room takes place in a sacred and solemn atmosphere. Advances in technology and information allow a da'i to improvise with humor and other things, so that the lecture material remains interesting to listen to. Given the challenges of da'wah in the era of technology and information, especially the media, cannot be separated from entertainment. As a result, the missionary orientation played by the preachers is also growing, and even tends to be biased.

Initially, da'wah which had more contact with the realm of worship, was always based on the intention and motivation to worship as well, that is, it was carried out with joy, a sincere heart and only hoping for the pleasure of Allah SWT. However, in its development the

pattern of preaching through the media as a form of technological progress has become a challenge for a da'i. The influence of the media allows a da'i to gain popularity in the eyes of his audience like a celebrity (public figure) and does not rule out the possibility that his preaching activities are often judged by material.

In dealing with various problems that are increasingly severe and complex, as a result of the demands of the development of science, technology, globalization and the demands of needs, it is presumably that the da'wah activities carried out by individuals are inadequate. Therefore it should be carried out through an institution that is well organized and collects the necessary expertise. Therefore, the achievement of the objective of da'wah effectively and efficiently is in principle inseparable from how the da'wah can be prepared and planned in such a way, taking into account everything that might happen. This means that da'wah must begin with calculations that are accurate, thorough, precise and holistic. Such as, Who does what, when it is done, where it is done, what is needed and must be done, why must it be done and how to do it. Or in formulation. Pahlawan Kayo (2007 : 35), that preaching planning must at least be able to answer questions 1) What form of da'wah activity will be carried out? 2) What is the goal to be achieved in the da'wah activity? 3) Where is the da'wah activity carried out? 4) When or when the da'wah activity was carried out? 5) Who is involved in the da'wah activity? 6) What techniques and methods are used in the da'wah? Thus the existence of planning in carrying out da'wah becomes a very important and deterministic aspect in an effort to achieve the stated goals of da'wah. This is in accordance with what was stated by Dean R.Spizer, as quoted by Muhyiddin and Safei (2002: 134);

Those who failed to plan, plan to fail (who failed to make a plan, in fact he was planning a failure). According to Hasibuan (2011: 91),

a plan is very important, because 1) Without planning and planning means there is no goal to be achieved. 2) Without planning and planning there are no implementation guidelines so there is a lot of waste. 3). The plan is the basis of control, because without a control plan nothing can be done. 4). Without planning and planning means no decisions and no management process. In the context of da'wah activities according to Rosyad Shaleh (1997: 48), that with planning, the implementation of da'wah can run in a more directed and orderly manner, because with careful thought about what things must be carried out and how to do them in the context of da'wah, then it can be considered what activities should get priority and take precedence and which activities should be followed up. It is on this basis that the da'wah activities can be sequenced and arranged in such a way, step by step that leads to the attainment of the goals and objectives that have been set.

## **2. Research methodology**

In this study, researchers used a qualitative phenomenological approach that focused on planning the preaching of the digital era. To collect data, researchers determine data sources and locations where data sources can be found and researched. This field research is in the context of collecting data through observation, interviews and documentation through data sources, both primary and secondary sources. Based on the characteristics above, this research was carried out using library sources as secondary sources in order to support primary sources in collecting data closely related to Islamic Da'wah in the Digital Age. where the data source is an informant as the main source consisting of having their respective capacities from academics, preachers, and religious leaders.

While secondary sources are taken from literature, internet sourcing, dissertations,

theses and journals related to Islamic da'wah in the digital era with data mining techniques through: (1) Observation. Through observation the researcher can describe what happened, who or what was involved, when and where it happened, how and why it happened. Simply put, observation can be interpreted as a process of looking at the research situation. (2) Interview. Several things that need to be considered by a researcher when interviewing respondents are voice intonation, speed of speech, sensitivity to questions, eye contact, and nonverbal sensitivity. In seeking information, researchers conducted two types of interviews, namely interviews conducted with the subject or respondent and interviews with the respondent's family (Sugiyono: 2013: 227). (3) Documentation and immediately jump into the field of conducting research. The documents shown in this case are all related documents so that these documents can strengthen the data collected and analyzed in a study.

The method of determining the subject is determined by Purpose Sampling , namely determining the subject based on the research objective. This method focuses on selected informants who are rich in cases for in-depth studies (Nana Syaodih: 2012: 101). In research with a qualitative approach, the description of the subject/informant includes, initial informants and key informants and their characteristics (Nawari Ismail: 2015: 10).

## **3. Results and discussion**

Da'wah planning comes from the words planning and da'wah. Planning according to Agus Dharma (2003: 41), is the process of setting goals and objectives and determining how to achieve these goals and objectives. According to Winardi (1983: 149), planning is determining in advance what to do and how to do it. Then according to GR Terry, as quoted by Hasibuan (2011: 92), Planning is

the selecting and the relating of facts the making and using of assumptions regarding the future in the visualization and formulation of proposed activities believed necessary to achieve desired results. (Planning is choosing and connecting facts and making and using assumptions about the future by describing and formulating the activities needed to achieve the desired result).

Furthermore Hasibuan (2011: 9) came to a conclusion that planning 1) is the main function of the manager, the execution of work depends on the merits of a plan. 2) planning must be directed to the achievement of goals. If the goal is not achieved it may be caused by a lack of good planning. 3) planning must be based on objective and rational facts to realize effective cooperation. 4) planning must contain or be able to project events in the future. 5) planning must think carefully about the budget, policies, programs, procedures, methods and standards to achieve the goals that have been set. 6) planning must provide a working basis and background for other management functions. Meanwhile, according to Asmuni Syukir (1983: 17), the word da'wah comes from the word "da'a-yad'u. It means calling, inviting or calling. Then in terms of preaching it is inviting mankind with the wisdom of wisdom to follow the instructions of Allah and His Messenger (Hamzah Ya'cub, 1978: 13). Then when the word "planning" is combined with the word "dakwah", so that it becomes the word "preaching planning," according to Rosyad shaleh (1997: 54), da'wah planning is a process of thinking and making decisions that are mature and systematic, regarding the actions to be taken. in the future in the context of organizing da'wah.

Meanwhile, according to Munir and Wahyu Ilaihi (2006: 98) that da'wah planning is tasked with determining steps and programs in determining each target, determining da'wah facilities or media, as well as da'i personnel to be deployed, determining suitable material for perfect implementation,

making assumptions about various possibilities that can occur which can sometimes affect how the program is implemented and how to deal with it and determine alternatives f. Based on the explanation above, it can be understood that Da'wah Planning is a process of setting goals, objectives and ways of achieving da'wah objectives through various da'wah activities by taking into account the possibilities that will occur, and involving all resources that can support the success of da'wah.

#### Da'wah Planning Process

In order to formulate a da'wah plan, one must first determine the steps in the planning itself. The planning steps according to Susatyo Herlambang (2013: 47), are as follows: 1. Analyze the situation 2. Identify problems and priorities 3. Determine program objectives 4. Assess program constraints and weaknesses 5. Prepare operational work plans Then according to Hasibuan (2011: 112), that the planning procedure (steps) are: 1. Explain and formulate in advance the problems, efforts and objectives to be planned 2. Collect data, information and facts needed sufficiently 3. Analyze and classify data, information and facts and their relationships 4. Define plans, premises, and constraints and the things that encourage them 5. Determine several alternatives 6. Choose the best plan from the existing alternatives 7. Sequences and detailed timing of the proposed plan 8. Carry out checks on the progress of the proposed plan.

Meanwhile, according to Prajudi Admosudirdjo (1982: 181), every plan consists of certain steps that must be carried out sequentially, and the planning procedure is just a "logic of thinking" in carrying out the planning. The procedures are as follows: 1. Identification of problems that require planning action 2. Analysis of the situation and whether or not the problem should be responded to in a planned manner 3. Formulate the objectives to be achieved with the plans to be made Prepare an outline

plan, and make a kind of "plan proposal" " 5. Plan proposal is discussed together, with superiors, colleagues and relevant subordinates 6. Analysis of the interim plan, determine the components 7. Determination of the people (staff) for each component and the responsibilities of each 8. Determine the out line rather than a joint plan 9. Initiate contact with units and parties concerned with issues and plans, and determine relevant data 10. Relevant data collection 11. Data processing 12. Conclusion and tentative planning 13. Discussion of tentative plans with relevant parties 14. Preparation of final plan text 15. Testing of final plan text al to reality 16. Approval of plans 17. Descriptions for implementation. Based on the explanation above, it can be underlined that the planning steps or procedures must start from a problem, and it is from this problem that facts, data and all information are collected, after which an analysis is carried out including the problems that might occur when an alternative plan has been selected and agreed upon held.

In relation to alternative decision-making plans, Rosyad Shaleh (1997: 54), explains that thinking and decision-making regarding the actions to be taken must be based on the results of careful estimates and calculations, after first conducting research and analysis of reality. and concrete explanations. If related to the conceptualization of da'wah planning, then at least according to Muhyiddin and Safe'i (2002: 134) there are several stages that must be formulated, namely as follows: 1. Establish a series of da'wah objectives. This planning begins with a decision about the wants or needs of the da'i or da'wah organization. Without a clear formulation of objectives, da'i or da'wah institutions cannot use their resources effectively. 2. Formulate the current state of affairs. It is very important to understand and identify the conditions faced by the da'wah community (mad'u) to formulate and determine the most appropriate steps to take. This stage requires the supply of

adequate data and information about a community that is used as the target of da'wah. 3. Identify all facilities and obstacles. This is done to measure the ability of a da'i or da'wah institution to achieve the goal of da'wah. Thus, it is also necessary to immediately identify things that can become obstacles and things that can be a driving factor for the successful achievement of da'wah objectives. Even though it is difficult to do, anticipating circumstances, identifying problems, and opportunities and threats that may occur in the future is an essential part of the da'wah planning stage. 4. Develop a missionary plan for achieving goals. The last stage in the da'wah planning process includes developing various alternative activities to achieve the goals, evaluating alternatives, and selecting the best alternative among the existing alternatives.

In relation to the explanation above, Munir and Wahyu Ilaihi (2006: 100) put forward the elements of the da'wah planning framework in the form of steps and activities, namely: 1. Da'wah must have a vision, mission and main goals for the future 2. Assess reality, and environment which includes all aspects contained therein 3. Setting goals that might be realized, namely by following the existing da'wah methods 4. Proposing various forms of wasilah or da'wah means and determining alternatives 5. Choosing the most suitable means and methods of da'wah 6. Da'wah must be able to answer the target in this case; what is the purpose of preaching? Where will the da'wah be carried out? When? And what material will be presented?

Likewise with the opinion of Rosyad Shaleh (1997: 54) explaining that the da'wah planning process will include the following steps, namely: 1. Forecasting and calculating the future 2. Determining and formulating targets in order to achieve predetermined da'wah objectives 3. Determination of da'wah actions and implementation priorities 4. Determination of methods 5. Determination and scheduling of time 6. Determination of

location (place) 7. Determination of costs, facilities and other factors needed From the several expert opinions above, it can be understood that the planning process Da'wah can be carried out with two assessment approaches, namely internally and externally. Internally, this can be started through: 1) deep understanding of the vision, mission, goals and profile of the organization or da'i. 2) in-depth understanding of the capabilities and weaknesses of the organization or da'i. 3) take an inventory and classify the resources they have, as well as their weaknesses. 4) projecting the opportunities and challenges to reality that will be faced by the capabilities and weaknesses of the organization or da'i. 5) estimate the reach of the organization or da'i towards reality internally and externally. As for externally, the da'wah planning process can begin with: 1) an in-depth understanding of what problems the ummah are very urgent to address by the dakwah, 2) finding out and collecting all facts, data and information about the problems of the ummah that will be faced by the dakwah, 3) accurately select facts, data and information that underlies the problems of the ummah, 4) classify facts, data and information carefully about the ummah's problems, so that the root causes can be identified, 5) intensively and comprehensively analyze the substance of the ummah's problems, 6) developing alternative da'wah plans, while keeping in sync with the vision, mission and goals of the organization or da'i, 7) selecting alternative da'wah plans that are considered appropriate.

**Figure 1.** Digital da'wah planning, research

results in 2023

### Benefits of Da'wah Planning

According to Munir and Wahyu Ilaihi (2006: 105). Whereas there are several benefits that can be achieved by carrying out da'wah planning, namely as follows: 1. Can provide goal boundaries (goals and targets of da'wah) so as to be able to direct da'i appropriately and maximally 2. Avoid sporadic use of human resources and also avoid conflicts among overlapping da'wah activities 3. Can predict and anticipate various problems and is an early preparation for solving da'wah problems 4. Is an effort to prepare preacher cadres and get to know the facilitation, potential and abilities of the people 5. Can organize and save money time and proper management 6. Saving human and material facilities and capabilities 7. Supervision can be carried out in accordance with objective and specific measures 8. Arranging and sequencing the implementation stages so as to produce an integrated and perfect program.

Meanwhile, according to Muhyiddin and Safe'i (2002: 135), that the uses or benefits of da'wah planning are as follows: 1. Helping preachers or da'wah institutions who will enter the field of da'wah to adapt to changes that occur in the environment mad'u 2. Assisting in crystallizing agreements on key issues 3. Allowing da'i or da'wah institutions to understand a clearer picture of operations 4. Assisting in determining the steps of da'wah more precisely and effectively 5. Making goals clearer, specific and detailed 6. Minimizing uncertain jobs, thus saving more time, effort and funds.

### Basic Objectives of Da'wah Planning

In its use, it is oriented towards the desired results, for example for da'i, mad'u, or the community. It is the goal that gives direction to all management decisions, and is a criterion used to measure actual performance. This is what is called the basis of planning.

Multinety of Goals At first glance, it may be

that the activities of the da'wah organization only aim at the spiritual or vertical context, whose goal is faith. In other words, the goal of da'wah is oriented towards converting non-Muslims to Islam, increasing faith for those who are already believers, giving answers to the people on the problems of their religious life. This statement is a narrow view, because in a more substantive analysis, that da'wah organization is to penetrate all lines and touch a more essential life.

1. Targets Set Da'wah Targets set are official statements of the organization so that it is trusted by the public as its target. In da'wah organizations, this goal can be in the form of pamphlets, leaflets, and bulletins that are issued. At this level, a da'wah manager is responsible for statements that have been issued if there is a problem or conflict from the mad'u.

2. The Traditional Method of Setting Da'wah Targets The definition of traditional targeting is that targets are set, then classified into sub-targets. In da'wah organizations the efforts of preachers at various levels of the organization are adjusted to meet the goals set in their areas of responsibility.

3. Management Based on Targets Management based on this target is one of the management that is widely used by organizations. Management based on objectives or MOB (Management by Objective), namely management where detailed performance targets are set jointly by subordinates and leaders. Progress toward these goals is periodically reviewed, and rewarded based on that progress. MOB also aims to motivate subordinates.

#### The Role of Da'wah in the Digital Era

Da'wah of Islam in the digital era is not free from various obstacles and challenges it faces. So that the da'wah of Islam will face various very complex and complicated problems. Today, at least the challenge of Islamic da'wah is related to the excesses of globalization and the reality of religious plurality. The rapid progress of science and

technology has transformed human civilization from agricultural to industrial culture and then to the information and communication age.

Vocabulary and at the same time a weapon that is so significant and determinant in the current era of globalization is the sophistication of information and communication technology. Through information and communication technology networks in the era of globalization it continues to spread to all corners of the world. So that the reality of the world today with all its diversity, inequality and irony has become the nation's socio-cultural barriers and obscures the country's geographical boundaries.

In the digital era where everyone can get and do something very easily and quickly. Maybe in the era before the invention of electronic media existed, that person needed various books and references in the form of books. Meanwhile, in this digital era, people just have to look for something they want on an internet site. All the necessary information will appear with the various models.

The digital era is the peak where everything that is instant (fast) can be enjoyed by the public. A da'i (mubaligh) can preach through various media, both electronic and print media such as television, radio, YouTube, newspapers, magazines, bulletins, and others. Sometimes I think that it's not only artists who want to appear on television, but preachers can too. In this era they get a comfortable behavior, a sense of peace because of the existing facilities.

In general, da'wah carried out in a taklim assembly in a surau, mosque or prayer room takes place in a sacred and solemn atmosphere. Advances in technology and information allow a da'i to improvise with humor and other things, so that the lecture material remains interesting to listen to. Given the challenges of da'wah in the era of technology and information, especially the media, cannot be separated from

entertainment. As a result, the missionary orientation played by the preachers is also growing, and even tends to be biased. Initially, da'wah which had more contact with the realm of worship, was always based on the intention and motivation to worship as well, that is, it was carried out with joy, a sincere heart and only hoping for the pleasure of Allah SWT.

However, in its development the pattern of preaching through the media as a form of technological progress has become a challenge for a da'i. The influence of the media allows a da'i to gain popularity in the eyes of his audience like a celebrity (public figure) and does not rule out the possibility that his preaching activities are often judged by material.

Arnold Toynbee, quoted by Basit, said: "I believe that the style of a civilization is a manifestation of its religion. I fully agree that religion has been a source of vitality which has led to the presence of civilization in the world and has maintained its presence. Even more than that, religion is a spiritual bond that has united civilized society".<sup>30</sup> As an approach, digital da'wah provides structural and cultural strength. Structurally strengthening is meant for institutionalized digital da'wah. These institutions can be formal or non-formal, whether initiated by the private sector or the government. Thus, the spirit of Islam can be enjoyed collectively as a structural missionary effort.

### 1. Opportunity Da'wah in the Digital Age

With the renewal and progress of digital technology and information media, it makes human life in this world more advanced and can realize the unity of preachers in preaching and spreading Islamic teachings that are rahmatal lila'lamian, the increasingly sophisticated digital era is indeed an increasingly complex da'wah challenge. so that with this progress the preachers are required to be able to keep up with it, even though it sometimes has an unfavorable effect, if Muslims are observant of the state of

this digital era then it will be a great opportunity for the success of Islamic da'wah throughout the world.

Currently, online literature or digitization is highly developed, religious references are easily accessible in a timely and precise manner, can be accessed via the web and Google, which circulate through digital media, and are not limited to electronic books. Islamic literature can be disseminated through digital tools. (Muzayyin Ahyar, 2017; 435) .And at this time the da'wah movement through online is already very lively, thus we must increase the opportunities for da'wah by using digital tools, because this is an opportunity where the da'wah that is being carried out can be reached by people all over the world.

The sophistication of digital technology at this time can be utilized by every human being, especially the preachers to maximize in spreading the teachings of Islamic law or preaching widely, optimizing the digitalization of da'wah something that cannot be separated, preaching and technology is a unity that can enhance the maximum in preaching in the world. digital era. Da'wah delivery must be carried out optimally, including the use of social media tools, so that da'wah can be quickly accepted by the wider community so that the maximum results of da'wah can be felt. ( Haryantomo. 2011; 23)

In the current contemporary era, it has indeed had an influence on the pattern of human life, has had an influence on modern life which can encourage Muslims to become more enthusiastic in following the flow of advances in digitalization tools, starting from the age of children, teenagers to adults, all can use digital tools. digital and social media that are increasingly developing and sophisticated, for people who want to gain insight into knowledge about Islam it is also easy for them to be able to get Islamic information by always opening access to social media which specifically provides Islamic da'wah content,

thus it will become an opportunity for da'wah extraordinary for the preachers of the homeland. (Fahrurrozi, 2017; 5).

Dakwah through digital tools has penetrated all corners of the world, the flow of information development has also entered the santri community in the archipelago, they have a virtual digital community that is easy to use as a communication tool. (Rusli Nasrulaoh, 2014; 139).so that at this time alumni of Islamic boarding schools who incidentally have a strong and better understanding of religion, they also have a great opportunity to inform about Islam, they can participate directly in spreading Islamic teachings through available social media, students can become cyber- cyber youtube in the realm of the internet. Even digital social media tools also make it easier for students to discuss religious issues that are currently happening in the midst of life so that students can easily answer and provide solutions to these problems.

The pesantren alumni students who narrate the Islam of the archipelago are able to explain to the public that Nusantara Islam is not a new religion, not a new teaching, but is an identical term to make it easier to apply Islamic teachings to the people of the archipelago, as a simple example, charity is a form of Islamic teachings, it is difficult for Indonesians to alms like the prophets and companions, because Indonesians do not have property exactly like those of the Prophets and Companions, then the alms of Indonesians can be with sweet potato leaves, can be watermelons, which maybe in the time of the prophet did not have these items. In their activities, students can use social media as a very effective da'wah medium for the target level of the millennial generation, senior students who are active in the virtual world. They become activists to be more digital savvy.

there is a time of progress in science and technology (IPTEK) and transformation with various negative impacts at this time, it seems

that we are all called upon to do da'wah, namely inviting or calling to do good and prevent evil, changing people from one situation to another situation that is better in in all fields, realizing Islamic teachings in daily life for an individual, family, group or mass as well as for the life of the community as a whole order of living together in the context of developing the nation and humanity. Identification Parker (1973), as quoted by Agoeng Noegroho, pays attention to several impacts of communication technology, including:

1. The occurrence of a monopoly in the management, supply and utilization of information.
2. Unequal distribution of information.
3. Lack of educative message content.
4. There is information pollution.
5. There is inflation of privacy.
6. Issues related to copyright arise

The information civilization that has dominated the modern world in the last few decades has had a global impact on various sectors of human life, both the positive and moreover the negative impacts, almost all of which can be linked directly or indirectly with religion, especially the opportunities and challenges of preaching. The positive aspect of this information civilization which is an opportunity for da'wah, among other things, can be used as a medium of da'wah, even by religious parties, including Islam has been made to support the development of their religion, both regarding institutions and weaknesses, as well as those related to efforts to dynamicize teachings -his teachings. In this latter context, as far as the author knows, many science and technology findings have and will greatly help preachers to provide contemporary interpretations of Islamic texts themselves. Many things that until now have seemed vague to the scholars, have finally been revealed in terms of their meaning and content thanks to the findings of science and technology.

Information Technology indirectly has a

broad effect in changing social control. This can be seen how the media can smooth coercion, so that it appears as persuasion. As already mentioned, information civilization makes religions more transparent both in terms of doctrines and teachings, as well as in terms of activities and programs produced by every religion, not just Islam. Thus, the transparency of these religions, the occurrence of religious conversions (religious conversions) among the people is a very necessary thing, especially people who uphold the values of freedom and rationality. This is where the actual opportunity for Islamic da'wah to appear to play its role in using information communication technology as an effective media for preaching so as not to lose out in competition and change religions (leaving Islam) just because of the lure of momentary need. On the other hand, as has been predicted by futurologists that the 21st century will be the century of religious revival, in this century there will be a kind of respiritualization among modern society. Those who previously experienced soul aridity due to spiritual emptiness began to try to find things that could bring inner satisfaction and happiness. Spiritual satisfaction is of course more potential to be obtained in religious spirituality. Along with the symptoms of respiritualization that are now starting to appear, there has also been a kind of revitalization and resurgence of major religions in the world. If religion has rediscovered its vitality in governing human life as a result of the roles played by da'wah in taking advantage of various opportunities, then this will not only benefit certain religions, but also have a positive impact on all religions, especially Islam which is essentially fundamental. is as Rahmatan lil alamin religion.

#### 1. Da'wah Challenge

In its development, technology is not only used to create comfort so that humans can live more happily and not be subdued by the will of nature, but in fact the development of

technology as we are witnessing today has gone so far that there is a tendency, not the technology itself. submit and serve humans, but it is humans who follow technological developments that have gotten out of control. So it's not an exaggeration if Dr. Rollo May said that the 20th century is the age of anxiety. While anxiety according to Dr. FW Bawengan, is not only a psychological symptom but a disease that affects humans in this modern era. The rest, anxiety is also the cause of the emergence of various diseases called psychosomatic. That is why, amidst the roar of industrial machinery, many people are confused, looking for peace to escape from the gripping anxiety, meanwhile crime and clashes are also rampant.

The culture of materialism that dominates almost all of society is a challenge to the world today, including Eastern religious societies. Among these challenges

1. The displacement of religious moral values and the loss of the function of religion itself is another result of a materialist culture that sees everything through a process of calculation, measurement and control.

2. The dysfunction of religion in the social life of society along with the emergence of the notion of secularism is seen everywhere, directly or indirectly, consciously or unconsciously. In almost all countries, religion really only occupies a marginal position and charity is dysfunctional, including in the fields of socio-economic, cultural, educational, political and so on.

3. The ferocity of alcoholism and morphinism, such as ecstasy and so on, which killed generations of people and rampant sadism, rape and other crimes are derivatives of the elimination of religious moral values. In an industrial society that defies science and technology, da'wah faces formidable opponents, unless science and technology is filled with religious content with high weight, because efforts to give religious content to science and technology, naturally require humans with reasoning powers and firm faith

in large numbers . However, it must be understood that this is where the main weakness of Indonesian Muslims lies, namely their low mastery of science and technology. Apart from that, the industrial society and the information society need intensive capital to finance various productions in all fields, including the mass media (press, film, radio and television). In this regard, Muslims also experience severe weakness. Because the majority of us are classified as still below the poverty line. This structural poverty has resulted in weaknesses in the field of education so that the professional ability to use mass media and other sophisticated technology for preaching also suffers a sad fate. These are, among other things, the unfavorable aspects of modern civilization which are a challenge for da'wah as well as a challenge for us religious people to then look for alternative solutions.

Although these challenges are generally global in nature, they are still relevant to be seen from the perspective of Islamic da'wah in the present and in the future, because we have truly entered the era of globalization and transformation of information with various trends and the impacts they have caused.

## 2. Impact of Information and Communication Technology in Da'wah.

The Impact of Information and Communication Technology on Da'wah The information age is characterized by an increasing number of workers and an increasing focus on activities related to information technology. In addition, the information era is also marked by the increasing role of information technology in economic, political, ideological and cultural activities

The impact it creates is that technology has a good impact on society, such as by using television, computers and the internet, you can quickly find out developments and events in Indonesia, even around the world. However, we must realize that there are not a few negative impacts that it causes. This can

be observed from the use of electronic media such as television and the internet via computers and so on, which actually damages the image and morals, especially among young people and even reaches children, namely by broadcasting pornographic and pornographic shows that are not in accordance with Islam. In dealing with the process of progress and changing times due to advances in science and technology is the ability to manage information.

It is common knowledge that the basis of world information no longer recognizes regional boundaries, common interests and social and political systems. Even space distance constraints have been overcome by transportation and telecommunications technology, so access to information has spread and varied. Now technology products can be said to be more dominantly used to access information. The use of information and communication technology cannot contribute significantly to the implementation of da'wah, but is only used as a means of conveying various kinds of information without sorting out which ones should be conveyed to the public and which ones should be avoided, such as the use of television as a medium for delivering da'wah. .

The development of television technology has been used as much as possible to reduce the distance or communication barriers to the public. The audience on the one hand becomes the king and determines the behavior of the various programs produced. Audiences are not just passive spectators. but they are given the opportunity to feel as if they are the most important part of the ongoing information transformation process. The era of globalization marked by the transformation of science and technology as well as communication has become so sophisticated that it makes it easier for humans to obtain information as material for their knowledge. The result of modern technology that has entered human life is a combination of various technologies. In the

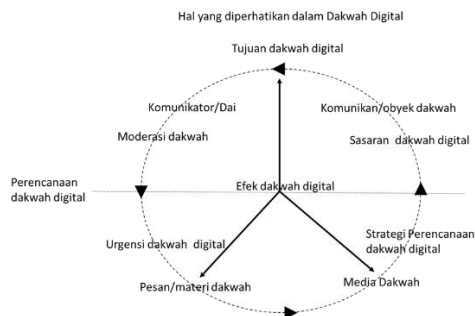

fast-flowing process of industrialization, Indonesia is faced with future alternatives such as: catching up on backwardness in science and technology, developing science and technology, choosing the process of transferring technology and adopting it for practical implementation. The problem is how to tap the use of information technology in the implementation of da'wah, because this is not only based on its use, but is expected to provide useful services for all aspects of human life and most importantly of course it can provide benefits in the implementation of da'wah. Then it requires the ability of reliable human resources in terms of its application in the life of the nation and state.

On the other hand, the two dominant factors that cause deviant behavior or unlawful acts committed by children are strongly influenced by the impact of globalization in the field of information technology. This indirectly affects changes in ways and lifestyles that have brought about fundamental changes in people's lives. The da'wah aspect used in the broadcast is actually the same as the aspect used in the communication process. What distinguishes it is that the process of communication reaches people without boundaries with various forms of information, whereas da'wah focuses more on religious, ethical and moral responsibilities in everyday life.

Consideration of religious law becomes very important in the rules of presentation. In this context, the da'wah process is seen as a conscious and intentional process of carrying out activities or efforts. This process should be carefully planned, taking into account all aspects that can influence the implementation of da'wah, such as the transformation of da'wah messages, their understanding and influence on society. The aspects of da'wah that must exist in the da'wah process are 1) Da'i, namely the person who is the source of information or the party who will convey the da'wah, 2) Mad'u, namely the person who receives the da'wah message, 3) Material,

namely the contents of the da'wah, 4) Da'wah means are facilities that can make it easier for the da'wah to convey the contents of the da'wah to the public.

The use of communication media and understanding the changing mindset of the people where the da'wah takes place, the presentation of the da'wah needs to be modified to attract the masses and understand the da'wah material it conveys. Based on the rationale above, it can be stated that the implementation of da'wah cannot be separated from various aspects such as economic, political and socio-cultural with the development of information and communication technology which is basically a representation of the local community and social system. The same thing also applies to da'wah communication using mass media. In this era, the opportunity for da'wah has also become very large because information and communication technology services can be used not only in the implementation of da'wah, but also in the process of belief in the Almighty Allah. By utilizing science and technology as a tool (media).

**Figure 2.** Things to pay attention to in digital da'wah, research results for 2023

### 3. Principles of Da'wah that must be carried out in the Information and Communication Technology Era

Da'wah faces big challenges not only because of the increasingly diverse intensity of changing times which each time raises new questions and studies, but the

multidimensional needs and interests of humans now tend to be more critical due to the breadth of information and experience.

It has been explained that modernity is characterized by industrial activities or the use of technology in almost all aspects of human life. For this reason, it is necessary to understand religious teachings in solving the problems of modern society, for this reason, integrated principles are needed in carrying out Islamic da'wah. Discussing the principles of da'wah, of course the elements of da'wah involve all the elements that make it possible to achieve the goals or objectives of da'wah, which have complete linkages and integration with one another.

Elements of da'wah can consist of people who convey Islamic teachings (dai), ideas or principles conveyed (material), methods taken to achieve the intended goals (methods), equipment used (media), then the intended target (da'wah targets). . So far, the da'wah approach is synonymous with tabligh. Islamic teachings are spread through the pulpit media, so that to determine the criteria for the preacher is someone who is active/preaching through the pulpit. Someone who is active in a da'wah organization but does not actively give lectures is not considered a preacher. At present it is increasingly difficult to gather people to give lectures. People are less and less fond of lectures that smell of sermons. People tend to be seen as human beings who need to be respected for their humanity, "then the broadcasting of religion through education must be increased in which the study of Islam is gradual , programmed and planned.

Facing an industrial society that is bound by rules, we need to understand the meaning of da'i and da'wah in depth, meaning that da'wah is not only synonymous with tabligh, but includes all efforts to realize Islamic teachings in all aspects of human life. An activity can be called da'wah if it is a system of joint efforts of believers in an effort to realize Islamic teachings in all aspects of life

which is carried out through a da'wah institution. Da'wah activities, as well as in the communication process, feedback is very important to note. Awareness and sensitivity in detecting feedback will make the da'wah process more effective. For da'wah to be effective it is necessary to observe some basic principles. The basic principles include conveying persuasively informative, serving, not instructive and burdensome, let alone threatening (QS 20:43-44), Delivered at all times, places and opportunities. Done by spreading the news of the truth without having to vilify other parties (QS.6: 108).

Da'wah should be directed at forming quality human resources, so that Muslims are taken into account in the development of science and technology.

The process of actualizing faith as a da'wah order on all levels of human reality, requires an organized effort in order to realize the function of the caliphate. This process consists of changing the system of feeling, thinking, behaving and acting individually and society towards the development and creation of a new reality system that upholds human values, justice, truth, peace, beauty, goodness which is referred to as Islamic reality.

The process of change that is carried out in a planned manner with clear goals will bring about intensive and excessive changes and directly touch the most fundamental values for Muslims. Islamic da'wah in this case is faced with a series of problems that must be answered simultaneously within a clear framework. On the one hand, Islamic da'wah appears to provide a sense of security to its adherents from symptoms of alienation, psychological shock, legal uncertainty, political instability, the loss of the role of the environment which is increasingly dense to breathe and is haunted by increasingly uncertain situations and the emergence of science in bringing an unjust and prosperous society. In addition, the role of da'wah is as a filter that can assist us in making more

humane and Islamic value choices, in the current changes that occur as a result of the discovery and application of various modern technologies. It is also hoped that it can play its role as a guide who can guide us to better understand the real meaning of life, so that with da'wah, it is hoped that the people will not experience a process of confusion over disoriented in the dynamics of world civilization.

For this reason, if preaching is seen as a communication activity, then in communication activities it turns out that the sophistication of the media as a result of the development of communication technology is not the only determinant that determines the success or failure of a communication activity. Because in every communication process, there are at least five communication components that must be considered, namely: communicator, message content, media, communicant and feedback. Thus, to increase the effectiveness of da'wah in playing its role, there are several things that need attention: First, the meaning of communicators (subjects of da'wah) must be expanded, namely not only those who can be called scholars or preachers in the Taklim Assembly, mosque pulpits and mushallah, but it must be perceived that in fact we all have a mission of preaching so that statesmen, researchers, technologists, doctors, economists and so on can preach according to their expertise. For this reason, the subject of da'wah is not only interpreted individually, but must be developed at a broader level in the form of da'wah institutions or institutions that are intentionally managed professionally. Second, the content of the message (da'wah material) also needs to be further clarified, namely not only referring to standard sources that are understood only in a rigid and textual manner, but also to dynamic sources in the form of the "great Koran" namely universal, heaven and earth. and everything in between .

Preachers are no longer dominantly talking

about the hereafter, heaven and hell but contemporary da'wah material must be able to develop human progress in the present and hereafter life order. Third, the media (washail) to convey da'wah messages also needs to expand its meaning, so that all types of mass media are like television. radio, newspapers, magazines and so on can be used for missionary purposes. Fourth, the meaning of the audience or target audience also needs to be broadened, apart from mosques, mushalla, and taklim assemblies as well as those in other places such as offices, companies, hospitals, and even include all members of the community with various variations. In other words, the kiai network, as well as at the national level and even at the international level, need to be built with good management and professional handling. Fifth, with preaching activities, as well as in the communication process, feedback is very important to pay attention to. Awareness and sensitivity of the da'wah subject (communicator) in detecting feedback will make the da'wah process more effective, for example being able to change the da'wah model after seeing feedback from the audience. Through feedback allows the emergence of a more productive dialogue, so that no one pretends to know everything.

### 1. Preparing Da'i with Science and Technology

To support changes in preaching, preachers need to continuously improve their knowledge, knowledge and technical skills needed to carry out da'wah. Da'i is not satisfied with the knowledge he has, but continues to learn, lifelong learning (long life education). Especially in the current information age, the preacher's ability to operate computers and the internet is a non-negotiable prerequisite. With a computer, da'i can write and store ideas that will be conveyed to the public, can be used to operate LCDs, read books and the Koran with the help

of CD-Rooms, access the internet and so on.

Why do da'i need to have computer and internet skills? Because society is the object of da'wah, more and more are using computers and the internet. Now computers and the internet have been introduced to children at the elementary school level, even since kindergarten. The government has also tried to help the internet network so that it can enter the villages. Hand phone facilities are filled with systems that can access the internet. Restaurants, hotels, campuses, schools, offices and so on have provided hotspot areas (free internet areas). If the community is so open to being able to use computers and the internet, while the da'i doesn't want to know about computers and the internet, there could be an "apocalypse" for the preacher and his da'i activities don't keep up with societal developments .

Learning computers and the internet is not a difficult matter for preachers, it is much more difficult to learn Arabic or Javanese. One to three days, guaranteed if there is a strong will to learn. In principle, don't be afraid of being wrong, the computer won't break or burn, and don't be shy about asking.

Then in this modern era, the science that develops is multidisciplinary and complementary. Religious knowledge which has been the main source of Islamic preachers (da'i) needs to be strengthened with other scientific knowledge so that what is conveyed to the community becomes solid and can be operationalized in the field. Islamic religious knowledge can be strengthened by using the study of psychology, sociology, history and so on. Therefore, preachers need to strengthen their religious knowledge by adding insight and knowledge based on the social sciences, humanities and natural sciences.

An interesting example is the fatwa of Sheikh Adil al-Kalbani, one of the Imams of the Mecca Mosque, which goes against the flow of public opinion among Saudi clergy. al-Kalbani, who initially defended the opinion

that music and singing were forbidden suddenly changed his mind and considered that playing music and singing was not against Islamic teachings. This fatwa received strong criticism from senior Saudi Arabian clerics who considered music and singing, whether performed in crowds or alone, is forbidden by Islamic law. This discourse about music and singing has received sufficient attention and been discussed in the mass media. Many scholars oppose but not a few who support al-Kalbani. If the fatwa is only guided by religious sources without paying attention to sociological studies of society, then the fatwa will collide with the growing reality in society that music is a community need and even a creative industry that can prosper society.

By broadening the approach in developing Islamic religious knowledge, da'wah activities can also be expanded with various approaches. Because da'wah activities are derived from da'wah scholarship which incidentally is part of Islamic religious scholarship. Da'wah activities can be approached with Management Science, Politics, Sociology, Anthropology, Health Sciences and so on. In this way, da'wah activities are very varied. Da'wah activities can accommodate various needs that develop in society.

If we learn from teachers' ways to improve student competence, usually class teachers conduct classroom action research. With this research it is expected that teachers can know clearly what problems are faced by students and how alternative solutions are. Likewise with da'wah activities, when preachers carry out da'i, it is better for da'i to know the needs and abilities of the object of da'wah. "Dakwah while researching" is a smart way that can be applied at this time.

Preachers need to merge and get involved together in solving the problems faced by the community. Da'i is not only "NATO" (No Action Talking Only) and only as a resource person, but also as a motivator, manager,

facilitator, and initiator. Communities have difficulty solving their problems because of the lack of people who are the driving force for change. Not many Islamic leaders have concern for people who are mustad'afin (weak). Though Islamic teachings strongly encourage people to care for the mustad'afin. It is in this context that preachers need to take on the role of leaders who can make changes to society. God's Word emphasizes the role of the da'i in da'wah bil-qaul and da'wah bil-'amal.

It means; "Who has a better speech than one who calls to Allah, does righteous deeds, and says: "Surely I am of those who surrender?" (QS. 41: 33).

## 2. Utilizing Information Technology

In this modern era, developments in the field of information technology are so fast that when depicted graphically, the progress that is taking place looks exponential and nothing can stop the speed of development of information technology.[19] It is very unfortunate when the advancement of information technology is not utilized for the benefit of da'wah. Especially in today's reality, almost the majority of people already have information technology equipment, be it computers, internet, mobile phones, and so on. It's like the world of today's society is the world of information technology. People will be considered "nervy" (less social) or "technologically clueless" (technologically illiterate) if they do not have information technology equipment.

One example of technological equipment that many people like is television. The presence of television for industrial society is like a "new religion". Why not, television has shifted conventional religions. His sermons were heard and witnessed by a larger congregation than any congregation of any religion. The houses of worship are spread all over the world, the rites are followed with great reverence and can thrill the heart and affect the human subconscious. The presence of television has also taken up most of human

time to watch television. According to the Broadcasting Year-book (1985) of homes in the United States, 25% watch TV in the morning, 30% in the afternoon, and 63% at night (8-11 hours), and almost ¾ or 84% of them is watching television.

In addition to the extraordinary presence of television, television also exerts social, political, economic and cultural influences. Socially, television affects the psychological effects of the audience, especially the influence of violence and relationships between the sexes. Politically, television influences the political structure, public opinion, and political culture. Economically, television can influence individual/community consumption patterns and market prices. Finally, culturally, television influences cultural development in various countries.

Broadly speaking, programs on television are divided into two parts, namely: fiction programs and reality programs. Fictional programs can be in the form of cartoon films or sitcoms (films or soap operas showing family life by presenting fictional characters). Meanwhile, reality programs can be in the form of news, documents (such as ABRI events, natural beauty, craft creations and so on), cooking, sports and live entertainment (music).

Muslims can fill fictional television programs. Currently, fiction programs show more violence. Our children are shown cartoon films that feature violence every day for several hours. In a report from the Children's Research Center that television programs for adults are far less violent than commercial programs for children. There are approximately 20 to 25 acts of violence per hour given to children through cartoons, while 3 to 5 acts of violence per hour are given to adults. This is not to mention the addition of soap operas or family films that feature violence against children, such as stepchildren's lamentations. Likewise, youth soap operas/films that show a lot of violent

acts are broadcast during broadcast hours where children find it difficult to avoid and don't want to move away from the television, such as Kick Si Madun, not Mawar but Melati and many other youth soap operas. being loved by all television stations.

The violence shown by television is very influential on children's behavior. Television will shape children's minds, especially their image of violence. In addition, television is also capable of distorting children's way of thinking about the realities of life so that children are easily frustrated, less friendly, and more aggressive. There are several underlying reasons, including: first, before the age of seven years, children are unable to connect stories from beginning to end or do not understand the plot of the story. Second, children remember their physical actions more than the conversations that exist. Third, before the age of five years, children are not yet able to distinguish between fantasy and reality, as a result, children are very easy to behave violently.

It must also be admitted that at this time several television stations are broadcasting religious soap operas. The existence of this soap opera, at least, can enliven the message of Islam and at the same time can minimize the presence of violent scenes on television. We as Muslims should be grateful and grateful to the managers of television stations and production houses and the actors/actresses who are involved in religious soap operas.

Nonetheless, there are some things that need to be improved and developed in the future. First, soap operas that exist in general are still focused on the theme of strengthening faith or God's judgment on sinners. Unfortunately, the thickening of faith conveyed is only seen through black and white glasses. The sinner is punished in this world, usually at death or in a burial place. The punishment given seems to have really happened, even though in reality it may be difficult to find its existence. Is it true that it is a punishment from God or

is it just a natural symptom caused by a disease suffered by its creatures. An incident whose basis is unclear is then justified by an Ustadz about the truth of the story based on a verse or hadith quote. As a result, the audience is directed to a shallow religious understanding and the mind given by God is not used critically and analytically.

Second, there are some sinetrons which are syncretic (merging mystical elements with religious elements), sometimes the mystical elements are stronger. It's hard to say that soap operas like this can strengthen one's faith, instead they can lead someone to the brink of polytheism. There are many strange stories that are difficult for a human to accept logically or critically. In Islamic teachings, activities that smell mystical (magic) are prohibited in Islam, because this can lead to polytheism.

Third, sometimes the television audience is exhibited by the acting of actors/actresses in religious soap operas who are so good at Islam. However, in the same place, the audience was also exhibited by actors/actresses of religious soap operas with behaviors that were exactly the opposite of what was being played. In other words, the actor/actress in religious soap operas can become Ustadz, but outside soap operas they can become "criminals" or can pollute religious teachings. So there are still many actresses/actors who only meet market demands or ratings. They have not made what they have played as an expression of their faith as a Muslim in developing art.

Starting from the description above, a great opportunity challenges us as Muslims to fill in the gaps or weaknesses that exist. Fictional films (cartoons) for children that carry a cool feel, are full of education and have religious values are good areas for development. Likewise, family films/soap operas that start from reality and are able to inspire enthusiasm to try hard and stay away from acts of violence.

With regard to religious soap operas, there are

still many themes that can be raised to the surface and are relevant to the reality of Muslims. The socio-religious life of adolescents, devout Muslims who have had successful careers from the bottom, the unique and modest religious life of rural communities, students who are successful in entrepreneurship, and so on. Raise themes that can motivate and serve as examples for Muslims to advance in worldly life while still paying attention to Islamic values and create storylines that are not too thick with the nuances of da'wah. In principle, Islamic values become the color of the storyline in soap operas. That is what we notice that art cannot be separated from preaching. In art, Islamic values radiate so that people are called to follow. Likewise, preaching that is cool and not pushy is a reflection of aesthetic sense (art).

**Figure 3.** Digital da'wah, research results for 2023

### 3. Dakwah Formula (Recipe) for Da'i in facing challenges in the Information and Communication Technology Era

Every believer is a preacher. In order not to take a wrong step, a da'i must know the formula of da'wah that he will carry out. Dakwah is like river water that must flow all the time. He couldn't stop for a second. If he stops, it means he is gathering a strategy to continue his journey with a long breath and new, greater strength. Sometimes he has to separate to find a gap that he can go through. Sometimes he also had to gather to step over the big rock in front of him. That's preaching. So that the missionary journey is easy and without obstacles. A da'i must know what da'wah formulas he must do. Thus he can

more easily direct his da'wah according to the character he has, including:

#### 1. Rabbaniyah (divine nuances)

Whatever the form, da'wah must be oriented towards divine nuances. Where his teachings must refer to one point, namely worshiping Allah SWT. Methods can vary but the target is only one. In the history of all the preaching of the Prophets invites to one estuary, namely the Oneness of Allah. Allah said: It is not natural for a human being that Allah has given him the Al-Kitab, wisdom and prophethood, then he says to humans: "You should be my worshipers, not Allah's worshippers." However (he said): "Become rabbani people, because you always teach the Al-Kitab and because you keep studying it. (QS Ali Faith: 79).

This divine orientation becomes important when preaching must collide with all worldly interests. Where the da'wah period has penetrated to various sides, if you are not careful it can drag the da'i out of the rabbaniyah rail. Not a few among the preachers who are not strong enough to resist temptation, thus "divining" wealth or position. Everything is from Allah, for Allah h, and returns to Allah SWT

#### 2. Wasatiyah

Balanced not too much and not too little. Give rights to every person who has the right, fulfill the needs of everyone who needs it according to the level, (Islam before congregation). This is important for preachers, and there is nothing wrong with forming several congregations. Even now, the condition of the people who are scattered, actually demands people to live in congregation.

Uniting the people in congregational knots, of course much easier than gathering them one by one. It's like gathering leaves. This would certainly be easier if the leaves had already been collected in several groups, rather than putting them together in scattered or scattered conditions. That is a picture of the urgency of the congregation. But the congregation is not everything, because it is only a means.

Therefore, the application of Islamic values must be a priority. It cannot be defeated by the interests of the congregation. Therefore a da'i must really be Muslim before going to congregation. Where he should be proud of Islam, not with the congregation or the group. Allah says: namely those who divide their religion and they become several factions. Each group feels proud of what is in their group. (QS Ar Rum: 32).

In another verse Allah states: And hold all of you to the rope (religion) of Allah, and do not be divided into pieces, and remember Allah's favor upon you when you were enemies before (during Jahiliyah), so Allah united your hearts, then you became because of the favor Allah, people who are brothers; and you were on the brink of hell, then Allah saved you from it. Thus Allah explains His verses to you, so that you may be guided. (QS Ali Imran: 103).

3. Syumuliyah, Whole and comprehensive in its manhaj (comprehensive), not juz'iyah (partially)

Da'wah does require stages but still must be comprehensive. It can't be half measures. Islamic teachings must be conveyed as a whole. Stages are just a method. Among the characteristics of a comprehensive da'wah are continuous, interrelated, and not contradictory. They cannot be separated from one another. When discussing political issues, he did not forget the issues of faith and morality.

In politics, these two sides cannot be ignored. Likewise when discussing the issue of fiqh, it should not conflict with political conditions. Allah says: O you who believe, enter into Islam as a whole, and do not follow the footsteps of Satan. Surely Satan is a real enemy for you. (QS Al Baqarah: 208).

4. Mu'ashirah (modern). Da'wah must keep up with the times.

If not he will be abandoned fans. Advances in technology and communication systems as they are now should support da'wah, not the other way around. It is very ironic, for

example, that a preacher who is not familiar with the internet world, cannot send e-mail, or has a stutter in operating a computer. In fact, in today's technological advances like that has become a necessity. However, this does not mean that da'wah must lose its originality. The progress of time and technology should not undermine Islamic values. Islamic da'wah is flexible but it should not fade, it can mix but not mix.

5. Waqi'iyah, Realistic in treating individuals and society

Take into account local circumstances and act accordingly. Islamic law recognizes territorial boundaries. Therefore, da'wah must be global. Whichever hemisphere is stepped on, that is where the homeland of Muslims is. For this reason, the concept of da'wah offered must reach all the interests of Muslims wherever they are. The problems of Palestine, Iraq and other parts of the world must be of concern to the Ummah. However, there must be a priority scale. The concept of da'wah must remain grounded and touch the problems of society.

6. Scientific. Islamic da'wah must be based on science

Da'wah that is not based on science will only boomerang and then the object of da'wah will be abandoned. Allah says: And do not follow what you have no knowledge of. Truly hearing, sight and heart, all of that will be held accountable. (QS Al Isra': 36).

7. Inqilabiyah (total change), not tarqi'iyah (patches)

The process of change made in da'wah should be carried out totally and thoroughly. This is where the comprehensive meaning finds its partner. However, still total change must be done gradually and naturally. On the other hand, preaching should not be done rigidly. Total is meant, that da'wah must cover all lines of society. Da'wah should not only touch the elite and forget the common people. Both should receive attention. The elite have advantages in terms of quality, while the common people have a large scope in terms

of quality.

8. Al-mana'atun al-islamiyah (has Islamic immunity)

This is important for propaganda. Islamic immunity will be a stronghold for da'wah. The level of defense of da'wah is determined by how much immunity the propagator has. Such is the character of da'wah. By knowing the religion of these elements, preachers will be able to tread the path of da'wah in the right way.

This element is like a torch that can illuminate the path of preachers so that they can move forward with certainty, especially in the current Information and Communication Technology Era. No more groping. Da'wah in the midst of people's lives will definitely face a number of obstacles, challenges, obstacles and even threats. Especially when da'wah has entered the realm of political and state institutions, there will be even more challenges that must be faced. Da'wah cadres must have a strong character in order to be able to face these challenges steadfastly. At the very least, da'wah cadres are expected to have the following seven characteristics, so that they can be strong in facing the reality of the field of da'wah which sometimes feels very violent in collision, especially in the current era of globalization.

First, atsbatu mauqifan, da'wah cadres must be people who are the most firm in their stance and the most solid in their attitude. At-Tsabat (steadfastness) is tsamratus shabr (fruit of patience). As the word of God, "Famaa wahanuu lima ashabahum fii sabiillillahi wamaa dha'ufu wamastakaku". They do not become weak because of the calamities that befall them in the way of Allah, and do not become weary or give up, and Allah loves those who are patient. That determination makes calm, rational, objective and brings God's trust to give victory.

Second, arhabu shadran, da'wah cadres must be the most generous people. Da'wah fields often make the heart narrow. Many words of ridicule, ridicule, scorn, swearing were

thrown out of nowhere from many quarters. Da'wah cadres must not be narrow-minded and chest tight because of people's scorn and because of the news in the mass media which often discredits without confirmation and accountability.

Third, a'maqu fikran, da'wah cadres must be people who have the deepest thoughts. Da'wah cadres must always try to understand what is happening, not get lost in surface phenomena, but see what is the essence behind these phenomena. If the cadre's thoughts can be in-depth, when responding they will be more objective, measurable, and balanced.

Fourth, ausa'u nazharan, da'wah cadres must be people who have broad views. The horizon of views of da'wah cadres must be continuously broadened, so as not to experience symptoms of a narrow perspective. Reading reality with a broad view will bring cadres to a just and moderate attitude. Don't get caught up in extreme and exaggerated attitudes.

Fifth, ansyathu practice, da'wah cadres must be the most active people at work. Da'wah cadres should not be preoccupied with arguing over issues, or countering negative voices, because that doesn't bring much productivity. What is more productive is always working in the midst of society. Show real work. If there is something that needs to be responded to, you may respond as needed, but you still have to work hard for the good of society, nation and state.

Sixth, ashlabu tanzhiman dakwah cadres must have the most solidly structured movement. As a community of human beings, there must be shortcomings and mistakes. But our obligation is to keep trying to avoid mistakes and weaknesses, while continuing to improve. The da'wah structure must be continuously strengthened from the center, regions, branches to branches. Don't leave gaps that can be used to weaken the da'wah structure

Seventh, aktsaru naf 'an, da'wah cadres must be the people who benefit the most. The best human being is the most useful for other human beings. Da'wah cadres must prove that their existence in the midst of community life contributes a lot to goodness. It doesn't harm or cause trouble, but instead provides a lot of benefits and goodness. If these seven characters are owned by da'wah cadres, they will undoubtedly be lighter and easier to face challenges and obstacles in the Information and Communication Technology Era. Da'wah cadres and all da'wah activities will be stronger and accepted by the community, in presenting the various virtues that are expected by the people, nation and state.

#### 1. Packaging Da'wah Messages in the Digital Age

The message is a meaningful set of symbols conveyed by the communicator. (Onong Uchjana Effendy, 2003; 5). The message is what is communicated by the source to the recipient which is a set of verbal or non-verbal symbols and represents the feelings, values, ideas or intentions of the source. (Deddy Mulyana, 2005; 20) says messages in media communication are an important factor for achieving communication goals. Da'wah messages must be packaged as attractively as possible in order to have appeal so that they can be well received by mad'u, especially the general public. The message has three components, namely meaning, the symbols used to convey meaning, and the form or organization of the message. The most important symbols are words (language), which can represent objects (objects), ideas, and feelings, both speech (conversations, interviews, discussions, lectures, and so on). Messages can also be formulated nonverbally, such as through actions or gestures of the body (thumbs up, head nods, smiles, facial expressions, etc.), as well as through music, painting, dance, films, and so on. Delivery of messages can also be done verbally, face to face, directly or using media/channels. (Widjaja, 2000; 14). In

addition to components, messages also have special characteristics, namely informative, persuasive, and coercive.

Messages are informative because they only provide information. In certain situations, informative messages are more successful than persuasive messages. Persuasive messages contain persuasion that awakens one's understanding and awareness. Meanwhile, coercive messages are coercive. A well-known form of conveying coercive messages is agitation, namely by emphasizing that creates inner depression and fear among fellow members of the public. Coercive messages can take the form of orders, instructions and so on. Some of the message concepts above can be used as a reference in packaging da'wah messages.

If combined, then packaging can be done in various ways, including as proposed by Wilson, namely by paying attention to the dimensions of message abstraction, audience suitability, types of message strategy design to achieve certain goals or coordinating various kinds of goals, types of content themes, messages, choosing specific words, and so on. (Build Wilson, 2012; 56). So, in order for the message to be well received by the communicant (recipient of the message), the communication message consisting of the message content and symbols must be produced very carefully. In this context, it appears that Lecturers Abdul Somad, Yusuf Mansur, Gus Baha' adhered to the teachings of Aristotelian rhetoric. According to Aristotle, the speaker's relationship with the audience is very important, and therefore the audience must be the main consideration if the conversation is to succeed. Therefore, his humor always works because he is always close to the audience. In this way, he is able to build a stronger closeness with the audience.

#### 2. Digitization of Da'wah through the Website

Just like what has been done by M. Quraish Shihab related to the moderation of da'wah

with the appearance of M. Quraish Shihab Official Website has an interesting variation in transforming religious insights. If you look at the initial appearance of the website, what you see are the 5 main menus at the top of the website, namely the Home, Blog, Work, Books, and Contact menus. On the Blog menu, it is divided into 6 sections, namely articles, audio, e-posters, events, quotes, and videos. Meanwhile, on the Books menu, it is divided into two sections, namely print books and e-books. On the main contact menu, there is an explanation about the website, which opens services for anyone who wants to ask questions about Islam, and questions that have been answered are archived on Alifmaqz.com. not only that, the contact menu also provides books by M. Quraish Shihab. The appearance presented by M. Quraish Shihab Official Website is systematized in presenting various religious insights, this can be seen by the categories menu. In the categories menu, there are sub-themes of the study. Another interesting display, the website also displays a calendar and there is a recommended menu. (Mutaqin Alzamzami, 2019; 8).

### 3. Maximizing Da'wah Videos in the Digital Age

Social media offers multimedia in the form of images, videos and designs that are disseminated to other users and one example is YouTube. Youtube is the largest video service provider today and is a medium for uploading for free. Users can load, watch and share video clips for free. Youtube is also very suitable for those who want to find information without having to read articles. Another benefit of using youtube is that content can be broadcast to millions of viewers. YouTube is available in almost every country in the world and on every computer with internet access, and is visited daily by millions of people.

Youtube is a file sharing place for all its members where someone can search for or upload their recorded videos for others to

watch. In the context of da'wah, the public's need for short duration videos in order to answer their needs is very high. Several facts show that there are many media maniacs who watch YouTube. For example, Indonesian residents aged 16 to 64 surf the internet (on all devices) an average of 7 hours 59 minutes a day. Meanwhile, internet users in Indonesia reach 175.3 million or 64% of the total population of Indonesia. The majority of these users use mobile phones, namely as many as 171 million or 98% of Indonesian internet users. Social media ranks second with the average Indonesian spending 3 hours 26 minutes. Youtube and Whatsapp are the most popular social media with respective percentages of 88% and 84%. Meanwhile, for other media, it takes 3 hours 4 minutes to watch television, 1 hour 30 minutes to stream music, and 1 hour 23 minutes to use a game console. As Dwi Hadya Jayan said, Indonesians spend almost eight hours (8 hours) surfing the internet online. . (<https://databoks.katadata.co.id/datapublish/2020/02/26/indonesia-habiskan-hampir-8-jamuntuk-berinternet>). The data above shows that 88 percent of Indonesians access YouTube. It is not surprising that Abdul Somad later used social media such as YouTube to build his popularity before becoming famous in conventional mass media and social life.

Abdul Somad, Yusuf Mansur and Gus Baha recently used the change of era to become a digital era, who represented a group of speakers using social media (YouTube) in delivering their lectures. He seems to understand well the tendency of people to consume media nowadays who use the internet more. Seeing the phenomenon above, the popularity of young preachers in Indonesia cannot be separated from the wider social context. The context in question is the view of the middle class society on Islamic values. Sociologist Ariel Heryanto, in the book Identity and Pleasure: The Politics of Screen Culture in Indonesia, sees a middle

class interest in anything related to Islam. Therefore symbols that strengthen their Islamic identity are considered important. On the M. Quraish Shihab Official Website, it also provides education through videos that are distributed via the YouTube channel. The website has displayed 11 pages, and each page holds a maximum of 10 videos, so that currently the number of videos that have been entered on the website has reached 109 videos, and each video is between 4 and 15 minutes long. It can be said that the da'wah method via YouTube videos is quite efficient, considering that almost every Android user accesses YouTube, so that religious content in da'wah studies is not only accepted by the congregation present at the recitation, but the teachings conveyed by the da'i can also be accepted by YouTube users. wherever he lives, as long as he watches the da'wah channel.

#### 4. Conclusion

Advances in science and technology in the field of information and communication technology can clearly support Islamic da'wah in the digital era, so planning for digital era da'wah is very meaningful and crucial in delivering da'wah at this time and in the future. Da'wah planning in the digital era then becomes strategic, where in this study it was found that the Da'wah Formula (Recipe) for Preachers in facing challenges in the Information and Communication Technology Era is a character possessed by da'wah cadres, undoubtedly lighter and easier to face challenges and obstacles in the Information and Communication Technology Era. Da'wah cadres and all da'wah activities will be stronger and accepted by the community, in presenting the various virtues that are expected by the people, nation and state. Apart from that, it can also package da'wah messages in the digital era, carry out digitization of da'wah through websites, and maximize da'wah videos in the digital era, so this shows that planning da'wah in the digital era is a reference for preaching.

## PRODUCTIVITY IN DULD AGE (STUDY OF DATUK KALAMPAYAN'S ACADEMIC IN CULTURAL PROCESSING IN THE LAND OF BANJAR)

**Abstract:** *This research focuses on the productivity of Datuk Kalampayan's twilight years in his work on da'wah in Banjar Land, especially in writing and teaching several books written directly by him after returning to study in Haramain in the Middle East for 35 years. This research method uses descriptive qualitative with a phenomenological approach, by taking respondent data from 10 people who know about his work, either zuriat, or academics. The results of the study found that Datuk Kalampayan's productivity in writing 12 and 14 of his books in his old age, namely at the age of 65 years and over, also taught it in the village of Dalam Pagar by establishing the first Islamic Boarding School in the 18th century. Datuk Kalampayan's twilight is based on the spiritual spirit that he has, so that his spiritual intelligence is extraordinary which can realize his dream of illuminating the diversity of people in the land of Banjar. In fact, teaching religious knowledge is considered strategic and crucial as a logical consequence in conveying da'wah in the land of Banjar while at the same time providing peace and happiness for the people in the land of Banjar, by realizing the regeneration of Islamic propagators from zuriat and his students in the future from time to time. also taught it in the village of Dalam Pagar by establishing the first Pondok Pesantren in the 18th century. The productivity at the age of Datuk Kalampayan was grounded by his spirituality, so that his spiritual intelligence was very extraordinary which could show his mind to illuminate the diversity of the people in the land of Banjar. Even teaching religious knowledge is considered strategic and crucial as a logical consequence in the delivery of proselytizing in the land of Banjar as well as providing peace and happiness for the people in the land of Banjar, by realizing the regeneration of the spreader of Islam from zuriat and his students in the future from time to time.*

**Keywords:** *Communication, Da'wah Datuk Kalampayan*

### 1. Introduction

The Banjar community was formed and the

Banjar kingdom was founded in Bandjarmasih (now Banjarmasin) in 1526. In the story, Banjar was founded by Raden

Samudra, the crown prince who was exiled from the Hindu kingdom in Negaradaha by his own uncle, Prince Temenggung, after he received the help of volunteer troops from the kingdom. Demak Islam (Java). Immediately after that he moved the center of government to Bandjarmasi. Raden Samudra himself later embraced Islam and made Islam the official religion of the kingdom. Since then he has the title of Sultan Suriansyah. Communities who are Muslim, both Javanese and Dayak (Ngaju, Maayan, Lalawanan and Bukit) are the main elements in the formation of Banjar society.

According to H.Gt. Abdul Muis, (Kamrani Buseri, 2012) (Analiansyah, 2007), Islam entered the area of South Kalimantan around the beginning of the 16th century AD, brought by traders and preachers through the north coast of East Java. Islam had actually begun to be embraced by some of the Banjar community before the Banjar kingdom was founded, because Islam was made the official religion of the kingdom, Islam grew rapidly. However, the development of the entry of Islam was not matched by the development of Islamic knowledge of the people until the return of Sheikh Muhammad Arshad Al Banjari (1710-1812) from Mecca after studying there for 30 years. Sheikh Muhammad Arsyad Al-Banjari (Datuk Kalampayan), studied in Mecca for about 30 years and in Medina for 5 years.

In carrying out da'wah in the era of the Banjar sultanate (1710-1820) he did not forget the local element, even though he mastered religious knowledge and law, he had shown a non-rigid mind, and remained a moderate at that time, because he saw that the diversity of society and traditions before the people embraced Islam are still clearly visible, as the customs of the people. Datuk Kalampayan realized that his breadth of knowledge and intelligence in seeing the situation of the people made him motivated in preaching and propagating Islam and building a famous Banjar throughout the country. He also networked with other ulama outside the

Banjar sultanate, such as Aceh, Palembang, Banten , and others. He is aware that Islamic da'wah is actually conveyed significantly and touches layers of society that have uniqueness and diversity, so that they can bring people to know universal virtues, goodness that is recognized by all humans, regardless of time and space boundaries.

The concept of universal goodness is indeed seen as too broad, therefore it is defined through al ma'ruf , namely local wisdom, customs, goodness that is known according to the context of space and time, including within the scope of inviting al-khair , is preventing what is evil, namely something actions that are denied according to the context of a particular society as part of good customs. From here, every community that is touched by da'wah remains connected with socio-cultural backgrounds, besides that they will experience a certain transformation from the form of an ignorant society to a Muslim society. Every Muslim community has its own period of ignorance, when they have not been touched by the Da'wah itself.

The Sultanate of Banjar was immediately active as a supporter of Islamic da'wah. This can be seen in almost all the territories of the sultanate, the majority of the people are Muslim, this means that the Sultan is very instrumental in the success of da'wah. at that time still a little. Sultan Tamjidillah I sent Datuk Kalampayan to study in Mecca who upon his return became a cleric and preached which was centered in the village of Dalam Pagar Martapura.

Students of knowledge came, apart from Martapura, also came from Banjarmasin, Negara and from Upper River. On the other hand, the Sultans also actively facilitated places for recitation of the ulemas, encouraged the ulema to actively guide the ummah in writing, so Datuk Kalampayan was encouraged to write books/books as a guide for the ummah, by looking at the diversity of the Banjar community which is more specific

and localistic which is not always the same as Islam in Arab land.

Datuk Kalampayan was one of the central figures of reform in the archipelago, particularly in the Sultanate of Banjar, who espoused neo-Sufism, which means harmonization between the teachings of Shari'a and Sufism (fiqh-sufistic/tasawuf-syar'i). Datuk Kalampayan's writing ability was extraordinary, in fact there have not even been recent scholars comparable to him. According to Asywadi Syukur and Abu Daudi, there are 12 books written by Sheikh Arsyad, and according to Moh. Shaghir Abdullah there are 15 pieces, and according to researchers

Datuk Kalampayan's renewal efforts made the Banjar Muslim community, which was originally a minority and embraced by those around the palace, now become a majority Muslim community who are loyal to Islam. This reality is often associated with the efforts of preachers who are usually students and grandchildren of Datuk Kalampayan himself who were sent by him to remote areas of the Sultanate of Banjar and its surroundings. This shows that the seriousness and consistent attitude in pursuing religious knowledge is a lesson that should be emulated by the current generation, so that the many books written by Datuk Kalampa as products of his thoughts really highlight local wisdom.

The flexibility of Datuk Kalampayan's Da'wah by prioritizing local wisdom from Banjar culture is very evident in the books he composed. This illustrates that during his lifetime he greatly respected and appreciated the customs of the Banjar people, and showed an attitude of modesty and nobility by always providing religious teachings through cultural communication according to the habits and customs of the Banjar people, making him a charismatic person until now. Datuk Kalampayan respects and appreciates the customs of the Banjar people, he consciously made adjustments to the habits of the Banjar people who had undergone a transformation

from Hindus and Buddhists before embracing Islam, which immediately in the practice of Islam the Banjar people could not break away from tradition. previously. The da'wah carried out by Datuk Kalampayan in the current context is called Cultural Da'wah in the land of Banjar, which is full of management of local wisdom values in a planned and neatly arranged manner in the books he wrote which shows Datuk Kalampayan's literacy abilities which greatly inspire generations. scholars today.

## 2. METHOD AND RESEARCH

The research method used in this research is qualitative research. To collect data, researchers determine data sources and locations where data sources can be found and researched. In contrast to field research, the location of data collection for library research is much wider and does not even recognize spatial boundaries. The research setting is a benchmark for where the location is carried out. Before mentioning the research location, it's a good idea to mention the specific characteristics of library research to differentiate library research settings from other research such as field research. Library research has several special characteristics, including; First, this research relates directly to text or numerical data, not to fields or eyewitnesses, in the form of events, people or other objects. Second, the data has been prepared, meaning that the researcher is not going anywhere except to meet face to face with sources already in the library. Third, library data is generally a secondary data source, in the sense that researchers obtain data directly, not first-hand in the field. Fourth, the condition of the data in the library is not divided by space and time. Based on the above characteristics, this research was conducted in a library that collected data related to Datu Kempayan's Da'wah Work and its Development, especially the progress of his religious thought, which until now has

been deeply felt by the Banjar people.

### **3. RESEARCH RESULTS AND DISCUSSION**

The phases of a person's life journey are different. There are those that are passed with ease, not a few who have to struggle with struggles and resistance against various obstacles. Normally, and it is everyone's ideal wish that in the twilight or past old age it is done quietly. As a result of hard work, working when you are young is capable and can be enjoyed in your old age.

However, not all humans are able to enter into such pleasures. Not infrequently after entering retirement, the difficulties often come. This is due to various things. Those who do not get old age benefits, of course, will try hard again to be able to continue to meet their daily needs due to the absence of a pension guarantee. Even if there are those who get guaranteed retirement, not a few still complain because it turns out that it is not enough to meet their daily needs. Maybe, when you are still active, your daily needs can be filled with other additional income, and that is outside of the normal salary you usually get every month.

In addition to financial problems, veterans of a job, of course, at the beginning of retirement often experience what is called post power syndrome. Conditions in which mentality is honed to be able to learn to get used to being a nobody when compared to before when I was still a worker or even serving in an institution. For workers who are currently still working for long periods of time who also happen to not have a pension guarantee, or even those who are approaching retirement, they must immediately prepare themselves, to be able to get through day after day productively producing quality work.

The hope is that if you have prepared for things that usually happen to people who are no longer working, then going through

retirement is the thing with the most potential to continue working. Don't let it happen, entering retirement will become even more withered and not growing. Not infrequently we find parents who are entering retirement age are no longer passionate about living life. It is as if the wheel of life stops when we enter retirement, in the end all kinds of diseases will appear. Of course this cannot happen if we all realize, then change our mindset and echo the motto "Become empowered in old age!"

Of course there are many things that can be done. Old age or retired people will continue to be able to inspire in the present, even though they are no longer actively working in an institution or company. Some of them are by actively writing, or creating inspiring videos that can be shared with the general public. So thus, the freshness of the mind will continue to run. This is because our brain will always work. The effect is that with continuous brain performance, health can always be obtained.

On the other hand, if entering retirement we are faced with a condition of feeling that we are constantly sad, then we will not get in prime condition, it may even cause various kinds of diseases. Being empowered in old age, productive and active even though you have entered retirement age must always be done. This is to prevent oneself from continuously mourning the condition. This is an example of what is called post power syndrome.

There will be many people who need our knowledge or the experience of retired parents. One solution is to share useful articles in the fields you have been in. The author's experience will certainly be very useful for those who read it. So in this way at least you will get at least two things from sharing the writing or experience, including the reward for sharing, the brain which is always guarded to keep on thinking.

Now is the time for us to start preparing ourselves. Take care of your body's health

while maintaining your mind. Continue to be active and productive, try not to stop thinking at all times. Prepare yourself for the future by continuing to do various good things, especially vertical worship to Allah SWT, not only that, horizontal relations *hablumminnas* must also be maintained.

The next effort is to choose a community so that we always keep our minds active. Talk about positive things when you meet anyone. So it is hoped that we will become human beings who are actually *Husnul Khatimah*, because when we enter old age we still maintain the gift of Allah SWT in the form of the ability to think as well as possible. Come on, Come on! Empowered at Dusk.

There are three words that are very meaningful in the theme above, namely healthy and productive and old age. Old age literally refers to a condition where a person gets older or better known as elderly. According to the 2013 Indonesian Health Profile released by the Ministry of Health, the elderly are divided into 3 categories:

1. Pre-Old Age (age 45 – 59 years)
2. Older Age (age 60 – 70 years)
3. High Risk Old Age (over 70 years)

Sheikh Muhammad Arsyad Al Banjari (*Datuk Kampayan*), in the 18th century was one of the well-known figures in the land of Banjar, even to Southeast Asia and Africa, after studying or studying at *Haramain*, he returned to the land of Banjar at the age of 65, and devoted himself in the Banjar sultanate at that time for 40 years until he died at the age of 105 years. Between the ages of 65-105 years, *Datuk Kalampayan* wrote a number of books and taught them as part of his *da'wah* in the land of Banjar. Communication and *da'wah* became a synergistic unit with the Banjar sultanate, making it easier to spread *da'wah* in Banjar lands.

*Datuk Kalampayan*, who has been active for 40 years, is clearly categorized as an elderly who is at high risk, but with his spiritual mentality he looks very productive in his

work, and has written several books in preaching in the land of Banjar. The spirit of the *Mahatahari Islam* in the land of Banjar means a lot to the community in practicing religious values in the 18th century, more than that the spread of *da'wah* came from his upbringing to his students, who were assigned to develop Islamic *da'wah* to other areas, so that with the spread of Islamic *da'wah* to other areas, His students developed Islamic *da'wah* outside the land of Banjar, such as Malaysia, Brunei Darussalam, Thailand and others.

A Brief History of Sheikh Muhammad Arsyad Al Banjari

### 1. Shaykh Muhammad Arsyad Al Banjari's Childhood

Muhammad Arsyad Al-Banjari, who is also known as *Datuk Kalampayan*, was born in Lok Gabang Village, Martapura, South Kalimantan on 15 Safar 1122 H, which coincides with March 19, 1710 AD He is the eldest son of five children, his father's name is 'Abd Allah and his mother named Siti Aminah. Muhammad Arsyad was born in a family known for being religiously devout. These favorable environmental conditions contributed greatly to shaping Muhammad Arsyad's later personality.

In his childhood he had visible intelligence, and when Sultan Tahlil Allah (1700-1745), made a working visit to the village of Loh Gabang, the sultan was stunned to see a child painting calligraphy and was so amazed, when the sultan tried to approach the little boy, and with guilt and fear he ran in haste, feeling guilty and worried that he would be punished by the kingdom.

When the sultan returned to the palace, the next day he ordered *Mangkubumi* to look for the figure of the child he saw, but *Mangkubumi*'s efforts yielded no results, but managed to find out the whereabouts of his parents, this was conveyed to the sultan, then the sultan ordered that the child's parents be brought to the palace.

When Muhammad Arsyad's mother was

brought to the palace, and knelt to apologize to the sultan if his child's mistakes occurred and asked himself to replace the punishment if his child was guilty, really the protection of parents for their children so that their mother was willing to be punished even though she was killed, the sultan smiled at her mother's words. That. Furthermore, with the authority of the sultan and his gentleness and politeness, he asked the mother to get closer and explained the sultan's admiration for Muhammad Arsyad, and conveyed his intention to maintain it in the palace environment.

After hearing the sultan's explanation, the mother, who did not understand the previous situation, was finally able to smile, and asked the Sultan for permission to talk to her husband, the sultan also gave the mother the opportunity to talk about it in the family. Upon returning from the palace, at night his mother told her husband and Muhammad Arsyad what the sultan had told him, and finally they agreed to hand over Muhammad Arsyad to the palace at the request of Sultan Tahlilullah, with very heavy feelings because he was separated from his children who were still children. at the request of the sultan to be educated also raised in the palace environment as well as being adopted as an adopted child. They also handed over their children to the Sultan to live with the children and grandchildren of the royal family. Since then Muhammad Arsyad has lived in the palace environment of the Sultanate of Banjar.

## 2. Marriage and Studying

During his life journey at the palace, Muhammad Arsyad was very active in studying until he was an adult. In the midst of this happiness, the environment was shocked by the death of Sultan Tahlilullah due to illness, but the mandate and will that was conveyed to Mangkubumi was still carried out by Mangkubumi. After Muhammad Arsyad grew up, Mangkubumi planned to marry him to a woman who was equal to him.

The court was ordered by Mangkubumi to find a woman to marry Muhammad Arsyad in the Sultanate community, but they did not meet the woman Mangkubumi wanted. Within the Palace environment, there was a woman who was still a virgin and very suitable for what she wanted according to the Sultan's mandate. Finally Muhammad Arsyad married a woman in the palace environment named Tuan Bajut.

After marrying Mr. Bajut, Muhammad Arsyad lived harmoniously, harmoniously and peacefully with his wife, but then Muhammad Arsyad was summoned by Mangkubumi and conveyed the sultan's mandate before he died, namely to study knowledge at Haramain, and asked Muhammad Arsyad to discuss it with his wife, In such a situation his wife showed concern, then the wife asked about the concerns her husband was facing, and what was happening and being faced by Muhammad Arsyad in the palace, then Muhammad Arsyad conveyed the Sultan's mandate which was expressed by Mangkubumi before the Sultan died, namely beside married, also studied at Haramain, listened to her husband's explanation, then Mr. Bajut said that indeed this was an order and a mandate from the Sultan, sincerely Mr. it is mandated to be a prayer that pleases, so that it can guide the community one day after returning from Haramain.

The sincerity and pleasure of Mr. Bajut letting his husband go to carry out the sultan's mandate was not an easy struggle, especially when it was known that the wife was young, but with sincerity and pleasure accompanied her husband's steps to study for ± 30 years in the Haramain.

After a long time studying knowledge Muhammad Arsyad returned to the land of Banjar and devoted himself to carrying out Islamic teachings in the Banjar sultanate in guiding the people in the empire, both among the sultanate and within the people of the empire.

Datuk Kalampayan's closeness to the Sultanate of Banjar

Proximity based on religious values binds the strength of faith to unite in harmonious and synergistic relations in the life of the nation and state, in line with the vision of the sultan of Tahlilullah who raised him as a child, namely the implementation of Islamic law in the Banjar sultanate.

This means that to unite life in society, nation and state, one cannot only hold on to the strength of the human aspect which is based on the culture of society. But the continuity of life in society, nation and state is based on monotheism which is displayed with noble morals, because life in a society, nation and state This is part of *ijtihadi asi* in *fiqh*.

Meanwhile, to bridge the implementation of *fiqh* ( *ijtihadi asi* ) that is by displaying good morals, because politics as *ijtihadi cation* is of course political interaction and communication prioritizing civilized politics, not making it difficult for others or troubling other people, but civilized politics, always contributes to ideas, ideas and thoughts in supporting government and pray for the government to always be blessed and safe, so that it can carry out its programs well, so that the people will feel prosperity.

Then the closeness of Datuk Kalampayan with the sultanate of banjar seen from the interactions and communications he made in the Banjar sultanate who was so visionary with what he conveyed to the sultan, strongly supported and strengthened Mead's theory of symbolic interactional communication in 1934 through his book entitled *Mind, Self, and Society* , because Datuk Kalampayan had practiced it in the sultanate, with his ideas and thoughts which became his contribution to the sultanate at that time

Da'wah communication by Datuk Kalampayan in the Banjar sultanate refers to the verses of the Koran sura *An-Nahl*; 125 which means:

“Serullah (people) to the way of your Lord with wisdom (correct words that can distinguish between right and wrong), and teach good, and argue with them in a good way. Truly your Lord, He is the one who knows better who has gone astray from His way, and He is the one who knows better who is guided . ” (Hatta: 2009:281).

The verse above explains that communication is carried out in the context of inviting truth and goodness based on the values of Islamic teachings with the foundation being to strengthen *aqidah* (monotheism), with the abilities that must be possessed as a communicator, including;

First , Ability to upgrade oneself with scientific disciplines, both religious and general knowledge, Second, Having superiority and toughness in attitude and manners that do not harm others, Third, Ability to adapt in any situation and condition, Fourth, having visionary ideas and thoughts and fifth , Having a consistent commitment and *ghirah*/enthusiasm in supporting the government towards the benefits of *mashlahah*. These five abilities are self-concepts that can be developed by always having an understanding of the values of Islamic teachings, which makes them act humble, not criticizing the government (sultan), but instead giving their thoughts and always praying for the government (sultan) in running its government.

Interpersonal communication generally only involves two individuals, such as between husband and wife, parents and children, brothers and sisters, two colleagues. Interpersonal communication is carried out in close proximity, communicators and communicants send messages directly and simultaneously.

Interpersonal communication is the process of conveying information, ideas and feelings to others verbally or nonverbally in order to gain meaning so that other people understand or change their attitudes, feelings and behavior that occur in a society (Deddy Mulyana,

2005:65).

Persuasion is a complex communication process carried out by individuals using verbal and nonverbal messages in order to persuade or provide encouragement that aims to change one's attitude and behavior voluntarily. Fourth, the instructive approach emphasizes the higher bargaining position of the communicator where he gains legitimacy to govern, teach and even propose one kind of idea to the communicant.

This approach is said to be coercive where the communicator can force and sanction the communicant. In general, a communication process is carried out with the hope that there will be an impact or effect from the message conveyed by the communicator to the communicant. The expected impacts or effects of communication include impacts in the form of cognitive, affective, and behavioral changes. Cognitive change expects the impact of increasing knowledge or insight from the recipient of the message about the information conveyed by the communicator. Affective changes in the form of communication messages that have an impact on the emotions and feelings of the communicant. Meanwhile, behavioral change is the impact of messages that affect changes in the behavior or actions of the communicant.

In this interpersonal communication, there are approaches that occur both verbally and non-verbally, these approaches include:

#### 1. Dialogical Approach

The characteristics of interpersonal communication with a dialogical approach are characterized by conversations or dialogues. In this approach, communicators and communicants are in the same and equal position, no one monopolizes information. Dialogic requires the willingness of both parties to listen to each other's ideas or ideas.

Furthermore, in this approach seek and determine solutions from the right views and attitudes in understanding and responding to

messages that are shared together. Communicators and communicants must have respect, trust and respect each other.

#### 2. Persuasive Approach

The persuasive approach is an interpersonal communication process in which the communicator conveys verbal and nonverbal messages to the communicant with the aim that the communicant behaves, acts as expected by the communicator. However, in the process there should be no coercion or pressure. Persuasive communication is a communication process in which the communicator conveys stimuli to influence, change the views, attitudes and behavior of others in a subtle way, namely persuading.

The persuasive approach is not difficult to implement properly and can even bring the communicant's feelings into togetherness and kinship so that the communication process runs well and effectively. Between communicators and communicants, they have the same position and role so that the message/information conveyed is more easily understood and understood by both.

In interpersonal communication symbolic interaction also occurs, in symbolic interaction theory trying to describe how humans use language to form meaning, how humans create and present themselves, and how humans use symbols to create society by working with others. This theory was later developed by Herbert Blumer by formulating 3 (three) premises, namely:

1. Human behavior is influenced by the meaning they have about other people and events;
2. Interaction is very important for the development and delivery of messages;
3. The meaning that a person has about various events or others can change over time.

Datuk Kalampayan's Progress of Religious Thought and Da'wah

1. Thoughts in the field of Aqidah

Datuk Kalampayandi's thoughts in the field of Islamic faith can be seen in his efforts to purify Islamic belief from bid'ah dhalalah and purify the ideology of ahlussunnah waljama'ah. The form of its purification was to prohibit the teachings of Wuduiyah and to convince the Sultan of Nata Alam that wahdatul contravened the ideology of ahlususunnah wal jama'ah. Datuk Kalampayan's thoughts in the field of Islamic faith can be read in his writings, including:

a. Tuhfat al-Raghibin fi Bayani Haqiqah Iman al-Mu'min wa ma Yufsiduh min Riddah al-Murtaddin.

Datuk Kalampayan (datuk kalampayan) lived in the early 18th and early 19th centuries in the Banjar kingdom of what is now South Kalimantan. Although Islamic teachings have been widespread among the people of the Banjar kingdom since the 16th century, remnants of old beliefs still exist in several places. This belief does not originate from Islamic teachings, therefore, Datuk Kalampayan considers it to endanger the faith of the Muslims.

Among the traditional ceremonies that received special attention from Datuk Kalampayan in Tuhfat al-Raghibin were the ceremonies of throwing and throwing pasilih. The ceremony is carried out by giving offerings containing various wadai (cakes) and offering them to unseen spirits, ghosts who are believed to be able to cure illnesses, get rid of bad luck and grant all kinds of requests. Communication with these spirits is carried out by a balian (shaman) through the medium of a human being possessed by a subtle spirit who is invited by the purchaser after offering offerings. According to Sheikh Arsyad, the two ceremonies are bid'ah dhalalah (heresy of misleading), therefore, the practitioner must repent.

According to him, there are three indicators of bid'ah contained in the two ceremonies. First, redundant behavior or throwing away wealth in the way that is forbidden. Datuk

Kalampayan refers to the word of Allah QS. al-Isra (17): Second, ally and follow Satan's steps. Datuk Kalampayan referred to several verses which prohibit such practices, among others, QS. al-Baqarah (2): 208, QS. al-Nisa (4): 119, Fathir (35): 6, QS. Yasin (36): 60. Third, the two traditions mentioned above contain polytheism. In relation to the indicators above, Datuk Kalampayan emphasized the law for ritual practitioners as follows: 1) If it is believed that the power that exists in both ceremonies can prevent people from danger, then the law is infidel. 2) If it is believed that the power created by Allah in the two ceremonies can repel harm, then the law is bid'ah but still disbelief. 3) If it is believed that the power of the two ceremonies does not have any effect, either from the power of the ritual or the power created by God in them, then Allah also averts the danger through customary law (sunnatullah) in the two ceremonies, then the law is only heresy and not to disbelief. But if it is believed that the two ceremonies are lawful, then the law is infidel. The Memanggar and Throwing Away Ceremonies are just a few examples of the many similar ceremonies mentioned by Sheikh Arsyad. He called on royal officials to eliminate these ceremonies in the Banjar royal society.

b. Al Qam al-Mukhtasar Fi'alamat al-Mahdi al-Muntashar

Research by Ahmad Nawawi ibn al-Hajj Ibrahim al-Qadhi al-Banjari al-Kayutangi identified that this treatise was written by Sheikh Muhammad Arsyad Datuk Kalampayan in 1196 H and is still in manuscript form. This treatise is a summary of several books consisting of eleven chapters, written around 1196 H or 1782 AD. This treatise contains an explanation of the signs of the end times, for example the emergence of Imam Mahdi, Dajjal, Gog, the Ethiopians managed to overthrow Ka' flood, eclipse of the moon and sun for three days and three nights, the sun rises in the West, the appearance of dabbatul ardi (climbing

animals on earth), smoke comes out of the top of Mount Karang in Aden, the natural world explodes<sup>14</sup>

c. The Book of Communion

In the edition published by Dar Ihya al-Kutub al-Arabiyyah Mecca-Egypt in 1912 it was written that this book was compiled by Mufti Jamaluddin bin Muhammad Arsyad Mufti Banjar and recited by Sheikh Abdullah bin Ibrahim Langgar al-Qadhi and Sheikh Abdurrasyid bin Isram Panangkalan Amuntai Sheikh Arshad. According to the statement of Abu Daudi, one of the descendants of Sheikh Muhammad Arsyad Sheikh Arsyad, this book was written by Fatimah bint Abdul Wahab Bugis, grandson of Sheikh Arsyad. But because of her humility, and her respect for her uncle, Fatimah dedicated the book to her uncle Sheikh Jamaluddin ibn Sheikh Arsyad. This book contains the basic knowledge of Fiqh and Tawhid.

d. Basar Association.

This book is another version of the Malayu-Banjar book which was written in Arabic-Malay script, a type of writing that was widely known throughout the Islamic empires in Southeast Asia. This treatise was compiled by Mufti Jamaluddin ibn Arsyad and recited by Sheikh Abdullah ibn Ibrahim Langgar al-Qadhi and Sheikh Abdurrasyid bin Isram Panangkalan Amuntai al-Banjari.

2. Thought in Aspects of Sufism.

Although he is better known as a Sharia scholar, Datuk Kalampayan also specializes in Sufism. In fact, Azyumardi Azra referred to him as the Caliph of the Tarikat Sammaniah who was considered the most responsible scholar for the spread of the Tariqa Sammaniah in Kalimantan, a congregation that greatly colored Sufism in the Archipelago (Indonesia, Malaysia, South Philippines, Pattani, Brunei Darussalam and Singapore) around the 18th century. .

According to his descendants, who are in the village of 'dalam Pagar', Datuk Kalampayan teaches the Tariq Khalwatiyah, while

according to his descendants who are in Marabahan, Datuk Kalampayan teaches Tarikat Syadzaliyah,<sup>20</sup> however according to Karel A. Steenbrink it is not pure Syadzaliyah but Syadzaliyah which is already in the Sammanian version. <sup>21</sup> For more details, we can look at the teachings of Sufism Sheikh Muhammad Arsyad Datuk Kalampayan in two of his books, the Risale Fath al-Rahman bi Syarh, the Risale al-Wali Ruslan and the Risale Kanzul al-Ma'rifah.

In the Risale Fath al-Rahman, which is a translation and syarah from Syekh Ruslan's work, contains descriptions of various 'shirk of the heart' and how to get rid of them by increasing monotheism of asthma, monotheism of af'al, monotheism of character, to monotheism of substance, which leads people to move from maqam farq to maqam jama' and the person who reaches the level of maqam jama' is called arif billah. Knowledge is no longer obtained from learning but is received directly or is called ladunni science.

To obtain it, one must go through it starting from the Shari'a, increasing to the Tariqat and ending to the essence. In the book also put forward the notion of Musyafah, Musyahadah, Muayanah. All of this can only be achieved through the mind, not the mind. The treatise also explains the meanings of iradah, murid and murid, the meaning of science of faith (basic knowledge), ainul assured (intermediate knowledge) and haqqul assured (highest knowledge). Worry comes from five sources: (1) Rabbani; (2) Malaki; (3) Akli; (4) Nafsari; (5) Human. A suluk (a person who draws closer to Allah) is of two kinds: (1) Muttaqi; (2) Muhibbu, and worshipers consist of 'aliq, arif, khawas and khawasul khawas. <sup>22</sup> Thoughts of Datuk Kalampayan The treatise Kanzul al-Ma'rifah contains procedures for remembrance in the tariqat, namely about the adab of dhikr nafi itsbat, namely the sentence La Ilaha Illallah, if If it is steady then it will increase to deep remembrance. According to him, there are

two kinds of remembrance, namely *fana* all the characteristics of *basyariah* and *fana ma siwallah*. According to Asywadie Thankfully, this teaching is closer in the form of *dhikr* than the *Syadzaliyah* order.

All of *Datuk Kalampayanini*'s thoughts, both aspects of *aqidah* and *sharia*, as well as *da'wah* and *tasawuf*, are points of thought that can develop the intellectual and spiritual aspects of the people. Even so, the thought of *aqidah* is not too able to develop the roots of intellectual development because it is more doctrinal and normative, although it is still scientific. Likewise in the aspect of *shari'a*, the studies are still dominated by the doctrinal and normative aspects rather than the scientific aspects. This can be seen in the efforts to compile the thoughts of various experts such as *Zakaria al-Anshari*, *Zamal Ramli*, *Bin Hajar al-Haitami al-Rafi'i* and *Noruddin al-Raniri*, while he adds some of the results of his thoughts originating from dialectics to reality or social conditions. *Banjar people*

### 3. Thought in the Shari'a Field

*Datuk Kalampayan*'s works in the field of *sharia* are found in the following books: a. The book *Sabil al-Muhtadin li al-Tafaqquh fi Amr al-Din* describes the problem of *Fiqh* based on the *Shafi'i* school of thought. *Datuk Kalampayan* mentioned several books that were used as references, including the *Nihayah* book, the *Tuhfah* book, and others. This book was published by the publisher *Darul Ihya al-Kutub al-Arabiyyah*, consisting of II juz. b. Book of *al-Nikah*. This book discusses the problem of marriage. This book was published by *Maktabah al-Haj Muharram Afandi* in 1304 H, after being printed for the first time by the *al-Asitanah al-Aliyah* printing house in *Istanbul*. These sources were written by scholars based on the *Syefi'i* school of thought.

Many of the problems and their explanations are quoted from *Shafi'iyah* scholarly sources such as *Syarh Minhaj* by *Syaikhul Islam*

*Zakariya Anshari* and *Nihayah* by *Sheikh Jamal Ramli*, *Mugni* by *Sheikh Khatib Syarbaini*, *Tuhfah* by *Ibn Hajar Haitami*. *Datuk Kalampayan*'s strength is that he is very accurate in selecting important matters to be explained in detail, and further enhanced by giving real examples in the lives of the general public. In fact, sometimes such explanations are not found in Arabic literature books. These problems include: a. Unclean and purify b. How to purify the unclean place/cloth with a little water Various kinds of *hadats* divided into three levels d. Definition of *musta'mal* water e. *Kaifiyat* and forms of prohibition during *qadha hajat* f. Suggestions for making a place for *qada hajat* g. Issuing *zakat* on fruits, especially with regard to mixed agricultural products that are irrigated and rained h. Regarding whether livestock is obligatory or not i. How to collect *zakat* for the poor j. Guidance and law on planting corpses k. Organizing the bodies of children who miscarried l. *Ijab* and *kabul* in marriage Many of *Datuk Kalampayan*'s findings are relevant to people's lives until now, for example: a. In the field of *taharah*, *Datuk Kalampayan* gives an understanding of *musta'mal* water and how to purify *mutanajjis*, places or clothes with a little water. b. In the field of *zakat*, *Datuk Kalampayan* explained in detail the *zakat* of agricultural produce which was worked on with a mixture of irrigation and rain-fed systems, and the concept of the technical arrangement of *zakat* for the poor. It is also interesting to state *Datuk Kalampayan*'s thoughts which are controversial among the general public, namely regarding the law of *kenduri* which he considers *makruh* and *heresy*. This law applies to those who organize and people who come to fulfill the invitation of the feast.

### 4. Thoughts in the Field of Education.

One of the things he did after being in *South Kalimantan*, specifically in *Martapura*, was to establish an Islamic educational institution which is very important to educate Muslims

in order to increase people's understanding of Islamic teachings and practices.

To realize his ideas, an Islamic education center was built, which is similar to a surau in West Sumatra or a Islamic boarding school in Java. The Muhammad Arsyad al-Banjari Education Center consists of rooms for lectures, student dormitories, teachers' houses and a library. The center is economically self-sustaining, as Sheikh Muhammad Arsyad al-Banjari along with several teachers and students transformed the land in the neighborhood into productive paddy fields and vegetable gardens. Before long, the center had established itself as the most important locus for training students who later became prominent scholars in the South Kalimantan region. (Azra; 1995; 254-255).

This non-formal educational institution, the first in the Banjar community, has taught various branches of knowledge more broadly and deeply. (Hasbullah; 1998; 64). Some of the education developed uses the halaqah system, which is generally followed by the community. In this education system, the students sit in a circle around the teacher to receive lessons. In addition, there are also special or sorogan lessons that are only given to close family and certain people using standard Arabic books as the main reference. In this system the students take turns facing the teacher by reading the book to be studied (Baderi, 1986: 13). This sorogan system is the most difficult part of the entire traditional Islamic education system, because it demands patience, diligence, obedience and personal discipline from students. . After that this system proved to be very effective, because it allows a teacher to supervise, assess and guide maximally the ability of a student to master his lesson (Dhofier; 29). The basic lessons given by Muhammad Arsyad were the Al-Qur'an and Arabic Malay reading and writing, and worship (fiqh) by means of imlakkan, followed by Nahwu and Nerves (Arabic), Interpretation, Hadith, Monotheism and others. (Hasbullah; 1998; 66-67).

## 5. Thoughts in the Field of Islamic Law

The reforms carried out by Muhammad Arsyad in the field of Islamic Law (Fiqh) include:

a. Implementation of congregational prayers in a special place (langgar) for the purposes of worship activities and the interests of the surrounding community. According to Muhammad Arsyad, it is a symbol of Islam so that travelers can know that the area is a Muslim community area. He stipulated the law of congregational prayers as fardu kifayah for a small hamlet with a population of around 30 male Muslimmukallaf. (Rasyidah; 1990; 128).

b. Regarding funerals, Muhammad Arsyad requires the use of tabala or coffins. This law was stipulated closely related to the natural conditions of the South Kalimantan region which are watery, swamps and peat soils. Besides that, it is also to avoid being disturbed by wild animals that eat carrion, so he makes it obligatory to wear tabala. (Rasyidah, 1990; 128).

c. The implementation of zakat as a manifestation of social justice has advanced according to the times, and is even still relevant today. According to him, zakat must be given to people who mustahak (people who are entitled) and have work skills, so that zakat can be used as productive business capital, not for consumptive purposes, with the intention that the recipient of zakat will receive it until the age of most people (approximately 60 years). ), no longer includes the poor who receive zakat. This attitude needs to be raised to the surface in fighting poverty among Muslims. (Rasyidah, 1990; 129).

d. Muhammad Arsyad's opinion regarding Kenduri, namely: (a) circumcision for the whole village and their families brings food for the dead family, (b) it is makruh again bid'ah for those who die to provide food to be eaten by many people, both before and after the body is buried, as is the case in the Banjar

community, (c) it is makruh and bid'ah for those who attend the banquet invitation provided for the feast by the family of the deceased, (d) it is forbidden to provide food for the family of the deceased who cries loudly (loudly) because it is considered to be helping the person in question. immorality. (Muhammad Arsyad, Sabilal Muhtadin II; 87).

e. Thoughts in the Field of Da'wah

Datuk Kalampayan has the ability and advantages in all things, has brilliant thoughts. In the field of da'wah, he applies his thoughts in various aspects of life fundamentally. In general, there are three classifications of da'wah developed by Datuk Kalampayan, namely bil hal da'wah, oral preaching and written preaching.

a. Da'wah bil p.

Da'wah bil hal is a da'wah activity carried out with various forms of activity and the positive impact can be felt immediately, or the results to be achieved are clearly defined. There are several forms of da'wah bil hal that have been practiced by the Datuk, namely, regeneration of the clergy, purifying religious teachings through marriage and building partnerships between businessmen and the community. In the context of regeneration of the clergy, Datuk Kalampayan built a fostered village called "In the Fence". This village was specifically intended for the recitation and development of Islam by forming a cadre of scholars who were able to carry out da'wah duties throughout the kingdom and even outside the Banjar kingdom. The study is carried out in a guided manner with strict supervision.

In the first two decades Datuk Kalampayan worked hard to create a cadre of scholars who were reliable and ready to use. Those deemed capable and knowledgeable enough were sent back to their respective hometowns to teach religion or preach there. The ulama regeneration process was carried out by Datuk Kalampayan until he was 80 years old.

Datuk Kalampayan has also carried out purification of Islamic teachings in a wise manner so that there has never been unrest among the people. After studying in the holy city of Mecca al-Mukarramah, Datuk Kalampayan returned to his homeland and saw that the Banjar people still strongly adhere to animist beliefs through several rituals, including bandaging and throwing away pasilih. The ceremony is accompanied by placing offerings or ancak which are offered to the spirits, so that the spirits will grant their wishes.

Datuk Kalampayan refused such rituals, but through a persuasive approach and finally succeeded in enlightening the community to return to the true teachings. In addition to purifying religious teachings from the influence and practice of animist beliefs, Datuk Kalampayan also purified religious teachings from the Wahdatul Wujud ideology taught by Syekh Abdul Hamid Ambulung. According to Datuk Kalampayan, this teaching is considered contrary to the teachings of Ahlussunnah wal Jama'ah and royal law. Datuk Kalampayan finally managed to abolish this teaching in a wise way.

Wisely and with mutual understanding, Sheikh Abdul Hamid Ambulung finally accepted the death sentence handed down by the kingdom to him. Datuk Kalampayan 's wise action was finally able to save Islamic teachings from the wahdatul existential ideology that was contrary to ahlussunnah wal jama'ah and saved the kingdom from conflict among the people because of this belief. The da'wah approach through marriage turned out to be very effective for the spread of Islam, because his descendants then spread throughout the kingdom and even outside the kingdom in carrying out the task of Islamic da'wah. Most of his descendants from eleven wives and one of Chinese descent, are great scholars who are respected and respected by the wider community. Datuk Kalampayan succeeded in uniting the ruling class of the

kings and the people of the jaba class under Islamic ties, so that there was no gap between the clergy, aristocrats and the jaba group. The success of approaching this noble class, made Sultan Tahmidullah or Nata Alam become his friend and student and even supported and encouraged all kinds of da'wah activities carried out by Datuk Kalampayan. By order of Sultan Tahmidullah, Datuk Kalampayan studied religion in the holy city of Makkatul Mukarramah for 30 years.

Sultan Tahmidullah also ordered Datuk Kalampayan to compile a book which was later named the book *Sabilul Muhtadin*, which was a guide for all the people of the kingdom in carrying out worship. His integration with the community is manifested in the form of his pioneering work in cultivating dead land so that it can function as fertile agricultural land. One of the ways he did this was by digging a river for the benefit of irrigating rice fields which became known as the Tuan River.

b. Da'wah with Oral

The pattern of preaching by word of mouth is a common pattern carried out by preachers because it is the easiest and most practical, as well as the technique of implementation and at the same time it can cover a large number of people. This pattern was also applied by Datuk Kalampayan to the activities of coaching cadres of ulama and ta'lim assemblies in the Foster Village, "In the Fence" within the Banjar kingdom. In fact, before returning to his homeland, Datuk Kalampayan was entrusted with giving lessons at the Grand Mosque in the field of Shafi'iyah law. One of his students was a Jin group named al-Badakut al-Mina, who accompanied him to the land of the Banjar kingdom.

c. Da'wah in writing.

The ability of Syekh Muhammad Arsyad Datuk Kalampayan which is very special is his ability in the field of composing, compiling religious books. Covering the

fields of Shari'at, Monotheism or Ushuluddin science and the field of Sufism. Most of these books were written in Malay, the language commonly used throughout Southeast Asia since the 14th century AD using Arabic-Malay letters. Some of his books are still used as handbook for teaching to the wider community, in fact, the book of *Sabilul Muhtadin* is still used as a reference book in Brunei Darussalam and throughout the Southeast Asian region. The results of this paper are the most valuable legacy of Datuk Kalampayan for all people to this day. Datuk Kalampayan has instilled six da'wah frameworks which serve as the main capital for the success of his da'wah. The six frameworks in question are as follows: 1) Da'wah must be followed by solid wisdom and full diligence in studying knowledge 2) Da'wah must be clearly oriented by prioritizing the development of cadres of scholars according to the demands of society 3) Da'wah must have a broad foundation of insight in various aspects of life society which is manifested in the bil-hal da'wah strategy 4) Da'wah must be able to protect all levels of society so that there is no social gap between the nobility and position groups in the banjar royal community 5) Da'wah must be realized with full wisdom and wisdom so that it can touch human civilization through oral, written and deed 6) Da'wah must be imbued with sincerity, high dedication and selflessness in accordance with Islamic teachings.

The definition of qalam etymologically comes from the Arabic qalam with the plural form *aqlām* which means the words of the writer, pen, writer (Yunus, 2010: 355). Other definitions mentioned in the *Universal Journalism* book include: according to Quraish Shihab that the word qalam refers to all kinds of writing instruments up to sophisticated writing and printing machines (Kasman, 2004: 118).

Al-Qurtubi states that qalam is an explanation like the tongue and qalam used to write (by Allah SWT.) Both those in the heavens and

those on earth. So al-Qurtubi's explanation shows that qalam is a tool for composing writing, then it develops into a printing tool. Al-Shabuni revealed that the qalam is a pen for writing, a tool for recording various knowledge from the knowledge that is in the book of Allah SWT. to what has become human experience from time to time (Kasman, 2004: 119). Al-Qurtubi's explanation is the same as what was conveyed by Imam ash-Syaukani in the book *Fath al-Qadir*, that al-qalam refers to the tools used for writing. And according to most scholars, the meaning of al-qalam is what is written in the tablet of al-mahfudz (Asy-Syaukani, 1994: 332). In this context, bilqalam must also be able to become a professional mover. In addition to being professional, the readiness of the da'wah subject, both mastery of material, methods, media and psychology, determines the success of da'wah activities (Amin, 2009: 13). Professional can be interpreted as an activity or job based on expertise and quality, in other words work that is in accordance with the field.

The skills and qualities of a person are usually obtained from special education and training. The job takes up time ( full time ) and becomes the foundation of a source of life while maintaining reputation, accompanied by adequate knowledge and skills, then the job is a profession, the perpetrator is called a professional.

As previously disclosed, the works of Datuk Kalampayan in writing as many as 18 books described in the description above, show that Datuk Kalampayan was a very productive scholar in his old age, because he returned to his hometown of Banjar land at the age of 65 after studying at Haramain for 35 years.

His works were also the result of a process of interaction and communication between the people within the Banjar sultanate which was very harmonious with their scientific discipline, so that Datuk Kalampayan 's role in the empire was so significant, even though he was not in the palace environment, he

preferred to live outside the palace. palace with his family. Datuk Kalampayan shows more in the form of works in the form of books that will guide his children, grandchildren, society and the continuity of the sultanate's government itself,

In this context the sultan of Banjar responded positively to the communication and preaching of this bil Qalam/bil kitabah, because it also provided benefits for the sultanate of Banjar in carrying out the sultan's government system, so that what Datuk did Kalampayan is good for the sultanate and its people.

In the communication and da'wah bil qalam / bil kitabah model, Datuk Kalampayan can broadcast Islam through the field of education, this is in accordance with the theory of the multi-dimensional communication model from the dimensions of the relationship Cuyno (1986) in Said Lestaluhu (2017; 17), indicating that there are five elements the basis of communication that interact with each other as a multi-dimensional relationship, which is used in politics or in the field of education.

Communication is seen from a multidimensional perspective, so there are two levels that can be identified, namely the content dimension and the relationship dimension . The content dimension shows the words, language and information carried by the message, while the relationship dimension shows how the communication participants interact with each other. Multidimensional communication is built on more than one relationship, namely one element can have four attachments to other elements. The basic assumption of multidimensional relationships is that an element may affect and be affected by one or more elements. This means that the source not only influences the message but can also influence the channel and receiver. Likewise, the channel and receiver can affect the source.

Datuk Kelampayan is a scholar who is very productive in writing books and teaching knowledge to the public. His existence meant a lot to the sultanate and the people of Banjar,

many of the books he wrote became guidelines for religious life according to Islamic law, among the books he wrote included;

**Table 2.** Authors of the books that are used as guidelines for religious life according to Islamic law

Abu Dawud version	Aswadi Thanksgiving version	Wan Sagir Abdullah's version
Kitâb Luqtât al-'Ajlân The Book of Usûl al-Dîn Kitâb Tuhfa al-Râghibîn fi Bayâni Haqîqat Imân al-Mu'minîn wa Mâ Yufsiduhu Min Riddat al-Murtaddîn Kitâb al-Fara'id Kitâb 'Ilm al-Falak Kitâb al-Qaul al-Mukhtasar fi 'Alâmât al-Mahdi al-Muntazar Kitab al-Nikâh Fatawa Sulaymân al-Kurdi Risâlah Kanz al-Ma'rifah Kitâb Sabîl al-Muhtadîn li Tafaqquh fi al-Dîn Mushaf al-Qur'an al-Karîm Kitâb Majmû' (Majmû')	Risâlah Usûl al-Dîn Risâlah al-Qaul al-Mukhtasar fi 'Alâmât al-Mahdi al-Muntazar Risâlah Tuhfat al-Râghibîn fi Bayâni Haqîqat Imân al-Mu'minîn wa Mâ Yufsiduhu Min Riddat al-Murtaddîn Basar Association Risâlah Luqtât al-'Ajlân Kitab al-Nikâh Risâlah Fatwa 'Atâ Allah Syarh Fath al-Jawwâd Kitâb al-Fara'id Kitâb Sabîl al-Muhtadîn li Tafaqquh fi al-Dîn Risâlah Fath al-Rahmân bi Syarh Risâlat al-Wali al-Ruslân. Risâlah Kanz al-Ma'rifah	Risâlah Tuhfat al-Râghibîn fi Bayâni Haqîqat Imân al-Mu'minîn wa Mâ Yufsiduhu Min Riddat al-Murtaddîn Kitab Sabîl al-Muhtadîn li Tafaqquh fi al-Dîn Risâlah al-Qaul al-Mukhtasar fi 'Alâmât al-Mahdi al-Muntazar Risâlah Kanz al-Ma'rifah Risâlah Usûl al-Dîn Kitab al-Nikâh Kitâb al-Fara'id Hâsiyah Fath al-Wahhâb Mushaf al-Qur'an al-Karîm Risâlah Fath al-Rahmân bi Syarh Risâlat al-Wali al-Ruslân Arkân Ta'lîm al-Şibyân, 1 Bulûgh al-Marâm Fî Bayân al-Qadâ' al-Qadar wa al-Wabâ' Tuhfat al-Ahbab Bidâyat al-Mubtadi' wa 'Umdat al-Aulâd

In another version, Abdussalam mentions several additional works written by Datuk Kalampayan, namely: Mushaf al-Qur'an with qira'at Hafs, Wars and Ibn Katsîr (text of the Koran in Datuk Kalampayan's handwriting), Jawâmi' al -Asrâr (in Arabic and accompanied by a translation by Usri Uthmân), Majmû'ah al-Asrâr, Risâlah al-Qiblah, Kaur al-Ardi wa Khâtî al-Istiwâ' and Risâlah Du'â' Anfaz.

The difference in the number of versions of the book is caused by several things, including: first, there is an ancient custom of viewing written works based on the writings of their own or the writings of their students, such as the Parukunan Malayu book. Second, relying on the translator of a certain book as his work even though it is only a translation. Third, there are still a number of papers in

various libraries both at home and abroad that have not been examined by ilologists. And it is possible that some philologists then attribute a work under study to Datuk Kalampayan.

In his busy teaching and preaching, al-Banjari also wrote several, among others; others Usul ad-din (written in 1188H/1774M.), Tuhfat ar-Raghibin fi Bayani Haqiqat Iman al-Mu'minin min Riddat al Murtaddin (written 1188H/1774), Kitab al Faraid, Kitab an-Nikah (never published in Istanbul in 1304 H), Lughat al-Alan fi Bayan haidh wa Istihad wa Nifas an-Niswan (printed in 1992M), Al Qaul al-Mukhtashar fi Address al-Mahd al-Muntazhar (written in 1196H), Kanz al-Ma'rifa h, falaq science, Fatawa Sulaiman Kurdish, Mushhaf al-Quran al-Karim and Sabil al-Muhtaddin li at-Tafaqaquh fi Amr

ad-Din. This latter book is a very famous Malay figh in the Archipelago, Malaysia, Thailand and Cambodia; and is the monumental work of al-Banjari. This book is stored in major libraries in the Islamic world, such as in Makkah, Egypt, Turkey and Beirut. (Abdullah, 1982: 47)

In addition, there are several books whose truth is still uncertain, including: Majmû', Arkân Ta'lîm al-Şibyân, Bulûgh al-Marâm Fi Bayân al-Qadâ' wa al-Qadar wa al-Wabâ', Tuhfat al-Ahbâb, Bidayat al-Mubtadi' wa 'Umdat al-Aulâd, Fatâwa Sulaymân al-Kurdi and Risâlah Fatwa 'Atâ' Allah. Muhammad Sagir Abdullah said that the book Bulûgh al-Marâm Fi Bayân al-Qadâ' wa al-Qadar wa al-Wabâ', Arkân Ta'lîm al-Şibyân, Bidayat al-Mubtadi' wa 'Umdat al-Aulâd and Tuhfat al-Ahbâb is really the work of Datuk Kalampayan'

Datuk Kelampayan was given the ability and advantage in many ways, he has brilliant intelligence and thoughts. In the field of da'wah, Datuk Kalampayan applied his thoughts in various aspects of life fundamentally. In general, there are three classifications of da'wah developed by Syekh Arsyad, namely bil hal preaching, oral preaching and writing preaching.

Datuk Kalampayan's special ability is his ability to compose and compile religious books. Covering the fields of Shari'at, Monotheism or Ushuluddin science and the field of Sufism. Most of these books were written in Malay, the language commonly used throughout Southeast Asia since the 14th century AD using Arabic-Malay letters. Some of his books are still used as handbook for teaching to the wider community, in fact, the book of Sabilul Muhtadin is still used as a reference book in Brunei Darussalam and throughout the Southeast Asian region. The results of this paper are the most valuable legacy of Datuk Kalampayan for all people to this day.

Datuk Kalampayan has instilled six da'wah frameworks which serve as the main capital

for the success of his da'wah. The six frameworks in question are as follows: 1) Da'wah must be followed by solid wisdom and full diligence in studying knowledge 2) Da'wah must be clearly oriented by prioritizing the development of cadres of scholars according to the demands of society 3) Da'wah must have a broad foundation of insight in various aspects of life society which is manifested in the da'wah strategy bil-hal . 4) Da'wah must be able to protect all levels of society so that there is no social gap between the nobility and position groups in the Banjar kingdom community, 5) Da'wah must be realized with full wisdom and wisdom so that it can touch human civilization through speech, writing and deeds 6) Da'wah must be imbued with sincerity, high dedication and selflessness in accordance with Islamic teachings.

From some of the information obtained by researchers during the research, it was found that Datuk Kalampayan served as a preacher also serves as:

1. As an educator, namely establishing the first Islamic boarding school in the 18th century in carrying out its educational function. Through the bil qalam communication model, he educated and taught the people and environment of the empire to carry out Allah's commands. and stay away from His prohibitions. Therefore the book Sabil al-Muhtaddin was written at the request of the sultan to him to write a book of worship in the Malay language, the statement of the sultan's request is contained in the words of the introduction to the book Sabil Al Muhtaddin. This aims to prevent people from deviating from Islamic law in the sultanate.

2. As an information straightener. There are three things that must be straightened out by dai through bil qalam communication. First , information about the teachings of Datuk Kalampayan in the Banjar sultanate. Second , information about the works or achievements of him who was a very productive person at

that time and gave the spirit of present and future generations. Third, as a writer, he was able to dig into the conditions of the people who were geographically very different from the geography of Haramain so he came to adapt Islamic teachings to the current situation and conditions. Islam.

3. As a reformer, namely the disseminator of renewal understanding of the understanding and practice of Islamic teachings (Islamic reformism).

4. As a unifier, namely to become a bridge that unites Muslims.

5. As fighters, namely fighters spreading Islamic teachings and trying to form public opinion that encourages the enforcement of Islamic teachings, rahmah li al-'alamin.

Datuk Kalampanyan's communication and preaching in the Banjar sultanate, when connected to today's dynamics, is still very relevant, bearing in mind that the trias politica was also carried out by him even though at that time the form of government was with a royal monarchy system. However, for him, whatever the form of the state and its governance system is not crucial, but how the implementation of Islamic values is carried out and gets support from the government.

#### Spirit of Spirituality.

If you examine Datuk Kalampanyan's work in developing his da'wah in the land of Banjar with the culture of the people, what he did was really a golden ink in his preaching work, he gave an Islamic light in the Land of Banjar. This is based on the spirit of spirituality that he has, where Spirituality can uncover the real causes of problems. Problems can occur because it is a reversal of ultimate truth, divine truth. What always appears to our senses is what is on the surface and not what is real. Humans cannot and will not find ultimate truth in past experiences. It is only a form of a repeating pattern and what humans can learn is only how that pattern works in life. Humans must move forward beyond all experience and the past.

Because the process is always progressing like space and the whole essence of the work of spirituality is that it changes consciousness and results in changes in things and forms. Everything is a manifested form of consciousness or energy. The concept of spiritual realization is to reduce high-level spiritual ideas to a physical form that can be touched and gross. Physical form that can be reached by human sensory devices. The essential point of all spirituality is the perfect way of doing worship, based on love. Not out of want of any gain or out of fear. This is the way to understand the profound facts about the meaning of spirituality when compared to its outward appearance.

Spirituality is directed to the subjective experience of what is existentially relevant to humans. Spirituality is not only concerned with whether life is valuable, but also focuses on why life is valuable. Being spiritual means having more attachment to things that are spiritual or psychological than things that are physical or material. Spirituality is self-awakening or enlightenment in achieving the goals and meaning of life. Spirituality is an essential part of a person's overall health and well-being. (Hasan, 2006:288)

Something spiritual has eternal truths related to the purpose of human life, often compared to something that is mundane, and temporary. In it there may be belief in supernatural powers as in religion, but has an emphasis on personal experience. Spiritual can be an expression of life that is perceived as higher, more complex or more integrated in one's view of life, and more than things that are sensory. One aspect of being spiritual is having a sense of purpose, which continually increases one's wisdom and willpower, attaining a closer relationship with divinity and the universe and dispelling illusions of wrong ideas originating from the sense organs, feelings, and thoughts. Others say that the spiritual aspect has two processes, the first is the upward process which is the growth of internal power that changes one's relationship

with God, the second is the downward process which is marked by an increase in one's physical reality due to internal changes. Another connotation of change will arise in a person with increased self-awareness, where the divine values inside will manifest out through experience and self-development, with beliefs expressed by certain institutions connected with beliefs expressed by certain institutions held by its members. . Religion has testimonies of faith, community and code of ethics, in other words spiritual gives answers to who and what a person is (existence and consciousness), while religion provides answers to what a person has to do (behavior or action). Someone may follow a certain religion , but have spirituality . People may follow the same religion, but they do not necessarily share the same path or level of spirituality.

#### 4. Conclusion

Datuk Kalampayan as a pioneer of 18th century clerics in the land of Banjar, was able

to contribute to the Banjar sultanate in conveying his da'wah in the land of Banjar and realizing its regeneration from time to time. He is also a scholar who is very productive in writing. The books he wrote as a form of productivity in his old age can be used as a role model for current scholars in conveying da'wah in the midst of dynamic social life, so of course it is hoped that they can make a positive contribution to the development of da'wah in the land of Banjar. The communication and da'wah approach is carried out using an argumentative dialogic communication approach and a persuasive approach, as stated in the following Al-Quran :

"Call (people) to the way of your Lord with wisdom and good lessons and argue with them in a good way. Verily, your Lord is He who knows better about those who have strayed from His way and He is the one who knows better those who are guided (QS Annahl: 125)."

Likewise , in carrying out his preaching, especially in teaching the books he wrote to his students, he did it very wisely.

## RELIGIOUS BASED MANAGEMENT PLANNING ON HUMAN RESOURCES ENGINEERING IN THE ENVIRONMENT WORK

**Abstract:** *This article highlights the importance of Human Resource Development (HRD) in achieving organizational goals and objectives in the era of globalization. The article argues that HRD is a critical parameter for organizations to attain competitive advantage and survive in the highly competitive global market. Human Resource Management (HRM) is an organizational function that plays a vital role in recruiting, managing, and navigating employees to work towards a common goal. The article cites various studies that show how ineffective and inefficient human resources can negatively impact an organization's performance. The article emphasizes the need for organizations to focus on HR development as their primary asset, which includes improving employee performance, career advancement, competency improvement, and talent development. Ultimately, the article concludes that organizations can increase productivity, quality, customer satisfaction, and organizational effectiveness by effectively managing their employees.*

**Keywords:** *Human Resource Development (HRD), Human Resource Management (HRM), Organizational competitiveness, Employee productivity, Career advancement, Competency improvement, Talent development, Organizational effectiveness.*

### 1. Introduction

This era is characterized by very attractive global competition. The competition that occurs becomes material for study for the development of the resources of a company/institution/organization. Human Resources (HR) is an important asset for any organization to achieve competitive advantage in the era of globalization. Therefore, Human Resource Development (HRD) is an important parameter for organizations to achieve goals and objectives in order to continue to exist on the National

and International level.

HRM is an organizational function that focuses on the recruitment, management and navigation of employees in working for an organization which is realized through synergy to strengthen mutuality towards a common goal. Susan (2012) stated that HRM is a strategic and comprehensive approach to managing people, workplace culture, and the environment to effectively and productively contribute to organizational goals and objectives. In recent years, many good companies have performed poorly due to ineffective and inefficient human resources

(Townsend and Wilkinson, 2010; Okoye and Ezejiofor, 2013).

Most organizations ignore HR development as their main asset. Okoye and Ezejiofor (2013) said that business in an organization is filled with uncertainty regarding the understanding of employee contributions in increasing organizational productivity and profitability. This is what causes a lot of unskilled workforce, uncompetitive organizations, high levels of poor performance, and low productivity. Various efforts have been made by the organization by emphasizing its employees regarding improving performance for the sake of beneficial outputs and outcomes as long-term effects (shodhganga.inflibnet.ac.in).

Human resource management (HRM) efforts aim to improve employees in handling various types of tasks in order to strengthen organizational competitiveness and adaptation to the environment, especially external turbulence (Jumawan, 2015) while at the same time benefiting employees for career advancement, competency improvement, and talent development. HRM increases productivity with high quality, satisfied customers and beneficial impact on the organization. In line with what was stated by Pfeffer (1998) that "the key to long-term success has been, and will continue to be, how organizations manage their employees, because creating meaningful work and otherwise keeping employees happy is central to fostering organizational effectiveness". Often organizations experience serious problems in managing employees to work optimally.

In line with Simon (1997) that "the basic challenge for all organizations is "inducing their employees to work toward organizational goals". In fact, to achieve long-term and sustainable success, organizations need human resources that create meaningful work (according to the talents and competencies of employees). In addition to talent and competence, organizations need to

pay attention to aspects of the resilience or toughness of employees at work so that an organization can continue to exist in the long term. Many competitive business organizations have emerged recently. However, the existence of these business organizations did not last long. This is because employers do not pay attention to aspects of the resilience or toughness of employees in recruiting. In fact, in addition to talent and skills, a job really requires resilience at work. This was made possible by management planning in human resource engineering not going well so that the achievement of goals did not go according to the desired goals.

Planning is a concept that realizes structured ideas and ideas and is manifested in working papers, as a basis for developing strategic and tactical steps for developing human resources in the work environment, so that engineering human resources is an impossible part, because it is a crucial part in improving productivity performance in the work environment itself.

Usmalian (2011; 48) says planning everything is also a concept taught in Islam. Rasulullah SAW said: "Whoever is someone who always plans every business, then he will be forgiven by Allah" (HR. Thabrani). As well as several verses of the Qur'an that teach to prepare (planning) for tomorrow.

The urgency of a plan is intended to be able to position an appropriate human resource in the right position and time. Planning is also a sunatullah because nature and everything in it and everything that befalls it has been planned by Allah SWT beforehand so that the natural system is able to run automatically well until now even until the end of the world arrives. Thus, human resource planning will also affect the sustainability and existence of an organization in the work environment.

Management planning in the work environment is the key to success in achieving goals, having abundant human

resources without being accompanied by the ability in good management planning, it is difficult to reach the goals to be achieved. Human resource management planning plays an important role in the successful management of an organization or work environment anywhere, be it a company, government agency, or educational institution and so on.

HR Management develops and works through a human resource management system that is integrated with other parts of a management. In general, there are five functional areas in effective human resource management: staffing, human resource development, compensation, safety and health, and staff relations. Planning in these five areas is absolutely necessary so that the provision and development of staff, compensation systems, safety and health systems and relations between staff are properly prepared and directed in line with organizational goals.

Nawawi (2005; 137-139) states that human resource planning can be interpreted as: first, a process that involves a series of activities such as forecasting or estimating, efforts to meet the needs of the organization's workforce within a certain period in the future including efforts to match internal and external HR with job vacancies that are expected to be needed, managing HR flow and utilizing available resources effectively and efficiently. HR flow arrangements are intended to determine certain requirements for new HR who will replace outgoing HR with resources that work effectively and efficiently.

Second, as a strategy for developing the contribution of human resources to the organization in order to achieve success. Quality resources owned by the organization will have an impact on increasing the organization's competitive ability. All tasks and work are carried out in a direction towards the success of the organization. Human resource planning is a process of carrying out one of the management functions

Machine Translated by Google includes activities, forecasting, fulfillment and management of the workforce so that it is efficient and effective as possible in order to achieve organizational success.

Human resource planning should be based on compatibility with strategic planning and organizational operational planning. Incompatibility will be a burden to the organization and can be a hindrance in the future. In addition, human resource planning must also be based on the results of job analysis. By using the information in job/position descriptions, qualitative and quantitative needs can be predicted so that the organization can run effectively and efficiently. (Nawawi, 2011; 141).

Religion-based management planning is crucial and strategic in human resource engineering, this should be disclosed more for organizations/companies/government agencies and even educational institutions to do, because outwardly everyone always wants to do good in managing a better tomorrow.

This description wants to review the importance of paying attention to religious-based management planning in the engineering of human resources in the work environment so that employees have resilience or toughness at work.

## 2. Research methodology

This study uses a literature study, namely a series of activities related to data collection methods through reading and recording, as well as managing research materials (Prabawati et al., 2018; Rizani et al., 2021). Literature studies were carried out by searching books, articles, national and international journals as well as using dictionaries and thesauruses. The literature used is adapted to the title of the study on religious-based management planning in human resource engineering in the work

environment.

### 3. Results and discussion

Human Resource Management, or abbreviated HRM is a science or method of how to optimally manage the relationships and roles of resources owned by individuals so that a goal is achieved. The definition of management according to Marwansyah is the utilization of human resources within the organization through the functions of human resource planning, recruitment and selection, human resource development, career planning and development, compensation and welfare, occupational safety and health, and industrial relations.

Marwansyah (2010) according to Flippo Human Resource Management is called personnel management, namely planning, organizing, directing and terminating employment, compensation, incentives, maintaining and terminating employment with human resources to achieve individual, organizational and community goals

(Flippo;1995: 4)

According to Sastrohadiwiryo, Human Resource Management is replaced with workforce management, namely utilization, coaching, knowledge, regulation, development, elements of the workforce. Good and bad employees or employees to achieve maximum efficiency and effectiveness according to the organization (Sastrohadiwiryo; 2002; 57).

### 4. Conclusion

In conclusion, HRM is the process of planning, organizing, implementing, and controlling human resources in an organization to achieve goals effectively and efficiently. Human Resource Management has a broad scope, one of the meanings and limitations used is human resource management, which are the policies and practices needed by someone to carry out aspects of human resources from a manager's position.

## BADAMAI CULTURE COMMUNICATION: CHARACTER DEVELOPMENT OF NATIONAL LAW

**Abstract:** *This article discusses the challenges faced in building and implementing law in society. The balance between law and the interests of the community is important, as the law should be created to protect the interests of the community. Sociologists view law as a cultural product, and laws will only be effective if they are created with an awareness of their urgency and sincerity to carry them out. The law is for humans and cannot be separated from the human aspect. It is centered on humans and made by humans, formulated in a human language that only humans can understand, and run by humans to serve the interests of humans. The article also highlights the importance of legal culture, which consists of structure, substance, and culture, in measuring law enforcement in a country. Lawrence Meil Friedman's legal system theory includes these components, and they are often used as standard references for measuring law enforcement. The article emphasizes that without legal culture, the legal system will be ineffective and will not serve its purpose of protecting the interests of the community.*

**Keywords:** *law, society, legal culture, law enforcement, humans, interests, challenges, balance*

### 1. Introduction

Building and realizing law in people's lives will definitely be faced with various challenges, both caused by internal and external factors of the community itself. Society as a translation of the term society is a group of people who form a semi-closed (or semi-open) system, where most interactions are between individuals who are in a legal group. It will be good if society accepts it voluntarily. Conversely, the law will be bad if the community even though the law will be good if the community accepts it voluntarily. Conversely, the law will be bad if the community cannot accept it, because it cannot protect the interests of the community. Thus the law and the interests of the community

must have a balance, in the sense that the law is created to protect the interests of the community. Sociologists see law as a cultural product. Laws are just inanimate objects, meaningless if they are not made with an awareness of their urgency and sincerity to carry them out. Laws will only become jokes and jokes if those who make them number one lawbreakers, and those who implement them are a nation without a culture of law. Lawrence Meil Friedman has an interesting anecdote on this subject, "Without legal culture, the legal system is where dead fish lying in a basket, not a living fish swimming in its sea." The law in this country is surely powerless, like a dead fish, if it is not supported by the nation's own legal culture. Law is for humans, meaning that a rule of law

cannot be separated from the human aspect. In fact, it is centered on humans because its essence and existence is centered on humans (anthropocentric), from, by, and for humans. It is the embryo of human desires, motives, ideals and concerns. It was made by humans, and formulated in a human language that only humans can understand. It is run by humans and to serve the interests of humans. This basic belief does not see law as Satjipto Raharjo, (2007; 151) dissecting progressive law stating something that is central in judging, but humans who are at the center of the law cycle. The starting point of all legal theorizing basically pivots on one thing, namely the relationship between humans and law. The more the basis of a theory shifts to regulatory factors, the more it considers law as a closed formal legalistic unit. Conversely, the more it shifts to humans, the more the theory opens and touches the social mosaics of humanity. Lawrence Meil Friedman includes components of legal culture in his legal system theory, namely: (1) structure, (2) substance, and (3) culture (legal culture). These three components in the legal system are often used as standard references to measure law enforcement in a country.

In the rhyme of the Banjar Culturalist Datu Adjim Arijadi (1940-2016), which has a character in the cultural values of the Banjar people can be seen in the strings of his words, as shown below;

Tapas salawar on a hot day  
 Dadai on the stairs to the right of the steps  
 Carrying small talk but a hot heart  
 Mun can't overcome many regrets  
 Saungan basingkingan chicken,  
 Maurak's feathers,  
 Baakuran, mbah bakahian.  
 Traditionally, then ours

Pantun Culturalist Banjar Datu Adjim Arijadi (1940-2016), we relate relevantly to the writings of Dr Anang S Tornado SH MH MKn (BPost 1-2-2023) entitled "Remedial Justice in Indonesia". Lately, law enforcers often socialize the need for legal settlement

outside the court, restorative justice, namely a restoration of relations and amends for mistakes committed by perpetrators of criminal acts (their families) against victims of criminal acts (their families) by deliberation to reach a consensus outside the court so that the problem can be resolved. law can be resolved properly.

Restorative justice is relatively the same as the customs of bapeace, baishlah, bapatut or baparbaik in the Banjar community. According to Ahmadi Hasan's dissertation research (2020), there has long been a tradition of "bapeace" as a way of resolving disputes within the Banjar community, both civil (such as debts), criminal (fights and abuse), husband and wife quarrels, and moral issues (immorality, adultery, adultery). The adat of bapeace was inherited from the time of Sultan Adam al-Watsik Billah (1825-1857), and became one of the articles in the Law on Sultan Adam (UU-SA), enacted since 1835. Even though the Sultanate of Banjar was abolished unilaterally by the Dutch in 1860, the spirit of the Law -SA related to peace is still widely practiced by the Banjar people until now.

The peaceful formula as an effort to overcome disputes, conflicts and grudges that can endanger lives, peace and social order, is adopted by many tribes in Indonesia, including the Dayak tribe. They have adat barunding, hapakat and nyangkalang procedures. Barunding means negotiating or agreeing. If the relationship between the parties heats up, in the term ela hakalawan, it is discussed together. Negotiations are carried out by representatives of the disputing parties. The parties to the dispute prepare whatever is needed or desired by the other party or the opposing party. The parties may not ask for their rights at a fixed price, but bargain so that there is a meeting point. Furthermore, granting concessions, leeway and lowering the bid on the limits of ability.

Hapakat (consultation), the disputing parties ask for opinions or advice from other parties

who can help solve the problem. Usually the Damang Traditional Chief is chosen as the negotiator, because the Damang knows customary law regulations and can resolve them according to custom. Nyangkelang, means mediation, namely the settlement of cases using neutral and impartial intermediaries. The mediator then resolves the issue actively but voluntarily. The principle of this settlement is in accordance with the motto of the Dayak Ngaju people in Central Kalimantan, namely hatangku manggetu bunu, hanangkalu penang mamangun betang, meaning to unite together to solve problems, agree to build togetherness. The Dayak people also have a motto: Penyang hinje simpe, paturung kumbak tamburak manggatang sent by the Dayaks, which means living in harmony and peace for the common good, with the will of the heart and unanimity to elevate the dignity of the Dayak people.

Even though our court principles are easy, cheap and fast, the resolution can be complicated, consuming energy and emotions, takes a long time and costs, and may not necessarily satisfy the parties to the dispute. If resolved peacefully (ishlah), the settlement can be faster and simpler, as long as the parties have good intentions and an agreement. If the case has already been reported to the police or court, peace is still important, at least it can lighten the sentence and eliminate resentment in the future. That is why, even in court hearings, peace is still being offered.

Peace is important and can be realized well if it is supported by the parties. First, family and community institutions (RT/RW), religious and customary leaders should have the influence and power to reconcile. That way when disputes and crimes occur, the family and community can immediately mediate, appease, negotiate settlement formulas and then reconcile.

Second, the police should be able to help, for example temporarily detaining the

perpetrators of crimes, but after peace is established the perpetrators are released, if the crimes committed were not so serious. Of course with a stamped agreement that the perpetrator will not repeat it again. If the perpetrator continues to be prosecuted, it is estimated that he will still hold a grudge.

Third, the victim or the victim's family who feel hurt, suffered and harmed by a crime, should be a priority for recovery, with compensation, compensation or other forms of compassion. This means that the money spent by the perpetrator or his family is not mostly for other parties who are not hurt and harmed. If the victims or their families do not receive proper compensation and compensation, it is feared that peace will still be half-hearted, unless they forgive sincerely. Forgiving is very commendable from a religious point of view, but giving compensation and compensation is also very important.

On the other hand, when viewed from the aspect of communication, it is very clear that communication is the key in interacting with each other, where the messages conveyed cannot be separated from the realm of applicable law, both positive law and customary law that apply in every region in Indonesia, including South Kalimantan. Culture and communication have a very close relationship and play an important role in human survival. People communicate according to the culture they have. When, with whom, and how much was communicated depended on the culture of the people interacting. It is the existence of cultural differences and influences that people learn to interact through communication. Communication lies in the process, namely an activity that "serves" the relationship between the sender and receiver of messages beyond space and time. Humans cannot be said to interact socially if they do not communicate in a way or by exchanging information, ideas, thoughts, intentions and emotions expressed in symbols with other

people (Alo Liliweri, 2013: 5).

The reciprocal relationship between culture and communication is like a symbiosis of mutual influence. Like culture affects communication and vice versa communication affects culture. Culture can affect the process by which a person perceives a reality. All communities in all places always manifest or manifest what is their view of reality through culture. On the other hand, communication helps in creating the cultural reality of a community (Judith N. and Thomas K. Nakayama, 2003).

Basically cultural communication is ordinary communication, what distinguishes it is the people involved in the communication differ in terms of background. When someone tries to communicate with people of different cultures and adjusts for the differences, it proves that culture is learned. Cultural differences in cultural communication interactions are very easy to occur. Adjusting to and studying different cultures will create harmony in the process of cultural communication. As stated by Stewart, intercultural communication is communication. Basically, cultural communication is ordinary communication. What distinguishes it is that the people involved in the communication differ in terms of background.

When someone tries to communicate with people of different cultures and adjusts for the differences, it proves that culture is learned. Cultural differences in cultural communication interactions are very easy to occur. Adjusting to and studying different cultures will create harmony in the process of cultural communication. As stated by Stewart intercultural communication is communication, between people of different cultures, for example between ethnicity, ethnicity, race and social class. Communication that occurs in a condition that indicates cultural differences such as language, values, customs, habits.

Thus the Communication on customary law culture, if you look at Lawrence Meil Friedman's view, includes components of legal culture in his legal system theory, namely: (1) structure, (2) substance, and (3) culture (legal culture). These three components in the legal system are often used as standard references to measure law enforcement in a country. LM Friedman then places "legal culture" as one of the components in his "grand theory" building, namely The Legal System.

This theory has become very monumental in legal science, because of its "great" nature, law can be studied with a systems approach to all aspects related to law. Law is constructed as a system that is related to one another (substance, structure, and culture). Due to the strong influence of the legal approach as "the legal system", the theory has become a reference in legal textbooks around the world. Seeing how important the study of legal culture is as a component of the legal system, this paper will present several theoretical concepts which are the substance and essence of LM Friedman's thought, especially those related to legal culture as a fundamental component of his phenomenal thinking. In addition, a correct understanding of the substance and essence of thought needs to be clarified, so that the intended assumptions can be understood everyone's right when talking about Legal Culture.

Therefore, it is an obligation to conduct a review of the concept of Legal Culture and attempt to reconstruct it into a theoretical study as a very appropriate step in fully understanding the theory of the "legal system". Apart from examining in depth the aspects of legal culture, it will be found that the operation of a legal system in society (law in action) cannot be separated from the influence of aspects of values and attitudes, which provide an understanding of the operation of the legal system.

## 2. Research methodology

The research method used is to use a socio-judicial (socio-legal) approach by using an interdisciplinary approach or a hybrid between aspects of normative legal research and a sociological approach using qualitative analysis, namely by analyzing a data in depth and holistically. This research is supported by the statutory approach (statute approach), historical approach (historical approach), and the concept approach (conceptual approach). The research data includes primary data, namely field studies using interview techniques and observation. Primary data is supported by secondary data, namely reviewing and analyzing primary legal materials in the form of laws and regulations governing dispute resolution outside the court, and secondary legal materials, namely materials that provide explanations regarding primary legal materials such as research results, works from legal circles others are authoritative. Using a purposive accidental sampling technique considering the characteristics of the study population whose number cannot be known with certainty, spread over a relatively wide geographical area. Primary data was obtained directly from informants by referring to structured interview guidelines that were compiled to obtain data related to patterns of dispute settlement outside the court, local government policies. The data collected from field research is primary data about everything that has to do with the problem under study. In obtaining the primary data, the area, object of research and secondary data are determined in the form of primary, secondary and tertiary legal materials.

## 3. Results and discussion

### Cultural Communication

Humans are social beings who always interact with each other, be it with others, customs,

norms, knowledge or the culture around them. In fact, we often cannot accept or find it difficult to adjust to the differences that occur as a result of these interactions, such as problems with technological developments, different habits of a friend from a different region or ways that become habits (language, traditions or norms). ) from one area while we come from another area.

In relation to cultural processes, communication addressed to other people or groups is a cultural exchange. The process contains elements of culture, one of which is language, while language is a means of communication. To study communication as a cultural process, we must first understand what is meant by the term culture or culture and what is meant by the term communication, because understanding these two terms will make it easier for us to discuss communication as a cultural process.

Culture and communication have a very close relationship and play an important role in human survival. People communicate according to the culture they have. When, with whom, and how much was communicated depended on the culture of the people interacting. It is the existence of cultural differences and influences that people learn to interact through communication. Communication lies in the process, namely an activity that "serves" the relationship between the sender and receiver of messages beyond space and time. Humans cannot be said to interact socially if they do not communicate in a way or by exchanging information, ideas, thoughts, intentions and emotions expressed in symbols with other people (Alo Liliwari, 2013: 5). The reciprocal relationship between culture and communication is like a symbiosis of mutual influence. Like culture affects communication and vice versa communication affects culture. Culture can affect the process by which a person perceives a reality. All communities in all places always manifest or manifest what is their view of

reality through culture. On the other hand, communication helps in creating the cultural reality of a community (Judith N. and Thomas K. Nakayama, 2003).

Culture is basically the values that appear in the process of interaction between individuals. Julia T. Wood (2013: 132) defines culture as one of the most important systems in which communication emerges. When we are born, we do not know how, when, and to whom we speak, just as we are not born with different attitudes regarding race, religion, sexual orientation, and other aspects of identity. It can be said that the definition of cultural communication is a communication process carried out by two or more people to get a common understanding through symbols or behavior from human activities of different cultures. Cultural communication refers to communication activities between people from the same culture or different cultures who have cultural beliefs, values, or ways of behaving. Basically cultural communication is ordinary communication, what distinguishes it is the people involved in the communication differ in terms of background. When someone tries to communicate with people of different cultures and adjusts for the differences, it proves that culture is learned. Cultural differences in cultural communication interactions are very easy to occur. Adjusting to and studying different cultures will create harmony in the process of cultural communication. As stated by Stewart intercultural communication is communication between people of different cultures, for example between ethnicity, ethnicity, race and social class. Communication that occurs in a condition that indicates cultural differences such as language, values, customs, habits. Martin and Nakayama (Judith N. and Thomas K. Nakayama, 2003) review how communication influences culture. He explained that culture cannot be formed without communication. Communication

patterns that are certainly in accordance with the background and cultural values will describe one's cultural identity. Distinctive characteristics are born because of communication behavior that is built and patterned in such a way. This distinctive characteristic will form a habit/culture of communication for a particular cultural community. It is clear that the communication activities of a person from a particular cultural community can represent the beliefs, values, attitudes and even the worldview of that culture.

Communication is a form of culture. Because, communication can only be realized after previously there is an idea that will be issued by the individual's mind. If the communication is carried out within a community, then it becomes an activity group (a complex of activities within a certain community). And in the end, the communication that is carried out often results in a physical form, for example a work like a building. Wasn't the building erected because there was a concept, an idea, then it was discussed (with family, workers or architects) and a house was built. So communication, actually becomes a form of culture. In other words, communication can be called a cultural process that exists in society.

If viewed in a more concrete way, the relationship between communication and cultural content will become clearer:

1. In practicing human communication requires certain equipment. At a minimum communication requires means of speaking such as mouth, lips and matters relating to the sound of speech. There are times when hands and other body parts are needed (non-verbal communication) to support verbal communication. Viewed more broadly with a wider spread of communication as well, mass communication tools such as television, newspapers, radio and others are used.
2. Communication produces the livelihood

of human life. Communication conducted via television, for example, requires a person who is paid to "take care" of television.

3. The social system becomes an inseparable part of communication, for example the legal system of communication. This is because communication will be effective when regulated in a regulation so as not to violate societal norms. In the field of the press, guarantees of legal certainty are needed in order to realize freedom of the press. However, freedom of the press also does not necessarily develop outside of societal norms. This is where the need for a legal communication system.

4. Communication will find its form better when using language as a means of conveying messages to others. The form of the number of languages used as a means of communication shows that language is the content or form of communication. How to use language effectively, using what language, who is the target is a manifestation of communication as a cultural process. Included here are also manifestations of communication as an artistic process, for example, on television there are motion arts (drama, soap operas, films) or sound arts (singing, dialogue).

5. The system of knowledge or knowledge is a substance that cannot be separated from communication. How is it possible that a communication will take place interestingly and dialogically without the support of science? This knowledge also includes the knowledge of speaking and expressing opinions. Evidence that each person is different in delivery, style, knowledge possessed shows this reality.

Communication as a cultural process is undeniably an objectivity between culture and communication. This process includes the role and influence of communication in the cultural process. Communication is a cultural process because in it there is a process like a cultural process, which has

form and content as well as a whole complex. Something is said to be communication if there are elements involved in it. Culture can also only be called culture if there are elements involved in it that form a system.

According to the definition of Littlejohn and Foss (2009:460), communication ethnography is a simple application method in the pattern of communication of a group. Communication ethnography looks at, (1) the communication patterns used by a group, (2) the meaning of all these communication activities for the group, (3) when and where group members use these activities, (4) how communication practices create a community, (5) the diversity of codes used by a group.

The founder of the ethnographic tradition is an anthropologist, Dell Hymes. According to Hymes (Sumarsono, 2007: 311), the term ethnography of communication itself shows the adequacy of the study, namely the ethnographic basis and the communicative range and types of complexity involved. Actually, the ethnographic concept of communication studies is more on sociolinguistics. Before the term ethnography of communication became more popular, the term ethnography of speaking was earlier referred to as the use of spoken language. However, the ethnography of communication becomes broader because it does not only cover modes of spoken communication (speaking), but also involves written communication (writing) as well as gestures, body movements (kinesics), or signs (signing). In the ethnographic concept, it is stated that there is a language community or speech community. Hymes denotes a speech community, a concept that has become an ornament in ethnographic studies of continuous communication. Conversational communities are very different from one another and this makes generalizations difficult (Littlejohn and Foss, 2009:460). However, it is not only the conversational communities that are different from one another, in which there are modes of

communication of gestures, body language or signs that use different limbs or tools.

A communicator can use almost all members of the body to convey messages that contain certain meanings according to what the communicant understands. In addition, it can also use an object or tool to show a meaning that can be understood. For example, the color yellow for the Malay ethnicity is the color of greatness which symbolizes majesty and only certain groups can wear something yellow, such as the Sultan or the King. Other categories include the use of traffic lights to send messages or signs to motorists when to go, be careful, and stop.

#### Legal Culture

If a society is observed, it will appear that even though the individual characteristics are different, the citizens as a whole will give the same reaction to certain phenomena. With the same reaction, they have the same general attitude. The things that belong together in cultural anthropology are called culture. Drawn from this understanding, legal culture is a part of human culture that is so broad.

Legal culture is the same general response from certain communities to legal phenomena. The response is a unified view of legal values and behavior. So a legal culture shows the pattern of individual behavior as a member of society which describes the same response (orientation) to the legal life that is lived by the community concerned. Knowing the legal culture of the local community is an important information material, meaning to become more familiar with the structure of the local community, the legal system, legal conceptions, legal norms and human behavior.

Legal culture is not a personal culture but rather the overall culture of a particular society as a whole of attitudes and behavior. Therefore, in discussing legal culture, it cannot be separated from the condition of society, the system and structure of society that contains this legal culture. Legal culture

is a response that accepts or rejects a legal event. It shows the attitude of human behavior towards legal issues and legal events that are carried into society.

Types of legal culture can be grouped into three forms of human behavior in public life, namely: 1) parochial culture, 2) subject culture, 3) participant culture. In parochial (insular) societies, ways of thinking the members of the community are still limited, their response to the law is limited only within their own environment. Such a society still adheres to its own legal tradition, the legal principles laid down by the ancestors are a talisman that cannot be changed. If anyone behaves deviantly, will get a curse. This type of society has a high dependence on leaders. If the leader is egocentric, then he is more concerned with himself. Conversely, if the nature of the leader is altruistic, then the members of the community get attention, because he places himself as *primus inter pares*, the main one among equals. In general, a simple society, the nature of its legal culture is ethnocentric, prioritizing and being proud of its own legal culture and considering its own law to be better than the laws of others. In a subject (subject) cultural society, the way of thinking of members of the community is already concerned, there has been a general legal awareness of the output of higher authorities. Input from the community is still very small or nonexistent. This is because the knowledge, experience and association of community members is still limited and there is fear of hidden threats from the authorities. The orientation of their views towards the new legal aspects already exists, there is already an attitude of acceptance or rejection, even though the method of disclosure is passive, not openly or still hidden. This self-conquering type of society considers itself powerless to influence, let alone try to change the legal system, the legal norms it faces, even though what it feels is contrary to its personal and societal interests. In a participatory

(participating) cultural society, the ways of thinking and behaving are different for community members. There are those who still have a culture of submission, but many feel they have the right and obligation to participate because they feel they are part of the general legal life. Here the community already feels that they have the same position, rights and obligations in law and government. He does not want to be ostracized from responding to legal inputs and outputs, participates in assessing every legal and judicial event, feels involved in legal life both concerning public interests and the interests of his family and himself. Usually in such a society, the knowledge and experience of its members is extensive, there are already associations of organizations, both those whose composition is independent and those that have relationships with other regions and from top to bottom. Legal culture, as described above, is only part of the attitudes and behaviors that influence the legal system and conception in the local community. There are other factors that also have no small influence on legal culture, such as social, kinship, religious, economic and political systems and arrangements, the environment and ways of life, in addition to the nature of a person's personal character, all of which are interrelated.

## **THE TRADITION OF THE THREAD**

adat bapeace status can rise to become customary law, because the community already considers mutual forgiveness and peace as a positive attitude, something that should apply and is a tradition in the communal environment of the Banjar adat community. In addition, the adat badamai which is also commonly referred to as baakuran or settlement by means of torches, can also be interpreted as a process of deliberation or consensus deliberation to reach a joint decision as a settlement of a dispute that has arisen.

Apart from that, the election of adat adat being part of the social institutions of the Banjar tribal people because the deliberation-style mechanism to get the best decision is considered the most suitable for the Urang Banjar culture, so it is believed to be very effective in preventing the occurrence of feuds, disputes, hostilities, disputes, and even effective in neutralizing feelings of resentment between communities which can harm the social order of society.

As befits "deliberation" in general, adat bapeace also become an effective communication medium to strengthen friendship, as well as kinship between fellow members of the community, so that it also strengthens and tightens the process of social control in society which is expected to suppress the emergence of disputes or disputes, so that the Bapeace custom also plays a role as a catalyst for order and peace, as well as security.

Refers to factual roles adat Badama i in the socio-cultural structure of Urang Banjar, it is only natural that until now the people who are used to settling all disputes, disputes or disputes with adat badamai tend to be reluctant to settle them through litigation institutions (the courts), even for matters related to traffic violations. or even related to actions that could lead to criminal offenses such as fights that lead to persecution

Based on these references, a framework can be made that the Badamai Customary Law in the Banjar community consists of 3 elements, namely:

(1) unwritten elements, in the form of habits that grow and develop in the practice of social life in society. This includes everything that society is used to seeing as good and will cause reactions from various layers of society if it is violated. Strictly speaking, violations will get a minimum sanction in the form of reproach from the community. Such habits in the Banjar community differ from one place to another, especially in terms of the size of

the influence of education and modernization as well as other development activities carried out by the Government.

(2) elements originating from Islamic law, which includes all provisions of Islamic law and fiqh laws that are maintained and adhered to by the community as a large part of their religious teachings. In this regard, the determination of what constitutes religious teachings depends on the perceptions of the community according to what has been conveyed by the ulama in this area since ancient times. The determination of something as obligatory, circumcision, mubah, makruh and haram is basically determined by the scholars and is still being held as a criterion for judging when someone faces certain facts that require an assessment.

(3) elements originating from the Banjar kingdom era, for this matter no provisions were determined other than the so-called Sultan Adam Law (1835) a Sultan who was known to be pious and respected by his people. It seems that this law which consists of several articles depends on the Sultan, so that after the death of Sultan Adam, even more so after the death of Sultan Adam, he received little attention except in the area of land law which is still obeyed by the people.

Judging from this framework, what is called the Adat Law of South Kalimantan or more specifically the Customary Law of Badamai in the Banjar community is a reality that can be found in the Banjar people in South Kalimantan.

Traditional Customs Past, Present and Future  
In Banjar society, respect is generally given to older people, people who because of certain personal qualities are elders in society, people who occupy certain positions in their village community, or other positions outside their village, and are respected for serving as teachers, especially religious teachers, or carry out certain functions in society. The mentions mentioned above actually cover each other, but it will be clear after just an

explanation below. A form of courtesy that is first taught to a child is how he should pay respect to adults in the extended family and other adults.

This respect is continued until the child becomes an adult, which is addressed to parents, and generally to the older generation, to older siblings and generally older relatives. In addition to older relatives in the village and older people in general. The elders in the community are usually the village elders who are considered figures, who are always included in every village activity, and are always the first to be contacted when there is an attempt from outsiders to make peace (babaikan) with a group of relatives. (bubuhan) or one of the community members in the village.

Within certain relatives, there are usually residents who hold positions that are prominent (such as providers, civil servants in the city, and so on) compared to other residents in the affix, or are considered wise after being proven in various events, so that they are elders and thus are equated with their parents. foam symbol. There is a tendency for figures who are elderly in this particular affix to be elderly among the village community, especially if the group of relatives who support them is influential or large. 39 In the village there are also people who are elders not because they are considered wise and are the people's trust, because that is always the case. invited to participate in solving the problems faced by the village. Someone who is respected because of his extensive experience or because he is considered brave (warrior figure) belongs to this last category.

Likewise, certain village officials include people who are also respected, namely the head of the village (pempekal), the head of the RK (formerly pengrak, recently the head of the hamlet), the head of the padang (head of agrarian affairs), and the deputy head of the village, and also the village head who has resigned from his position. According to Alfani Daud, among the Banjar community,

especially those who still adhere to their customs, socialization is expected only between age groups of more or less the same age (papantaran) 40, perhaps so that they do not have to always carry out the formalities of respect as stated earlier. Contact with older age groups is necessary. It is also expected that children obey the orders of their parents and those of the same generation. A respected figure in a village or among certain tribes stands out when there is a dispute in the community and there are attempts by one of the parties to persuade the other parties to reconcile. A dispute in the community, especially if there is bloodshed, even though it is actually only minor injuries, is usually always considered to be sustainable and if this happens it will endanger the peace of the community.

In the past, before the influence of legal modernization came into effect with the issuance of Law no. 1 of 1974 concerning Marriage, the position of Penghulu is still very prominent in resolving marital disputes. The prince can reconcile people who want to divorce, even the prince can provide a way out for couples to divorce in accordance with the requirements according to the provisions of the Shari'a (Fiqh understanding). Along with the birth of Law no. 1/1974, the dualism of the role of the dispute resolution institution emerged. The proof is that in the villages to this day there are still terms of underhand marriage and divorce, which in terms of laws and regulations are considered unofficial (not tauliyah).

Modernization of law has also affected the attitude of the people in viewing or responding to the existence of this peaceful institution. In practice, even though people have started to get used to resolving disputes through court institutions, in the view of the community, they still cannot resolve feelings of resentment and have not been able to resolve problems unless they are brought to justice. in the bapeace forum. Now, along with developments in various fields, dispute

resolution is used as an object of side work for certain sections of society. Usually such a profession is commonly referred to as a motorcycle taxi, sometimes this work can be used as an object of extortion against the parties. Because of his position as a third person, sometimes his position can be advantageous for him. Coming to the first party with information that is somewhat negative when it isn't, but to the other client is scenariod as if it doesn't want to open a dialogue and make peace unless it fulfills a number of requirements. Even though the requirement was made up by the person concerned to gain personal economic benefits.

In the research report there are 10 cases that are the object of research, each of which has a motive to fulfill the demands of the respondents from Party I respectively to seek financial gain, redeem self-esteem, tatamba takajut, 44 contain deterrent. Apart from that, there is a motive to comply with the demands of party II, each of them is just threatening, forced, to maintain security, not wanting to prolong the problem.

The Process of Communication of the Indigenous Culture of Badamai.

Adat bapeace is a form of dispute resolution that is commonly practiced by the Banjar people. Adat bapeace also means the result of a process of deliberation or deliberation in joint discussions with the intention of reaching a decision as a solution to a problem. Adat bapeace are values that live in society. Customary values are considered important as part of a culture that from time to time experiences ups and downs. Especially when dealing with change and modernization.

Adat bapeace describes eastern culture that is familiar with the values or views of society which is characterized by mechanical solidarity, in conditions like these adat adat is functional and very appropriate as a solutive mechanism in resolving various problems in society. When society changes according to

the changes and modernization that has occurred, the position of adat bapeace still has a place in the civil aspect, namely when it is in a space and social order characterized by organic solidarity, which relies more on dispute resolution mechanisms using a litigation approach. However, in the criminal aspect, it seems that the customary law approach cannot function, except for rural communities who are still familiar with mechanical solidarity. In the future, the position of adat adat is quite prospective and is still being maintained by the community, although it still needs to receive support from the community itself to fight for and perhaps strive for the preservation of adat adat values as a living law in society.

As an example, we can see that traditionally the National Police has developed a Community Guidance program (Bimmas) and programs related to the Independent Security System (Siskamswakarsa). The police tend to see themselves solely as the holder of authority and the police institution is seen solely as a tool of the state so that approaches to power and even repressive actions often color the implementation of the duties and authority of the police. Even though the principles of "serve and protect" (to serve and to protect) are emphasized, bureaucratic, centralized, uniform/uniform approaches color the presentation of police services.

This policing style encourages the police to prioritize the mandate of the central government and ignore the "approval" of the local community served, even though local people have their own wisdom in resolving disputes. In addition, the police tend to cultivate an attitude that presents itself as a formal and exclusive figure from other members of society. In the end, all of this resulted in the waning of the legitimacy of the police in the eyes of the public, on the one hand, as well as diminishing public support for carrying out police duties as well as a bad image of the police, on the other hand.

This condition occurred even more so when the Police were made an integral part of ABRI and the police were ABRI soldiers who in carrying out their duties were characterized by rigid and even disproportionately militaristic attitudes and actions. Such policing is also characterized by, among other things, the implementation of police duties, especially law enforcement, which is authoritarian, rigid, tough and insensitive to the needs of the public to feel safe.

On the other hand, the implementation of daily police duties prioritizes law enforcement, primarily to deal with criminal acts. Based on TAP MPR Number II/MPR/1993 concerning GBHN relating to the Independent Community Security and Order System, the Police are burdened with the task of carrying out Kamtibmas development which is played by Babinkamtibmas as the forefront. Such an approach positions the community as if they were only objects and the police as a "all-more" subject so that figures are able to handle and resolve all Kamtibmas problems faced by the community.

In line with the shift in human civilization, universally, especially in developed countries, people tend to be increasingly "saturated" with the ways of government institutions that are bureaucratic, official, formal/rigid, general/uniform and others in providing public services. There is a tendency that people prefer personal approaches and emphasize problem solving rather than just fixating on rigid legal formalities. In the field of law enforcement, especially those involving disputes between citizens, settlements using informal mechanisms are seen as more effective than processes in the formal criminal justice system which often do not provide a significant role for victims in making decisions to resolve their problems. From the paradigm shift in the role of community policing community policing officers, it is hoped that the role of the police can encourage the resolution of disputes

between communities through informal or adat bapeace mechanisms. Because the goal of criminal or criminal settlements in the end is to create peace, order and justice in society. If these things can be achieved by itself the purpose of punishment is achieved.

Another example is when there was a fight between two tribes that resulted in the death of the victim, where according to information obtained in the field it started from the harassment of someone who was drunk on the victim. However, the victim did not want to give money to the perpetrator, resulting in an argument and a fight that ended in the loss of the victim's life. The victim's family asked to find the perpetrator who had fled to be processed according to criminal law, but on the other hand they were also asked to be processed according to customary law, so as to avoid lives are paid for with lives, which can disrupt the stability of community security.

In the demands of the victim's family from one of these tribes asked the tribal leader who killed his family, resulting in intercultural communication to find solutions and ways out of this incident. From the meeting through mediation that was held, it was agreed that the perpetrators should be found from their escape, and as a result the perpetrators were picked up to be processed according to criminal law, and applicable customary law.

In this example, there was a process of cultural communication of the adat bapeace carried out by the two respected tribal leaders in the area through deliberation as a way of mediation, in which community leaders and religious leaders were also involved together with the National Police as the government representative who handles security in the community.

### Settlement of Criminal Cases Through Criminal Mediation on the Banjar Indigenous People

Adat bapeace is a form of dispute resolution that is commonly practiced by the Banjar

people. Adat bapeace is meaningful as the result of a process of deliberation or deliberation in joint discussions with the intention of reaching a decision as a solution to a problem. 17 BaPema decisions produced through deliberation mechanisms are alternative efforts in finding solutions to solve problems that occur in society. The Banjar people tend to resolve disputes through adat adat. Adat bapeace is recognized as effective in resolving disputes or disputes. At the same time, to get rid of feelings of resentment, Adat badamai is a term for settling disputes, both civil and criminal. Adat bapeace in the settlement of criminal disputes is also known as *Baparbaik* and *Bapatut*. 18 According to Ahmad Bahruni's research results from traffic accident data that occurred in Banjarmasin during 1995-2000 there were 43 (forty three) traffic accident cases. A total of 25 (twenty five) traffic cases were resolved amicably. Settlement initiatives were taken from the perpetrators or their families in 17 (seventeen) cases, initiatives were taken by the victims or their families in 5 (five) cases, and initiatives were taken by the police and the victims' families in 3 (three) cases. 19 Through peace negotiations then reached an agreement in general can be divided into three, namely: 20 a. Victims received assistance for treatment or medical expenses, found in 15 (fifteen) cases. 21 b. The victim died.

### Steps in the Process of Communication of the Culture of Customary Law of Badamai.

According to Law Number 30 of 1999 concerning Arbitration and Alternative Dispute Resolution, mediation is a continuation of negotiations and is carried out if the negotiation process has failed, and is specifically regulated in the realm of private law. As stipulated in Article 6 paragraph (2) of Law No. 30 of 1999 states "Disputes or differences of opinion through alternative dispute resolution are resolved in direct meetings (negotiations) by the parties within a maximum period of 14 (fourteen) days and

the results are set forth in a written agreement.” Furthermore, in paragraph (3) it is clearly stated, “In the event that a dispute or difference of opinion as referred to in paragraph (2) cannot be resolved, then by written agreement of the parties, the dispute or difference of opinion is resolved through the assistance of one or more expert advisors or a mediator. ”. The success rate of mediation carried out by village officials is very high, this is evident in the success of mediation carried out in Banjar Regency and Barito Kuala Regency. The mediation process is carried out in a family manner, paying attention to the interests of both parties, considering aspects of long-term relationships between community members, this is because the parties are residents of the same village.

So that the agreement that is taken is beneficial for both parties, the relationship between the people is maintained. The role of the Village Head is very important in resolving disputes in village communities. Strengthening the role of the village head in resolving disputes in the village is strengthened by Article 26 paragraph (4) letter k of Law Number 6 of 2014 concerning Villages which confirms that the village head is obliged to resolve community disputes in the village. The function of the village head as a mediating party is in line with the provisions of Article 3 of the Law of Sultan Adam of 1835. Article 3. Every village I tell them to pay attention to their subordinates by reaching a consensus, *astamiyah* again between relatives so that they don't talk and argue. The article reflects the existence of peaceful methods that must be taken if a problem arises in society. The pattern applied is to prioritize the aspect of deliberation for consensus between the community. The obligation of the village head to resolve community disputes as stipulated in Article 26 paragraph (4) letter k of Law Number 6 of 2014 concerning Villages embodies an attitude as a just leader, by referring to a

concept of harmony between peace and order so that peace will be achieved in society. The village head as a mediator creates peace when in the mediation process he maintains the harmony of the pattern of community interaction at every stage of the community dispute resolution process in the village. The village head appears as a judge of peace for the community who is neutral in facilitating the parties to reach an agreement. Paying attention to the characteristics of disputes that are resolved in the customary way through mediation, the mediation that has been carried out is based on interests. Mediation is carried out by the village head using the settlement mediation model. Settlement mediation is a compromise mediation whose purpose is to encourage a compromise from the demands of the two conflicting parties. This mediation model requires a high-status type of mediator even if they are not very skilled in mediation processes and techniques.

If we examine the elements in the settlement mediation model applied by the village head in the mediation, they are very relevant, namely:

1. Adat *bapeace* is intended to allow communication to bring differences closer and find agreement
2. The mediator (village head) focuses only on the main issues, namely the problems faced by its residents
3. The village head is a figure in the village who acts as a mediator, carrying out this task only based on experience and has never received special training regarding mediation techniques.

The implementation of peace by way of mediation by the village head is directed at the substance of the interests of the parties, based on aspects of joint resolution of a problem starting from the elements of interest for both parties, resolving the root of the problem, avoiding prolonged conflicts between the parties, and the desire to have good relations long-term. These factors have

been well applied by the village head in mediation.

By emphasizing the aspect of interest, the various interests of the disputing parties can be maximally accommodated. This will affect the level of satisfaction of the parties in achieving win-win solutions that are decided voluntarily by both parties. Empowerment of the settlement mediation pattern with an emphasis on current interest-based in resolving disputes is something that can have a beneficial impact on both parties. The dispute resolution mechanism through mediation outside the court is a form of dispute resolution by reducing state interference (state justice), this dispute resolution prioritizes cooperative ways of the parties prioritizing land dispute settlement with the principle of a win-win solution.

Customary customary law cultural communication as a concrete step that is carried out through elder/respected figures such as religious leaders, traditional leaders, and community leaders, as well as academics, who are part of mediating those who are in dispute to be resolved by deliberation and agree in agreement.

To maintain this harmony in South Kalimantan, an institution was formed which acts as a communication forum for these figures called the Ethnic Communication Association, abbreviated as IKASBA South Kalimantan, which is the only one in Indonesia.

The South Kalimantan Ikasba is a synergy of ethnic groups living in South Kalimantan. According to Masrani, one of the Ikasba administrators, the existence of the Ikasba is a bridge and mediation if there are disputes between ethnic groups in South Kalimantan. exists in South Kalimantan as a cultural heritage of the Banjar people which was sparked by Sultan Adam in the Banjar sultanate under the name of the Sultan Adam Law (UUSA), as a spirit in resolving disputes on Banjar lands as stated in Article 21 of the

UUSA.

Cultural communication in adat law can be carried out through the Ikasba institution of South Kalimantan, which is an element of the ethnic leaders in South Kalimantan, and religious leaders and academics are also involved, so that the content of cultural communication in the steps of the adat law communication process can be comply with the provisions and regulations that apply in Indonesia.

Besides that, other institutions in South Kalimantan are other forums such as the National Mixing Forum (FPK), which was formed by the government, whose duties and functions are to strengthen the nation's cultural values in South Kalimantan, so that cultural communication synergizes with the traditional culture of the people of Aceh. Alone. Besides that, there is also the Community Early Warning Forum (FKDM), which was formed by the government, which, if you look at the management elements, also consists of Traditional Leaders, Religious Leaders, Community Leaders, Youth Leaders, Press, Academics, who have their duties and roles in anticipating potential vulnerabilities. social conflict, as a preventive action with the motto Quick Gathering - Quick Report as part of Early Detection, because preventing social conflict before it occurs is better than dealing with it when the conflict occurs itself. The two forums were formed in all districts/cities and even sub-districts/and villages, especially the FKDM itself.

The existence of these institutions is a strategic step in anticipating and overcoming problems in South Kalimantan, including resolving disputes from those who are in dispute themselves. Usually, these three institutions always go to the field to gather information and data which will become material for study to provide recommendations to the government, so that any problems can be taken as soon as possible to take preventive measures, and other

actions. If then the problem enters the realm of positive law, a customary law approach is also carried out, the aim of which is peace/ishlah towards the common good in goodness.

The cultural communication approach to Badunia's customary law is carried out using an intercultural communication approach, an interactional communication approach, and a multi-way communication approach, where the three communication approaches will be in line with the Badamai customs that apply in South Kalimantan.

received compensation in the form of money for condolences from the crashing party, found in 6 (six) cases.22 c. Victims received assistance with vehicle repair costs and maintenance costs, in 4 (four) cases.

Analysis of the Development of Indigenous Badunia.

In the indigenous Banjar community, there are several terminologies for criminal cases such as cases of traffic decency violations and acts of violence, better known as Badamai, Baparbaik (babaikan) mamatut , baakuran and so on. As for civil cases, the terms basuluh or ishlah are used .

Adat Bapeace is carried out in order to avoid disputes that could endanger the social order. The Bapeace decision that is produced through a deliberation mechanism is an alternative effort in society. In the Banjar community, if there are disputes between residents or acts of persecution or violations of (traditional) norms or there are fights or traffic violations, the community members tend to settle peacefully. This bapeace custom is recognized as effective in resolving disputes or disputes. As well as being able to get rid of feelings of resentment.

If there is a conflict or dispute between the residents and the customary rituals are not carried out, it is believed that it will damage the harmony order which is a violation of traditional wisdom. If conflicts occur especially those related to criminal incidents,

community leaders (tetuhakampung) take the initiative to reconcile the disputing parties. Family meetings (deliberations) are sought, followed by congratulations with apologies and sometimes accompanied by agreements not to prolong disputes and hostilities. even between the two parties bound in a brotherhood which is commonly referred to as baangkat dangsanak (brotherhood) or baangkat kuitan (being parents and adopted children).

The distinctive feature that distinguishes Adat Badamai from peaceful settlements in other communities is the existence of values or norms that must be obeyed, the existence of accompanying ceremonies as a symbol of resolving disputes or disputes, the event of maangkat dangsanak or maangkat kuitan (brotherhood) which is full of elements religious rituals such as the batapung bargain ceremony (a peace ceremony marked by the symbol of sprinkling likat baboreh oil (coconut oil mixed with fragrance) on the heads of the parties as a symbol of brotherhood), complete with a dish of sticky rice and grated coconut mixed with palm sugar.

The role of Adat Badamai in the form of settlement of disputes over criminal cases is so important, it is not accompanied by a legal basis that regulates or recognizes the existence of adat Badamai in the regional regulations of the province of South Kalimantan. Its existence is only regulated in general in the 1945 Constitution. Laws that recognize the existence of indigenous peoples such as the basic agrarian law, the forestry law and so on.

Taking into account customary law as a form of dispute resolution that lives in society (customary law), its position in the future is quite prospective and still exists, considering several things:

1. Constitutionally received recognition from the 45 Constitution Article 18 B (2).

2. There are statutory regulations that are still ambiguous, for example Law no. 5 of 1966 concerning Basic Agrarian Provisions, that the applicable agrarian law is customary law. Law no. 41 of 1999 concerning Forestry.
3. Academically, many Law Colleges have developed non-positivistic legal studies such as "Law and Society" and Legal Anthropology which explores the study of Folk Law and legal pluralism.
4. The development of post-reform regional autonomy which began with the enactment of Law no. 22 of 1999 concerning Regional Government which has now been replaced by Law no. 32 of 2004 has opened up opportunities for the widest possible autonomy, giving fresh air to the development of local laws, although in some cases there is a tendency to regulate law through regional regulations as a form of formalization of applicable customary law.
5. The emergence of the indigenous peoples movement began with the convening of the Indigenous Peoples Congress of the Archipelago on 15-22 March 1999 by declaring March 17 as Indigenous Peoples Awakening Day and the formation of the Indigenous Peoples Alliance of the Archipelago (AMAN).
6. There is a political statement that promises to prepare legal instruments. Legislation that will specifically regulate the existence and recognition of indigenous peoples, such as President Soesilo Bambang Yudhoyono's statement on the commemoration of the International Day of World Indigenous Peoples on 9 August 2006.
7. Finally, the issue of the position of customary law was discussed at the Seminar on Legal Pluralism and its Challenges for the Formation of a National Legal System which was organized by the National Legal Development Agency of the Indonesian Ministry of Law and Human Rights in Makassar, 1-2 May 2007. The issue discussed was that the issue of legal pluralism would be shifted to the realm of politics, at least to the politics of national law. Besides that, there has been a change in the paradigm of law enforcement officials, especially starting from significant changes made by the Indonesian National Police.

Adat bapeace is a form of dispute resolution that is commonly practiced by the Banjar people. Adat bapeace also means the result of a process of deliberation or deliberation in joint discussions with the intention of reaching a decision as a solution to a problem. Adat bapeace are values that live in society. Customary values are considered important as part of a culture that from time to time experiences ups and downs.

Especially when dealing with change and modernization. Adat bapeace describes eastern culture that is familiar with the values or views of society which is characterized by mechanical solidarity, in conditions like these adat adat is functional and very appropriate as a solutive mechanism in resolving various problems in society. When society changes according to the changes and modernization that has occurred, the position of adat bapeace still has a place in the civil aspect, namely when it is in a space and social order characterized by organic solidarity, which relies more on dispute resolution mechanisms using a litigation approach. However, in the criminal aspect, it seems that the customary law approach cannot function, except for rural communities who are still familiar with mechanical solidarity. In the future, the

position of adat adat is quite prospective and is still being maintained by the community, although it still needs to receive support from the community itself to fight for and perhaps strive for the preservation of adat adat values as a living law in society.

#### **4. Conclusion (Times New Roman, 12pt, Bold, align Left, Hanging 0.5cm)**

Conflict resolution between perpetrators of criminal acts and victims of criminal acts in indigenous peoples in Indonesia, as found in the indigenous Banjar community, shows a similar form, namely the existence of peace efforts and ending conflicts by involving third parties which is a form of criminal mediation approach known as Traditional village or tribal moots. Settlement of customary law through peace efforts can be the basis for modern mediation programs, including for criminal mediation which can be set forth in

statutory regulations.

The Bapeace Customary Law Process can provide us with a legal culture by carrying out cultural communication, with interpersonal and interactional communication approaches, as well as a multi-way communication approach, so that conflict or dispute resolution can be carried out through mediation from traditional leaders, religious leaders and community leaders together with security forces as representatives of the government.

The Adat Badamai community of Banjar, South Kalimantan, has cultural values that are very important to be maintained and preserved. The Bapeace tradition teaches us that in living a social life, if there is a dispute, it is as much as possible to resolve it in a family way, by deliberation for consensus and asking for papadah (advice) from wise people. Apart from that, maintaining harmony through Adat Badamai can also be done with the culture of raising dangsanak to expand a sense of solidarity (kinship).

## REGENERATION AND REMANUFACTURING IN EMAS REPORTS

**Abstract:** *Regeneration and remanufacturing are two of circular economy strategies. The aim of the study is to compare the degree of communication of activities that are part of the regeneration and remanufacturing strategies based on the reports of organizations operating in Poland and which are registered in the EMAS register. The analysis included the latest reports from 20 companies. The analysis was carried out in terms of the presence of keywords and activities related to regeneration and remanufacturing. An analysis showed that regeneration is a strategy better communicated in EMAS statements than remanufacturing. In this study, there were limitations connected with the type of organizations.*

**Keywords:** *circular economy, regeneration, remanufacturing, circular business models, EMAS*

### 1. Introduction

Circular economy (CE) is an economic system that displaced the “end of life” concept for reducing, reusing, recycling, and recovery of materials. CE can be realized at all economic levels: micro, macro, and meso. One of CE aims is to achieve the assumption of sustainability (Kirchherr et al., 2017). This is only one definition of CE. According to Kulczycka and Pędziwiatr (2019) in literature, there are more than 200 definitions of this term. Some of these definitions concentrate on the regenerative approach e.g., Geissdoerfer et al. (2017), Suárez-Eiroa et al. (2019).

The regenerative approach is one of the principles in circular business models such as ReSOLVE and 10R (Morseletto, 2020; Nobre & Tavares, 2020). The first model presents six CE-based strategies: regeneration, share, optimize, loop, virtualize, and exchange (Dev et al., 2020). The second model is made of 10 strategies which are divided in three groups and are arranged in terms of circularity. The most circular strategies, according to 10R

model, are connected to smarter use and production of products. This group included: refuse, rethink, and reduce strategies. In the middle, there are actions aimed to extend the life cycle of products and their components, such as: reuse, repair, refurbish, remanufacture and repurpose. The last group of circular strategies includes recycling and recovery. These two are connected with useful applications of materials (Potting et al., 2017).

In both of these models, there are strategies connected with the word “regeneration”. Regeneration in ReSOLVE model is based on environmental renewal, which is connected with, e.g., the health of ecosystems returning of resources to the biosphere, so it can be reborn. In this model also is mentioned remanufacturing but under a different strategy - looping (Ellen MacArthur Foundation & McKinsey Center for Business and Environment, 2015). In 10R model, there is only remanufacturing strategy, but there are also strategies in which activities are connected with regeneration. In Polish, both of these strategies are translated as

---

“regeneracja”.

The implementation of activities related to the circular economy concept is possible with using the tools e.g., environmental management systems (EMS). EMS helps organizations achieve goals of reducing environmental externalities like CO2 emissions, water use or environmental pollution (Jain et al., 2020). There are two the most common EMS to implement in organizations: a system compliant with the requirements of ISO 14001:2015 standard and Ecomanagement and Audit Scheme (EMAS) (Erauskin-Tolosa et al., 2020). According to Martins & Fonseca (2018) EMAS include all elements of ISO 14001 but has added items like an environmental statement. In EMAS there is higher control of environmental performance. Organizations have to prepare environmental statements which are validated (Ociepa-Kubicka et al., 2021). According to Kryk (2017) environmental reporting is one of the tools to communicate activities connected with groups of stakeholders. In those statements are included, e.g., organizations ecological results.

Environmental reporting is an element of both EMAS system and EMS complaint with the requirements of ISO 14001. The EMAS regulation is about stricter requirements connected with external reporting. Organizations that have decided to join to EMAS register have to prepare environmental statements, update them per year, and make them available to all stakeholders (UE, 2009). That is why in this study, authors focused on the analysis of EMAS reports in terms of communicating activities related to the concept of the circular economy in them, which fit into the strategies of regeneration and remanufacturing. Moreover, according to Matuszak-Flejszman and Paliwoda (2022) EMAS system is one of the main instruments that can help organizations with transition from a linear to a circular economy.

## **2. Regeneration and Remanufacturing in Circular Economy – Literature Review**

According to Scopus Data Base, there are more or less 300 publications connecting remanufacturing with the circular economy (research in keywords and title for remanufacturing/remanufacture and title, abstract, and keywords for circular economy). In the same research fields, there were almost 140 publications which were including regeneration with the circular economy. According to this, remanufacturing is presented better than regeneration. Table 1. contains a review of publications which are presenting regeneration and remanufacturing through circular economy concept. In this table, there are also presented subjects of these articles and examples.

In these articles, there were no publications that presented regeneration or remanufacturing as a part of EMAS statements. None of these articles were connected with the level of communication actions connected with these two strategies.

According to 4 databases (Scopus, Science Direct, Web of Science, and EBSCO) there are only a few articles that connects EMAS with the circular economy. Only 4 of them analyze EMAS statements in terms of CE: Szafraniec (2018), Barón et al. (2020), Barón Dorado et al. (2022), Janik and Szafraniec (2019). In their research, Baron et al. (2020) focus on the analysis of EMAS environmental declarations in terms of identifying CE practices that organizations in Spain have implemented and quantifying them. The study identified 23 CE practices, which indicate that organizations are primarily focused on minimizing emissions by optimizing material cycles and improving production processes. Also, eco-projects have become an important element of the circular economy concept. Barón Dorado et al. (2022) focused on the analysis of EMAS reports in

order to determine the usefulness of this system to measure the level of implementation of activities in the field of the circular economy concept. The research results showed that the information contained in the reports is not sufficiently comprehensive or quantified, therefore EMAS statements are not a relevant tool for

measuring progress in the transition to a circular economy model. The last study presents an analysis of EMAS environmental statements in terms of indicating which CE-related information is already collected and reported. Information that could be presented in reports as part of monitoring the progress of the circular economy was also indicated.

**Table 1.** Examples of researches connected with regeneration and remanufacturing

General subject	Detailed subject	Examples
Regeneration in circular economy	Regeneration in adsorption process	Ghanim et al. (2020), Kandel et al. (2022)
	Removing harmful substances	Qie et al. (2019), Villarim et al. (2022)
	Regeneration in cities	Giorgi et al. (2020), Balletto et al. (2022)
	Regeneration of materials: production of biomaterials and raw materials from waste	Dobrotă and Dobrotă (2018), Melotti et al. (2021)
	Regeneration as possibility to improve life quality in cities	Nesticò et al. (2022), Ricci (2022)
	Energy recovery	Asiain – Mira et al. (2022)
Remanufacturing in circular economy	Remanufacturing with Industry 4.0 and automatization	Okorie et al. (2021), Mangold et al. (2023)
	Remanufacturing in supply chains	Dominguez et al. (2021), Zhou et al. (2022)
	Consumers perception of remanufactured products	Milios & Matsumoto (2019), Kabel et al. (2021)
	Barriers and benefits of remanufacturing	Matsumoto et al. (2021), Zhuang et al. (2023)
	Impact of remanufacturing process on the environment	Pamminger et al. (2021), Kanazawa et al. (2022)
	Achieving circularity through CE strategies e.g. remanufacturing	Yang et al. (2022), Schulz-Möninghoff et al. (2023)
	Critical success and ecological efficiency factors for remanufacturing	Jiang et al. (2019), Singhal et al. (2020), Khan et al. (2022)
	Methods and design for remanufacturing	Kimita et al. (2021), Handawi et al. (2021)

### 3. Activities connected with regeneration and remanufacturing

The regeneration strategy, according to

ReSOLVE model, concentrates on the increasing use of renewable energy sources and improving ecosystems (Kouhizadeh et al., 2020; Mastos et al., 2021). Moreover, it determines to use renewable materials and establish a recycling energy system or

mechanism (Tu et al., 2020). According to Jastrzębska (2017) good practices related to regeneration include activities e.g., energy-efficient construction, energy recovery, and industrial symbiosis. In this model, there is also a strategy connected with remanufacturing – looping.

Model 10 R defines remanufacturing as using parts of products that are discarded in new products having the same function (Potting et al., 2017). According to Reike et al. (2018) remanufacturing is not only a repairing. In remanufacturing, products are reborn. In this process, products and their components are restored to a condition comparable to the new products. Remanufacturing is an opportunity to recover the residual value of used products through the reuse, renewal, and replacement of components. Taking these actions is aimed at bringing the product to a new state, and such a product is offered to consumers (Hazen et al., 2017). According to Morioka et al. (2005) a better option than traditional substitution and recycling is to extend the life cycle of products by remanufacturing. In remanufacturing, there is no need to use original materials and energy and the costs incurred in connection with them. It is an industrial process that allows you to restore used products to a usable state. It covers activities related to deletion, sorting, inspection, or reassembly. Remanufacturing helps to keep products in circulation and store them for a long time (Khan et al., 2022). This strategy contributes to reducing waste and resource use (Liu et al., 2019; M. Zhang et al., 2022). According to Fofou et al. (2021) not all products can be remanufactured. Some researchers concentrate on remanufacturing of engines e.g., Li et al. (2022). According to Barón Dorado (2022), CE practices that are included in remanufacturing are: remanufacturing products and easy separation of components.

In summary, the list of practices that are included in both strategies was prepared:

- a) Regeneration:
  - using renewable materials,
  - using renewable sources of energy,
  - recovery of energy,
  - energy-efficient constructions,
  - industrial symbiosis.
- b) Remanufacturing:
  - remanufactured products,
  - easy separation of components,
  - reuse, renewal, and replacement of components.

Those elements will be used in this study.

## **4. Methodology**

The study aims to compare the degree of communication of activities that are part of the regeneration and remanufacturing strategies based on the reports of organizations operating in Poland and registered in the EMAS register. In this study, the environmental declarations of organizations included in the EMAS register were reviewed. According to the register, there are 70 organizations entered into the EMAS in Poland. In the first stage of this study, organizations that had been suspended from the register were rejected (2 reports). One EMAS report was not identified in the register or on the organization's website. Therefore, 67 reports were included in further analysis. The next stage was connected with checking the publication date of the declaration. Only reports that were published in 2022 were taken into account in the research. So the reports that spanned several years were rejected (3 reports), but also reports that were not submitted in 2022 (13). Finally, 51 organizations were qualified for the selection of the research sample. From that sample, there were 20 reports selected randomly to analyze. All reports were in the Polish language. Figure 1 presents the characteristics of the examined organizations in terms of their activity profile.

## Organization business profile

**Figure 1.** Organization business profile

According to figure 1. in this research, 70% of organizations were service-oriented. Only 25% of organizations were connected with the production. And 5% of researched organizations were both involved in production and services.

All statements have been fully read. Two analyses of reports were carried out. In the first step, keywords were searched while reading the statements. Because of the Polish language in all analyzed reports, searching for keywords was in this language. In Polish, there is only one word for both of those terms called „regeneracja“. There were also used variants of this word like: „regenerować“ and „regenerowany“. The second analysis concerned a more detailed analysis of the reports and was related to finding activities that fit into the regeneration and remanufacturing strategies in accordance with the business models of the circular economy concept and literature review. Based on the literature review, it was found that regeneration has 5 components (using renewable materials, using renewable sources of energy, recovery of energy, energy-efficient constructions, industrial symbiosis), while remanufacturing has 3 (remanufactured products, easy separation of components, reuse, renewal, and replacement of components). All the analyzed reports were read, and then, based on the descriptions

contained in the reports, attempts were made to determine and track whether the content communicated in them could concern the components of both strategies.

The level of communication was calculated as the sum of the number of reports in which indicators determined on the basis of the literature review were reported.

## 5. Conclusion

In the first stage of this research, the keywords: „regeneracja“, „regenerować“ and „regenerowany“, have been searched to check if any organization communicates actions under the slogan of regeneration or remanufacturing. Only 2 reports include this word, but it was only mentioned. In the first statement keyword was mentioned not so much in terms of the organization itself as its shareholder. But it was connected with the regeneration of oils. And because oils are products, it refers to remanufacturing. In the second statement, organization presents that they transfer oils to organizations that also remanufacture them.

### 5.1. Regeneration in EMAS reports

In this part of the analysis, we were checking the level of communication activities that are including in regeneration according to

ReSOLVE model and literature review. The result of this analysis is presented in figure 2.

### Regeneration

Figure 2. Regeneration in EMAS reports

According to figure 2 there is one activity connected with regeneration that is the most popular among reports – energy-efficient constructions (55% of declarations). The second most reported activity was using renewable sources of energy, which was mentioned in 45% of statements. The other three were presented in the following order: recovery of energy (30%), using renewable materials (20%), and none of the statements presented industrial symbiosis.

#### 5.2. Remanufacturing in EMAS reports

In this part of the research, the level of communication activities that are including in remanufacturing was checked. Only in 2 (10%) statements there were information about remanufacturing of oils. But it was not related to the activities of the organization that the statements concerned. Remanufacturing of oils was carried out by external organizations.

### 6. A Discussion Section

This research focused on two CE strategies and the level of their communication in EMAS reports. According to this study in EMAS statements were included mostly activities connected with regeneration strategy. The remanufacturing strategy was

presented, but it was on a low level of communication (10%). However, remanufacturing was not strictly related to the activities of this organization. The low communication level of remanufacturing strategy is also presented in Barón et al. (2020) and Barón Dorado et al. (2022) studies.

Definitely regeneration strategy is presented in EMAS reports better than remanufacturing strategy. This is confirmed by research conducted by Barón et al. (2020), Barón Dorado et al. (2022). In those publications using of renewable sources of energy is reported accordingly: about 32% and 38,5% of EMAS statements. In this study, in 45% of statements, this activity was reported. The level of communication regarding using renewable sources of energy is similar.

In EMAS statements of organizations operating in Poland, using of renewable materials was mentioned only in 20%. A similar level is presented in Barón Dorado et al. (2022) - 22,1% of reports. In this study, also was mentioned that remanufacturing of products was presented only in 3% of EMAS statements. In this study level of presentation of this category was only 10%. These results also can be compared. In the EMAS statements of organizations operating in Poland, there were activities connected with energy-efficient construction which allowed

to improve energy efficiency and saving. This category was presented in 55% of EMAS statements. According to Laskurain et al. (2017) as EMAS system includes indicators connected with energy efficiency. This might be the reason for the highest level of communication of this activity in EMAS statements.

This study had some limitations. Remanufacturing is connected with products but in material form. That is why organizations can separate some components or offer remanufactured products. In this research, 70 % of organizations were concentrated on services and administration. There is no possibility of remanufacturing services. But organizations that provide services definitely use some equipment and devices. In some of EMAS statements, it was mentioned that organizations repair their machines or devices. But there was no information about remanufacturing devices or machines or their parts. In the theory section, there was mentioned that not all products could be remanufactured. This is the second limitation connected with this study.

## 7. Conclusion

Regeneration and remanufacturing are two CE strategies that, in translation to the Polish language, mean the same. But they are connected with different activities. The first one is more concentrated on the environment reborn, and the second one is connected with products. There is a possibility to research circular economy activities in environmental reports. EMAS reports have stricter requirements than other environmental reports. This was the main reason to choose them as materials for this study.

This research showed that there is a different level of communication actions connected with regeneration and remanufacturing strategy. Only a few researched organizations include remanufacturing in their EMAS statements. This can be connected with organization profiles which were connected mostly with services. On the other hand, the regeneration strategy was better described in EMAS statements. But not as much as in other results of research.

## A REVIEW OF SUSTAINABLE DEVELOPMENT OF ADDITIVE MANUFACTURING IN THE CONDITIONS OF DIGITAL AND GREEN TRANSITION

**Abstract:** Additive Manufacturing (AM) declared is as 3D printing and represents a revolutionary technology in developing and applying the fourth industrial revolution (Industry 4.0). Models, rapid prototypes, components, and parts for final use realized are with 3D printing significantly cheaper than with classical technologies. The paper's main goal is to point out the sustainable development of three-dimensional 3D printing technology in the efficient implementation of Industry 4.0 in the conditions of the green and digital transition. Due to the possibility of successfully realizing every desired object, 3D printing has applications in almost all areas from industry, construction, architecture, automotive, aviation, and household according to medical applications. Additive Manufacturing 3D printing technologies analyzed and classified are according to the type of process, purpose, production equipment, energy, materials, and other factors influencing sustainable development. Green plans and digital transformation implemented have been at full capacity in these innovative 3D technologies.

**Keywords:** Sustainable development, Additive Manufacturing, 3D printing, Industry 4.0, Digital and Green transition

### 1. Introduction

Additive Manufacturing (AM), 3D printing defined by the American Society for Testing and Materials (ASTM) Committee F42 for all additive manufacturing technologies (ASTM F2792-12a 2014). Additive production or 3D printing also declared as Rapid Prototyping is an advanced sophisticated production technology in which the final object made is by adding material, layer by layer. Today, 3D technology can print almost anything we want, which in the first phase we turn into a three-dimensional geometric object, expressed in a computer-aided CAD program (such as CATIA, SolidWorks, Autodesk Inventor or many others), and in the second

phase is exported to STL file or G-code. In the next step, the STL add-on entered into the Slicer software to handle all relevant printing settings such as material selection, production time, temperature, speed and selection of support structures, and more following printer setup and finally commissioning, which is a universal input for all types of 3D printers (Alammar et al., 2022; Salmi 2022). 3D printing is very cost-effective for the production of the most complex geometric models/products that realized can very quickly in various variations according to the digital display. Additive manufacturing has the potential to support greater efficiency by

combining with the integration of data and the Internet of Things (IoT) in Industry 4.0 providing greater utility and better environmental conditions for green and digital transition for acceptable manufacturing (Khorasani et al., 2022). 3D printing has a qualitative and quantitative impact on sustainable development and the

life cycle of the principle of multi-purpose optimization by digitalization (Khorasani et al., 2022). According to the standard (ASTM), Committee, F42 AM 3D printing technologies grouped are into seven categories as shown in Table 1 (ASTM F2792-12a 2014; Salmi 2022; Sljivic et al., 2017).

**Table 1.** The main classification of the process of AM 3D printing according to the typical material and field of application, listing some of the world's most famous manufacturers of 3D printers

PROCESS / Known companies	TYPICAL MATERIALS	APPLICATIONS
<b>1. Material Extrusion:</b> Fused Deposition Modeling (FDM); - <i>Stratasys, 3D Systems, RepRap, Prusa i3, Ultimaker, etc.</i>	Polymer (ABS, PP, PC, PPS, PLA, ASA), Composite, Wax, WPC-Wood plastic composite	Prototypes, tools, casting moulds, soft (silicone) functional parts/products, etc.
<b>2. Material Jetting:</b> Multi-jet modelling (MJM) – <i>Object PolyJet, 3D Systems, Project, etc.</i>	Polymer (ABS, PP, Acrylic), Rubber, Wax, etc.	Prototypes, tools, casting moulds, soft, functional parts/products, etc.
<b>3. Binder Jetting:</b> Powder bed and inkjet head, Plaster-based 3D printing; - <i>Zcorp, Voxleljet, etc.</i>	Composite, Gypsum, Ceramic, Sand, Metal, Polymer, etc.	Functional parts/products casting moulds, soft (silicone) tools, etc.
<b>4. Sheet Lamination:</b> Laminated object manufacturing (LOM), Ultrasonic (UAM); - <i>mCor Technologies Iris, Fabrisonic, etc.</i>	Paper, Metal: Steel, Aluminium, Titanium, Cooper, etc.	Prototypes, models, tools, functional parts/products casting moulds, soft, etc.
<b>5. Vat Photopolymerization:</b> Stereolithography (SLA); - <i>Digital Light Processing (DLP), Micro-SLA, (SLA)-Stratasys, etc.</i>	Polymer, Epoxy, ABS, PP, Composite, Gypsum, Ceramic, Wax, etc.	Prototypes, models, casting moulds, soft (silicone) tools, etc.
<b>6. Powder Bed Fusion:</b> Selective Laser Sintering (SLS), Electron beam melting (EBM), Direct metal laser sintering (DMLS); <i>EOSINT, etc.</i>	Metals: Alloy Steel, Steel, Aluminium, Titanium, Ceramic, Polymer, Composite, Rubber etc,	Prototypes, models, casting moulds, functional parts/products, etc.
<b>7. Directed Energy Deposition:</b> Focused thermal energy, - <i>Laser metal (LMD), (LENS), Trumpf...</i>	Metals: Alloy Steel, Steel, Aluminium, Titanium, etc.	Prototypes, models, functional parts/products, etc.

## 2. Applications of AM 3D printing technologies in the activities of the different sectors

This paper discusses and provides an overview of the current state of AM 3D

printing technologies in terms of their efficient application in almost all industrial areas including aerospace, automotive, architecture, medicine, academic applications, and many other new applications within the conditions of sustainable development, and environmental

impact. AM 3D printing technologies very successfully applied are in the rapid production of prototypes, models, and tools, but also in the production of components and parts for final use in individual and serial production (Sljivic et al., 2017; Salmi 2022). The research focuses on the interrelationships between 3D printing, Industry 4.0, sustainability of technology, and environmental impact in relation to energy and resource use, as well as reducing the amount of waste material. Characteristic examples of sustainable development of AM 3D printing analyzed are in activities of different sectors. The application of material extrusion is one of the most prevalent processes in almost all sectors of activity. In

the process of fusion deposition of materials (FDM), filament from a coil of a certain diameter through is extruded a nozzle that follows the cross-section of the object forming the geometry of the body, layer by layer. The nozzle contains resistance heaters that heat and hold the material above its melting point, allowing the material to flow and form layers. Useable are various materials including ABS plastic, polyamides, polycarbonates, polypropylene, metal, composites, and molten wax. A scheme showing the formation of layers using the FDM method show is in Fig.2.1 (a), and Fig. (b) Shows a home 3D printer, with a printed model of a doll's head.

**Figure 2.1** (a) Fusion deposition modeling scheme (FDM): 1-Material, construction filament, 2 -Material, support filament, 3 -Extrusion head, 4 -Drive wheels, 5 -Flow manifolds, 6 - Extrusion nozzles, 7 -Model, fabrication facility, 8 -Support, 9 -Foam base, 10 -Fabrication platform, 11 -Support material coil, 12 -Model material coil, and (b) Image of one home 3D printer, with a printed model of a doll's head during the 3D process.

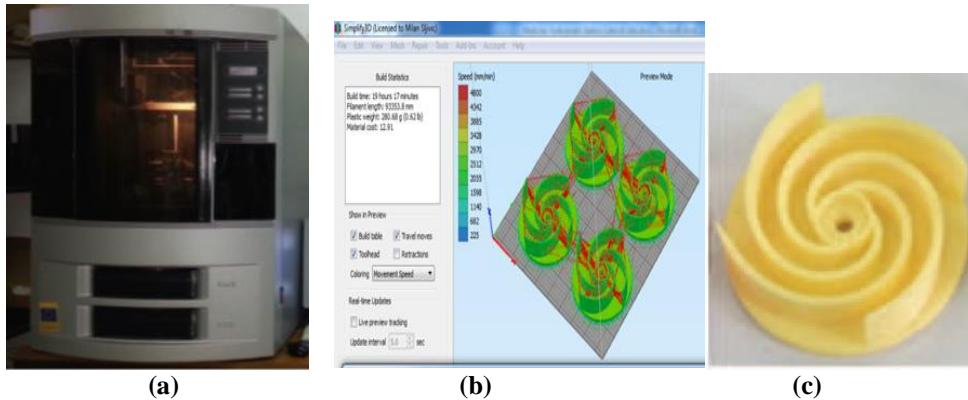

## 2.1. Applications of Material Extrusion - Fusion Deposition Modeling (FDM) technology

A characteristic development of a functional propeller investigated was for a water pump, which printed was on a professional FDM 3D printer Dimension Elite-Stratatis (USA) in the Laboratory of the Faculty of Mechanical Engineering in Banja Luka, shown in Figure

2.2 (a). The propeller printed is from ABS polymer, and post-processing performed has been successfully using the manual method. All the necessary parameters of the printing operation defined are through the Simplify3D software for cutting Fig. 2.2 (b). The functional propeller printed is a life-size in three copies per pass, Figure 2.2 (c) (Sljivic et al., 2017). The direct advantages are the

following: Full flexibility in designing complicated geometric shapes, directness of components from the digital model, shortened

production time, fewer waste materials reduced to the lowest measure, and a green transition achieve.

**Figure 2.2** (a) 3D Printer Dimension Elite-Stratatis (USA) and (b) Defining all operating parameters in Simplify 3D software and (c) Printed propeller (Sljivic et al., 2017)

Development of a complex Model of the Church of Christ the Savior, Banja Luka, successfully done by FDM technology, Fig.2.3 (a) and (b). The Model of the Church scanned was with reverse engineering technology, and then created in the SolidWorks software Fig. 2.3 (a), and Fig. (b) Show the finished printed model of

the Church. The applied technique for making the model of the church used can be successful for 3D printing of models of archaeological monuments, even entire settlements, independent buildings, bridges, museum exhibits, and many other valuable finds and objects.

**Figure 2.3** (a) Model of the Church of Christ the Savior, Banja Luka scanned and processed in SolidWorks and (b) Printed model of the church on a 3D printer Dimension Elite-Stratatis (Sljivic et al., 2017)

There are now professional FDM 3D printers suitable for serial and high-volume production on the market. We present one such from the company UltiMaker S7 with two characteristic printed end-use elements, Fig. 2.4 (a), (b) and (c) (All3DP, 2023). Using the professional 3D printer UltiMaker S7, a very wide range of models,

end-use parts and components for final use printed can be from stainless steel and plastic (All3DP, 2023). This process of 3D printing has the potential to support greater efficiency, cost-effectiveness, and reduced environmental impact on industrial systems and product life cycles compared to traditional production.

**Figure 2.4** (a) Professional 3D printer UltiMaker S7, (b) and (c) End-use parts made with the professional 3D printer UltiMaker (Source: UltiMaker), (All3DP, 2023)

Advanced 3D printers developed have been that use the same working principle as FDM called Fused Filament Fabrication (FFF) and can successfully print metal and ceramics (Sljivic et al., 2022; 3DEO, 2023). Fig.2.5 (a) shows one (FFF) 3D printer

from 3DEO (USA) capable of producing high-quality metal components of small to medium sizes up to 250 mm (3DEO, 2023). Two characteristic case studies of metal 3D printing produced by this company shown are in Figures 2.5 (b) and (c) (3DEO, 2023).

**Figure 2.5** (a) Metal FFF 3D printer from 3DEO (Source: 3DEO), (b) One end-use metal component (source: 3DEO) and (c) One optimized pair of toothed bars (Source: 3DEO)

For this printing, a metal wire developed has been that integrates a suitable metal powder with wax polymers into a wire

thread used in 3D metal extrusion printing. Parts printed in this way require post-processing such as ventilation for washing

and sintering and, if necessary, heat treatment or some other treatment in order to fully transform the printed parts into the final metal part. Despite this post-processing, the process of 3D printing by metal extrusion is far more profitable than traditional technologies because it has an impact on sustainable development as well as favourable conditions for the digital and green transition (Sljivic et al., 2022; 3DEO, 2023).

**2.2. Applications of Binder Jetting Metal 3D printing technology**

Binder Jetting metal 3D printing is a process of printing with metal powder and jet binder of complex geometric shapes of high precision, very fast, and economically viable for prototype and serial production, schematically shown in Figure 2.6 (a)

(Sljivic et al., 2022). The Inkjet-style head used is to apply the liquid binder to a fine layer of metal powder, and other powders (ceramic, sand or composite, etc.). The process continues in layers until the object is completed. Otherwise, the process includes complex powder management, mandatory sintering, and recommended post-treatment, such as surface finishing, heat treatment, etc (ExOne, 2020; Sljivic et al., 2022; Khorasani et al., 2022). ExOne.com is a global leader in the serial production of metal 3D printers using binder injection technology as well as companies: Stratasys, Digital Metal, 3DEO, etc (Sljivic et al., 2022; Khorasani et al., 2022). Typical cases of finished metal components produced by ExOne.com with Binder Jetting 3D printing shown are in Figures 2.6 (b), (c), and (d) (ExOne, 2020).

**Figure 2.6** (a) Schematic representation of the Binder Jetting process of metal 3D printing, (b) Metal filter, (c) Compound metal component and (d) Binding injection moulding by 3D printing of one metal casting tool from ExOne.com (ExOne, 2020)

In the metal industry AM, 3D printing revolutionizes the production process and is a major impetus for sustainable development and advanced applications in Industry 4.0. Metallic materials suitable for 3D printing are stainless steel, tool steel, steel alloys, superalloys, titanium, copper, and aluminium (Sljivic et al., 2022). These materials are mainly made of fine metal powder which is the basis for most 3D printing processes including filament fabrication for some types of 3D metal

printing. 3D metal printing requires state-of-the-art printer solutions that are capable

of producing parts and components for the end-use of complex shapes. The classification of methods of metal additive production processes mainly done is according to the type of energy, the material in the form of a fine powder, wire, or metal paste, and the type of equipment for printing metal. The following four additive manufacturing processes are standard in the production of metal parts for end use: (a)

Metal Additive Manufacturing Extrusion, (b) Direct Energy Deposition, (c) Binder Jetting, and (d) Metal Powder Bed Fusion (Sljivic et al., 2022). The analysis showed that metal 3D systems in the production of metal components achieve mostly more favourable design flexibility, shorter production time, high precision of complex shapes, reduce the amount of waste material and achieve significantly lower production costs compared to traditional processes.

### 2.3. Applications of Large-format Additive Manufacturing 3D printing technology

Developed successful have been Large - format 3D printers for printing for industry, mass production, printing car prototypes, moulds, stencils, museum exhibits as well as end-use parts [Carlos et al., 2023, Schwaar, 2023]. In Fig. 2.7 (a) The mModix Big-180X large-format 3D printer for commercial use with a build volume of 1,800 x 600 x 600 mm presented is (Schwaar., 2023). Creating applications on this Large-format 3D printer is fast and cheaper than conventional technologies, and the production of waste is almost negligible. Recycled materials can used also successfully be for printing.

**Figure 2.7** (a) The Modix Big-180X large-format 3D printer for commercial use with a build volume of 1,800 x 600 x 600 mm (Source: Modix), and (b) and (c) The Exabot large-format 3D printer from Re3D (Source: Re3D). (Schwaar, 2023)

Fig. 2.7 (b) and (c) show The Exabot large-format 3D printer from Re:3D (USA) for a wide range of commercial needs. These printers have a dual extruder with base and soluble support material and can process PLA, ABS, PC, and thermoplastics with a melting point below 350°C (Source: Re3D) (Schwaar, 2023). Large-format 3D printers

have the ability to print the most complex geometric forms of models, prototypes, and parts for large-scale end use accurately and sustainably. The main requirements of the standard on the conditions for digital and green transition for the sustainable development of 3D printing in large formats fully implemented are.

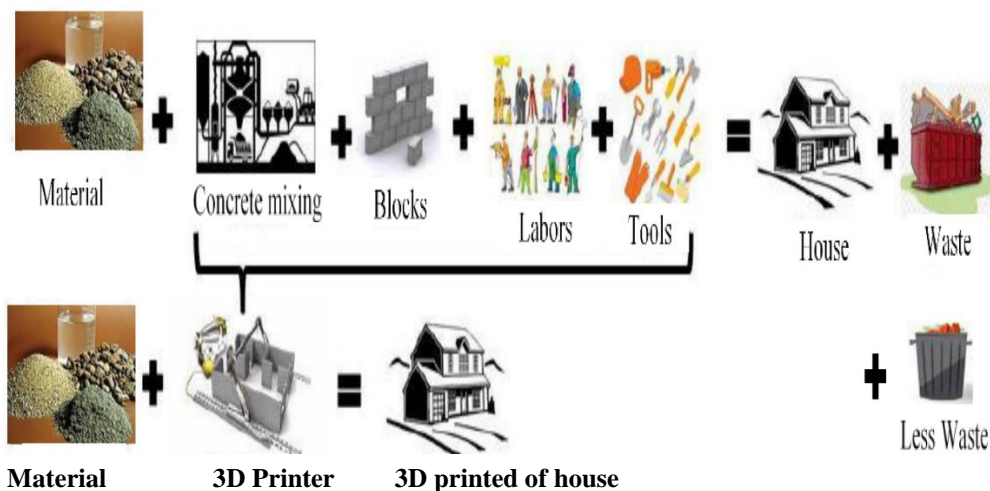

### 2.4. Applications of Additive Manufacturing 3D printing in constructions

The rapid development and implementation of AM 3D printing have initiated extensive research and experimentation for the

application of 3D printing of houses, apartments, and other construction and architectural achievements. The same principle of operation of 3D printers is used as in other 3D model prints that are successfully applied in prototype fabrication, and individual and serial

production. For application in construction, quality cement prepared as a quick-drying mixture is used. Still, there are also various new variants of technology for preparing materials for printing, depending on the company that deals with this 3D printing technology. The paper from the Journal "Sustainability" (Hossain et al., 2020) gives a comparative overview of the classic

construction of a house and a printed house with a 3D printer. Significant advantages of the 3D printing house in terms of efficiency, speed of production, and very little waste (recycled mining waste and converted into usable materials) and the process is both economically and environmentally viable, as shown in Fig. 2.8.

**Figure 2.8.** Comparative overview of a classic built house and a printed house with a 3D printer (Hossain et al., 2020)

The research and use of 3D printing in construction in China have achieved quite good results in this area. Figures 2.9 (a) and

(b) show the 3D printing process, and Fig. 2.9 (c) shows a 3D-printed residential building in China (Cooke, 2016).

**Figure 2.9** (a) and (b) Illustration of the 3D printing process in constructions, and in Fig. (c) One 3D printed residential building (Cooke, 2016)

The first German ready-to-move 3D printing house printed was at the end of July 2021, printed by PERI at the COBOD BOD2 printer in Beckum, North Rhine-Westphalia, as part of the Innovative

Buildings program, shown in Figure 2.10 (a) (PERI AG, 2021). The American company SQ4D from New York, which focused on engineering and building high-quality sustainable houses, printed the first

3D-printed house in the USA for sale, shown in Figure 2.10 (b). The company believes that this 3D technology will soon be able to eliminate more expensive and inferior building materials, making 3D structures even more cost-effective. The use of concrete reduces costs by at least 30%, as well as makes the structure more fire-resistant than traditional methods (Fermin, 2021). The first 3D printed house in Serbia "ProtoDom" premiered in the

Science and Technology Park Cacak, made by two people and one 3D printing machine in just 21 hours and 15 minutes, shown in Fig. 2.10 (c). The manufacturer of the 3D printing house, the company Natura Eco made the house from concrete and performed the necessary tests, which confirmed the safety of being resistant to winds, earthquakes and other disasters (FoNet. 2021).

**Figure 2.10** (a). The first German 3D printing house ready to move in (PERI AG, 2021), (b) The first 3D-printed house for sale in the USA (Fermin, 2021) and (c) The first printing house in Serbia (FoNet. 2021).

From the analysis of additive production of 3D printing in construction, it can be concluded that this process has great potential to accelerate construction, contribute to the strength of structural elements, and significantly reduce waste material, which contributes to better environmental ecology and reduce the number of construction workers and

workers. In order to achieve this, it is necessary to adjust and make a suitable printer in relation to the type and size of the object to be printed. Then the appropriate mixture of materials for 3D printing is very important. Tests have shown that cement-based mortar mixed with appropriate components, which harden quickly, achieved the best results.

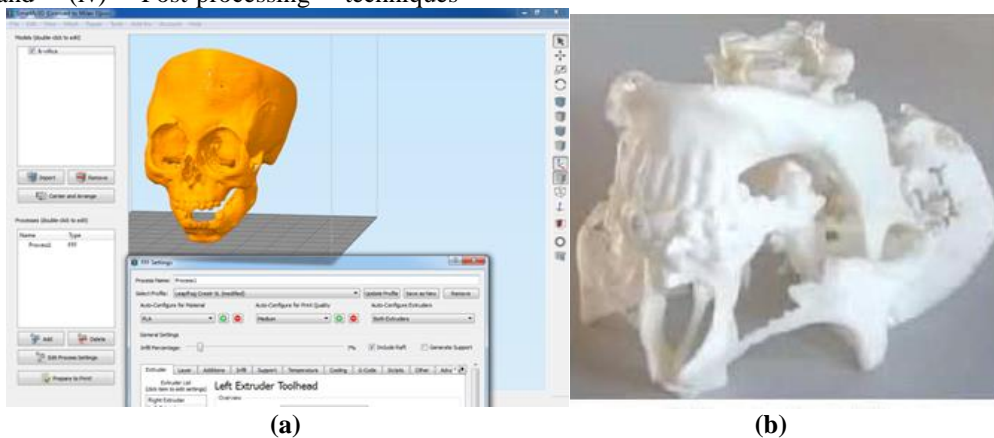

### 2.5. Additive Manufacturing 3D printing and 3D bioprinting for medical applications

Additive technologies of 3D printing and 3D bioprinting in medicine are used for a very large number of applications, namely: creating models for planning a complex surgical intervention; craniofacial implants in the hip, knee and spinal

implants and others; bioprinting of human tissues and organs; prosthetic dentistry; production of various medical tools and other 3D printed and bioprinted procedures (Murphy and Atala, 2014; Mironov et al., 2011). For the successful application of the technique of 3D printing and 3D bioprinting for medical applications, the most important influencing factor is the

choice of the appropriate material. The application of 3D printing and 3D bioprinting is based on 4 basic steps of a 3D printing system: (i) Imaging 3D image of the object by computed tomography (CT) or magnetic resonance imaging (MRI), with digital (DICOM) medical file format, (ii) Image processing, including segmentation and surface modelling steps, (iii) Production with a 3D printer or 3D bioprint, and (iv) Post-processing techniques

(Murphy and Atala, 2014; Mironov et al., 2011; Sljivic et al., 2017). Figure 2.11 (a) and (b) show an example of 3D printing of the skeleton of the head of an anonymous patient according to the above procedure for the preparation of surgery performed at the University Clinical Center Banja Luka in cooperation with the Mechanical Faculty of Banja Luka (Sljivic et al., 2017).

**Figure 2.11 (a).** Head jaws presented in SolidWorks, conversion of STL jaw format to CatalystEx for printing on Dimension Elite 3D printer (Banja Luka Faculty of Mechanical Engineering and **(b)** Printed head jaws for medical intervention preparation in UCC - Banja Luka (Sljivic et al., 2017)

Fig. 2.12. (a) shows one Inkjet 3D bioprinter from the Laboratory "3D Bioprinting Solution" Printer – Moscow (Mironov et al., 2011).

Fig. 2.12. (b) Bioprinting for testing drugs and vaccines and (c) Bioprinting for human skin (Murphy and Atala, 2014; Mironov et al., 2011)

**Figure 2.12 (a).** Photograph of Inkjet 3D bioprinting from the Laboratory “3D Bioprinting solutions” Printer - Moscow (Mironov et al., 2011), and on **(b)** Bioprinting for testing drugs and vaccines and **(c)** Bioprinting of human skin (Murphy and Atala, 2014; Mironov et al.2011)

3D bioprinting technology is a sophisticated technology of the future because products obtained by bioprinting technology can mimic both the biological and functional properties of the natural structures and tissues of our bodies. This leads to a wide range of different types of applications. World-renowned researchers are working hard to apply the bioprinting technique using stem cells that can be obtained from a patient's adipose tissue.

### 3. Conclusion

The paper highlighted the very significant potential of advanced additive manufacturing 3D printing in integration with the Industrial Revolution - Industry 4.0. This is at the forefront of the components of digitization tools use through the Internet of Things (IoT) and the effects that 3D printing brings. It has shown that the greatest effects are in design because 3D printing used can be to print any three-dimensional model, object, element, and anything else with the appropriate material in the required scale. This presented examples of the use of 3D printing for rapid prototyping, models, and tools as well as for use in single and batch production. Examples of successful use of

Stem cells are then transformed into a laboratory cell conglomerate that fills a bioprinter cartridge to process the formed biological production of the corresponding tissue or organ (Murphy and Atala, 2014; Mironov et al.2011).

We can conclude that the possibilities of 3D printing and 3D bioprinting applications in medicine are unlimited and represent a revolutionary future in modern medicine and dentistry.

3D printing in the fabrication of elements of plastics and composite materials, metallic materials in the metal industry, construction, and advanced applications in medicine are given. All these examples of 3D printing have shown that they significantly reduce the environmental impact of industrial systems on the life cycle of products and have a great advantage over conventional production systems. The review showed that Additive Manufacturing 3D applications in almost all sectors achieve mostly more favourable design flexibility, shorter production time, high precision of complex shapes, and environmental benefits because they reduce the amount of waste material and achieve significantly lower production costs compared to traditional processes.

## IMPLEMENTATION OF CIRCULAR ECONOMY AND LEAN APPROACHES FOR A MORE COMPETITIVE AND SUSTAINABLE INDUSTRY

**Abstract:** *The circular economy concept has been considered one of the most innovative and essential approaches for more sustainable economic and industrial growth in the 21st century. Regardless of their size, organizations are frequently structurally designed to be efficient and optimized at all levels or defined as being LEAN. LEAN is a widely acclaimed approach for identifying and eliminating unnecessary and wasteful activities in the production process with simultaneously increasing the value of products. Observing the efficiency and advantages of circular economy and LEAN approaches, this article aims to show how their application can support the establishment of a more competitive, sustainable and green industry.*

**Keywords:** *circular economy, LEAN, sustainable industry, environmental improvements*

### 1. Introduction

Over the past decades, environmental issues such as ozone depletion, the greenhouse effect, air pollution, toxic materials, noise pollution, ecosystem imbalances, and loss of biodiversity have caused great concern in economies around the world (Safari et al., 2018; Yang, 2018; Kuo & Lin, 2020). This concern is justified by the growth of population, along with technological advancement. The global problem of population growth is that the production of material goods is also growing, in order to satisfy consumer needs through the market. Contemporary consumer society is characterized by the syndrome of instantism (Nikolić et al., 2013), which is caused by the speed of change and instability of market flows. The global economy has been fluctuating over the last few decades (Fu & Liu, 2023) so characteristics of business

environment at the global level have experienced significant changes. Since the beginning of the first industrial revolution, economic activities have been continually growing, while the basis of their development has recorded a constant reduction of available reserves. In the period from 1970 to 2017, a significant exploitation increase of natural resources was noted at the global level, from 27.1 to 92.1 billion tons, which represents an average annual growth of 2.6 %. Demand for natural resources per capita has increased annually from 7.4 tons in 1970 to 12.2 tons in 2017 (IRP, 2019). On the other side, for the global economy, it is devastating that about one-fifth of the extracted resources worldwide end up as waste (OECD, 2015). In accordance to prior, resource extraction and waste production have increased rapidly in recent decades (Marín-Beltrán et al., 2022).

To reduce the impact that population have on the environment at a global level, it is necessary to transform unsustainable patterns

of production and consumption of goods. The rapid changes in technology and global politics that characterize the modern world require management methods and the business environment which is constantly changing and improving. Innovation, flexibility and the ability to anticipate, identify and meet market needs are considered as crucial mechanisms for the growth and development of the economic system (Ćosić & Maksimović, 2014; Stanković, 2018).

The development of the global green economic system can be realized if business management finds and manage new working procedures and methods in organizations in order to increase resource efficiency and sustainability (Bengtsson et al., 2018; Kurdve & Bellgran, 2020). One of the types of adaptation to the requirements of modern economic development and technological progress is a LEAN and circular approach, which implementation in a particular organization includes techniques for establishing a productive and efficient work environment. The combination of these concepts represents an ideal solution to the current global problems, such as resource scarcity and environmental damage as well as a solution for the establishment of a closed-loop economic system (Nadeem et al., 2019).

The recognition of LEAN management and circular economy by academics and policymakers is apparent, but of the highest importance is that organizations accept and implement those concepts. Consideration of these approaches has shown that many of their shortcomings of them result from the way they are implemented rather than any other aspect of business culture. These approaches allow rational business devoid of all forms of costs, losses and waste. Both analyzed approaches are considered relatively new and therefore there is still not much expert research on their long-term effect on industrial organizations.

In order to answer the question of whether the application of the circular economy and LEAN approaches can support the establishment of a more sustainable industry, this research aims to understand the relationship between the circular economy and the LEAN approach through a literature review and comparative analysis of their basic principles.

## 2. Literature review

The current global business environment is characterized by dynamism, unpredictability, and intense competition, creating a demand for innovation in various forms, particularly in business philosophy. Primarily, high competition in the global market forces organizations to look for ways to maintain and improve competencies and gain a competitive advantage (Simeunovic et al., 2012). Competitive advantage and consumer satisfaction can be achieved through continuous work on improving business processes (Abbas & Hosein, 2010), which is possible through the implementation of modern approaches such as the circular economy and LEAN.

### 2.1. Circular economy

The concept of the circular economy (abbr. CE) is observed in contrast to the traditional linear economy based on the "take-make-dispose" model, where resources are extracted, transformed into products, used, and ultimately disposed off in the form of waste (Morseletto, 2023). The CE can be described as an industrial economy which is based on the restorative capacity of natural resources (Bastein et al., 2013; Rizos et al., 2015) and in order to achieve minimization of generated waste, utilization of renewable sources of energy and gradual abolition of harmful substances (Ellen MacArthur Foundation, 2012) as well as retention of the value-added in products for as long as

possible.

The implementation of CE is a process which takes place throughout society, involving different stakeholders and largely depends on the emergence of innovations in technology, social practices, organizational forms and business models. The main goals of adopting a CE are to reduce waste, increase resource efficiency and achieve a better balance between the economy, environment and society, in order to achieve sustainable development.

Consequence to prior, resource efficiency and green innovation have been identified as two key factors in achieving sustainable economic growth in developing countries (Sun et al., 2023). Namely, the fundamental principles of the CE are based on identified key factors in achieving sustainable economic growth. According to the Ellen MacArthur Foundation (2023), the implementation of a CE is guided by three main principles:

- Eliminate waste and pollution - materials used in the design of products should be able to re-enter the economy at the end of their life cycle;
- Circulate products and materials (at their highest value) - keeping materials in use, either as products or, when they can no longer be used, as components or raw materials.
- Regenerate nature - shifting the focus from extraction to regeneration of materials, since it is important to instead of continuously degrading nature, build natural capital.

In practice, the CE is implemented through a range of industrial and business solutions and applications based on 3R (reduce, reuse, and recycle) or an expanded 6R model (Jawahir & Bradley, 2016) that represents a new way of thinking about the use of resources.

The 6R model defines the CE through six activities that are shown in Figure 1.

**Figure 1.** 6R model

The mentioned activities in a context of a CE can be described as follows:

- Reducing energy and material consumption in production processes as well as pollutant emission through the application of eco-design;
- Reusing products by giving or selling them to someone who needs them instead of disposing of them;
- Recycling waste into products, materials, or substances for their original or alternative purposes;
- Reconsidering business models to reduce waste generation and achieve cost savings;
- Repairing components and parts to prolong the product's lifespan;
- Refusing the use of anything that is not strictly necessary.

In response to climate change and resource concerns, the industry has recognized the significance of implementing CE through 6R activities. As a result, there has been a noticeable increase in the number of publications and case studies that seek to explain and demonstrate the specific strategies and technical elements necessary to achieve desired sustainability and circularity level in the industry.

## 2.2. LEAN

LEAN thinking originated in the Japanese automotive industry after World War II and is

based largely on the Toyota Production System (abbr. TPS ) developed by Eiji Toyoda and Taiichi Ohno, and it was used to improve quality and productivity at the Toyota Motor Company (Čiarnienė & Vienažindienė, 2014; Kumar et al., 2022). Before the establishment of LEAN, traditional business practices were used. The traditional concept of business was focused on ensuring the welfare of capital owners neglecting the other aspects of sustainable business. However, this orientation is not compatible with the convictions of the LEAN business philosophy.

The LEAN approach is a set of tools that help identify and frequently eliminate losses, and improve quality, time and cost of production and business. The LEAN philosophy improves the entire organization by eliminating losses that occur during the work process. The LEAN organizations use fewer materials than traditional organizations, require less investment, use less equipment, require a lower labour force and generate less waste through the simultaneous creation of added value. Literally, the LEAN philosophy is a productivity approach used in business and production to optimize processes, provide resources, and maintain conditions that ensure the maximum quality of products and services delivered to customers. Implementation of the LEAN approach in the production process focuses on the reduction of waste and improvement of operational efficiency using a set of different tools to get these objectives (Al-Zuheri et al., 2021). The point of LEAN is not only in the concrete implementation of LEAN methods and tools but in the sweeping change of employees' and employers' consciousness (Abu et al., 2019).

Today, the implementation of the LEAN production system includes a large number of tools, but the type of applied tools depends on the conditions of certain goals specific to the company. Except for tools, this philosophy incorporates various models, methods and techniques to achieve predefined goals

including Kaizen, Jidoka, Poka Yoke, 5S, Total productive maintenance (abbr. TPM), Total quality management (abbr. TQM), Value stream mapping (abbr. VSM), Kanban, and Just in time (abbr. JIT), Heijunka, etc. (Despoudi, 2021). LEAN combines theory and tools that include both fundamental TPS concepts and newly created tools for process optimization and communication between people. TPS bases its philosophy on three Japanese terms, more precisely, on the 3Ms model shown in Figure 2.

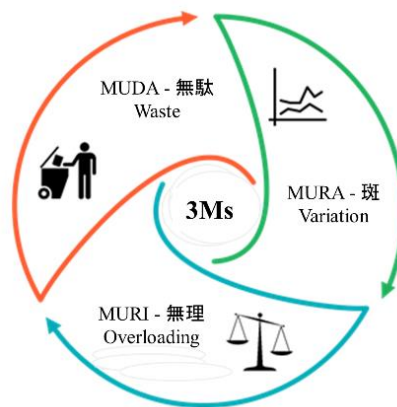

Figure 2. 3Ms model

Namely, the 3Ms model defines three causes of business inefficiency:

- MUDA - stands for loss (waste) and is used for any activity that does not add value to the product/service but adds cost to it such as overproduction, inventory, motion, defects, over-processing, waiting, and transport;
- MURA - represents all kinds of variations that can occur in production (in demand, in processing time, in product quality, etc.), which prevent the production process from taking place efficiently and effectively;

- MURI - shows the loss due to overloading that occurs due to the demand that a worker, machine or any technical system work beyond their capabilities.

The LEAN approach to process improvement is a popular and effective method for achieving significant positive results in various industries or organizations (Womack et al., 1990) but first, it is necessary to identify all inefficiencies in the organization. To ensure the benefits of applying the LEAN business concept, the following principles must be respected (Womack & Jones, 2003):

- Identify value - defining value from the point of view of the end consumer;
- Map the value stream - identifying all procedures in the business process and eliminating those that do not create value;
- Create flow - ensuring the smooth flow of products to consumers;
- Establish pull - harmonizing the product flow with consumer requirements;
- Seek perfection - clearly defining the value for consumers, adequately identifying and establishing the value stream and eliminating redundant procedures and resource losses in the process.

It is essential to understand that LEAN principles can be used to improve all processes in a particular industrial organization, and not only its production part (Jina et al., 1997). Applying the basic principles of the LEAN business concept leads to numerous benefits both at the operational and strategic levels.

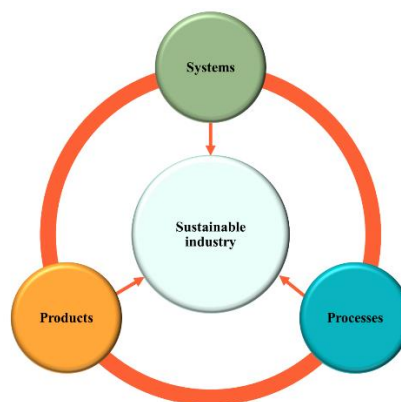

Application of the analyzed LEAN concept improves the level of sustainability in the industry. The contribution of LEAN tools to support organizations in achieving sustainable production is due to synergies between LEAN tools and sustainability (Silva

et al., 2021).

### 3. Implementation of CE and LEAN approaches for a more competitive and sustainable industry

Considering European Green Deal whose main objective is to form the world's first continent that is climate-neutral by 2050, industry will need a secure supply of clean and affordable energy as well as raw materials (European Commission, 2020). Additionally, one of the main European Green Deal goals is to encourage the development of new markets for climate-neutral and green products which is the result of an established sustainable industry.

Establishment of a sustainable industry has become a necessity for modern consumer society. Sustainable industry represents manufacturing of products using economically sensible procedures that reduce their negative effects on the environment while conserving energy and natural resources („EPA”, 2023). There are numerous benefits to promoting a sustainable industry including improving worker, community, as well as product safety.

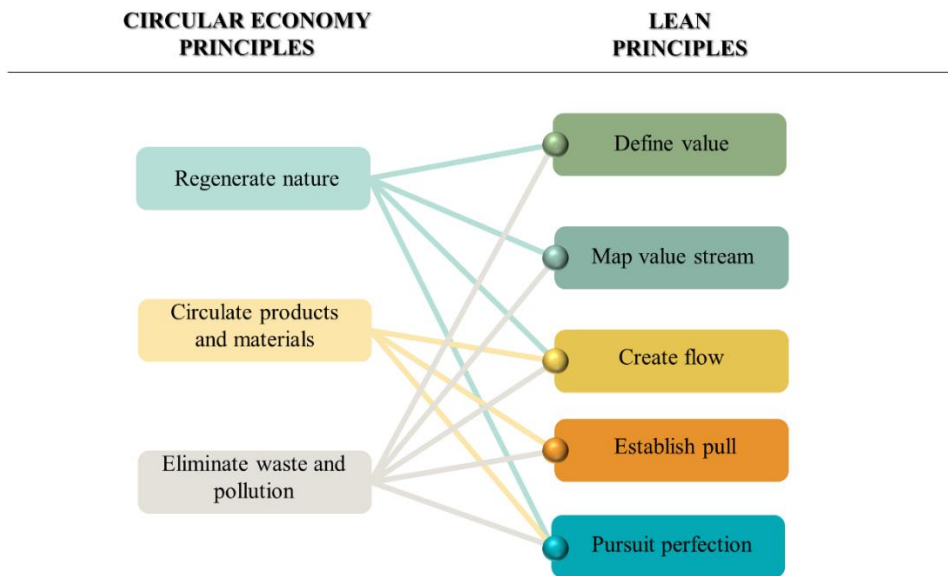

**Figure 3.** Integrated elements of sustainable industry (Jawahir & Bradle, 2016)

Contemporary and sustainable industry is based on the use of advanced manufacturing method which promotes innovative technology for improving products or processes that drives the industry. Therefore, three integral interacting levels must be taken into account to attain a sustainable industry: products, processes and industry systems (Figure 3). It can be concluded that the achievement of a sustainable industry is a very complex task since identified elements must be integrated. Regardless, organizations are faced with the need to innovatively address their product development challenges to remain competitive in today's market. More precisely, to improve the resource efficiency and environmental friendliness of industrial processes, manufacturers must

identify unique techniques or methodologies. Promising plans to accomplish this goal include a CE and green-LEAN production. Integrating CE and LEAN thinking into the product development process can encourage a sustainable industry since both approaches focus on optimization of products, processes or systems. Based on the findings of the literature, there is a necessity for the coalescing of these approaches in the industry (Schmitt et al., 2021; Ciliberto et al., 2021; Skalli et al., 2022).

The possibility of implementation of CE and LEAN approaches for a more competitive and sustainable industry can be verified by analysis of the principle between these two approaches (Figure 4).

**Figure 4.** Relation between CE and LEAN principles

Based on Figure 4, it can be concluded that the main common elements of analyzed approaches are waste minimization and value creation. LEAN and CE approaches have a lot in common to contribute to one another (Nadeem et al., 2019). Even though they have certain differences, these approaches complement each other in creating significant

results in industry (Pernstål et al., 2013). LEAN and CE differ in that CE takes a more holistic approach from a systems perspective to maximize the utility of the resource even after one life cycle of the product, whereas LEAN focuses on the immediate usage of the resource within a specific process (Nadeem et al., 2019).

Integration of the LEAN and CE is based on the maximum application and promotion of all positive sides of the analyzed approaches („Novotek“, 2022). In order to attain circularity as well as efficiency and effectiveness in industry, this integrating approach combines LEAN tools and processes with CE principles. Therefore, this paper introduces the first definition for proposed integration entitled **C-LEAN** which uses key principles from considered approaches. The abbreviated name of integration indicates that its application can contribute to the development of a **cleaner** production that is a crucial element for the transition to a green and sustainable industry. C-LEAN is a framework for the sustainability transformation of business models in industrial organizations. Industrial business models formed in this way would help organizations to make and save money by maximising resource use, reducing resource loss, and eliminating waste generation. C-LEAN emphasizes lean thinking, design thinking, systems thinking, extending life of product, as well as reuse and recycling.

Downside of C-LEAN is reflected during the actual implementation of this approach since is not universal and uniform and cannot be applied in every organization in the same way. To address these issues, a uniform methodology and implementation of the newly defined approach should be developed.

#### 4. Possibility for applying the C-LEAN approach in the Republic of Serbia

C-LEAN should be the target of many industrial organizations nowadays, all over the world. However, the problem is to implement this kind of model in industrial organizations operating in developing countries.

In general, the LEAN approach found application in the Republic of Serbia at the beginning of the 21<sup>st</sup> century, first in foreign

organizations, and then in domestic ones (Kirin et al., 2018). On the other hand, CE was popularized in Serbia since the European Union adopted a package of measures for the transition to a CE at the end of 2015 to improve the region's competitiveness, open new workplaces, and establish sustainable growth systems (European Commission, 2015). Given that these business models are still new in the Republic of Serbia, their coalescent implementation would require systemic transformation. One of the characteristics of such transformation is that the costs are relatively low and that improvements are achieved primarily by better resource utilization that organization already possesses (Stojanović, 2019). Therefore, C-LEAN could be interesting for organizations that operate in transition economies like the economy of the Republic of Serbia since there are limited resources.

Applying C-LEAN approach in the Serbian industry is possible through one complex 5-phase process shown in Figure 5.

**Figure 5.** C-LEAN implementation process („CircularTRANS“, 2023)

This implementation process starts with a diagnostic part where management of organization conducts research on the current business model and checks whether there is a possibility to apply analyzed approaches. Namely, in the first phase of implementation, performance measurement of CE, as well as LEAN thinking, is carried out. Obtained results represent a base for identifying opportunities in the C-LEAN implementation. The fourth step consists of defining a roadmap and finally, an action plan to address C-LEAN opportunities. C-LEAN

implementation process is created in accordance with the already developed CircularTRANS complete process. Undoubtedly, although Serbia is a developing country, applying C-LEAN in industrial organizations would create numerous benefits.

It is important to note that the biggest barrier to C-LEAN implementation in the Republic of Serbia is the lack of legal regulations in this area, as well as the lack of guidelines on how to implement and monitor this approach. Many organizations are not able to fully apply the C-LEAN due to the lack of a clear understanding of performance measurement of the CE as well as LEAN thinking which is considered as the first step of implementation (diagnosis).

## 5. Conclusion

C-LEAN approach in industry will create an opportunity to encourage circular, sustainable and working-intensive economic activities. CE and LEAN are two related concepts that are often discussed in the context of sustainability and operational efficiency in different aspects of business and production. CE is a sustainable economic model that seeks to minimize waste and maximize reuse of resources by keeping materials in use for as long as possible. It is based on the principles of reduce, reuse and recycle.

LEAN, on the other hand, is a production

philosophy that aims to optimize the flow of products and eliminate waste in manufacturing and service processes. It is focused on delivering high-quality products with minimum waste and maximizing value for customers.

Relation between CE and LEAN lies in their shared goal of reducing waste and maximizing efficiency. Principles of LEAN can be applied to support the implementation of CE by reducing waste in the production process and enabling reuse of resources. Additionally, CE offers a more holistic approach to sustainability, including the entire lifecycle of a product, which can be integrated into LEAN methodologies to further optimize the production process. When suggesting a particular organization to shift to a system where all operations are harmonized with the mentioned concepts, the risks associated with changes in the system must be analyzed. Namely, if one company already operates according to the LEAN approach, it will be easier for the management to transform it into a circular business, but there are undoubtedly certain risks. Barriers to the implementation of the CE in LEAN organizations largely depend on how much employers and employees are eager to change and to what extent they are engaged in the process of implementation. For this reason, further research will analyze some of the main structural barriers and risks when industrial organizations pursue C-LEAN business approach.

## THE IMPACT OF RENEWABLE ENERGIES ON SUSTAINABLE DEVELOPMENT

**Abstract:** *The people of the world have entered a decade phase after bidding farewell to the previous year 2019 and to begin with stability towards a future that is looming on the horizon of many variables that could shape the characteristics of the next decade with the start year of 2020, it will therefore constitute a fundamental change for the future of daily life and the international economy.*

**Keywords:** *renewable energies, sustainable development, green economy, natural electricity, clean technology*

### 1. Introduction

Today, the world is witnessing a continuous and growing renewal in various fields and sectors, in particular in the field of the digital economy, which has become a real bet in a direct way on the new technologies of communication and information. In addition, the green economy is considered to be the back home of sustainable development and it is classified among the characteristics of economic modernity of the last decade so that research development and innovation can be doubled at its heart so to achieve a true balance which guarantees the required productivity and national wealth and to maintain a healthy environment without gaseous toxins. The traditional energies that humanity used in the primitive phases of the industrial revolution to operate machines and energies such as cars, planes and trains, in particular petroleum energy and its derivatives such as gas or also nuclear energy, which has all caused a real environmental catastrophe today, which has caused the ozone layer to burst. They have also caused

land pollution and the spread of natural disasters such as floods, earthquakes, global warming and climate change. On the other hand, environmentally friendly renewable energies are considered to be a main alternative to these polluted traditional energies. They also have the same operational results as those with less disasters and costs, and among the most important of these energies, we mention in particular that the production of electricity from solar energy and the sales volume and the production of biofuels from vegetable oils such as corn, sunflower and the Jatropha or the use of new clean technologies which are considered a current event which can shape the main features of the future of the technological industry.

### 2. The production of natural electricity

Nature is considered a main source for the production of energy in large quantities and efficient and effective power. Also, it has become in consumption with the lowest

---

Corresponding author: Foued Sabbagh  
Email: [fouedsabbagh\\_2010@yahoo.fr](mailto:fouedsabbagh_2010@yahoo.fr)

possible costs, so that most countries of the world today reach it as a serious alternative to the production of electricity from fuels and large tanks. Nature has major advantages and contributes to maintaining a clean environment without toxic gas emissions, including mainly wind energy which is available continuously over a long period exceeding six months of the year. In addition, including solar energy, especially on the African continent, in Latin America and in some Asian countries, so that it forms a major production base with the lowest financial costs. First, by installing panels to produce these types of energies and then the storage and finally the conversions for electrical consumption. In this regard, many European companies, particularly in the southern Mediterranean countries, such as Egypt and Tunisia have already started to distribute and exploit these solar panels to produce natural electricity and then to direct towards the Northern Mediterranean countries, which means that the countries of the European Union will be among the largest consumers of natural electricity. Thus, also with regard to aerobic turbines to generate electricity from the wind, they also became propagated and visible on most of the hills of the mountain in various countries of the Southern Mediterranean. Overall, this electric power is currently considered the best to reduce the burden of public expenditure on the purchase of fuel, especially in non-oil countries to produce electricity at lower costs.

### **3. Biofuels - Biodiesel**

Today, the biofuels extracted from vegetable oil are among the most important types of emerging renewable energy, especially in emerging countries so that they have a direct impact on the consumer and also on public consumption. We note that the production costs and the prices of its supply which are generally less expensive. This energy, as under the name of biodiesel and it is even

capable of operating all industrial engines and machines constantly and continuously, and has almost the same operational capacities as the use of other energies. Among the most important oils extracted from this energy we note in particular corn, sunflower and the most important is the *Jatropha* plant which is very similar to the natural oils in terms of productivity. These oils are refined and processed in laboratories to produce large quantities of biofuels called biodiesel or "Green fuels". In addition, most of the stations of the world that supply gasoline to cars have become a major distribution of this type of fuel, especially in developed countries.

### **4. The clean technology**

The technology has become a tangible reality in our daily lives and this next decade is considered to be technological by excellence due to the increasing prevalence of technologies, research and innovations devoted to the industry, especially in the automotive sector, and household manufacturing which has become largely dependent on electronics and the use of the internet connection in the simplest parts of our lives. The clean technologies are the bet of the future in order to reduce the proportion of toxic gas emissions from the consumption of crude oil and fuels, which have globally become the main cause of major environmental disasters, in particular the problem of pollution nature and air in all cities of the world. It has also now become the main contributor to the stimulation of sustainable development because of its important role in achieving a balance between industry and environment. For example, we mention the TESLA car, which has spread rapidly in recent years to highlight charging stations for this type of car at supply stations, which is very similar in design to cell phone. This technology is also easy to use efficiently and achieves its goals with high quality and

equally effective precision.

## 5. Conclusion

The renewable energies have become the bet of the future of the world to achieve sustainable development which takes into account productivity in constant and required quantities and also contribute to the development of industry and technology and maintain an environment without of toxic gas. Furthermore, in this regard, the natural electricity extracted from wind and solar

energy is considered to have a direct positive impact on the national economies of most countries of the world so that it contributes to reducing the budget deficit, limits the accumulation of debts, increases the economic growth rates and therefore preserves the environment and is capable of achieving the desired sustainable development. The biofuels have recently been the main global event at the heart of the green economy, known as biodiesel extracted from vegetable oils, in particular from the Jatropha plant or also by the recycling of household waste, plant materials and plastics.

## ECONOMIC SUSTAINABILITY OF INTERNATIONAL FINANCING AND LOAN PROGRAMS IN IRAQ

**Abstract:** *The spread of phenomenon of international loans and their positive or negative results, especially in countries of Middle East, require the development of economically sustainable plans for these loans, as well as their social and environmental sustainability for these countries in order to obtain best results from loans. Research included introducing these loans, especially in developing countries, and their objectives. As well as offering two successful experiences in benefiting from these loans, namely Malaysia and Turkey. Then research moves to main topic, which is Republic of Iraq, the reality of state of international loans resulting from it, and an inventory of all those loans and years of repayment.*

**Keywords:** *Loan, Iraq, sustainable, international, challenges*

### 1. Introduction

Idea of totalitarianism and totalitarism has dominated international relations system, taking its tendency to integrate all parts of globe into one society, with closer relations in various fields. Globalization has allowed free flows of individuals, goods, services and capital to occur, creating an integration of economies and societies until concept of global village has reached.

Stable and sustainable growth is a goal that most economies want to achieve, as it is indicator that can change direction of many economic variables towards desired direction from point of view of governments, as it is possible to achieve an increase in income and living capacity of population and elimination of unemployment and thus achieving social sustainability. Governments are trying to mobilize various local sources to maximum extent possible to finance development, but weakness of these sources poses to governments a real problem that calls for resorting to international financing of its various types in form of conditional

loans that may be of high cost, or resort to exploiting conditions produced by globalization subject to necessity of Liberalizing economy and reducing effects of restrictions to allow country to integrate into world market, which can provide it with an important amount of financing resources in form of capital flows looking for profits.

Within framework of dominance of idea of freedom of movement, these flows can enter at time they wish and withdraw also at time they wish. This is what can create with it serious repercussions on economy. Only here can we raise a fundamental question about possibility of promoting growth with foreign funding sources in light of developments imposed by globalization?

These phenomena have become focus of preoccupation at top of international economic deliberations table. There are developments that are not devoid of facts and are moving in direction of a more understanding of map of economic variables. There are also repercussions that are not lacking in evidence, and there are risks and concerns that are not reassuring in rapid and

violent global movement of capital flows. money. research problem is focused on not taking advantage of time period in employing international loans in affiliated fields and activities. As for research hypothesis, length of international loan repayment period is a positive factor for implementation of short and medium-term development programs.

Research aims to:

1. Recognize concepts and importance of long-term loans
2. Benefiting from successful experiences approaching Iraqi case, especially Malaysia and Turkey.
3. Strengthening functional relations between activities in internal financing of projects.
4. Achieving productive convergence and developing secondary production lines from main programs included in financing.

## 2. International Finance: Concept, Importance, Objectives

Many economic researches indicate that term international finance consists of two words, finance, and this means provision of financial resources to cover current or capital expenditures according to certain conditions that include price and term, and this concept has become popular since first decades of twentieth century. A group of countries, and on its impact international institutions such as International Monetary Fund and International Bank for Reconstruction and Development have emerged... Also, other writings indicate that what is meant by international finance is that aspect of international economic relations related to provision and transfer of capital internationally, and this takes many aspects of them (1) commodity (real) aspect of international economy (2) monetary or

financial aspect, which usually accompanies flow of goods and services among countries of world (3) international capital flows for purposes of foreign investment in its various forms, and international finance falls within second dimension, and its importance appears, as an inevitable result Financial and monetary relations in international economy (Magdi El-Shorbagy, 2005).

Apparently, international finance, according to necessities presented, is a need for existence and continuity of any economy, whether it is developing or advanced, and it is a fundamental need for economies of developing countries, where process of economic and social development requires provision of many needs, to reach a level appropriate to rate of economic growth. In forefront of it comes capital as one of basic elements of production, and its loss or weakness in developing countries, we find that they are forced to use foreign capital to fill shortfall in development process in these countries, and thus search for it is most important challenge facing developing countries in order to raise economic growth rates.

## 3. Theoretical explanations for need for international finance

Many economic researches refer to several development models to explain problem of developing countries' need for external financing, including Harrod-Domar Model, which aimed to demonstrate extent of close interrelationship between national product and capital investment rates, that is, on gap between desired investment and level of savings. domestic resources gap, which is called saving gap or domestic resource gap foreign capital will be used alongside local savings to cover required level of investment, and this model is one of most important analyzes in highlighting vital role of foreign capital in process of economic development As for Walt Rostow's theory, it

focused on need to raise rate of investment, in order for economy to reach "take off" stage to be able to run itself, or so-called "self-sustained growth stage".

It is noted on both theories, Harrod-Domar + Rostow's theory, that they assume "existence of necessary conditions for development in developing countries, and reality is opposite, in addition to that, external factor or external factors are not appropriate" and are beyond control of these countries, by virtue of their dependence their economies to global economic system dominated by developed countries. As Professor Samuelson believes that as long as there are many obstacles, as for capital formation from real sources, it is necessary to rely on external sources. He explained that main problem in many developing countries is severe shortage of savings, especially in poor areas. , where phenomenon of competition of increasing current consumption is manifested, either need to invest scarcity resources, and result is directing a very small amount of investments to accelerate process of economic development. Thus, most important imbalances in savings in developing countries, including (R Gillet et Minguet ,1995). Disguised Unemployment , compactness , Irrational behavior of foreign exchange , Irrational consumption (public and private) , Tax evasion and "Capital Flight" and other remittances.

Economic equilibrium occurs when savings coincide with investments, but it is difficult to achieve because each of them is not necessarily identical, and what developing countries suffer in this aspect can be summarized in following points:

- a. A distortion in economic and productive structure
- b. Under-utilization of available resources
- c. Low productivity
- d. Low incomes
- e. A decrease in savings of individuals
- f. An increase in consumption

g. High inflation.

Therefore, these countries suffer an investment gap due to small amount of capital in their productive sectors, and here need for external financing appears... and thus an external gap occurs called "Foreign Trade Gap", which embodies imbalance in balance of payments, and this analysis is called a model Two Gaps Model (Christian Saint-etrenue 1998).

### **First: Economic Financing Systems**

It is that framework that is concerned with mechanism of accumulating savings surplus to needs of their owners and directing them to finance various activities and projects. Depending on activity of each party, two types of economic units can be distinguished; Surplus economic units and deficit economic units (J.M..Healey, 1979).

**Surplus units:** each unit that constitutes an economic decision-making center that, following its activity, has a surplus ability to finance other units.

**Deficit units:** They are economic units that need financing.

Depending on reality of direct and indirect financing, a distinction can be made between two forms or two financing systems that allow achieving this compatibility between surplus units and deficit units; We distinguish between debt economy and financial market economy.

**A - Debt economy:** It is economy in which non-financial dealers depend on loans they obtain from banks, which allow them to obtain sufficient resources to operate their investments and various activities.

**B - Financial market economics:** It is system in which non-financial dealers - in their financing to meet their various investment or exploitation needs - depend on issuance of financial assets in financial markets, which have witnessed tremendous development, and deepening of global trend towards financial globalization, and increasing level

of developments witnessed by financial tools that ensure availability of investment , employment tools according to tendencies and desires of dealers.

#### **4. Driving forces of globalization of finance**

Currents of globalization have imposed a continuous and rapid growth in role of financial markets; Markets that operate continuously, taking their way to development, driven by following factors:

A - Creativity in financial and banking industry and automation of various transactions.

B- Increasing number of companies that are active in financial intermediation, and steady growth of banking activity under pain of narrowness of local market. Investors or savers, while narrowness of local market with weak or slow economic growth formed a real restriction. As for decrease in banking brokerage profits, it is necessary to reduce severity of restriction imposed, and thus get out of local level on global markets in search of diversification in activity and exit from base.

C- tendency of banking financial intermediation institutions to comprehensive financing of activities such as carrying out leasing and bank insurance operations and entering into financial market activity with a specific branch, or creating a new department in bank to secure service of non-traditional activities (AsariFakhri Abdul Latif, [www.uluminsania.net](http://www.uluminsania.net)) as well as their tendency to benefit from capital flows that reached in year 2000 to \$7.5 trillion (GerdHassler 2002) with increasing trend to reduce number of banks operating in activity, and this fact resulted in banks entering into activities unrelated to financial intermediation, in an attempt to seize opportunities offered by financial market activity through possibility of converting

assets into traded securities, and Conducting interest rate swaps in order to avoid credit risks, and raise rates of return for benefit of bank owners to strengthen confidence of property shareholders, especially since non-bank financial intermediation has become a real constraint for it, as it narrows resources available to banks by accumulating cash surpluses from banking sector. Families or business sector and allowed them to achieve relatively high rates of return (GerdHassler 2002)

D- huge growth of multinational companies: their number reached 40,000 companies in late nineties after it was 7000 companies in s (United Nations - 2001.). To a very large financing resources Thus, it generated huge revenues, creating dynamism of ebbs in capital flows at global level, as it controls a large amount of capital flows (AsariFakhri Abdul Latif, [www.uluminsania.net](http://www.uluminsania.net)).

E- tremendous and steady growth of information and communication technology, development of use of computers, increase in use of Internet, and most of global markets have been linked to World Wide Web, thus allowing this field to further deepen globalization of financial markets, and this advanced technology provides a continuous flow of information to everyone who needs it in time. Location and location allow for evaluating market conditions, studying opportunities, monitoring and analyzing risks, and anticipating future trends in order to be able to manage them.

#### **5. Impact of foreign direct investment flows (IDE) on developing countries**

FDI flows express transfer of financial and material resources from exporting country to receiving country with aim of establishing long-term investment projects aimed at maximizing profits and benefiting from comparative advantages of host country.

John Perkins revealed in his book, *Confessions of an Economic Hit Man* about this profession, that he was not chosen out of nowhere as he was nominated by many parties. I told him that he had two primary goals in his job as a credit pirate: The first: creating justifications for the huge international loans granted to the country in which he will work, while reinjecting these funds into American companies (John Perkins, 2004). In addition, it will allow transfer of a certain amount of technical expertise and technology (Abd al-Salam Abu Qahaf, 2000) and This investment may take form of a unilateral direct flow in ownership of new project or ownership of assets of an existing establishment, or bilateral direct investment flows that take form of a partnership in which ownership of project is distributed between private foreign capital and local capital, and this type of investment flows occurs reinforced by strategies Multinational companies:

- Searching for best sources related to raw materials and idle energies in terms of costs that can be used in host country, which means making investments in order to take advantage of relative advantage of receiving country.

- Market search: Here IDE moves in search of a new market, whether it is in host country or in markets of its neighboring countries, reinforced by motives of establishing investments to replace imports. - Searching for elements that can serve strategic goal of company, so that foreign investment is supported by strategic forces drawn by multinational company. Foreign direct investment flows are financial resources that can serve path of sustainable development in recipient countries, but this will not be certain as it can produce negative effects on various variables, and this is what will prompt us to track foreign direct investment flows and their effects on various variables.

## 6. International experiences

### 6.1 Malaysia

Starting from 1986, Malaysia put forward a strategy for development through a five-year plan in 1986, whose main focus is to stimulate activity of private sector, as it is main engine of growth. To liberalize, many researchers have listed reasons for progress in Malaysia in following factors (Abdel Rahim Abdel Wahed, 2003):

1. political climate of Malaysia is characterized by appropriate conditions for accelerating economic development.
2. Malaysia has become among top five economies in world in terms of local economic strength.
3. Malaysia has pursued a largely self-reliant strategy by relying on indigenous population of country, who represent Muslim majority.
4. Malaysia's interest in improving social indicators of Islamic human capital, by improving living, educational and health conditions of indigenous population, whether they are indigenous people or Muslim immigrants to which authorities welcome resettlement.
5. Malaysia's dependence to a large extent on internal resources to provide necessary capital to finance investments, as gross domestic savings increased by 40% between 1970 and 1993, and gross domestic investment increased by 50% during same period.

There are other factors that contributed to success of Malaysian experience, most important of which are (Medhat Ayoub, 2009):

1. Malaysia treated foreign direct investment with caution until mid-1980s, then allowed it to enter, but under conditions that goods

produced by foreign investor would not compete with national industries.

2. 2 Malaysia's possession of a future vision for development and economic activity through successive and integrated five-year plans since independence until now. Rather, Malaysia's early readiness to enter current twenty-first century through planning for Malaysia 2020.
3. 3- Great diversity in industrial structure and its coverage of most branches of industrial activity "industries: consumer - intermediate - capitalist".

What are procedures that established success of experiment, which are summarized as follows:

First: Continuing success in managing macroeconomics and financial policies, with aim of achieving an information-based economy, with a low inflation rate supported by strong demand and private investment in local economy, and stable growth of global economy.

Second: Strengthening income distribution programs for a more balanced participation between ethnic groups, maintaining objectives of previous plans to address problem of poverty, reducing extreme poverty rates to less than 1% in 2005, and restructuring functional distribution between races and states with aim of building a just and unified society.

Third: Promoting development driven by more competitiveness, by improving levels and performance of workers and employees, and raising level of research and development.

Fourth: Enhancing competitiveness in main economic sectors with intensification of competition between countries to attract investment and market industrial, agricultural and service production.

Fifth: Expand uses of "information

communication technologies", and make Malaysia a regional and international center for its services and production, while working to provide a constitutional and legal environment, with aim of reducing digital difference between poor and rich, and between economic sectors, by expanding communication infrastructure.

Sixth: Supporting development of human resources, through an effective educational and training system, and building more schools, with application of central education system and concept of integrated schools.

Seventh: Achieving concept of "balanced and stable development" to benefit from country's wealth in most efficient way and to preserve environment.

Eighth: Providing better opportunities for all Malaysians to improve their standards of living, and expand access of poor and a section of middle class - which is majority of urban dwellers - to benefits of public services "education, housing and health".

Ninth: Continuing education on positive behaviors and moral values in working and living life, through educational curriculum and special programs for workers in organizations, government institutions, awareness institutions and media, given that existence of a morally disciplined society and a population with values and principles of straight transactions is basis for success of country.

## 6.2 Turkey

One of main reasons that helped Turkish economy to thrive and grow at these rates, are measures taken by country in such as (A report on the Turkish economy 2011):

- Banking reforms and rebuilding financial sector following local banking crisis that occurred in 2001.
- Implemented structural reforms that allowed different institutions and

markets to function properly (independent central bank, independent authorities, privatizations, in addition to reforms undertaken by European Union).

- Macroeconomic and political stability.
- currency reforms that took place in 2002, through which country succeeded in deleting six figures from Turkish currency.
- Providing support to small and medium-sized enterprises, which accounted for more than two-thirds of Turkish economy.
- Commercial initiatives through which country has been able to strengthen its ties with various African and Latin American countries.
- Establishment of Housing Development Department, which provided low-cost housing for more than one million Turkish citizens.
- Social security reforms, according to which a unified social security system was applied to self-employed, and Social Security Institution and retirement fund were merged into one body.
- Health care reforms through which country provided free health care services to elderly.
- agricultural sector accounted for 29.5 percent of employment in 2009.
- industrial sector remained main economic sector in country, and occupied a leading position in development process (An Overview of Turkish Economy, 2011).

## 7. Development in Iraq: goals and obstacles

Over decades, Iraqi economy has suffered a

state of deterioration and repeated crises due to circumstances that affected it and orientations of political system during period between 1980-2003, when Iraq witnessed two wars that overthrew foundations of economic development in it, followed by imposition of severe economic sanctions that threw They cast a shadow over entire economic life and imposed complete isolation on Iraq from its regional and international surroundings. Those sanctions contributed to increasing imbalance in Iraqi economy and deepening its crisis. With entry of US forces into Iraq in 2003, Iraqi economic crisis increased. Growth and development of any economy requires conditions, most important of which is existence of a safe and stable environment, as well as availability of a degree of cultural and civilizational sophistication, along with other factors. It can be said that there is an inverse relationship between existence of occupation and possibility of developing a solid national economy that has complete sovereignty in making its decisions, including economic ones. goals intersect with country's national interest represented in achieving economic advancement and growth. changes that took place under US occupation of Iraq have had their repercussions on environment of Iraqi economy as a whole, as Iraqi economic crisis revolved around collapse of state and all its institutions, and problems (unemployment, inflation, debts, infrastructure collapse, financial and administrative corruption...etc) appeared. And other problems.

### 7.1 First axis: challenges that faced economic development in Iraq after 2003 (reality of economic development)

Iraqi economy faced many problems that had accumulated during past twenty-five years, which hindered its growth and even led to its decline and collapse. Those in charge of fiscal and monetary policy in Iraq did not use any realistic solutions to problems that

began to accumulate since outbreak of Iran-Iraq war through Kuwait war and economic sanctions. Reason for this is not due to inability of specialists to find these solutions, but rather as a result of political decision that seems to have insisted on futile applications of its economic policies. second type is new or emerging challenges, and it is a group of challenges that surfaced strongly on economic and political scene after 2003.

#### **Inherited challenges**

Set of challenges and structural economic characteristics associated with Iraqi economy include a semi-rentier oil economy and a state of political and social instability. most prominent of these challenges are:

#### **Structural imbalances**

It includes set of imbalances related to structure of Iraqi economy as a semi-rentier oil economy resulting from dominance of crude oil sector over main contribution to gross domestic product and other macroeconomic variables, and at expense of relative underdevelopment of rest of productive sectors, especially agriculture and manufacturing. Those challenges were exacerbated at beginning of seventies After nationalization of oil, and huge increase in oil revenues, and consequent focus on goal of excessive oil production, and unjust exploitation of those oil resources for security and military purposes, and without this being accompanied by a serious effort to employ revenues generated in expanding productive investment and expanding non-productive capacities Oil and other material and human development investments to create necessary prerequisites for launch of Iraqi economy, which reduced opportunities for productive diversification and deepened phenomena of structural imbalances, and gave way to excessive government spending biased to policies of staying in power, and misuse and distribution of oil revenues, and those have deepened Imbalances after

imposition of international sanctions and imposition of an economic blockade in Following invasion of Kuwait, and since then Iraqi economy has entered a state of long-term stagflation, then Iraqi economy has been subjected to a severe structural crisis after devastating war in 1991, which caused worst damage to infrastructure and productivity, and that crisis continued to exacerbate after regime was overthrown and country turned into an occupied state. by United States of America in 2003.

#### **Political instability**

The history of Iraq is a long series of foreign invasions and counter-coups, which made most of changes in successive governments and leaders be in form of violent and sudden shocks, which prevented development process from achieving necessary stability and continuity, which resulted in failure of planners and implementers to spend money Allocated in development plans programs and in all its sectors, according to criterion of efficiency of performance or efficiency of spending. Despite hopes that were placed on process of political change in 2003, as it would be an entry point to end political and social conflict over power and establish principle of peaceful transfer of power, but that process came with low results Until now, weak role of parties and civil society organizations has made power-sharing process based on sects and national and religious components and not on civil and political foundations that have given priority in selecting ministers and senior state officials for considerations of political quotas and budgets. All this factor is a serious challenge at expense of academic specialization. Efficiency and integrity.

#### **Linking investment spending to increasing oil revenues**

All successive governments, regardless of their ideological inclinations, linked investment spending to an increase in oil

revenues, without taking into account limits of economy's absorptive capacity, or availability of specialized technological and human requirements, which made investment allocations directed towards all economic activities a variable subject to conditions of general budget, which in turn is variable. Continued to oil revenues, when government budget deficit rates rise as a result of decline in oil revenues, focus will be on covering requirements of current part of spending and sacrificing investment part, and this is what usually happened in most stages of development in Iraq, as it confirms Iraq's economic experience from fifties until now. On failure of successive governments to employ revenues generated in expanding productive investment, expanding non-oil production capacities and creating capabilities necessary to launch Iraqi economy, as a result of adopting a policy of rushing towards achieving maximum amount of oil revenues without a clear national vision and a specific economic strategy, so it failed to achieve goal of rational allocation of available oil revenues that will ensure achievement of a goal diversification, increase employment opportunities and reduce dependence on oil revenues.

Accordingly, financial budget for 2017 is a realistic budget of austerity and devoid of investment aspects, as "loans do not fill deficit in them", so this budget is not commensurate with size of investment projects and this is due to lack of revenues and because it is hardly enough for operational side as there are a lot of expenses including salaries of employees, so new budget is a perpetuation of previous projects that work has begun and have not been completed or may be deleted or postponed.

### **Failure of economic policies**

A careful review of economic policies in Iraq reveals absence of their role or their inadequacy, whether in their financial, monetary, commercial, industrial,

agricultural or other policies represented by misuse of oil revenues, in prevalence of manifestations of underdevelopment and deterioration of levels of production and productivity in various economic activities and thus weakness level of economic diversification, which deepened manifestations of imbalance and distortion in Iraqi economy, most prominent of which is distortion in economic structure as a result of dominance of oil sector and decline of commodity sectors, especially industrial and agricultural sectors, electricity and water sector, and growth of parasitic sectors, as well as distortion in exchange rate of dinar, and distortion in tax system In prices in interest rate structure, distortion resulting from lack of coordination between macroeconomic policies, and distortions in distribution of income and wealth, so most of economic policy measures in Iraq have failed in all mentioned aspects.

### **7.2 Second axis: Emerging challenges**

It is a set of challenges that surfaced on surface of Iraqi political and economic scene after process of change in 2003:

#### **Security challenge**

This challenge was linked to collapse of state's security and military institutions and decline in role of legal system, after collapse of government with all its institutions and transformation of Iraq into an occupied country in 2003, and accompanying chaos in management of institutions and failure to protect Iraq's borders. All of these developments inflicted most severe losses on infrastructure and productivity, after sabotage operations focused on oil pipelines and sabotage electric power transmission lines and generating stations as well as electricity and water, as well as directly targeting lives of citizens. Isolation, as dozens of innocent people are martyred or injured every day, and it is natural that

continuation of this daily challenge leads to giving priority in allocations to security aspect at expense of reconstruction and development process, however, after more than seven years of difficult and costly experience, I remain security file It constitutes a serious challenge facing development and transition process in Iraq, as a number of Iraq's governorates still lack a stable state. German, in addition to social and political instability, and there are still difficulties facing processes of imposing authority of law, public order and justice among citizens.

### **Unemployment Challenge**

Unemployment is one of factors of political, economic and social tensions due to its negative effects on large segments of society, represented in high dependency rates and inability of Iraqi family to meet its necessary needs. Such as army and police, in addition to activities of trade, building and construction, and so on. phenomenon of unemployment did not emerge clearly during eighties and nineties due to conditions of general military mobilization that included most of economically active, but this phenomenon has clearly exacerbated and posed a serious challenge, and after occupation administration dissolved former army and laid off thousands after fall of regime, and this crisis worsened as a result of continued deterioration Industrial, agricultural and service production, and failure to take quick measures to start reconstruction of infrastructure and rehabilitate main sabotaged industries, especially capacities for production of electricity and drinking water and provision of public services. unemployment rate reached 15% until 2015, according to statistics of Ministry of Planning.

### **Poverty Challenge**

High unemployment rates, continuation of security challenge and stagnation of

economic activity have resulted in a steady rise in poverty rates for vast majority of population, and absence of a clear improvement in level of middle-class incomes. phenomenon of poverty today is one of main dilemmas facing development process after its percentage reached More than 20% of population until 2015, and increase in this percentage is due to increase in population, and consequently increase in dependency rates, increase in supply of labor force, high unemployment rate and widening of phenomenon of marginalization. real thing is despite continuous increases in cash incomes, and result was continued high rates of poverty, and this situation provided ample space to push many residents of slums to carry out terrorist acts, and also led to high rates of theft and kidnapping crimes and distorted image of social scene in Iraq.

### **Corruption Challenge**

Administrative and financial corruption leads to disruption of development process in addition to its economic and social effects. spread of this phenomenon after change process in 2003 constituted one of main challenges facing transition process in Iraq. Abroad, entry of foreign companies in implementation of reconstruction projects and multiplicity of sources of economic powers related to reconstruction to create appropriate conditions for practice of corruption, and as a result of these developments, Iraq took first ranks in corruption in reports of Transparency International.

### **High Debt Challenge**

The external indebtedness of countries represents one of most important indicators of strength of their economy. greater external or even internal indebtedness of country, more this indicates weakness of economy in that country, and certainly size of high indebtedness means that burdens of servicing this debt will also be high, and these burdens

are represented in interests paid on debts and installments Pay off debt. Serving foreign debt means deducting a percentage of state's revenues that are supposed to be directed towards serving citizen and presenting it to crediting parties. Therefore, foreign debt is considered one of most important problems or obstacles that stand in way of growth of Iraqi economy, which must be addressed once and for all before Iraqi economy can regain its breath Achieving capital accumulation, which is key element in increasing investment and thus generating income.

### **Explosive inflation**

Challenge In economic terms, inflation means a decrease in purchasing power of money or an increase in prices of a basket of goods and services compared to a certain base period. Inflation is an indication of imbalance of forces of supply and demand in economy, but it may be explosive when it takes form of a spiral as it naturally rises at levels that reach prices at increasing, continuous and large rates for successive periods that cannot be easily controlled, and this is what Iraq witnessed during previous years. With existence of fixed exchange rate systems and central policy in pricing, black market has flourished in various types of commodities in Iraq, economy has suffered from price distortions, purchasing power of Iraqi dinar has decreased significantly, spending levels have increased, savings and investment levels have decreased, which led to Iraqi economy entering a cycle of depression and decline.

### **The challenge of transitioning to a market economy**

Development failure in Iraq during previous decades proved that dominance of public sector institutions, centralization of economic planning and severe centralization of decision-making processes were unable to achieve efficiency in use of available resources and caused many serious structural

problems, and led to squandering of oil resources on wars and various problems.

### **Soft country challenge**

Most of state agencies in Iraq suffered after change process in 2003, a state of administrative chaos that contributed to perpetuating chaos that accompanied occupation administration. Academic, competence and integrity, and result was to deprive advanced technical, organizational and administrative cadres and competencies of opportunity to assume these positions and these developments led to perpetuating phenomenon of soft state, a phenomenon that expresses state of state that suffers from slackness of its administrative apparatus as a result of its inability to carry out its functions and tasks and falling victim to lack of Efficiency, spread of corruption and nepotism as well as absence of pursuit of public interest, and lack of continuous evaluation and accountability of citizens or their true representatives constitute internal laws and main specifications of soft state.

As for most important elements for advancing developmental reality in Iraq, it is concentrated in availability of human resources, availability of enormous natural resources, diversity in economic sectors and investment opportunities. On other hand, development goals in Iraq are elimination of financial and administrative corruption, reconstruction of infrastructure, privatization, and finally attracting capital.

## **8. Finance and foreign loans and their impact on development programs in Iraq**

Iraq was subjected to two shocks, first of which was drop in crude oil prices and attack of terrorist entity ISIS, which led to a significant decrease in public revenues and an increase in expenditures. As a result, financial deficit in general budget for years (2015 to 2017) increased, which required

borrowing from local and foreign sources to finance fiscal deficit. This has led to a significant increase in public debt in last three years, from \$73.7 billion in 2014 to \$111.7 billion at end of 2016.

### 8.1 Public debt details

Debts are distributed according to funding sources as follows.

		(millions of dollars)
1	Paris club dues	5979
2	Dues of countries outside Paris Club	2045
3	large trade creditors	2790
4	Multi-currency creditors	68
5	Arab Monetary Fund dues	153
	Total	11033

Source:Ministry of Planning/Grants and Loans Division 2018

### 8.2 Old foreign debt

It amounts to about (11) billion dollars, distributed according to table 1 (Ministry of Planning / Division of Grants and Loans 2018).

### 8.3 New foreign debt

Iraq obtained a number of cash loans to support budget from major parties, according to Table 2.

### 8.4 New Loans (2017)

**Table 1.** External debt in Iraq / before 13/12/ 2016

No.	Statement	Amount
-----	-----------	--------

**Table 2.** New Debt in Iraq 2010-2016

### 11. Suggested strategy

Appropriate strategy for loan repayment program must be developed with required priorities for investment projects for their sustainability, and whose profits will contribute to economic development of country. Since repayment of loans is continuous, distribution of projects is carried out in two periods: short-term (1-3) years, and medium-term (4-10) years, and greatest weight, according to table (7), is on medium-term plan because debt repayment ratios are few and no It puts a lot of weight on budget.

#### 11.1 Statistical model and its inputs

Inputs are adopted as effective indicators in economic development process, and importance of these indicators varies according to: value of required capital, time period for implementation, possibility of actual implementation. As for evaluation of

indicators, they depend on extent of their impact and success through practical experiences and theoretical framework, and ineffective indicators can be excluded in line with Iraqi investment climate. In this research, indicators are identified as follows:

**First:** Economic indicators: They include main economic activities represented by:

- A. Agricultural sector
- B. Industrial sector
- C. Commercial sector
- D. Services sector
- E. Public transport

**Second:** Social indicators, including:

- A. Educational sector
- B. Health sector
- C. Labor opportunities
- D. Housing for all categories

**Third:** environmental indicators

- A. Waste recycling
- B. Expanding green areas
- C. Alternative energy

#### 11.2 Plan and distribute projects

The projects are distributed in two phases: short-term and medium-term, and all proposed projects are investment projects, and payback years are calculated within loan repayment period. According to following tables 7-8.

**Table 7.** Suggested distribution of short-term projects by sectors

Sectors	Projects	Estimated cost/\$	Project duration	Year of implementation	Notes
Economic	Agriculture	10 million	One year	2022	project is annually renewed for a period of 20 years
	Industry: construction industry	20 million	One year	2023	project is annually repeated for a period of 3 years
	Trade: Free Zone	15 million	One year	2023	Implementation of four free zones every one year
	Public transport: supernet	10 million	One year	2023	Repeat for five years

Social	private universities	12 million	Two years	2023	Five universities are established over subsequent years
	Specialized hospital with no more than 50 beds	15 million	One year	2023	Repeat for three stages
	vertical housing	20 million	One year	2024	project will be re-implemented until 2038
Environmental	waste recycling plant	5 million	One year	2023	Implemented every year a station until 2038

Source : Researcher

**Table 8.** Proposed distribution of medium-term projects by sectors

Sectors	Projects	Estimated cost/\$	Project duration	Year of implementation	Notes
Economic	Agriculture for industrial crops	20 million	Three years	2023	project continues until 2038
	Industry: construction raw materials industry	40 million	Three years	2023	project is repeated every 3 years
	Commerce: Airport Transportation, which is a development of existing airports	35 million	Three years	2024	Implementation of two airports every three years
	Public transport: metro network	50 million	Three years	2024	It can be implemented in stages, depending on size of cities
	Grand Mall	20 million	Three years	2024	It is distributed every three years
Social	international universities	25 million	Three years	2025	Four universities are established, distributed over subsequent years
	Specialized Hospital 200 Beds	60 million	Three year	2024	Repeat for three stages
	Large vertical housing projects	50 million	Four year	2025	project will be re-implemented until 2038
Environmental	recycling and recycling plant	30 million	Two year	2025	It is implemented in major cities every three years
	Electricity generation from organic matter	20 million	Three year	2026	project is repeated for subsequent years every two years
	solar power plants	30 million	Two years	2026	Repeat every three years

Source : Researcher

## 12. Conclusion

1. Project costs have been determined and distributed over years in a way that does not affect repayment of loans.
2. It is possible that proposed projects contribute to payment of debts instead of budget
3. projects provide very large job opportunities that reduce unemployment as an alternative to central appointments that put another burden on budget
4. Exploiting alternative energy from sun and wind that achieve environmental and economic sustainability, which contributes to reducing dependence on fuel and reducing environmental pollution
5. Developing knowledge cities through reputable universities, and providing amounts spent outside country. With bringing currency to country through foreigners who study inside country.
6. Providing opportunities for treatment inside country and providing amounts spent outside country on treatment. With bringing currency to country through foreigners who are treated within country.
7. Developing healthy, low-pollution cities through public transport networks and reducing polluting cars.
8. Contribute to reducing industrial and agricultural imports by providing a local alternative.

## CLIMATE CHANGES - TRENDS AND PERSPECTIVES IN THE REPUBLIC OF SERBIA

**Abstract:** *Climate change definitely has a global character and is clearly happening and has an impact in every part of the planet Earth. In the last few decades, the climate on the territory of the Republic of Serbia has seen significant changes in most climate parameters. These changes have an unequivocal impact on the quality of life of the population of the Republic, as well as on the development of the economy. The paper analyzed the degree of change in certain climatic parameters, especially the increase in average temperature. A comparison with corresponding global trends was also made. As a comparison, two time periods were analyzed, the first from 1961-1990 and the second from 1991-2020 (in accordance with the periodicals of the World Meteorological Organization - WMO). The parameter values were observed at 26 main meteorological stations, i.e. the entire network in the Republic of Serbia, except for the stations on the territory of Kosovo and Metohija due to the unavailability of complete data for the period 1991-2020. Especially for the city of Kragujevac, the trend of changes in average temperature and precipitation was observed. In accordance with the results of the analysis, appropriate conclusions and assumptions of future trends in changes in climate parameters were drawn. As part of the final considerations, the possible impacts of climate change on the quality of life of the citizens of the Republic of Serbia, as well as on the living world in general, are listed.*  
(Times New Roman, 10pt, Italic, align Justify).

**Keywords:** *Climate change, Republic of Serbia, Global warming, changes in climate parameters*

### 1. Introduction

Climate, in fact, represents a kind of product of the climate system. The Earth's climate system is a complex dynamic system that consists of the five most important components: atmosphere, hydrosphere, cryosphere, lithosphere and biosphere, as well as their mutual reactions.

Climate changes, in a broader sense, are the

consequences of complex abiotic and biotic processes and are reflected in statistically significant changes in climate parameters over longer or shorter periods.

The phenomenon of global warming caused the first scientific polemics during the seventies and eighties of the last century. Today, just a few decades later, major changes in the entire climate system of planet Earth are an almost undeniable fact that is

---

Corresponding author: Saša Jovanović  
Email: [dviks@kg.ac.rs](mailto:dviks@kg.ac.rs)

contested by relatively few researchers. A somewhat more intense controversy is being waged over the real causes of this potentially catastrophic consequence for life on Earth. Nevertheless, the great coincidence with the extreme increase in the number of inhabitants on the planet and accelerated technological development as well as the enormous increase in energy needs indicates that the anthropogenic factor is dominant in terms of influencing dramatic changes in climate parameters [Jovanovic et.all].

Life on planet Earth is, among other things, possible due to the existence of the natural greenhouse effect. However, the greenhouse effect, which was a blessing for the planet Earth for millions of years, is gradually turning into a serious threat due to certain human activities. With accelerated

industrialization and rapid human population growth, greenhouse gas emissions—caused by the burning of fossil fuels, deforestation and land clearing for agriculture, and many other activities—are constantly increasing. In the last 100 years, greenhouse gases were emitted into the atmosphere significantly more intensively and faster than natural processes could remove them. The diagram shown in Figure 1 shows changes in the mean global temperature, changes in the concentration of carbon dioxide in the atmosphere, as well as variations in solar activity [www.co2.earth]. The coincidence between the increase in CO<sub>2</sub> concentration and the increase in global temperature is more than obvious. Also, it can be concluded that solar activity did not significantly change its intensity.

**Figure 1.** The connection between the change in mean global temperature and the increase in CO<sub>2</sub> concentration in the atmosphere [www.co2.earth]

It goes without saying that the climate of any climate on the planet is one of the most influential factors on the quality of life of

people, as well as on all economic activities. In addition, climate change is one of the five most significant factors that lead to the loss of

biodiversity, endangering many plant and animal species, whose survival depends mostly on their speed of adaptation to new conditions. And in this sense, these processes lead to the disruption of many segments that make up the quality of life of every inhabitant of this planet.

## 2. Changes in climatic parameters on the territory of the Republic of Serbia

The climate of Serbia, as a country located in the southeastern part of Europe, can be described as moderate-continental with more or less pronounced local characteristics. Spatial distribution of climate parameters is determined by geographical location, relief and local influence, as a result of a combination of relief, air pressure distribution on a larger scale, terrain exposure, presence of river systems, vegetation, urbanization, etc. Among the geographic features that characterize important synoptic situations important for the weather and climate of Serbia, we should mention the Alps, the Mediterranean Sea and the Gulf of Genoa, the Pannonian Plain and the Morava Valley, the Carpathians and the Rhodope Mountains, as well as the hilly mountainous area with valleys and plateaus. The predominant meridional position of the river basins and the plains in the north of the country enable the deep penetration of polar air masses to the south [[www.hidmet.gov.rs/klimatologija\\_srbi je.php](http://www.hidmet.gov.rs/klimatologija_srbi je.php)].

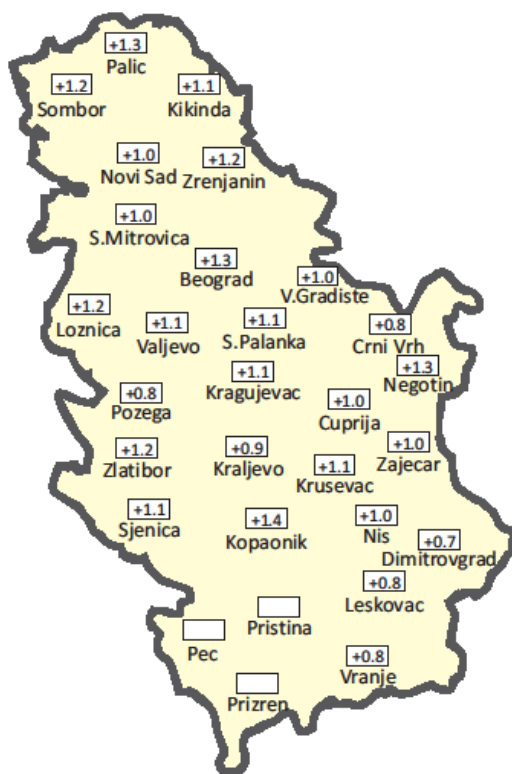

The characteristics of the climate in the territory of the Republic of Serbia have also undergone significant changes, especially in the last few decades. The size and trend of these changes depend on the observed climate parameter, but certainly the most pronounced change was observed in the increase in air temperature in all periods of the year (with different intensities), as well as in the entire territory of the Republic of Serbia. In this

part, an analysis of the change in certain climate parameters was performed, as well as the relationship with certain global climate changes.

Data from 26 synoptic stations throughout Serbia were analyzed, excluding the stations located in Kosovo and Metohija due to incomplete data. The structure of the observed stations is dominated by stations with a relatively low altitude (< 300 masl) - there are 19 of them. Three stations belong to the altitude zone between 300 and 500 masl, and the remaining four stations are at positions with an altitude higher than 1000 masl. Values for two thirty-year time periods (according to WMO periodicals), namely: 1961-1990 and 1991-2020, were observed and compared. As a result of the analysis, Figure 2 shows the change in mean annual temperature for each of the observed stations. It can be clearly seen that there has been an important change at all stations - an increase in the average annual temperature. The average increase in mean annual temperature for all stations is +1.06 °C. Only a few stations recorded an increase of less than one degree Celsius. It can also be seen that the biggest change, in terms of temperature, took place at Kopaonik (+1.4 °C), the station with by far the highest altitude (1710 masl). Of the remaining three mountain stations, two more (Zlatibor and Sjenica) also record above-average warming on an annual basis. Only the mountain station Crni Vrh has a below-average increase in mean annual temperature (+ 0.8 °C). Among the other trends, it can be pointed out that the largest number of stations in Vojvodina, as well as Belgrade, which is located on the border of this northern autonomous province, have an above-average growth in Tsr. The south of Serbia, on the other hand, generally has a below-average increase in temperature. In the cities of central Serbia, warming around average values (1.0 - 1.1 °C) was recorded in most cases. The region where the Negotin station is located showed a certain specificity of changes in

climate parameters. Until now, this region has shown certain specificities of the climate and important differences and characteristics

compared to relatively close localities.

**Figure 2.** Changes in mean temperatures at the observed stations for the two analyzed periods

The change in temperature for the observed two periods at the annual level is not evenly distributed across all seasons. Figure 3 shows the observed change in temperature for four seasons: winter (January, February, December), spring (March, April, May), summer (June, July, August) and autumn (September, October, November). It should be noted that only in the case of the winter period, the months from the calendar year, which are not in a three-month sequence, were taken. What is unequivocally observed is a markedly higher increase in summer temperatures compared to the remaining three seasons. This increase corresponds to a significant increase in the number of days

with temperatures higher than 30 °C or 35 °C at all observed stations [[www.hidmet.gov.rs/klimatologija\\_srednjaci.php](http://www.hidmet.gov.rs/klimatologija_srednjaci.php)], which unambiguously affects the health of the majority of the population, the working abilities of employees, as well as the living world in general.

In comparison with the global increase in temperature [[www.ncei.noaa.gov/access/monitoring/monthly-report/global/202213](http://www.ncei.noaa.gov/access/monitoring/monthly-report/global/202213)], it can be noticed, at first glance, that the air temperature over the territory of Serbia has changed more than the planetary average. However, when calculating global deviations, air temperatures above water surfaces (seas

and oceans) have a significant share and in those locations, due to the temperature inertness of the water mass, as a rule, the effect of global warming is smaller (example of the month of March 2023 for the Northern Hemisphere: warming over the seas and oceans it was +0.84 °C, and over land surfaces as much as +2.66 °C, while in the

forest it would be, due to the dominance of water surfaces, +1.62 °C). In this sense, it is relatively difficult to compare the increase in temperature on the territory of the Republic of Serbia with the global average, but it can be said unequivocally that the warming is significant and has an accelerating trend.

**Figure 3.** Temperature rise by season

When we talk about the change in the precipitation regime, there was not such a degree of change as in the average temperature, but it can be said with a high degree of certainty that there was a noticeable increase in the amount of precipitation. That average increase during the year, at the level of the Republic of Serbia, amounts to 30.44 mm, that is, almost 5% compared to the previous reference period (1961-1990). This increase indicates the fact that the increase in temperature, at least for the time being, caused a corresponding increase in the amount of precipitation and that this is one of the possible natural defense mechanisms. This fact is somewhat contrary to the majority of predictions that a warmer and drier climate awaits these areas in the future. However, due to increased evaporation due to higher temperatures, the question is whether the

increase in precipitation is sufficient compensation for that process, so that the possible effects of precipitation deficit can certainly be discussed. The largest absolute deviation, i.e. increase, was again recorded at the station on Kopaonik (+119.3 mm), and in percentage terms in Novi Sad (17.2%). Figure 4 shows the distribution of changes in the amount of precipitation at the observed stations.

At the stations in the north of Serbia, in Vojvodina, an above-average increase in precipitation was recorded in relation to the entire republic, and below-average in the east. In addition, the amount of maximum daily precipitation increased at a larger number of stations (on 21 of the observed 26), as well as the frequency of days with precipitation of over 10 mm (20 of the observed 26).

**Figure 4.** Changes in the annual amount of precipitation at the observed stations for the two analyzed periods (mm)

With the aim of a more detailed overview of the trends in average temperature changes for the city (station) of Kragujevac, a

comparative analysis was performed for the two mentioned periods (Table 1), but on a monthly basis.

**Table 1.** Mean monthly temperatures and amounts of precipitation for the two observed periods for the Kragujevac station

	Tsr, [°C]												
	Jan.	Feb.	Mar.	Apr.	May	Jun.	Jul.	Aug.	Sep.	Oct.	Nov.	Dec.	Year
61-90	-0.1	2.2	6.3	11.3	16.1	19	20.6	20.2	16.7	11.4	6.4	1.8	11.0
91-20	1.3	3	7.1	12.1	16.7	20.7	22.6	22.3	17.3	12.2	7.4	2.4	12.1
Change	1.4	0.8	0.8	0.8	0.6	1.7	2	2.1	0.6	0.8	1	0.6	1.1
	Amount of precipitation, mm												
	Jan.	Feb.	Mar.	Apr.	May	Jun.	Jul.	Aug.	Sep.	Oct.	Nov.	Dec.	Year
61-90	41.1	38.7	44.4	49.4	73.8	84.7	68	53.3	48.1	38.2	48.2	47.6	635.5
91-20	42.1	40.1	46.6	54.3	70.3	77.2	65.8	56	53.6	54.2	44.6	47	651.8
Change	1	1.4	2.2	4.9	-3.5	-7.5	-2.2	2.7	5.5	16	-3.6	-0.6	16.3

The diagram in Figure 5 shows the distribution of changes in average monthly temperatures for each of the 12 months during

the year, and the diagram in Figure 6 shows the change in monthly precipitation.

**Figure 5.** Temperature change by month for Kragujevac station

**Figure 6.** Change in the amount of precipitation by month for the Kragujevac station

The distribution of the increase by month (Figure 5) shows that several months, primarily the summer months - June, July and August, as well as the winter month of January - show a more significant increase in temperature than the average annual increase. This applies especially to July and August.

On the other hand, several months (May, September and December) have a relatively small change in mean temperatures. When it comes to precipitation, on a monthly level, for the city of Kragujevac, the biggest change is observed in the months of October (precipitation surplus of 16 mm) and June

(deficit of 7.5 mm). If we look at the change at the annual level, it can be seen that it is practically equal to the October increase, while the other months, in summary, are in balance for both observed periods (1961-1990 and 1991-2020).

### 3. Conclusion

Climate change, and above all global warming, represent a big and difficult problem for today's civilization. These changes are mostly caused by human activities, and especially as a result of the excessive emission of greenhouse gases. An increase in average temperatures has been recorded practically in every place on planet Earth, but this change is certainly uneven. The

aim of this paper was to indicate the scope and trends of climate change in the territory of the Republic of Serbia, as the central part of the Balkan Peninsula. In the paper, according to the presented data, the trend of a serious and accelerated increase in average temperatures, as well as a moderate increase in the amount of precipitation, is clearly indicated. There is also a clear trend of a marked increase in temperatures in the summer months and a more moderate one in the other seasons. This type of change, among others, has a special impact on the health, quality of life and work abilities of people in that time period. At the end, a shorter, more detailed analysis was given, by month for the city of Kragujevac regarding the change in mean temperature and amount of precipitation during the year.

## MODELING THE OPERATION OF MULTI-SCENARIO SYSTEMS

**Abstract:** *The relevance of the declared subject of this research work is determined by the need to develop and implement software for users of various skill levels, as well as to create effective multi-scenario systems for describing processes occurring in multiple environments. The primary purpose of this scientific research is to study the principles of modeling the functioning of multi-scenario systems. The basis of the methodological approach in this scientific study is a combination of methods of system analysis of the principles of creating models for the functioning of multi-scenario systems with an analytical study of the prospects for building monolithic architectures of online learning systems. In the course of this scientific research, results were obtained that describe the principles of modeling a multi-scenario online learning system, as well as illustrating the features of the interaction of individual subsystems within a single multi-scenario system, taking into account the effectiveness of each of the subsystems performing the functions assigned to it within a single multi-scenario system. The results obtained reflect the fundamental principles of building the operation of multi-scenario systems in the conditions of the need to process a large amount of data, taking into account the difference in user characteristics, their levels of preparedness, as well as the variety of user requests that have a significant impact on the process of creating a multi-scenario system model and its functioning in constantly changing environments. External conditions. The practical significance of the results obtained in this scientific study, as well as the conclusions formulated on their basis, lies in the possibility of their application in the development of information presentation systems, the operation of which is based on the principle of multi-scenario, in order to provide the option of choosing modes of use and their automatic adjustment.*

**Keywords:** *Adaptive Interface; Monolithic Architecture; Microservice Architecture; Learning Systems; Information Systems; Software.*

### 1. Introduction

The problem with this scientific research is that today there is a tendency to transfer many areas of activity online, which

necessitates the search for adequate opportunities for the mass use of modern computer systems and the creation of maximum ease of use. In this context, the provision of convenience in choosing the

---

modes of using computer systems and improving the quality of their settings are the fundamental factors for the success of modeling multi-scenario systems. The problem of modeling the quality of modern information systems was considered in a scientific study by V.A. Monakhov and V.Ye. Mager (2020). In the course of the joint research, the scientists concluded that each type of scenario for the system's functioning is characterized by specific steps necessary to determine these scenarios, as well as calculate their reliability and implementation time. According to the researchers, such systems scale well, while their accuracy does not deteriorate when the base scenarios change and the base set of components increases.

The topic is developed by a group of authors represented by V.V. Gribova, S.V. Parshkova, L.A. Fedorishchev (2022), who considered several problematic aspects of the development in a joint scientific study and implementation of adaptive user interfaces. Scientists concluded that today the expansion of interfaces for knowledge base editors is an urgent task in knowledge engineering. According to scientists, taking into account the difference in the level of training of experts in the field of modern information technologies, the convenience of an adaptive user interface is a fundamental aspect in assessing the quality of their development while providing prospects for including experts in the process of developing knowledge bases. For its part, the team of researchers represented by T.M. Zubkova, L.F. Tagirova, V.K. Tagirov (2019), considered in a joint scientific study the problems of prototyping adaptive user interfaces of application programs using artificial intelligence methods. Scientists note that the development of automated information systems allows you to select a user interface, taking into account the characteristics and conditions of a particular technical specialist. According to the

researchers, the practical application of artificial intelligence methods for selecting a user interface when designing application programs will make it possible to consider the specific properties of a particular user audience as much as possible.

In a joint scientific study, A.F. Verlan, M.F. Sopel, and Yu.O. Furtat (2014) raised the problem of organizing an adaptive user interface in automated systems. The scientists concluded that taking into account the cognitive characteristics of the user of a multi-scenario system and the specifics of work processes determines that the user interface adaptation system has the property of flexibility, which allows it to be effectively used in various fields of activity, in particular, in decision-making systems, in the development of learning processes, and also in automated control systems for workflows occurring in a wide variety of fields of activity. Building dynamic adaptive interfaces using artificial intelligence technologies is considered in the scientific study by I.M. Ismagilova and S.S. Valeyev (2018). The result of the research conducted was the conclusion of the authors that the practical use of the developed algorithms for adapting the user interface system by redistributing tasks between operators, taking into account their personal characteristics, can improve the efficiency of solving control problems. Researchers point to the fact that it is the quality of the interface of user systems that determines the effectiveness of the interaction between system data operators and the systems themselves at all stages of their management. The main goal of this research work is to study the fundamental principles of modeling the operation of multi-scenario systems used in various branches of modern science and technology and the field of education and training.

## 2. Materials and Methods

The methodological approach in this scientific study combines system analysis methods of the fundamental principles of modeling multi-scenario systems with an analytical study of the prospects for building monolithic architectures of online learning systems. The main research is preceded by the creation of a theoretical base, which includes an analysis of the results of research by several researchers on the problems of modeling multi-scenario systems and their practical application in various fields of science, technology, and the construction of an education system. A systematic analysis of the main aspects of creating models of multi-scenario systems made it possible to identify the main directions of their practical application, as well as to determine the real prospects for creating an effective software model of online learning for its subsequent use in various areas where there is a need to ensure high-quality interaction between users online. In addition, the analysis of a software multi-scenario system includes several aspects that determine the parameters of study within the system itself. At the same time, a systematic analysis of the sequence of operations for creating a model of a multi-scenario system includes an analysis of this system's critical functional requirements and modes of operation.

An analytical study of the real prospects for building monolithic architectures of online learning systems made it possible to analyze the features of user behavior in direct interaction with a multi-scenario system. At the same time, they were diagnosing the potential possibilities of building monolithic architectures that mainly affected non-specific and specific symptoms, individually and in their direct combination, within the framework of interaction in a single multi-scenario system. The selected combination of scientific research methods determined the presence of specific stages of the work.

At the first stage of this scientific research, the fundamental principles of constructing a

software multi-scenario learning model were considered. In the future can be used as a base for developing similar types of models of multi-scenario systems. The fundamental principles of creating a model of a multi-scenario system of this type are presented based on its subsequent functioning, as well as the interaction of an individual user and groups of users with the system itself. The main problems of interaction of this kind and ways to overcome them are considered.

In the second stage of this scientific research, a multi-scenario distance learning system model was presented and considered, indicating the main subsystems and assessing the features of functioning, both subsystems and the entire system as a whole. Graphic displays of the entire system and its individual structural elements are presented in the corresponding diagrams. The principles of the interconnection of particular aspects of the system were also shown in the context of their functions within a single multi-scenario learning system.

At the final stage of this scientific study, an analytical comparison of the results obtained during it with the results and conclusions of several researchers involved in the scientific development of issues of creating models of multi-scenario systems for their subsequent practical application in various industries was carried out. This made it possible to clarify the results of this scientific study and formulate, on their basis, final conclusions that act as their logical reflection and sum up the entire range of scientific research in the field of studying the principles of modeling multi-scenario systems.

### 3. Results

Today, due to the spread of the COVID-19 coronavirus pandemic, as well as several threats of a different nature, the problem of implementing the monolithic structure of the online learning system, as well as several

other data exchange processes and online differences, is relevant. At present, the issues of increasing the efficiency of data exchange, the development of computer training, and the introduction of methods of collective and individual training are the most relevant in the activities of educational centers in many countries of the world. In this context, developing a software learning model for its subsequent use in organizing online learning in various educational institutions, as well as in other structures where there is a need to ensure high-quality interaction between users online, is highly relevant. This scientific study proposes considering the program learning model, which can be used as a basic model for developing various types of multi-scenario systems in the future. When creating the interface, differences in the level of user training were considered, which led to the maximum adaptation of the model to various types of user characteristics. The basic concept of developing the proposed model of a multi-scenario system was based on the following principles:

1. The system's maximum possible and permissible adaptation to users' needs.
2. Accounting for differences in personal and psychophysical differences in the state of users, as well as differences in the level of technical training and health status at the time of using the system.
3. Adjustments to the model's functionality del each time users log into the system.
4. Possibility of upgrading the user's skills as his interaction with the system develops.

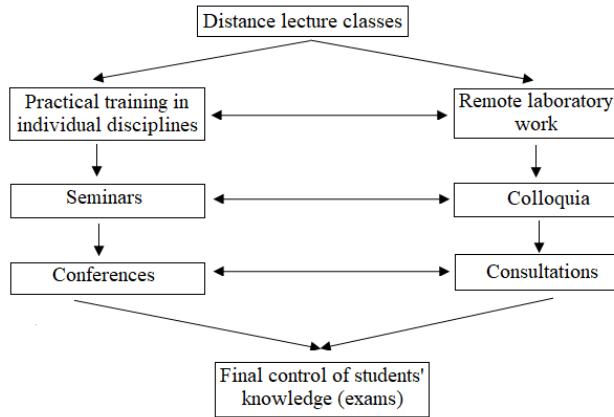

Adaptation of the system to the needs of users was implemented by setting the system services for specific user requests. In contrast, the user model is created directly when he first accesses the system, after which the necessary adjustments are made to

it. At the same time, the system services are configured by placing certain information, tips on them, and a significant amount of additional information stored in particular databases. Taking into account the level of training of users and their personal differences implies an emphasis on differences in the level of their information competence, which is expressed in the difference in skills in handling computer equipment. In addition, a system of tests for determining user competence is provided, which involves determining differences in the training of users in the field of knowledge of hardware and software computer software (Mistrik et al., 2017). The need to adjust the model's functionality at each user login to the system is determined based on information obtained by clarifying the level of information competence of a particular user, the basis for which is the analysis of the actions performed by him when entering the system. Similarly, there is a test assessment of his psychophysical characteristics at a particular time.

Improving the user's skills in the development of his interaction with the system, including its direct adaptation to various aspects of system software management, is achieved through the introduction of a system of assessment tests, training events, and a system for explaining complex aspects of using information stored in the system's knowledge bases. Analysis of the results of passing tests by users is the basis for making decisions on changing the structure of user access to the system, as well as supplementing and expanding, if necessary, the information array contained in the knowledge base of the multi-scenario system (Dong and Nguang, 2020). Ensuring many options for user access to the architecture of a multi-scenario system is implemented by constantly monitoring user access levels, with the provision of rights to a specific system user that provides access to information arrays of various levels

(Boucher and Yalcin, 2006). In this case, the level of user access is determined depending on the level of his general training in computer skills and the level of mastery of the software disciplines included in the online learning system. All changes in the level of user competence are tracked within

the system. As the user's competence increases, the level of his user access to individual nodes and elements of the system increases. Figure 1 shows a schematic representation of a multi-scenario e-learning system model allowing distance learning programs to be implemented.

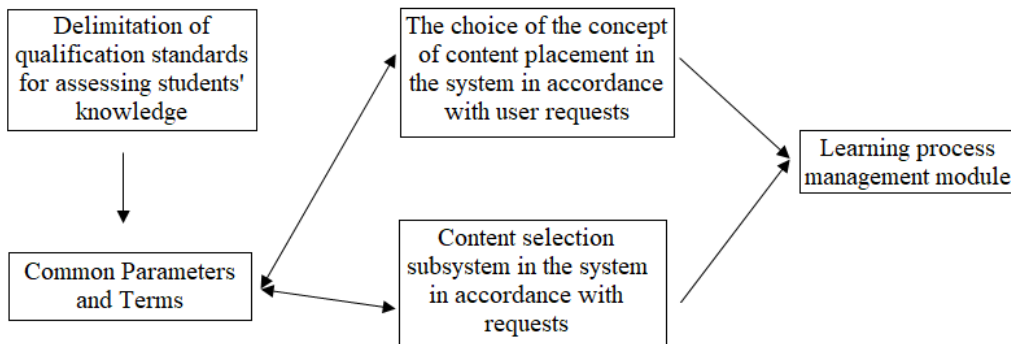

**Figure 1.** Model of a multi-scenario system of distance e-learning

In order to provide a multi-level system of access to a multi-scenario distance learning system and to adapt the system itself to the requests and needs of users, this model provided:

- subsystem for choosing widely used and most frequently used concepts and terms;

- content selection subsystem.

These elements are presented in Figure 2, which shows the interconnection diagram of the central nodes of the multi-scenario distance learning system.

**Figure 2.** The central nodes of the multi-scenario distance learning system

The module for distinguishing qualification standards for assessing students' knowledge is designed to determine differences in the level of computer training of users and create the necessary basis for the subsequent assessment of the level of their knowledge after completing a training program within the system itself. In this module, systems of tests are formed to test students' knowledge of the material presented and the main directions and volumes of providing advisory information to improve system users' skills.

The module of the most widely used terms and concepts includes the placement of the most frequently encountered user queries to create conditions for a quick search for information on given queries. This simplifies the process of searching for information and reduces the time it takes to provide it, which positively affects the organization of the learning process as a whole, increasing its final efficiency.

The module for selecting the concept of content placement by user requests is designed to speed up the search for the necessary information. It acts as a link between the content selection subsystem and the subsystem for matching between user requests. The concept of content placement may undergo changes depending on the change in the frequency and nature of search queries.

The content selection module, by the most common search queries, provides the selection of information that is most relevant to user queries. The choice of content occurs automatically, to the need of users for information of one kind or another.

The learning process management module is responsible for coordinating the interaction of all subsystems in a single distance learning system. The functions of this module include receiving information on changes like user requests, making decisions regarding changes in the structure of the

distribution of information related to the educational process and the supply of educational materials, as well as making managerial decisions regarding other aspects of building the educational process.

Modeling the operation of a multi-scenario system implies the need to break it down into several separate services that perform specific functions within the framework of the functioning of a single system. The system management function is assigned to a particular module that performs coordinating functions (Li et al., 2021). In case of problems in the functioning of one of the modules, measures should be taken to ensure the reliability of the functioning of the entire system as a whole and to resolve the situation.

Creating a multi-scenario system model implies the development of an interface that is maximally adapted to the qualifications of various categories of users. The maximum possible adaptation of the interface to the different qualifications of users allows you to solve several issues effectively:

- achieving ease of system management by users of different levels of preparedness;
- provide access to the system to users with low qualifications in the field of handling computer equipment and software;
- ensuring the choice of the display scenario when changing the system parameters;
- the possibility of improving the skills of users, as well as studying the capabilities of the system by directly entering it;
- the possibility of increasing the options for system management scenarios by adding new functionality.

Changing a multi-scenario system's operation is possible at any stage of its functioning, depending on changes in the

external environment's parameters that directly affect the system and its functioning. For this reason, a multi-scenario system's component must be able to handle all possible failure scenarios correctly. At the same time, they should be able to ensure long-term waiting for orders on system management issues, as well as be able to return to regular operation promptly as a result of the restoration of the counterparty in the case of limited centralization of functionality (with a large number of databases, an excessive number of contexts, which implies the impossibility of achieving synchronous interaction of several microservices) (Rouwet, 2022). Problems of this kind can be solved by abandoning the constant data consistency, where probable errors are either handled by more complex system architecture or by using data obtained from monitoring the current state of the multi-scenario system. The functioning of a multi-scenario distance learning system implies the presence of three main blocks of the system around which all its work is built:

1. Lecture presentation of training material.
2. Independent work of students.
3. Final check of the level of knowledge and assessment of students' competence (qualification).

At the same time, providing the possibility of multiple access to the system implies the presence of a large number of interfaces for users of various categories: students, teachers, and system administrators. To implement this kind of capabilities, various microservices are used, in particular:

- personal account of the system user;
- online training courses in specific disciplines or areas of knowledge;
- systems of tests and verification of knowledge in certain sections.

Each of these microservices has its own features of providing information and providing users with access to them,

depending on the level of access. For each of these microservices, a separately located virtual server is programmatically provided, for which a particular resource is allocated, the volume of which is maintained in strict accordance with the fundamental principles of distributing the load on the system as a whole and its individual nodes in particular, as well as maintaining the necessary systems of tests and verification of knowledge in certain sections of the load balance in the system (Somerville, 2015). At the same time, the adjustment of the module for maintaining the balance of the allowable load is carried out at the server core level and involves the practical use of software decision-making algorithms based on the received data describing the system's current state. The category of data of this kind should include the following: the type of protocols used, the total amount of system memory and the average parameter of the used RAM, the average server response time, the average response time of the information database, and the average page load time.

The solution of possible problems of the microservice architecture of a multi-scenario system is achieved by synchronizing the functioning of individual nodes of the system, as well as by a consistent transition from monolithic system architecture to a distributed microservice architecture, the functioning of which is based on more minor constituent elements consisting in continuous structural interaction. Eliminating problematic situations that arise in operating individual elements of a multi-scenario system contributes to its efficient functioning for a long time and the highest quality satisfaction of user requests.

## 4. Discussion

The topic of modeling the operation of multi-scenario systems is discussed in the scientific study by V.R. Barinov (2016) on using use case programs to develop modern

software use cases. The scientist notes that a use case should be understood as a particular approach to describing the interaction of a system with the external environment. According to the scientist, in the practical application of a multi-scenario system, the parameter of the frequency of its use is of crucial importance from the point of view of the prospects for subsequent improvement in the quality of the final result of the entire project. The researcher's conclusions correlate with this scientific study's results in evaluating the use case concept. In contrast, the conclusion regarding the frequency of use of the model seems controversial since the final results of the entire project depending on several other parameters besides the specified one.

In turn, A. Garces (2021), in his scientific study of modeling, operation, and analysis of DC networks, touches upon the issues of modeling the operation of multi-scenario systems. The scientist concluded that effective management of a multi-scenario system is possible under the condition of effective and coordinated functioning of all elements included in the system. The author notes that testing of the software used has shown that the introduction of hardware and software in the process of creating a model of a multi-scenario system implies the need to monitor at each stage the accuracy of the execution of commands by the elements of the system, which ultimately results in the achievement of the high final quality of the functioning of the entire system. In general. The researcher's conclusions directly correlate with the results obtained in this scientific work, expanding them in the context of software testing issues. This opens up prospects for further scientific research in this direction.

The topic was developed by a team of authors represented by R. Bansal, J.J. Justo, F. Mwasilu (2022) in a collaborative scientific study of modeling and dynamics control features in renewable energy

microgrid systems. The team of scientists draws attention to the fact that the use of the multi-scenario approach allows for generalizing and clarifying the results obtained during the diagnostics of microgrid systems through the use of the logical input method. According to the authors, the practical application of fuzzy logic methods makes it possible to form certain systems for assessing the actual state of the microgrid system with renewable energy sources and build a system of cause-and-effect relationships based solely on data obtained during diagnostic measures. The conclusions of the research team are controversial because the assessment of the actual state of the microgrid system is possible only when using a sufficiently large amount of initial data that is not always available.

T. Noergaard (2012), in a scientific study of the fundamental principles of creating an embedded systems architecture, touches upon the problems of building multi-scenario systems and monitoring the quality of their functioning. The scientist concluded that using many options for the placement of embedded equipment, in particular, in e-learning systems, increases the variability of using the system and obtains a significant number of results that are not directly related to each other. The scientist draws attention to the fact that the coordination of the distribution of the load on all elements of the e-learning system can significantly improve the quality of its functioning while greatly complicating the whole process. The researcher's conclusions do not directly contradict the results of this scientific work. At the same time, the assertion that load coordination improves the system's quality requires additional verification in natural conditions.

At the same time, a team of researchers represented by A. Puder, K. Romer, F. Pihofer (2005), in joint research work, considered several problematic aspects of building an architecture of distributed

systems. According to scientists, the development and implementation of middleware allow you to effectively connect distributed applications with hardware-type platforms, operating systems, and network data distribution technologies. Scientists note that the operation of multi-scenario systems provides the ability to manage large amounts of data and use them to solve the problems of developing data distribution systems with many access options. The scientists' conclusions coincide with this scientific study's results in using multi-scenario systems to manage large amounts of information. In contrast, the conclusion regarding the combination of different software types seems controversial since the realities of each specific situation determine this.

A similar topic is considered in the scientific work of the research team J. Wang, C. Wang, M. Xin, Z. Ding, J. Shan (2020), devoted to studying the principles of joint control of multi-agent systems. In the course of the scientific research, the authors concluded that the functioning of systems formed by ensuring the effective interaction of several intelligent agents should be organized with a wide variability of decisions made. This will allow serving a significantly more significant number of users in a given unit of time, as well as achieving higher rates of satisfaction of user requests. The opinion of the researchers does not fundamentally conflict with the results obtained in this scientific work.

S. Batley (2007) conducted an independent scientific study of the fundamental principles of data architecture for information professionals. The scientist concluded that the design of modern information systems must necessarily include the creation of adaptive interfaces that are intuitive to users, as well as maintaining the performance of relevant information tasks at the proper level that meets the most common user requests. According to the researcher, this can be fully

implemented through the creation of effective models of the functioning of multi-scenario systems, including large amounts of data and tools for their recognition and timely practical application for a qualitative solution of the entire range of tasks assigned to systems at the stage of their design and development. . The conclusions of the researcher supplement and expand the results of this scientific work, while attention should be paid to the issues of using a large amount of data in the development of multi-scenario systems, as fundamental in this context.

A team of authors represented by I. Mistrik, R. Bahsson, P. Eeles, R. Roshandel, M. Stal (2014) conducted a joint scientific study of the basic principles of software architecture for cloud use of big data. Scientists note that the effective functioning of multi-scenario system models can effectively solve the issues of cloud storage of large amounts of data and increase the speed of operations performed. The authors concluded that rethinking specific software architectural solutions can speed up the data processing process and increase the volume of operations performed, which will satisfy several functional and non-functional requirements for the system directly related to the amount of data and the speed of their processing. The researchers' conclusions correlate with this scientific study's results in resolving data storage issues using multi-scenario systems. In contrast, the problems of accelerating data processing require additional study.

The issues of system architecture modeling were considered in a scientific study by P. Roques (2020). In the course of research work, the author concluded that a simple and understandable user interface provides ease of use of computer programs and is extremely important in ensuring that information is communicated to users with varying degrees of training. According to the researcher, intuitive model editing and significantly increased user interface

browsing capabilities improve modeling quality and productivity, enabling system engineers to focus on designing improvements to the system and its architectural solutions. The researcher's conclusions are entirely consistent with the results obtained during this research work.

## 5. Conclusion

The process of building a model of a multi-scenario system implies the need to consider several factors that affect the efficiency of the functioning of individual subsystems, individually and within a single system, in the context of searching and processing information, as well as satisfying key user requests. In addition, the functioning of subsystems within a single multi-scenario system involves control in the system of processes for distinguishing qualification standards for assessing the knowledge of students using this system, accounting and saving terms and parameters that are important in terms of system speed as a whole and the level of satisfaction of user requests, and also the choice of the concept of content placement in the system by user requests and its provision. Modeling a multi-scenario system allows one to substantiate the choice of the main scenarios of its behavior under changing external conditions. These conditions include a

change in the user's qualifications in the case of a multi-scenario online learning system, as well as changes in the volume of information entering the system and processing by the system. In addition, the change in the frequency and nature of user requests is essential, which, in turn, implies the need to adjust the information stored in the databases.

The effective functioning of a multi-scenario system is facilitated by developing a software interface that is maximally adapted to users of various levels of training. Such an interface ensures the efficiency of use, allowing users with different skill levels to access the necessary information. The use of the principle of multi-scenario in the development of the system proves its practical effectiveness in developing software systems and multi-interface systems intended for the broadest user audience. In particular, the model of a multi-scenario learning system can be applied in practice when developing learning systems with many possible scenarios for learning in a wide variety of areas. In contrast, the principle of interaction and information exchange between the individual modules of the system remains unchanged. However, the aspect of verification of data entered into the system needs additional research

## A STUDY ON IMPORTANCE OF ENTREPRENEURSHIP SKILL DEVELOPMENT PROGRAMME (ESDP) FOR SUSTAINABLE GROWTH OF MSMEs IN INDIA

**Abstract:** *The Entrepreneurship and Skill Development Program (ESDP) was launched by the Ministry of Micro, Small and Medium Enterprises (MSME) to build the capacities and skills of Indian entrepreneurs, both current and future ones. One of the many initiatives offered by the Ministry of MSME, it aims to increase the capacity of young people to take on challenges and create successful businesses across the nation. There are various activities under the plan that are coordinated in Industrial Training Institutes (ITIs), Polytechnics, and other specialized institutions/business colleges where there is talent available to influence teenagers toward self-employment. One of the essential elements for the development of any area is having an adequate supply of skilled human resources. The lack of skilled resources in the case of the Indian MSME area has undoubtedly prevented the region's development in a satisfactory manner. It is obvious that there are skill gaps, and they require special attention. The area has a lot of employment potential, but it isn't ready to act in that way because there aren't enough skilled workers, which is a big problem. It is often claimed that India has a segment profit and that, unlike other developed nations where reliance proportion is significantly high, India's is low. This substantial benefit needs to be converted into skilled labour so that the market demand can be met. Today, the problem is fundamentally linked to the employability problem rather than the lack of employment opportunities. This is a major problem in many developing countries where young children are taught, but they need skills that will help them become prepared for the workforce. Hence, the current study has been done with a view to give an analytical outline of the importance of ESDP for the sustainable growth of MSMEs in India and it includes both primary and secondary sources of data.*

**Keywords:** *Entrepreneurial Skill, Skill Development, Sustainable Growth, ESDP, Employment Opportunities, Programmes & Schemes and Government Initiatives*

## 1. Introduction

Entrepreneurs are essential to any economy because they have the knowledge and tenacity to anticipate needs and present brilliant, novel ideas to the public for purchase. Entrepreneurship that succeeds in building a startup despite the risks and difficulties is rewarded with benefits, notoriety, and continues to gain knowledge. Failure in entrepreneurship results in bad luck and less ubiquity in the business sectors for those involved. The Micro, Small and Medium Enterprises (MSME) sector is extremely important to home owners and plays a crucial role in the economic development of most countries around the world. In this way, it is a well-known undeniable fact that MSMEs significantly advance the growth of the overall economy. This commitment will accelerate the growth of the GDP, improve living standards, and slow down the pace of state formation. As a result of these facts, every economy should increase the benefit that such an endeavor provides. Skills are the facts that can only be verified through actions or a unique performance. Teaching is how skills are created and acquired. However, achieving sustainable business development may be a task requiring special abilities. Given the aforementioned circumstances, business owners who possess additional entrepreneurial skills are more likely to see their company succeed.

The most popular method for improving an entrepreneur's abilities to create, manage, and organize a business venture while taking into account the risks involved is through entrepreneur development. The goal of entrepreneur development is to increase the number of business owners. The Ministry of MSME has been organizing a few entrepreneurial and skill development programmes for current and potential entrepreneurs in order to create successful ventures. The MSME Service has sent out several programs, one of which is the

Entrepreneurship Skill Development Program (ESDP). In a nation like India, where the population is more than 45% between the ages of 20 and 35. India, which accounts for 1.224 billion people, or 17% of the global population, is evolving into a "youth reservoir." According to United Nations estimates from 2009, India will overtake the People's Republic of China as the world's most populous nation by 2050. Although India has a well-established system of vocational education, its youth are not properly equipped with the skills that the modern economy demands. The relevant government has stated that by 2022, the MSME sector is expected to require roughly 150 million qualified workers. Small and medium-sized businesses (SMEs) play a key role in economies, contributing to poverty reduction and employment, as well as sustainable development. In order to address the demand for skilled labour, India has developed a method of entrepreneurial development initiatives. The information for this study was gathered through secondary sources. The micro, small, and medium-sized business sector has developed a number of programmes in the areas of lending, marketing, infrastructure, and skill development in order to foster the growth of entrepreneurial activity. These regulations place a lot of emphasis on skill development because it's a need for launching a micro, small, or medium business.

## 2. OBJECTIVES OF THE STUDY

The present study has been associated with following objectives:

- To study the MSMEs in India and Entrepreneurship Skill Development Programme (ESDP).
- To analyze the various factors associated with current study and summarize the major findings.

- To recommend some suggestions for better reach of ESDP to all its beneficiaries.

### 3. REVIEWS OF RELATED LITERATURE

RajamohanS, Rajamohan and Sathish A (2019) conducted a study and investigated the topic as the primary goal that is typically pertinent to either evolved or emerging nation like India. To support entrepreneurship in MSME sectors like Khadi, Town, and Coir businesses, the Ministry of Micro, Small, and Medium Enterprises (M/o MSME) offers a variety of aids. The goal of this study was to pinpoint the strategies and encourage support offered by MSME to boost entrepreneurship in India.

According to NadafRajahusainS, et al. (2018)in this research, Micro, Small, and Medium-Sized Enterprises (MSMEs) have become a significant and active sector of the Indian economy. The government has launched numerous initiatives in this area, but the problem still persists because 79 MSME's are regularly affected by funding problems. The paper looks at MSME performance records, as well as the potential role they could play in the economy and other initiatives taken by various parties to advance MSME development in India.

According to Sen(2011),in this paper(The Key to Entrepreneurship Development in India) reported that the terms MSME, SME, and MSE all refer to micro, small, and medium-sized enterprises. MSME also refers to small and medium-sized enterprises. MSMEs are defined by India's Micro, Small, and Medium Enterprises Development (MSMED) Act of 2006. As countries promote horticulture's role in providing employment and as its contribution to GDP declines, the primary need is to create enormous amounts of employment. The MSME sector in India is heterogeneous, dispersed, and largely

disordered. It includes a range of artistic production units, from traditional artworks to cutting-edge businesses.

A study by Ravi and Shamika (2010)in this article (Entrepreneurship Development in the Micro Small and Medium Enterprise Sector in India) revealed that the MSME sector has frequently been referred to as the "driving force of development" for building economies. They begin with an overview of this region in India before looking at some recent trends that highlight the growth and significance of this region in contrast to the Indian economy. The main findings are that while more general development arrangements, such as consumption of framework and admission to funding, emphatically affect development of the MSME area across states in India over the course of recent years, even though explicit strategies that are focused on the MSME area essentially affect the development of this area.

### 4. STATEMENT OF THE PROBLEM

The Government of India has approved a variety of current and long-term professional courses at various levels of instruction so that students can receive both a broad education and specialized training. Since the government may not be able to implement this framework on its own, it has established the National Skill Development Chamber (NSDC), an organization that will work with other private players who are skilled in the relevant field to carry out skill development drives. As demands of the business may change, various other area skill gatherings are likewise evolving. Giving instruction to the students will undoubtedly help to reduce the dropout rate, which is a serious problem for the Indian educational system. Development and advancement of entrepreneurship projects are continuously being coordinated to support the talent of youth by educating

them on various aspects of modern or business action anticipated for establishing MSMEs. It is being a mandatory factor for the author to conduct a study entitled on 'A Study On Importance Of Entrepreneurship Skill Development Programme (ESDP) For Sustainable Growth Of Msmes In India'.

## **5. ENTREPRENEURIAL DEVELOPMENT PROGRAMMES (EDP/ESDP) IN INDIA**

The Entrepreneurship and Skill Development Programme (ESDP) was introduced by the Ministry of Micro, Small, and Medium Enterprises (MSME) to help existing and aspiring Indian entrepreneurs develop their entrepreneurial capabilities. It is one of many initiatives launched by the M/o MSME with the goal of enhancing young people's abilities to take calculated risks and establish prosperous businesses across the country. In order to encourage youth to pursue self-employment, the programme is planned to include a variety of activities in Industrial Training Institutes (ITIs), Polytechnics, and other technical institutions/business schools. The ESDP programme, a crucial component of the "Development of MSMEs," was modified in 2019 by the ministry to reflect the dynamic environment of entrepreneurship and MSME in India. The Enterprise Facilitation Centre (EFC), which aims to broaden the program's scope and deepen the enterprise facilitation process, is what distinguishes the up-scaled ESDP. The following list includes ESDP's primary goals in India:

- To educate/train people on an entrepreneurial culture.
- To encourage young people (men and women) from various societal groups, such as SC, ST, Women, and Physically Handicapped individuals,

Ex-Servicemen, and BPL individuals, to think about entrepreneurship or self-employment as one of their career possibilities.

- In order to encourage the target population to consider entrepreneurship as a career option and to help them succeed in any field, it is important to provide them with the technical and business skills necessary to think and act entrepreneurially from an early age.
- In order to help entrepreneurs implement their ideas, bring about an attitude and behavioural change in the target audience, and develop their own entrepreneurial abilities, fundamental entrepreneurship training will be provided.
- To provide high end/advanced training in the fields of e-commerce, BPO, Soft Ware, Biotech, Modern Agricultural & Animal Husbandry and Processing, Drug Discovery, Genomics, Tech. acquisition from premier labs like BARC/CSIR/DRDO, etc. with the aid of prestigious institutions like IIMs/IITs/ICAR/CSIR/NIT/Administrative Training Institutes (ATIs), post harvesting and food production.
- To assist the establishment of new MSMEs and enhance the growth of existing ones, which will lead to improved productivity and the creation of jobs. To develop technical and vocational skills or upgrade current capabilities of the target group. The responsibility for Udyam Registration of ESDP Beneficiaries shall fall under the purview of the Implementing Agencies (IAs).
- Support MBA/Engineering students by giving them the chance for vocational training, analysing the

results of a few typical ESDP programmes, compiling a list of available technology, setting up a top-notch lab for technology diffusion to MSMEs, etc. Additionally, students will be given other tasks, giving them a chance to work in a government setting. The hired students will receive a salary and an experience certificate.

ESDP includes the following modules:

1. Industrial Motivational Campaign (IMC): One-day or two-day Industrial Motivation Campaigns are held to find and inspire traditional and non-traditional business owners with the potential to found MSEs and Cluster SPVs, Industry Associations, and Chambers that will help spread MSMEs' promotion programmes.
2. Entrepreneurship Awareness Programmes (EAPs): These programmes are periodically held in order to develop young people's potential by educating them on many facets of the industrial activity necessary to establish MSEs. Typically, these EAPs are offered in ITIs, Polytechnics, and other technical institutions where there are resources to encourage students to pursue self-employment.
3. Entrepreneurship-cum-skill Development Programmes (E-SDP): By organising a variety of technical cum skill development training programmes, comprehensive training programmes are organised to upgrade the skills of potential entrepreneurs, the current workforce, and also develop skills of new workers and technicians of MSEs.
4. Management Development Programmes (MDP) and Mega Events: The goal of providing

training in this area is to enhance the ability of current and potential entrepreneurs to make decisions, which will lead to increased productivity and profitability.

The aforementioned activities/programmes will be carried out by various field officers of the DC (MSME) office who have been given the go-ahead by the empowered committee, which is chaired by AS&DC, MSME. The targeted recipients of EDPs and E-SDPs must comprise 40% members of the socially and economically disadvantaged groups (SC/ST/women/physically challenged). SC, ST, physically disabled, Below Poverty Line (BPL) and female participants are exempt from paying a participation fee. Up until November 2020, more than a million MSMEs were registered through the Udyam registration site, according to IBEF. Nevertheless, more than 93% of all registrations were for micro-businesses, highlighting the lopsided structure of the entrepreneurship process. Furthermore, according to the annual report issued by the M/o MSME, just 7% SC and 2% ST held businesses. The fact that the programme is meant to inspire people from underprivileged groups, particularly women, to pursue entrepreneurship just adds to the seriousness of the situation. Only 14%, or 8.05 million, of the 58.2 million MSMEs operating in India, according to the "Moving the Needle" report published by the NITI Aayog in March 2021, were owned by women. Women also agreed that businesses were even more skewed towards smaller ones, with almost 98% of firms falling into the micro-enterprise category.

## 6. MSMEs IN INDIA AND ENTREPRENEURSHIP SKILL DEVELOPMENT PROGRAMME (ESDP)

The most popular method for improving an

entrepreneur's abilities to start, run, and manage a business while keeping in mind the risks involved is called "entrepreneurship development." The "Entrepreneurship and Skill Development Program (ESDP)" has been launched by the O/o DC-MSME under the "Development of MSMEs" vertical. The program's goal is to inspire young people (both men and women) who represent various demographic groups. A clear objective is to promote new businesses, increase the number of MSMEs already in existence, and spread an entrepreneurial culture throughout the nation. The ESDP is implemented throughout the entire nation, both north and south. In total, 315 projects funded by the ESDP were completed during the years 2021–2022, and the recipients totaled 15,599 in total. The asset allocated and received is worth Rs. 10 crore, while the consumption that resulted costs Rs. 1.83 crore.

In order to eliminate unemployment and further contribute to the financial development of the nation, the Ministry of Micro, Small and Medium Enterprises (MSME) has planned a variety of strategies and projects for the development of entrepreneurs. The Service and its associations with entrepreneurs benefit from and collaborate with:

1. Adequate progression of credit from financial institutions/banks;
2. Support innovation up level and modernization;
3. Integrated infrastructural offices;
4. Contemporary testing facilities and quality assurance;
5. Access to rehearsals of the current management;
6. The development of entrepreneurship and the leveling up of skills through appropriate preparation offices;
7. Assistance with product development, plan intervention, and bundling;
8. Welfare of artisans and labourers;

9. Assistance with better entry into domestic and international business sectors and
10. Cluster-savvy actions to promote aggregate and unit empowerment and limit building

To create and strengthen the framework and support for entrepreneurship development and skill development preparation programmes, support is provided to national level preparation organizations working under the Ministry of MSME, specifically NIMSME, KVIC, Coir Board, Apparatus Rooms, NSIC, and MGIRI as a capital award. The main objectives of EDPs are to develop and strengthen the nature of entrepreneurship, choose reasonable products and plan various practical undertakings, familiarize people with the cycle and methodology involved in starting and operating a small business, train and prepare the entrepreneurs to face the challenges of business risk, broaden the perspective about business, and support its growth within the parameters of regulation.

## **7. SKILL DEVELOPMENT INITIATIVES BY MSMEs IN INDIA**

The Ministry of Micro, Small, and Medium Enterprises (MSME) and its field institutes have launched a number of programmes, including entrepreneurship skill development programmes (ESDP) and entrepreneurship development programmes, which provide training (EDP). These programmes, which are run by MSME-DIs, concentrate on developing trade skills in areas like electrical work, food processing, and electronics, among others. With the basic goal of upgrading the abilities of potential entrepreneurs and providing them with better and enhanced technological production skills, numerous extensive training programmes have been developed for the current workforce. Entrepreneurship development

and training, particularly for first-generation business start-ups, is one of the critical components for the promotion of micro, small, and medium enterprises (MSMEs). Three national level entrepreneurial development institutions have been established by the government to instill this entrepreneurial spirit in the next generation;

1. Hyderabad, India, opened the National Institute for Micro, Small, and Medium Enterprises (ni-msme) in 1960.
2. The establishment in 1983 of the Noida-based National Institute for Entrepreneurship and Small Business Development (NIESBUD) (UP)
3. Guwahati, India, hosted the Indian Institute of Entrepreneurship (IIE) in 1993. These were established with the intention of creating training modules, carrying out research, conducting training, and offering consulting services for the improvement of skill, entrepreneurship, and competitiveness.

The government has launched a number of programmes to support entrepreneurship and help those with it get skills. One of these is the Assistance to Training Institute (ATI) programme. The major goals of this programme are to promote indigenous entrepreneurship for micro, small, and medium-sized businesses, broaden the entrepreneurial base, and promote self-employment in rural and urban regions by offering training and helping people start businesses (Skill development report 2014-15). The government has launched a few more programmes to encourage skill development around the nation. They are as follows:

1. "Indian Institute for Skills" first ever Indian institute for skills.
2. "Skill India"

3. "PradhanMantriKaushalVikasYojana" (PMKVY)
4. "PradhanMantriKaushalVikasKendras" under skill India mission

## **8. IMPORTANCE OF ENTREPRENEURIAL DEVELOPMENT PROGRAMMES IN INDIA**

An entrepreneurship programme is currently more important than ever in India. As a result, it is crucial to present pupils with the proper information. The economy can grow significantly and potential of young brains can be realized through entrepreneurship. It is also true, though, that despite students' initial fascination with this field, it is frequently challenging for them to continue in it. It is due to the lack of appropriate mentoring and advice to get over obstacles in their way. One of the main reasons we advise you to enroll in courses like the WE NEN. The program's main objective is to instruct college students using case studies on the when, why, and how of starting a business. After talking about the possibilities of entrepreneurship, it is essential to examine what makes its growth so critical. The following are some important justifications for why entrepreneurship development is urgently needed:

**Better Job Possibilities:** The fact that entrepreneurship programmes in India provide to better job opportunities is one of the most crucial reasons for their promotion. Since most companies require a wide range of people to work under varied profiles, entrepreneurs produce a large number of employments. As a result, the job market has greatly improved. However, it can only be a direct result of an effective programme for entrepreneurial development.

**Independent Working Environment:** Increasing the independent working environment is another promising component of entrepreneurship programmes. Because

there is no requirement that one work for a specific boss, there is a great deal of flexibility. Consequently, a programme for entrepreneurial development is helpful in this area as well. As entrepreneurial development programmes aid in helping people envisage their lives and careers, this is perhaps one of their most important features. Entrepreneurs frequently have a lot of ideas but lack the knowledge necessary to put them into practice. The development programmes come into play here and are quite beneficial for aspiring business owners. In order for any entrepreneur to flourish, financial planning is also a skill that the curriculum assists in developing.

**Solve Issues Facing the Masses:** For his business to be successful, an entrepreneur must concentrate on addressing issues that affect the vast majority of people. An entrepreneurship programme can assist in developing this vision, which can support the creation of sustainable businesses. It is essential for entrepreneurs to have a strong vision because it helps them make better judgments when they are uncertain.

**Boost the Nation's Economy:** Entrepreneurship programmes are essential to the nation's economic development. Promoting entrepreneurship can be a step in the correct direction given that our economy needs a boost and that development programmes concentrate on generating jobs, which improve cash flow. Additionally, entrepreneurial programmes aid in raising the standard of life, which is necessary to raise the nation's existing economic stratification.

**Consider Local Resources:** State-level economic growth is important for a nation's GDP as well. Additionally, using local resources enables a state's progress. Most entrepreneurial initiatives emphasize using local resources, which increases demand for them, helps with money generation, and in turn encourages economic jurisprudence.

Challenges in ESD

The ESDP programme is one of the many skill-development initiatives the government has put in place to strengthen entrepreneurship in the nation and promote the creation of MSMEs. The development of MSMEs' capabilities, however, is being hampered by a number of issues.

**Infrastructure bottlenecks:** As was already said, the majority of MSME firms fall under the umbrella of microenterprises. Better infrastructure is required for the move from micro to small or medium enterprises, including a cost-effective location, reliable electricity and water connections, etc.

**Access to Technology:** MSMEs' ability to compete on the global market is severely limited by low technology levels. A fundamental issue impeding the development of the MSME sector's capability is technological obsolescence.

**Weak industry-academic interface:** Students' chances of becoming entrepreneurs are negatively influenced by the nation's weak connectivity between businesses and educational institutions.

**Scale and Cost:** Extending these measures and extending the reach of programmes remain a cause for worry, notwithstanding the financial support given by the government for the sustainability of various initiatives.

**Mismatch between Supply and Demand:** The supply and demand of skilled workers are very different. It is essential to align skill-development programmes with the potential skills that are in demand around the world.

## **9. INSTITUTIONAL SUPPORT FOR ENTREPRENEURIAL DEVELOPMENT**

Bankers and government organizations typically think that the borrower needs to have the necessary entrepreneurial skills. The truth is that no school or college curriculum ever takes this subject seriously. Because of

this, practically all graduates (including engineering grads) rush to get employment after finishing their studies and hold off on starting their own businesses. In fact, to improve their entrepreneurial competencies, both new and seasoned business owners need ongoing education and training. The Government of India, several State Governments, and the major financial institutions have established entrepreneurship training institutions in response to this need. These organizations offer ED trainings as well as need-based support and other services. The following is a list of these organizations:

**EDII:**The apex financial institutions support the EDII, which was established in 1983. Through teaching, training, research, consulting, and institution building, the institute has been promoting the growth of entrepreneurship. Additionally, the institute has been offering a DEC-approved open and remote learning programme in addition to two post-graduate diploma programmes with AICTE approval. Every year, EDII develops more than 10,000 aspiring entrepreneurs across all teaching and training programmes.

**Indian Institute of Entrepreneurship (IIE):**The IIE was founded in 1993 at Guwahati by the Ministry of MSME, Government of India, with the intention of conducting training, research, and consultancy activities in the small industry sector with an emphasis on ED. The North East Council (NEC), the Government of Assam, Arunachal Pradesh, Nagaland, and SIDBI were among the main partners when the institute began operations in April 1994. It has a presence in Uttarakhand and mostly runs programmes for the north-eastern region. Currently, the Institute is offering a number of Entrepreneurship and Skill Development Programmes (ESDPs) on topics such as food processing, jute diversified products, electrical wire manufacturing, bamboo products manufacturing, tailoring and embroidery, customer service, manufacturing

beauty products, steel fabrication, etc.

**National Institute for Micro, Small and Medium Enterprises (NIMSME):**In Delhi, India, in October 1960, the Central Industrial Training Institute was established as a division of the Central Government under the Ministry of Commerce and Industry. CIETI was relocated to Hyderabad in 1962, where it was renamed the Small Industry Extension Training Institute. It was given the new name NIMSME. The Institute's goal is to influence the expansion and development of MSMEs by providing services in the fields of management, entrepreneurship, technology, information, education, and policy. In the current age of globalization, NIMSMEs programmes are made to be applicable to everyone. Through all these special training programmes, the Institute has been effective in preparing business owners to meet problems, assist small businesses in surviving the competitive environment, and achieve the crucial competitive advantage in a worldwide context. The institute has also been hosting international training programmes financed by ITEC. It has run specialized programmes for the MSME officials at the national level. In the course of the year (2010–2011), the institute collaborated with 25 institutions and provided training to 10,000 FGEs, the majority of whom were from rural areas and members of vulnerable groups including SC, ST, women, and so on. In the southern and central states of the nation, NIMSME plans to collaborate with more than 30 partner institutions over the 2011–2012 year.

**Rural Development and Self-Employment Training Institute (RUDSETI):**The RUDSETI has been working very hard to promote entrepreneurship and self-employment. RUDSETI was founded in 1982 in Ujire, Karnataka, and has now grown to include 24 locations throughout 14 states. It has trained 2.41 lakh adolescents, of whom 1.69 lakh have found employment through their own businesses, making up 70% of the settlement rate. In order to accomplish the

shared goals, RUDSETI has collaborated with government departments, nonprofit organizations, and institutions such as NABARD, SIDBI, DICs, DRDAs, and NBCFDC.

The National Institute for Entrepreneurship and Small Business Development (NIESBUD): NIESBUD was established in 1983 as an apex body for coordinating and supervising the activities of various institutions/agencies engaged in ED specifically in the area of small industry and small business by the then Ministry of Industry (renamed as Ministry of Micro, Small and Medium Enterprises), Government of India. From 1986 to 2006, NIESBUD ran 680 different programmes with over 13,600 participants. Approximately 2,000 people have participated in the institute's primary foreign programmes, which are supported by ITEC. The institute offers ESDP programmes in security guards, computerized design for brass clusters, and hospitality.

The National Science & Technology Entrepreneurship Development Board (NSTEDB): The Department of Science and Technology (DST) and the Government of India formed the NSTEDB in 1982 as an institutional mechanism to support the promotion of knowledge-driven and technology-intensive businesses. The Board, which has representatives from socioeconomic and scientific ministries/departments, seeks to use Science & Technology (S&T) interventions to change "job-seekers" into "job-generators." The NSTEDB's programmes have encouraged more S&T professionals to pursue entrepreneurship as a vocation. TBI, STED, STEP, EDC/IEDC, FDP, STST, EDP, TEDB, WEDP, and EAC are a few of the NSTEDB's extremely effective programmes. Academics and researchers have begun to show a strong interest in such socially significant jobs and have joined a number of NSTEDB programmes. About 100 organizations, the majority of which are academic institutions

and nonprofit organizations have benefited from the NSTEDB's assistance with the goal of creating ED and jobs.

## **10. EDUCATIONAL INSTITUTIONS' ROLE IN ESDP**

A few incubation centres have also opened on educational campuses over the past ten years with the help of DST and other organizations, with the aim of developing entrepreneurs who are focused on technology.

AII, the Amity Innovation Incubator: AII's goal is to promote an entrepreneurial mentality. To support budding entrepreneurs, AII provides a variety of incubation services, including business development, company creation, legal and IPR support, venture capital investment, networking, partnerships, and alliances.

The DST and NSTEDB sponsor the Amrita Technical Business Incubator (ATBI), which is situated on the Amritapuri Campus in Kollam. Amrita TBI provides funds, services, and infrastructure to early stage start-ups and innovators to aid in the successful commercialization of their unique company ideas.

Technology Business Incubator (TBI) at Birla Institute of Technology and Science (BITS): In the fields of embedded systems and VLSI design, TBI has been formed by the BITS, Pilani in collaboration with the DST. The Center for Entrepreneurial Leadership (CEL) at BITS has been supporting entrepreneurial leadership throughout all disciplines in collaboration with TBI.

Innovation Incubation and Entrepreneurship Center (CIIE): With assistance from the Gujarat Government and DST, the Indian Institute of Management Ahmadabad (IIMA) established the Center for Innovation, Incubation, and Entrepreneurship. The Center has taken the initiative to strengthen India's entrepreneurial ecosystem and offer

mentoring, networking opportunities, and seed money to the nation's top ideas. The ICT, energy, and healthcare incubation centre promotes new ideas.

The Indian Institute of Technology Mumbai (IIT Mumbai) Society for Innovation and Entrepreneurship (SINE) was established in 2004 to promote entrepreneurship at IIT Bombay. SINE is in charge of a company incubator that supports entrepreneurship in the technology sector. Since its creation, the society has acted as a model for other academic business incubators around the nation. It finds ideas and technology that could lead to profitable business initiatives.

Indian Institute of Technology-Madras Rural Technology & Business Incubator (IITMs RTBI): IITMs RTBI claims to be the only incubator concentrating on rural technologies and businesses in India at the moment and has the unique distinction of having been funded both by the World Bank's Info-Development Project and the Government of India's Department of Science and Technology.

The Trivandrum India Techno-Innovation Park's Lab (Extension Center): This facility delivers fantastic opportunities for unique ideas to blossom and provides the ideal setting for innovative thinkers to launch their products. The Innovation Lab Fund, in addition to providing technical and infrastructure support, also acts as a catalyst to encourage technological advancement for aspiring entrepreneurs.

Communication Institute Mudra Ahmadabad's MICA-EDC (Entrepreneurship Development Center) since its founding, MICA-EDC has aimed to provide business support services in order to foster innovative concepts with the potential to alter this industry. A pioneering Communications Technology-Based Business Incubator (Comcubator), an Incubation Center exclusively for the Communications Sector, has been established by MICA-EDC to foster and commercialize ideas and breakthroughs.

National Design Business Incubation (NDBI): NID has pledged to build on India's design talents through NDBI. To encourage the invention abilities of individual innovators, NDBI is developing a novel programme called the "Technopreneur Promotion Program" (TePP) with the assistance of the Department of Scientific and Industrial Research (DSIR).

Science & Technology Entrepreneurs' Park: NITK-STEP (previously KREC-STEP) was founded in 1994 on the campus of KREC (Mangalore) with the goal of providing benefits to all participating agencies through business incubation, innovation, training, and skill enhancement in a value-driven and service-focused environment.

SIDBI Innovation & Incubation Center (SIIC): IIT Kanpur and the Small Industries Development Bank of India together established the SIIC (SIDBI). SIIC offers start-ups and potential entrepreneurs and entrepreneurs a platform on which to transform their ground-breaking ideas into marketable goods. In addition to other activities, the institution runs virtual incubation, giving entrepreneurs the chance to use SIIC/IITK as a platform for creating breakthrough commercial products without physically being at IITK.

Science and Technology Entrepreneurs Park at Tiruchirappalli Regional Engineering College (TREC-STEP): The national strategy to expand knowledge-based businesses in our society includes TREC-STEP. It has consistently worked to support numerous innovative initiatives for bringing about technology-based growth as well as a new breed of entrepreneurs.

Technological Business Incubator (VIT-TBI) at the Vellore Institute of Technology VIT University and DST, the Indian government, collaborated to create VIT-TBI. In its ecosystem of company incubation, VIT has excellent relationships with a number of key companies. As a result of network benefits,

incubates receive services that are significantly more valuable.

**11. ANALYSIS PART OF THE STUDY**

100 respondents (MSME Entrepreneurs) have

been selected randomly and collected the primary data through questionnaire. The questionnaire covered the questions which clear the importance and role of ESDP for the sustainable growth of MSMEs in India. Summary of major analysis and its findings were given below:

**Table 1.** Opinion of the Respondents on ESDP Training (SA – Strongly Agree; A – Agree; N – Neutral; DA – Disagree and SDA – Strongly Disagree)

<i>Statements</i>	<i>SA</i>	<i>A</i>	<i>N</i>	<i>DA</i>	<i>SDA</i>
A sufficient level of government support for the growth of entrepreneurship	30	27	29	10	4
Ample infrastructure support for aspiring business owners	29	38	24	6	3
Adequate Entrepreneur Training and Retraining for Current and Future Entrepreneurs	27	35	28	8	2
It is better for entrepreneurs to have access to reliable information systems	31	29	27	9	4
Better regular classes	23	39	20	10	8
Lack of energy availability and high costs are obstacles to entrepreneurs' success	26	29	32	8	5
The contribution of entrepreneurs to the source of government revenue	36	39	20	3	2
The growth and success of small business enterprises are significantly impacted by the development of entrepreneurship	18	37	29	9	7
Increase the training's duration	28	35	30	5	2
Provide more post-training handholding from MSME	26	34	25	10	5
Require refresher training in the newest techniques and technologies	28	38	24	7	3
Readily accessible financial assistance for aspiring businesspeople	30	29	33	6	2
Unpredictable social, political, and economic factors to take into account that may impede the growth of entrepreneurship	22	31	28	14	5

It is clear from the table out of 100 respondents the majority of the respondents (30 percent) have strongly agreed for the statement 'A sufficient level of government support for the growth of entrepreneurship', 38 percent of the respondents have agreed the statement 'Ample infrastructure support for aspiring business owners', 35 percent of the respondents have agreed the statement 'Adequate Entrepreneur Training and Retraining for Current and Future Entrepreneurs', 31 percent of the respondents have strongly agreed the statement 'It is better for entrepreneurs to have access to reliable

information systems', 39 percent of the respondents have agreed the statement 'Better regular classes', 32 percent of the respondents are neutral for the statement 'Lack of energy availability and high costs are obstacles to entrepreneurs' success', 39 percent of the respondents have agreed the statement 'The contribution of entrepreneurs to the source of government revenue', 37 percent of the respondents have agreed the statement 'The growth and success of small business enterprises are significantly impacted by the development of entrepreneurship', 35 percent of the respondents have agreed the statement 'Increase the training's duration', 34 percent

of the respondents have agreed the statement 'Provide more post-training handholding from MSME', 38 percent of the respondents have agreed the statement 'Require refresher training in the newest techniques and technologies', 33 percent of the respondents are neutral for the statement 'Readily

accessible financial assistance for aspiring businesspeople' and 31 percent of the respondents have agreed the statement 'Unpredictable social, political, and economic factors to take into account that may impede the growth of entrepreneurship'.

**Table 2.** Satisfaction Level of the Respondents on ESDP Training by the M/o MSME (HS – Highly Satisfied; S – Satisfied; N – Neutral; DS – Dissatisfied and HDS – Highly Dissatisfied)

<i>Training and Supportive Programmes</i>	<i>HS</i>	<i>S</i>	<i>N</i>	<i>DS</i>	<i>HDS</i>
Credit Facilities	24	28	<b>30</b>	11	7
ESDP Training	22	20	<b>33</b>	15	10
Financial Support	21	25	<b>30</b>	14	10
Linkages	25	28	<b>32</b>	9	6
Premises on work place	19	23	<b>38</b>	16	4
Project Preparation	18	25	<b>34</b>	18	5
Schemes and Programmes	19	<b>32</b>	25	18	4
Support and Development Services	24	<b>32</b>	30	11	3
Technical Training	24	26	<b>32</b>	12	6

It is inferred from the table 2, out of 100 respondents the majority of the respondents' satisfaction level is neutral for the training and supportive programmes 'Credit facilities', 'ESDP Training', 'Financial support', 'Linkages', 'Premises on work

place', 'Project preparation' and 'technical training', and for two training and supportive programmes i.e. 'schemes and programme' and 'support and development services' the majority of the respondents' satisfaction level is satisfied.

**Table 3.** Ranking Analysis on the Respondents' Opinion on the steps to be taken for ESDP in India (based on weight score)

<i>Options for Order Preferred</i>	<i>Weight Score</i>	<i>Rank</i>
Constructing training facilities	867	4
<b>Construction of industrial parks</b>	<b>932</b>	<b>1</b>
Creation of an entrepreneurial support unit	798	5
Creation of technology and science parks	880	3
Establishment of institutions for development	596	10
Fiscally liberal policies	720	7
Industrial regulations	896	2
Simple licensing process	693	8
Technical and vocational education advancement	750	6
The planning of workshops and seminars	627	9

The above table 3 shows that, out of given on the preference by the respondents on ESDP by M/o MSME, the option 'construction of industrial parks' secured first rank, followed by 'industrial relations', 'creation of technology and science parks', 'constructing training facilities', 'creation of an entrepreneurial support unit', 'technical and vocational education advancement', 'fiscally liberal policies', 'simple licensing process', 'the planning of workshops and seminars' and 'establishment of institutions for the development' have secured second, third, fourth, fifth, sixth, seventh, eighth, ninth and tenth ranks respectively.

## **12. DISCUSSION AND RECOMMENDATIONS**

One of the key sectors contributing to the expansion of the Indian economy is the MSME sector. The government has tried a variety of initiatives and strategies over the past few years to increase the number of MSMEs in the country and support entrepreneurship. ESDP, one of the numerous programmes run by the Ministry of MSME, has unquestionably helped the nation's skill development. However, a closer look at the programmes reveals that most ESDP recipients come from the overall classification, and only 10% belong to the SC/ST in reverse. Additionally, female entrepreneurs are still incredibly unimportant, and their businesses tend to focus on microbusinesses. Given this, significant efforts should be made to encourage entrepreneurship among the underprivileged and disadvantaged classes of society. As a result of the pandemic, ESDP exercises were discontinued, and the business environment was severely damaged. The government should support skill development that is in line with global demand as the economy recovers and revive the MSME sector.

The following suggestions are made to help the ESDP reach each recipient more effectively:

- When granting credit to business owners for the launch of their specialty units, credit-giving institutions like banks and other monetary organizations should reduce the administrative burden and other practices.
- Entrepreneurs should seize market opportunities as they present themselves, and various critical methodologies should be adopted to advance and support MSMEs.
- The ESDP must have a reliable system in place to follow up on the learners' situation at predetermined intervals, ideally for a period of a year following the training.
- It is important to develop and make available innovations that are appropriate for the MSME sector.
- Learn essential skills to keep up with global developments.
- Government should lessen the influence that entrepreneurs have when they first launch their businesses.
- The government should implement plans and initiatives that will foster an entrepreneur-friendly environment in business.
- The government should keep entrepreneurship development in mind as a subject for educational programmes at optional schools and at institutions of higher education in order to impart crucial fundamental knowledge and develop sufficient entrepreneur skill and demeanor among young people from a fundamental level.
- Government in general and society in particular should support and empower entrepreneurs.

- Mechanical progress and steering. A board of experts and advisors should be prepared to assist MSMEs.
- At the regional level, new and expanded sections of the Entrepreneurship Development Foundations should be opened in order to provide more eager entrepreneurs with the necessary training and knowledge to become more successful businesspeople.
- MSMEs should be given practical planning and development projects and mindfulness initiatives. Furthermore, there should be enough credit offices available.
- The government and the MSME-DI will place more emphasis on this preparation and work to include more students in the programme because the more vulnerable segments are the most hampered group with the highest rate of unemployment.
- There should be clear reviews to examine the financial and technical needs of the MSME.
- The dismantling of red tape and the relaxation of labour laws. For creative strategy for creation, management, delivery, and marketing, legitimate exploration and development should be developed.
- Optimal use of restricted resources (financial and human). It should receive instruction and information on the most recent events taking place around the globe.

### 13. CONCLUSION

For India's practical development, the Ministry of MSME tries to play a crucial role in entrepreneurship development. It embraces a broad and enormous commitment to

providing significant financial and other support to the small- and medium-sized businesses. It increased their reach into every sector of Indian business in order to open doors for employment and encourages entrepreneurship, which in turn helped to develop the neighborhood. India can generate additional financial growth by promoting entrepreneurial activities throughout its country, particularly among its growing working class. In addition to the fact that entrepreneurship has been shown to have significant financial benefits in a wide range of nations, India has specifically reached a stage of development where it can achieve comparable results through entrepreneurial endeavors. India is prepared to launch new businesses in the high-innovation sector, among other things, to help it become a significant competitor on the global economy. It has significant areas of strength for a base fit to entrepreneurial activities, increased inflows of foreign capital concentrated on its developing data innovation administrations area, and a sizable number of successful new business new companies, for example. India should now provide beneficial access to training targeted specifically at developing entrepreneurial skills, funding entrepreneurial endeavors and systems administration among potential entrepreneurs and their experienced partners in order to further the entrepreneurial approach to managing financial development. It is obvious that the government can contribute significantly to helping to provide these kinds of opportunities. Additionally, it can provide the necessary administrative frameworks and duties and aid Indian citizens in understanding how successful business ventures relate to financial prosperity.

One of the key sectors driving the expansion of the Indian economy is the MSME sector. The Government has implemented numerous programmes and initiatives over the past few years to support entrepreneurship and grow the nation's MSMEs. Unquestionably, the ESDP, one of the numerous programmes run

by the M/o MSME, has helped the nation's skill development. However, a closer examination of the programmes reveals that 90% of ESDP recipients fall within the general group, while only 10% are SC/ST backward. Additionally, there are still very few women who own businesses, and most of them are microbusinesses (Salini and Venkateswaran, 2020) In light of this,

significant effort needs to be made to promote entrepreneurship among the underprivileged and backward segments of society. Due to the pandemic, ESDP programme operations were suspended, and the entrepreneurial ecosystem was very dysfunctional. The government must support skill development that is in line with global demand as the economy recovers and revitalize the MSME sector.

## **MSME BUSINESS STRATEGY: ELECTRONIC BUSINESS SUSTAINABILITY DURING THE COVID-19 PANDEMIC**

***Abstract:** Indonesia has been hit by the coronavirus disease 2019 (COVID-19) pandemic since March 2020, but not only in Indonesia; some countries in the world are also experiencing the COVID-19 pandemic. This causes the economy to be unstable, which affects business people, including MSME players. The purpose of writing this article is how MSME actors are able to adapt during the COVID-19 pandemic in maintaining the sustainability of their business. The approach to writing this article uses qualitative and explained descriptively. The findings of this study are that the Government in its strategy can offer financial incentives based on advantages on financial technology (fintech) lending platforms, namely tax incentives, for fintech platforms that can provide direct access to funding for MSMEs, as well as MSME players in Indonesia in maintaining their business adapting by utilizing online media, such as twitter, facebook, instagram, gofood, gopay, wa group. This finding indicates the need for MSME actors to increase their strategies to adapt to the sustainability of their electronic business during this pandemic.*

***Keywords:** MSMEs, Electronic Business Sustainability, Adaptation*

### **1. Introduction**

MSMEs are one of the most important types of businesses in Indonesia, with important implications for economic growth. MSMEs also have an important role in the field of employment and equitable distribution of development results. In addition, it is also often called a sector that focuses on important issues of smoking. This is because most of the population has a poor education and their lives rely on small businesses that they have traditionally or modernly (Wijaya et al., 2021; Wagiono et al., 2022).

MSMEs are a strong economic pillar in Indonesia, which is able to survive various economic crises and stable growth. However,

after the world experienced the COVID-19 pandemic in 2020, the majority of MSMEs in Indonesia are estimated to be still turbulent, especially MSMEs in cities and villages as well as their businesses are volatile and even some of the benches (Mahfuzah et al., 2021; Wanidison&Shaddiq, 2021; Surti et al., 2022).

The COVID-19 problem in Indonesia has not been resolved; however, the economic turmoil is expected to get worse in the third and fourth quarters of 2020. According to the latest data dated December 20, 2020, the number of Indonesians exposed to COVID-19 is 664,930 people (Maulaa, 2020; <https://www.pikiran-rakyat.com/>; Shaddiq et al., 2021). The existence of a pandemic that is

quite long for up to 10 months (March – December 2020), and is expected to cause various problems in all aspects of life. One of them has a significant impact on the community's economy which tends to deteriorate (Wagiono et al., 2020; Shaddiq&Wanidison, 2021).

According to the Organisation for Economic Cooperation and Development, the world economy can be affected by the COVID-19 pandemic, seen from a policy point of view as well as demand and supply (Shaddiq&Haryano, 2020). Researchers are trying to better understand the current condition of society, one of which is the economic aspect that has an impact on MSME actors due to the decline in people's purchasing power (Saputra et al., 2020). Thus, many MSME actors are pursuing alternative economic activities (Hasan, at al., 2021; Rizani et al., 2022) while still working for the sustainability of their business (Rahman, at al., 2021; Rizal et al., 2020).

Since the outbreak of the COVID-19 pandemic in 2020, the number of MSMEs in Indonesia has decreased, because the results have been unable to finance certain services, such as electricity, water, building rents and others. In addition, many micro-enterprises whose products were not sold so they suffered damage and they closed their businesses. Currently, the economic crisis affects economic policy because many businesses that perform poorly even close, so unemployment increases (Lutfi et al., 2020). This is a critical issue that must be addressed in order to improve the economic condition of MSMEs, which is currently in a downturn (Arizal et al., 2021; Ramadhani et al., 2021). If you look at the economic sector as a whole, it will be seen that the most important factor in economic growth is MSMEs, which have been affected by the COVID-19 pandemic (Sugiri, 2020; Rahmadani et al., 2022). Therefore, the government must focus its attention on MSMEs to protect them from the economic downturn that occurred in the era of

the COVID-19 pandemic. The government must have new methods and procedures in place. The generation and development of MSMEs in Indonesia will regulate the economy again (Habibah et al., 2021; Putera et al., 2022).

Stabilizing the economy must start from special attention from the government to the people affected by COVID-19, one of which is MSMEs. Many bankruptcies have occurred, inspiring microenterprises to return to operation. This is a motivator for the government to continue to support MSMEs in increasing the income of MSME actors. For this reason, special methods and procedures used by the government are needed in the development of MSMEs in Indonesia (Shaddiq&Handayani., 2021; Norrahmiati et al., 2022).

In addition to losses due to COVID 19, business people must also have a strategy that focuses on growing and developing, which can be done by selling goods through online systems (twitter, facebook, istagram, gofood, gopay, group WA) or transferring goods to market places in Indonesia. This will help entrepreneurs in strengthening and developing their businesses because their products can be seen by potential buyers around the world (Hidayat et al., 2021; Norrahmi et al., 2021).

## 2. Literature review

The definition of "MSMEs according to LawNumber 20 of 2008" concerning MSMEs is:

1. Micro enterprises are productive businesses owned by individuals and/or individual business entities that meet the criteria for Micro Enterprises as regulated in thisLaw.
2. Small Business is a productive economic business that stands alone, which is carried out by an individual or business entity that is not a subsidiary or not a branch of a company that is owned, controlled, or is part either

directly or indirectly of a Medium Enterprise or Large Business that meets the criteria for Small Business as referred to in this Law.

3. Medium Enterprises are productive economic businesses that stand alone, which are carried out by individuals or business entities that are not subsidiaries or branches of companies that are owned, controlled, or part of either directly or indirectly. "

MSMEs are the main and vital force that can encourage the economy and job opportunities (Supardi et al., 2021) and are important in national development (Sugiyanto et al., 2021; Kurniawan et al., 2021), not only reflected in economic growth in the city, but also in economic growth in general (Hamid & Ikbal, 2017; Joko et al., 2022) as well as an increase in GDP in the State of Indonesia (Jefri & Ibrohim, 2021; Iyansyah et al., 2021). Events that occurred in 1998 to 2012 MSMEs showed that they were able to overcome the economic crisis, as evidenced by positive economic growth (Jefri & Ibrohim, 2021). This proves MSMEs are resilient from the economic crisis (Handayani et al., 2022).

Since the company's goal is to increase productivity, such as shortening business processes by moving them to automated processes, or to reduce the number of workers, the company's productivity can be increased through digitization (Chae et al., 2018; Irpan et al., 2022). Benitez, et al. (2018) found that digital transformation in business can increase revenue and productivity, for example, implementing digital business applications that enable more efficient operations. Bouman, et al., (2019) conducted an exploratory research on 321 MSMEs in Europe, by utilizing digital media and information technology (IT) to innovate their businesses. In today's digital era, it makes it easier for people to maximize their business and needs to have a business strategy (Hilmiana & Kirana, 2021). For this reason, along with the acceleration of digitalization, which is the main focus of every business (Sia et al., 2016; Hidayat et al., 2021), it must be

integrated into its business strategy (El Sawy et al., 2016; Irpan et al., 2021), the latest innovations are needed in order to increase the competitiveness of MSMEs (Suci, 2017).

### 3. Research method

A qualitative approach is used in this writing, to interpret in obtaining the meaning that is being studied (Raco, 2010). The qualitative approach aims to find the problem and develop in detail the details of a phenomenon, as well as analyze data to explain the description of the problem (Creswell, 2015).

This writing uses second-level (secondary) data, which the author took in the form of ready-made data, (Sekaran & Bougie, 2016). Sekaran & Bougie (2016) also explains secondary data sources sourced from published government documentation/records (reports), companies, the internet, industrial analysis / information carried out by the media, and soon.

This writing is categorized as a literature approach. Sari & Asmendri (2020) explained that research is carried out in a sequence or systematic manner in order to collect data and process data, as well as conclude data based on the appropriate method to answer existing problems is literature research.

### 4. Discussion

#### 4.1. Economy Affected by COVID-19 Pandemic

The health crisis that occurred had implications for the economy caused by the COVID19 pandemic (Nicola et al., 2020). This crisis has made the government quick to carry out policy strategies in inhibiting the acceleration of the health crisis, one of which is by maintaining social distancing. The most serious impact of COVID-19 on the economy is a decrease in output as a result of social distancing and the absence of employees infected with the coronavirus (Wren-Lewis,

2020). McKibbin& Fernando (2020) explain the consequences of affecting the smooth running of global supply chains. This inaction is due to a decline in transport and delivery, which has hampered global economic planning.

McKibbin& Fernando (2020), stated that the existence of unrest among producers and consumers also resulted in a shift in the variety of consumption and the emergence of market abnormalities. Furthermore, the implementation of Large-Scale Social Restrictions (PSBB) in several areas infected with the virus resulted in an increase in consumption of community residents for several periods (BKF, 2020). Since the announcement in March 2020 by the government that there is COVID-19 in Indonesia, there has been a significant increase in the growth rate of domestic consumption (BPS, 2021). Household consumption growth was around 5.44 percent in the second quarter of 2020.

Susilawati et al., (2020) said that national economic activity has decreased markedly as a result of the COVID-19 pandemic. Disruptions in demand and supply were felt by various business groups (services, trade, industry). Among them, sectors that provide food and drink accommodation, trade, transportation, hospitality and warehousing as well as MSME groups, bear the brunt of the consequences. Due to the decline in the activity of economic activity, the sector suffers greatly.

In addition to having an impact on the economic sector, the handling of COVID-19 has also accelerated the pace of the online / digital economy (ITU, 2020). The economy experienced improving changes during the COVID-19 pandemic, marked by an increase in the volume of e-commerce transactions and an increase in nominal value, fintech lending and digital banking in the fourth quarter of 2020. (BI, 2021). In terms of volume, it increased by 104.9 percent and nominally e-commerce transactions increased by 49.5

percent, when compared to the third quarter, the fourth quarter was higher. Digital banking is gaining popularity because it has become the preferred transaction method for the general public during the COVID-19 pandemic. This can be seen from the increasing transaction costs. Digital banking grew 12.5 percent nominally and by volume 41.9 percent.

#### **4.2. MsME's Contribution to the Economy**

MSMEs do not specifically have a broadly acceptable terminology (Agyapong, 2010). However, according to Henschel& Durst (2016) &Ekwere (2016) MSMEs have characteristics, namely:

- relatively small marketshare
- owned by an individual/family/group
- formal organizational structure is not owned
- the resources it has are limited
- limited access to capital markets
- management vagueness
- less clear investment and financing decisions

Each country has terms, definitions and measures about MSMEs (Ayyagari et al., 2007), according to the conditions of their respective countries. According to Agyapong (2010), MSMEs are a key sector with important implications for economic growth. This is because MSMEs contribute to the progress of developing the provision of job opportunities through creativity and innovation. The long-term impact of business from the MSME sector will be the increase in the income of a country, which in turn can contribute to programs to reduce unemployment and poverty.

The role of MSME peting on the economy of ASEAN member countries (ADB, 2020) is that MSMEs are able to create new job opportunities, business competencies and new ideas in innovation to maintain the sustainability of their business. Furthermore,

according to the Asian Development Bank, that of the total existing companies, MSMEs in Southeast Asia accounted for 97.2%, and amounted to 69.4% of the total workforce, as well as Broto Domestic Product 41.1% during the 2010-2019 period in a country. With the average contribution of MSMEs from the export value of a country in 2010–2018, it is around 20.4%.

MSMEs in Indonesia can absorb up to 97.04% or as many as 112,709,244 national workers (Suhaili and Sugiharsono, 2019). The proportion of each business to the absorption of the total MSME workforce by business group: (a) medium enterprises 3 percent, (b) small businesses 5 percent, (c) micro enterprises 92 percent. In 2012 – 2017, Indonesia's GDP was contributed from the MSME sector by 59.74 percent or worth Rp 5,928,934.98 billion. The contribution of MSMEs to the largest total GDP was given by micro-enterprises at 61.05 percent, followed by small businesses at 16.20 percent, and large businesses at 22.75 percent.

### 4.3. Strategy Concept

A business strategy is a long-term plan that considers every possible alternative option that can be used to achieve a goal in the future (Susanto & Sukarno, 2022). It is intended, during business activities, as an entrepreneur to be a must to have the ability to continuously improve business management and look for various strategic options. Entrepreneurs in managing their business can also make extensive adjustments to the surrounding environment, so that there is an increase in business performance.

In order for the MSME business to succeed in its goal of expanding its market share and increasing its income, a strategy is needed that can easily adapt to the ever-changing environmental conditions in which it operates, so as to be able to win the market. Thus a good strategy is a strategy that is able to adapt to its operational environment in

winning the market.

Effective sustainability of the MSME business in the face of increasingly broad and heavy competition requires the development of a business strategy that is able to answer this, namely: determining prices according to quality, choosing products that are in accordance with market demand, choosing human resources who have the best skills and the best, making the right promotion choices, determining and choosing a strategic location. This strategy can also be called the 5P strategy (product, price, place, promotion, people) or marketing mix. (Safa'atin, et al, 2022).

Marketing is a series of steps to create, communicate and add value to customer relationships in a way that increases customer satisfaction. For a good marketing strategy, business actors can carry out their marketing mix. The marketing mix is important because consumers take it into account when buying products and. (Amiroh, et al., 2022). If the business actor does not know what the customer wants, then the customer will turn to a new option.

### 4.4. Business Sustainability Strategy for MSMEs

The government plays a key role in the recovery phase of the COVID19 pandemic. According to the 1945 Constitution, the Indonesian government is responsible for proving that all its citizens have access to civil liberties and basic security, especially in the economic field. The government's responsibilities include maintaining MSMEs as an economic buffer during the COVID19 pandemic with various economic stimulus measures.

The government obtains tax payment receipts from "fintech lending", MSMEs and investors based on their income. PP Number 23 of 2018 concerning income tax from business results received with a certain minimum value, subject to 0.5% of the final income tax for

MSMEs (Kartiko, 2020; Fadilurrahman et al., 2021).

The problem of MSME access to banking that is difficult to obtain must be assisted by the government. In fact, MSMEs really need access to capital to maintain their business continuity. One alternative is a partnership between the government and a "fintech lending platform" to provide financing to MSMEs. In the era of the COVID-19 pandemic, the government can use its authority to encourage the growth and economy of MSMEs. The government can offer financial incentives based on a percentage of the profits earned. Incentives can be offered to "fintech lending platforms" that help finance MSMEs.

According to Kartiko&Rachmi, (2021) that the strategy to overcome the problem of sustainability of MSMEs is to provide a stimulus for the economy through the PEN (National Economic Recovery) program. Based on Article 1 paragraph (1) of PP 23 of 2020, the PEN Program is "a series of activities for the recovery of the national economy which are part of the state financial policy implemented by the government" to accelerate the handling of the COVID-19 pandemic.

Another strategy that can also be implemented by MSMEs in maintaining their

business is to adapt by utilizing online media, such as twitter, facebook, instagram, gofood, gopay, wa group, to increase their sales turnover. This strategy is very likely to be carried out by MSME players, considering the large number of "market places", which are available that can help bring customers (consumers) closer to the choice of products provided by MSME players. The use of online media can also speed up transactions and reduce costs incurred by both customers and MSME players.

## **5. Conclusion**

The government's policy strategy related to the absence of MSME access to banking includes providing stimulation to the economy. To implement this stimulus, it is possible to cooperate with "fintech lending", which can provide direct access to funding for MSMEs. The government in its strategy can offer financial incentives based on profits on fintech lending platforms, namely tax incentives. The strategy that can be implemented by MSMEs in maintaining their business is to adapt by utilizing online media, such as twitter, facebook, instagram, gofood, gopay, wa group, to increase their sale turnover.

## QUALITY OF TOP FOUR ERITREAN SUSTAINABLE BIO-RESOURCES FOR THE FUEL APPLICATIONS

**Abstract:** Worldwide 208% of increase in CO<sub>2</sub> emissions reported during 1965-2020, from 11.32 to 34.81 billion tonnes per year which has led to the contemplative global warming issues. However, transformation of non-renewable fuels into renewable alternatives enhance sustainable energy supply with a significant contribution in the energy mix. Since fire wood is commonly used in traditional mogogo (adhanet) for making daily bread (injera), approximately 2 million tonnes per year of biomass are consumed in Eritrea, primarily for household usage at 61% of total energy consumption in 2019. The net primary production of biomass in Eritrea measured at a rate of 12.5-16.67 % despite of 4% local consumption rate when compared with global production and consumes rates. Moreover, variance between the groups and within the groups analyzed to cognize the effect of different varieties of bio-resources in fuel applications. Further, mathematical models were constructed using Excel® and POLYMATH® tools to derive heating values from proximate parameters and validated with qualified former reports. Calorific values of forest wood species, temri musa (*Prosopis juliflora*) and seraw (*Acacia etbaica*) in conjunction with major crop residues of sorghum and wheat straws are assessed at 19.27, 19.38, 16.7 and 18.06 MJ/kg respectively as a function of proximate variables. Briefly, comparison of local samples with international species revealed that they are competitive in terms of energy content.

**Keywords:** *Prosopis juliflora*, *Acacia etbaica*, Wheat Straw, Sorghum Stalk, Biomass energy, HHV Prediction Models

### 1. Introduction

Globally there is a perpetual need of clean and sustainable energy sources due to rapid urbanization, persistent growth in population and consistent industrialization. In the past five decades, static 80% share of fossil fuels have maintained in the energy mix and there was threefold increase in energy demand despite the gains of energy efficiency. Worldwide 208% of increase in CO<sub>2</sub> emissions have reported during 1965-2020,

from 11.32 to 34.81 billion tonnes per year (Simmonds D 2022). The transformation of non-renewable energy resources to renewable resources could create sustainable energy supply and significant contribution in the energy mix. Thus the renewable energy options such as solar, wind, hydro power, geothermal, tidal, ocean thermal energy and biomass energy have gained prominence in the recent years. Of all energy sources, biomass is the third largest energy resource in the world. It is also the most dominant source

of cooking and heating energy for three-quarters of all people in developing countries, and accounts for about 14% of the total global energy use (Kpalo S. Y. et al., 2020).

The overlapping crises are affecting many parts of Africa's energy systems, including reversing positive trends in improving access to modern energy, with 4% more people living without electricity in 2021 than in 2019 (WEO Report 2022). They are also deepening financial difficulties of utilities, increasing risks of blackouts and rationing. These problems are contributing to a sharp increase in extreme poverty in sub-Saharan Africa, with the number of people affected by food crises quadrupling in some areas. With nearly one-fifth of the world's population today, Africa accounts for less than 3% of the world's energy-related carbon dioxide (CO<sub>2</sub>) emissions to date and has the lowest emissions per capita of any region. As of May 2022, countries representing more than 70% of global CO<sub>2</sub> emissions have committed to reach net zero emissions by around mid-century which include 12 African countries that contribute 40% of the continent's total emissions. At present, 600 million people, or 43% of the total population, lack access to electricity, most of them in sub-Saharan Africa. Today, 970 million Africans lack access to clean cooking. Countries are re-evaluating clean fuel subsidy schemes and exploring alternatives such as improved biomass cook stoves, electric cooking and biodigesters (WEO Report 2022).

Despite of the rapid depletion of fossil fuel reserves, excessive use of fossil fuels is posing serious environmental issues. In pursuit of alternative fuels, today renewable energy resources are paid of great interest in the world. Similar to many other countries in sub-Saharan Africa, the energy-development relationship has numerous social and political implications in Eritrea, where the national access to modern energy services is still very low although the government of Eritrea has given priority to the energy sector

immediately after independence in May 1991. About 70% of the Eritrean population, who lives in rural areas, has little or no access to modern energy services. At national level, access to electricity is about 32%, but only 3% of the rural population has access to it compared to 78% in urban areas (Zemenfes T 2015).

At present 52% of population has the accessibility to electricity majorly in the urban areas and 9% of total Eritrean people has accessibility for clean cooking and the rest depend on fire wood or locally made charcoal (IRENA 2022). At national level 72% of total energy supply in 2019 contributed by renewable sources primarily biomass despite of 11% share of solar energy, whereas 28% of energy supplied by non-renewable energy sources (IRENA 2022). Biomass is still the primary energy source in Eritrea despite of less biomass production. Net primary production (NPP) is the amount of carbon fixed by plants and accumulated as biomass each year and it is a measure of biomass productivity which is estimated as 0.5 tC/ha/yr substantially low when compared with global production of 3-4 tC/ha/yr (IRENA 2022). But unfortunately, fire wood and charcoal remained as major energy sources for cooking despite of social and environmental issues that are alarming globally. In the context of that development of sustainable and cleaner energy sources made significant field of study in Eritrea.

Biomass represents the biodegradable part of products, waste and residues from agriculture, forestry and, implicitly, from industrial and urban waste. Biomass, which represents around 15% of the primary energy sources used worldwide (Tumuluru J.S. et al., 2011), does not contribute to the increase of CO<sub>2</sub> concentration in the atmosphere, but it contributes to the reduction of the greenhouse effect and does not produce acid rains, thanks to sulfur content lower than to one existing in the structure of fossil fuels. In another report biomass is defined as the ensemble of non-

fossil organic matter in which are inscribed: wood residues, agricultural residues, plant residues from the forestry sector, but also cereals and fruits (Repsa E 2012). The main difference between the energy obtained from classic fuels and respectively biomass is the following one: fossil fuels can only be transformed into usable energy after thousands of years, whereas the energy from biomass is renewable and it can be used every year. Biomass in its original form is difficult to be used successfully as fuel in Compaction technologies are used for converting biomass (agricultural and forestry residues) into fossil fuels. These technologies are also known under the name of briquetting, pelleting, granulation, molding, packing, etc. (Adapa P.K et al., 2009). Lignocellulosic materials could provide up to 50 billion tons of dry matter on a global scale. Approximately 2 million tons per year of biomass are consumed in Eritrea, primarily in the household sector. About 80% of the energy use in Eritrea is from biomass resources such as fuel wood, dung and crop residue. Burning or disposal of biomass materials in the form of wastes or as a fuel creates more carbon dioxide emissions and other health and environmental problems.

Biomass is a primary renewable and sustainable energy source in Eritrea for many years particularly for cooking. Charcoal also placed as an essential fuel stock in house hold usage especially for homemade coffee as a tradition in Eritrea. Thus, biomass has become primary energy component in the country but unfortunately NPP rate is very less comparable with global NPP. Further, in most of the rural areas of Eritrea, injera (the baked bread) prepared on traditional fire wood stoves (mogogo) and their daily household coffee tradition include homemade coffee, consumes locally made charcoal which is inefficient and insufficient. Therefore, this work aimed to identify potential biomass resources in the country and assessing their quality attributes for fuel

usage purposes. Further, the development of models for the prediction of calorific values using proximate variables might serve as a database for the future relevant studies.

## 2. Potential Biomass Resources from Eritrea

As per the information from the Ministry of Agriculture (MoA), agricultural crop residues from the dominantly cultivated crops such as sorghum straw, wheat stalk and millets. Sorghum, wheat and millets were cultivated in 239700 ha, 34760 and 27434 ha respectively and their production rates of 112080 tons, 29486 tonne and 31836 tonne were measured respectively in 2021. Other vegetation in Eritrea varies based on the rainfall received and it has shown in Table 1. Bushland and shrub land covered majorly in the country with 43.19% of total land area followed by woody grasslands occupied about 18.93% of total land in Eritrea.

All woody species found in Eritrea can be used for charcoal and fire wood most commonly used species include *Balanites aegyptiaca* (Mekie), *Prosopis juliflora* (Temri musa), *Ziziphus spina-christi* (Gaba), *Albiza amara* (Chigono), *Terminalia browni* (Weyba), *Diospyros mespiliformis* and *Acacia* species.

### 2.1 *Prosopis Juliflora* (PJ) wood

Amongst the wide range of biomass species, *Prosopis juliflora* has been proposed as energy source by different researchers. It is a tropical and subtropical shrub tree, mainly found in the arid and semi-arid regions of the world (Africa, Asia and Australia) during the last 100-150 years. The species are now spreadover in the Africa; including Eritrea, Kenya, Ethiopia and Sudan (Nick P et al., 2001, Demissei E 2019).

Out of commonly used charcoal making species in Eritrea that are shown in fig.1, *Acacia etbaica* and *Prosopis juliflora* have

been selected as potential forest wood sources because of abundant existence and invasive attributes. According to the informants of MOA, PJ found in all zones except zoba Maekel and Dehub. It covers a vast area and

there is no quantifiable information on the extent of its invasion. But it is known to be covered in fertile crop lands, grazing lands, wood lands, river banks, water points, irrigation schemes and other areas.

**Table 1.** Variety of vegetation in Eritrea and their available areas in ha (MOA, Eritrea 2022)

Vegetation type	Area (ha)	Percentage of total land area
Closed to medium closed forest	51,520	0.42
Closed forest	40,790	0.33
Closed to medium closed woodland	452,730	3.68
Open woodland	1,112,760	9.05
Riverine forest	185,480	1.51
Mangrove	11,330	0.09
Bushland and shrub land	5,309,560	43.19
Grassland and wooded grassland	2,326,260	18.93
Bare land	1,879,190	15.28
Arable/cropped land	685,040	5.57
Other and non-classified land	240,320	1.95
Total	12,294,980	100

**Figure 1.** (a) *Acacia oregana* (b) *Albiza amara* (c) *Prosopis juliflora* (d) *Terminalia brownii* (e) *Ziziphus spina-Christi* (f) *Diospyros mespiliformis* (g) *Balanites aegyptiaca* (h) *Acacia etbaica*

Factors or Traits that makes PJ, a highly competitive and invasive, enabling it to spread at the cost of native species includes deep tap root system that can reach up to 50 meters deep, high potential of seed production and germination and long dormancy period (40 kg of pods/tree/yr, 60,000 seed 2-10 years), the ability to survive very low rainfall and lengthy dry periods, availability of mature trees with high photosynthetic productivity even in hot-arid climates and allelopathic potential

Invasive species such as *Prosopis* can have major negative impacts on food security and livelihoods if local communities are not mobilized and supported to adopt appropriate management practices to prevent further spread and restore invaded areas. There is a potential to control *Prosopis* spread and invasion by promoting its utilization in planned and regulated ways that provide economic incentives to local people. By this reason cutting of this woody plant would not lead to deforestation and the violation of the prohibited charcoal making law in Eritrea.

## 2.2 Acacia Etbaica (AE) wood

In a study of Ethiopia, the neighboring country to Eritrea targeting to know the most preferred fuel wood by the practitioners 88% of the frequency of the preference recorded for the *Acacia Etbaica* (Desta and Ambaye 2020). The green belt zone on the Eastern Escarpment is one of the natural woody forests in upland Eritrea dominated by *Acacia etbaica* (Seraw), a bushy wood plant used in this study to survey its potential for bioethanol production. The category “bush” is the dominant vegetation in Eritrea covering 63% of the total area. *Acacia etbaica* has a wide occurrence, from semi-desert shrub to wooded grassland at altitudes that extend from 1200 to 2000 m. *Acacia etbaica* is a tree or shrub (min. 2m) 2.5-12 m tall, survive with a mean annual rainfall of 200 -1400mm, and mean annual temperature of 22.3 °C and

native to Eritrea, Ethiopia, Kenya, Somalia, Sudan, Tanzania and Uganda.

Tree biomass of *Acacia etbaica* was estimated approximately as 4.5ton ha-1yr-1 by using allometry equations with tree height and canopy area as parameters in structure from motion(SfM) method. *Acacia etbaica* has a composition of 48.87 % cellulose, 21.37 % hemicellulose, 29.77 % lignin, and 2.35 % of ash contents and possessing a heating value of 19.14 MJ/kg which are prominent features of the plant in the selection as a feed stock for biobriquettes production (Aremanda et al., 2021).

## 2.3 Sorghum Stalk (SS)

Sorghum is the dominant crop variety cultivated in 35% of total arable lands of Eritrea. Sorghum biomass is an alternative energy source that offers producers a quick way to obtain biomass and it is easily available in Eritrea as it produced more. Sorghum cultivated in 239700 ha in 2021 at a production rate of 0.468 ton/ha. Ferreira et al.,I have tested sorghum waste for pellet production in Brazil. Pure sorghum biomass wastes have shown higher calorific values when compared with other additives that include steam and starch. Fixed carbon content of sorghum stalk measured as 14.45 % and a net calorific value of 3605 kcal/kg and their derived pellets have estimated as 3660 kcal/kg, which was comparatively higher than the other cases when they used starch and steam.

## 2.4 Wheat Straw (WS)

With the constant growth of the energy price, the interest for the energetic exploitation of the vegetal biomass, especially the straws, increased as well. From the specialty literature the burn heat values for different types of biomass are: wood, 18.5-19.5 MJ/kg, *myscanthus*, 17.6 MJ/kg, wheat straws, 17.2

MJ/kg, corn stems, 16 MJ/kg, rapeseed stems 16.5 MJ/kg, energetic coal 25 MJ/kg. From the qualitative point of view, the annual plants are comparable to the wood, as follows: wheat straws have a celluloses content comprised between 30-40%, lignin 16-21%, the average length of fibers is 1.50 mm.

### 3. Materials and Methodology

Based on the information provided by the Ministry of Agriculture, Eritrea following Agrocrop residue samples and forest wood samples collected for the thermochemical property analysis.

#### 3.1 Sample Collection and Preparation

Agrocrop residues and forest wood samples collected from the different parts of Eritrea. Sorghum stalk of 20 kg approximately collected from nearby farms to Barentu in Gash Barka region and transferred to Mainefhi and wheat straw of 20 kg collected from Himbrti farms in the form that they were left in the fields from the farmers. Later 100 g of each stalk reduced to the size range of 1-10mm using a cutters and grinder available in Chemical Reaction Engineering (CRE) laboratory, MCOETEC. *Prosopis juliflora* (locally known as Temri musa) wood logs about 20 kg were collected from Barentu subzone and transported to CRE laboratory, MCOETEC. In addition, locally available *Acacia etbaica* (locally known as seraw) plant wood of 20 kg were cut from MCOTEC premises with special permission from MOA and brought to CRE lab. Wood samples were cut into chips initially using axes and then grinded to 1-10mm of particle size for further analysis.

#### 3.2 Proximate Analysis

**Moisture Content:** The moisture content determined for the pulverized samples. 1g of each sample taken into a silica crucible and

placed inside an electric oven set at 105°C for 24 hours. It was then removed with the aid of tong and placed immediately in the desiccators to cool. The weight was then taken using a digital weighing balance. The procedure was repeated for all the samples and the moisture content was evaluated using the following Equation (Aliyu et al., 2016),

$$\text{Moisture content, } M (\%) = ((w_2 - w_3)/(w_2 - w_1)) \times 100$$

where,  $w_1$  = weight of crucible, (g)  
 $w_2$  = weight of crucible with the sample before heating (g)  
 $w_3$  = weight of crucible with the sample after heating (g)

**Volatile Matter:** The volatile matter (V) of all biomass species determined for the pulverized samples of 1 g each taken in to a crucible, covered and oven-dried until a constant weight was attained. It was then heated further in a muffle furnace at 600°C for 6 minutes then at 900°C for another 6 minutes as per method described in ASTM-3275. The difference in the weight as a result of loss of volatile matter was taken as the total volatile matter in the sample on percentage basis (Aliyu et al., 2016),

$$\text{Volatile matter, } V (\%) = ((w_3 - w_4)/(w_2 - w_1)) \times 100$$

where,  $w_1$  = weight of the crucible (g)  
 $w_2$  = weight of crucible with the sample before oven drying (g)  
 $w_3$  = weight of crucible with the sample after oven drying (g)  
 $w_4$  = weight of crucible with the sample after heating in muffle furnace (g) at 900 °C

**Ash Content:** The ash content was determined for the ground samples of 1 g each taken into a crucible and heated without lid in the muffle furnace at 750 °C for 90 minutes. The crucible was taken out and placed in a desiccator for cooling. The sample was then weighed. The procedure was repeated until a constant weight was attained. According to ASTM-

3174, the residue was reported as the ash content on percentage-basis (Aliyu et al., 2016), *Ash content, A (%)*

$$= ((w_3 - w_4)/(w_2 - w_1)) \times 100$$

where,  $w_1$  = weight of the crucible (g)

$w_2$  = weight of crucible with the sample before oven drying (g)

$w_3$  = weight of crucible with the sample after oven drying (g)

$w_4$  = weight of crucible with the sample after heating in muffle furnace (g)

**Fixed Carbon:** The fixed carbon content of coal was determined by subtracting the percentages of moisture, volatile matter and ash from the original mass of the biomass sample and it can be written as follows (Sipahutar et al., 2016),

*Fixed Carbon, F (%)*

$$= 100 - (M + V + A)$$

where,  $F$  is the weight percentage of fixed carbon,  $M$  is the percentage of moisture content,  $V$  is the percentage of volatile matter and  $A$  is the percentage of ash in the sample analyzed.

### 3.3 Statistical Analysis of Local and International Data Sets

Proximate parameters of all biomass resource samples were analyzed in one-way ANOVA study using Excel®, corresponding mean and variances were recorded for the comparison of deviations among the selected species. In general, statistical mean of  $n$  samples is given by,

$$\bar{X} = \frac{\sum X_i}{n} = \frac{X_1 + X_2 + X_3 \dots + X_n}{n}$$

and the standard deviation ( $\sigma$ ) or variance is given by,

$$\sigma = \sqrt{\frac{\sum (X_i - \bar{X})^2}{n}}$$

In addition, different sets of relative proximate parameters of prosopis juliflora

and acacia etbaica wood species, sorghum and wheat straw materials were considered from the open sources provided in the table 2 and determined the corresponding mean and variances among the international groups. The degree of correlation between two populations can be analyzed using the Pearson correlation coefficient, which is expressed in the following equation (Sunyong et al., 2023),

$$r = \frac{\sum (X_i - \bar{X})(Y_i - \bar{Y})}{\sqrt{\sum (X_i - \bar{X})^2} \sqrt{\sum (Y_i - \bar{Y})^2}}$$

The collected data was stratified as shown in figure 2. Highest data samples of wheat stalk (WS) and prosopis juliflora (PJ) have utilized in the statistical analysis and for further development of HHV prediction models.

**Figure 2.** Stratification of biomass data used in Statistical Analysis

### 3.4 Model Constructions for HHV determination and their validation

Many different statistical linear, single and multivariate models constructed in Excel® and POLYMATH® and verified for the better comprehensive statistical parameter  $R^2$  and to understand the precision of the proposed model. A simple single variant linear regression can be arranged as,

$$y = \beta_0 + \beta_1 x$$

and a multiple linear regression can be

described by,

$$y = \beta_0 + \beta_1x_1 + \beta_2x_2 + \dots + \beta_kx_k + \varepsilon$$

where  $y$  is the dependent variable and  $X = \{x_1, x_2, \dots, x_k\}$  are the independent variables and  $\varepsilon$  is the corresponding residual error.

**Table 2.** Data Sets of PJ, AE, WS and SS Biomass for the Statistical analysis and HHV Model Construction

4	Vaibhav et al., 2017 (India)	7.72	65.38	19.77	7.13	20.58

If the expected error,  $\varepsilon$  assumed as zero, the set of arbitrary coefficients ( $b$ ) can be

described as,  $b = \{\beta_0, \beta_1, \beta_2, \dots, \beta_k\}$  and it can be evaluated by the least square

method as,

$$b = (X^T X)^{-1} X^T y$$

Thus the developed linear and non-linear multivariate models are compared with earlier reported models (Ayse et al., 2019, Ayse and Serdar 2016) for the determination HHV as a function of proximate variables.

## 4. Results and Discussion

Prudent utilization of biomass resources in sub-Saharan African countries such as Eritrea is pertinent as the rain fall seasons are highly uncertain and unpredictable. In Eritrea, most of the forest wood and agricultural crop residues consumed as firewood for cooking applications without any scientific analysis of their aptness. However, the calorific value of a fuel substance is defined as the amount of energy released per kg of substance during its combustion and it is the most significant fuel character. Experimentally, higher heating values (HHV) of fuel substances are measured using Bomb calorimeter. Instead, HHV can also be determined using proximate analysis by developing the relevant and reliable models.

Although a model is preferable to develop when the plentiful data is available, in certain conditions a limited data facilitate the basic prediction of unknown and inaccessible parameters as a function of well-known and easily accessible variables. A total data set of 18 experimental proximate values of top-four biomass species as listed in the table 2 from the open sources and 4 additional results of locally performed experiments are considered for the ANOVA study and model construction.

### 4.1 Statistical Analysis Results

As given in the Table 4, ANOVA study of selected data sets of the top-four biomass species revealed that, amongst the tested species as received WS has highest range of

**Table 3.** Range, Mean and Variances of Proximate and HHV parameters for the selected biomass

moisture content and then followed by SS while PJ possess the least. Removal of moisture in the wood species consume more time in sun drying process and thus the variation among the forest wood species is minimum. Other words, PJ contain highest range and associated deviation of volatiles than others whereas SS has the minimum range and variance. Further, fixed carbon content is an indicator for the better fuel attributes and found in WS with a large range of 13.63 while SS acquire the lowest range of 4.57. Additionally, higher fixed carbon content favors in higher char yields which can be burned as fuel. AE and SS possess higher mean fixed carbon contents and thus they can generate value added charcoal or biochar through torrefaction or pyrolysis processes. Further, the deviation of fixed carbon content in the SS is very less as it accompanying relatively higher contents. Moreover, the ash content in the organic substances indicate the presence inorganic and trace elemental compositions. As silica found as the dominant component in agro-crop residues, WS and SS were identified with as high as 12.59 and 7.13% of silica respectively. The variations in the HHV were also analyzed and noted that PJ possess slightly higher range than the others whereas AE has the least variation, but the PJ and SS observed with maximum calorific values.

Pearson correlations between the proximate variables and HHV of selected biomass species are provided in the table 4. It was observed that the HHV correlated significantly with ash content (A) comparative with all other proximate variables. Additionally, M (moisture content) has shown better negative linear relation with volatile matter (V) and HHV. Further, comparatively a strong negative relation also ascertained between ash (A) and volatiles (V). Otherwise, the rest have shown very weak relations amongst them and deviated far from the goodness.

species

#### 4.2 Prediction of HHV using Proximate Parameters

Proximate analysis used for the prediction of gross calorific values (HHV) of potential biomass species in Eritrea such as AE, PJ, SS and WS. Equations (1) to (3) provided in the table 5 are the comparatively better linear multivariate regression models for HHV prediction by considering proximate variables as independent parameters. Model precision coefficient  $R^2$  has ensured that the model equation (3), which has constructed based on HHV dependence on all proximate variables (A, V, F, and M) provides comparatively better prediction than others.

Several other earlier reported models from the literature tested for the prediction of an optimized model as shown in table 6 and their corresponding coefficient of model goodness ( $R^2$ ) along with variances are also reported. (Ayşe et al., 2019) has developed HHV prediction models considering proximate analysis of 39 different biomass samples that include locust bean, ash, peanut husk and sour

cherry stem etc., This work has considered 22 different samples of forest wood of PJ and AE along with agro-crop residues of SS and WS and tested with Ayşe proposed models and found with similar accuracy coefficient  $R^2$  of 0.391 which is the highest amongst the other proposed models. The functions that includes moisture content have shown better predictions in similar with conclusions made by Ayşe et al.,, while HHV holds a very poor dependence on volatiles in contrast to the earlier reports (Ayşe et al., 2019).

#### 5. Conclusion

Being the third largest source of energy in the world, biomass contributes about 61 % of total energy consumption in Eritrea despite of its substantially lower biomass production rate of 0.5 tC/ha/year. In other words, lignocellulosic materials could provide up to 50 billion tons of dry matter on a global scale whereas in Eritrea approximately 2 million tons per year of biomass are consumed, particularly in the household sector. Bushland and shrub lands spread over 43% of total land

in Eritrea, subsequently the dominant and invasive forest wood species such as acacia etbaica and prosopis juliflora have recognized as potential biomass resources for fuels applications together with major agro-crop residues from sorghum and wheat cultivations. Proximate parameters such as moisture content, volatile matter, fixed carbon amount and ash quantity are analyzed for the top four biomass resources to understand their effect on fuel attributes. Statistical analysis of proximate results has revealed that prosopis juliflora wood found with higher volatile of 73.59% while the wood of acacia etbaica contains the highest fixed carbon content of 20.73%. In addition, from the selected agro-crop residues, sorghum straw exhibited good amounts of fixed carbon of 20.61% on average. Pearson's correlation between the HHV and proximate variables showed that HHV has relatively better linear relations with ash and moisture contents. Further, the calorific values of bioenergy sources modeled as the functions of proximate variables using multivariate linear regressions and their validation proven

that they coincide with formerly reported models. Calorific values of forest wood species, temri musa (*Prosopis juliflora*) and seraw (*Acacia etbaica*) in conjunction with major crop residues of sorghum and wheat straws are assessed at 19.27, 19.38, 16.7 and 18.06 MJ/kg respectively as a function of proximate variables. Thus, acacia etbaica wood from the forest species and sorghum stalk of the agro-crop residues are proven to be the best bioenergy sources for Eritrea.

**Acknowledgements:** The authors of this report gratefully acknowledge the people who helped in raw material collection, transportation and preparations for their invaluable support in providing the needful facilities. Authors convey their gratefulness to Dr. Sujana Ramesh for her consistent support in proof reading of the manuscript. Authors would like to extend their thankfulness to Mr. Bahreselam Sielu, Head of Chemical Engineering, Mai Nefhi College of Engineering & Technology for untiring support.

## EVALUATING THE SUSTAINABILITY OF SUGAR VALUE CHAIN: EVIDENCE FROM VIETNAM

**Abstract:** *This paper investigates the sugar value chain in Vietnam and evaluates its sustainability using integrative indicators based on the Triple Bottom Line (TBL) approach. A set of 27 indicators were used in our survey of key stakeholders in the sugar value chain of Vietnam. After 2 months, we received 482 questionnaires and retained 473 valid responses. Our findings show that there are still many challenges for the Vietnamese sugar value chain to grow sustainably. Thus, we proposed some suggestions to enhance the sustainability of the Vietnamese sugar value chain.*

**Keywords:** *Sugar value chain, Sustainable development, Triple Bottom Line, Vietnam*

### 1. Introduction

In recent decades, increased worldwide competitiveness and decreased commodity prices have led to agriculture sectors pursuing value chain possibilities to boost profitability and sustainability (Martin, 2001; Boehlje, 1999). Martin (2001) highlights other drivers, including the industrialisation of agriculture as farming shifts from a rural lifestyle to an agribusiness sector with a value chain mentality. Sugar industries around the world are no exception. The long-term sugar price trend has been downwards despite the costs of production generally has been increasing. Increased competition from new potent sweeteners as sugar substitutes may put more pressure on sugar pricing (Higgins et al., 2007). Furthermore, sugar production (per hectare) has stayed stable or decreased in many established sugarcane-growing regions during the last three to five decades (Meyer and Van Antwerpen, 2001; Garside et al., 2001). These challenges have resulted in a greater emphasis on value chain solutions to boost profitability.

In Vietnam, the sugar industry is essential and plays a vital role in agriculture-based industries. In the last 5 years, the Vietnamese sugar industry has suffered severe losses due to the impact of the unequal business environment. Over the years, the devaluation of sugar from Thailand has found many ways to enter the Vietnamese market, causing the domestic sugar price to drop below production costs. As a result, the local sugar factories are forced to sell sugar below the production cost, leading to severe damage to the sugar industry in Vietnam. In addition, climate change is also causing difficulties for the Vietnamese sugar industry. Prolonged drought, and quick drying of sugarcane lead to reduced weight and quality of sugarcane in the last months of harvest and high transportation costs. Processing and taking advantage of by-products after processing sugar are not much. In other words, the Vietnamese sugar industry is in a precarious stage.

As a result, there is a quest to maintain the sustainability of the Vietnamese sugar

industry. In this regard, it is essential to explore and evaluate the sustainability of the sugar value chain in Vietnam and raise some suggestions to improve the value chain.

## **2. Literature review**

### **2.1. Value chain and sugar value chain**

The value chain concept was developed and popularized in 1985 by Michael Porter, in “Competitive Advantage,” a seminal work on the implementation of competitive strategy to achieve superior business performance. Porter (1985) defined value as the amount buyers are willing to pay for what a firm provides. He conceived the “value chain” as the combination of nine generic value-added activities operating within a firm – activities that work together to provide value to customers. Porter linked up the value chains between firms to form a Value System. However, in the present era of greater outsourcing and collaboration, the linkage between multiple firms’ value-creating processes has more commonly become called the “value chain.” As this name implies, the primary focus in value chains is on the benefits that accrue to customers, the interdependent processes that generate value, and the resulting demand and funds flow that are created. Effective value chains generate profits.

In the agriculture sector, the value chain approach provides a systematic process to improve market linkage for farmers (Ferris et al., 2014). It provides a framework for identifying key constraints and considering appropriate solutions (Orozco-Romero et al., 2020). These constraints and solutions require a coordinated response by different stakeholders in the chain, which necessitates trust and a willingness to collaborate (USAID, 2012). Through the value chain approach, one can understand the farmer-trader relationship, power dynamics, and the distribution of benefits. According to Rota and Sperandini (2010), value chain analysis is essential to an understanding of markets, their

relationships, the participation of different actors, and the critical constraints that limit the growth of agricultural production and, consequently the competitiveness of smallholder farmers. These farmers currently receive only a small fraction of the ultimate value of their output.

Sugar industries worldwide are primarily “push chains”, where sugarcane is pushed through the chain to produce raw sugar with minimal product differentiation and sold at market value as a bulk commodity. A general sugar value chain consists of growing, harvesting, cane transport, mill processing, sugar transport, and storage/shipping/marketing sectors.

### **2.2. Sustainability of the sugar value chain**

The sustainability of the sugar value chain has been of primary concern for researchers and practitioners in recent decades. As a result, various issues related to the value chain have been discussed. For example, Higgins and Laredo (2006) explored the Australian sugar industry and proposed an analytical framework to model the components involved in the harvesting and transportation of sugar cane products in the value chain. Research by Higgins and Laredo (2006) showed that there are several key points for improvement, such as rearranging the harvesting process or streamlining the transportation infrastructure that will help increase the return value for stakeholders.

Similarly, Archer et al. (2008) conducted a review of the studies on the sugar value chain and elucidated the challenges in this research topic. These authors compared the sugar industry of Australia and South Africa, thereby pointing out solutions to develop the sugarcane value chain that not only include technical solutions but also need collaborative participation throughout the chain, and regularly change in a disruptive way. Accordingly, the sugar value chain should be developed in a lean and flexible

direction.

Kalinda and Chisanga (2014) studied the sugar value chain in Zambia and pointed out the opportunities and challenges for the development of the sugar industry. The specialty of the Zambian sugar industry is that it is a monopolistic industry with only one business, contributing 4% of the country's GDP and 6% of the country's total exports.

Perlata and Navarrete (2017) researched the problem of creating shared value in the sugar industry and offers a model that proposes 6 steps to choose a strategy to create shared value in the enterprise's value chain. According to these two authors, shared values are reinforced through supplier development. In another study, Manda et al. (2020) explores the factors influencing the participation of farmers in the sugarcane value chain and examines the preconditions required to secure the benefits and forms of participation, suitable for local groups in the chain.

Srichanthamit and Tipayawong (2018) designed and developed a set of criteria for evaluating value chain performance for the sugar industry based on value chain management theory and case studies. In this study, Srichanthamit and Tipayawong (2018) use a quality function development (QFD) tool to integrate with value chain activities and find success factors with different evaluation weights, together. This set of indicators is applied to the case study of a sugar factory to assess its relevance to practice. Research results show that this set of criteria can be used by sugar mills for internal evaluation.

In general, researches on the value chain in the sugar industry in the world have focused mainly on value chain tools to assess the current situation of the value chain and find solutions to improve the performance of the sugar industry. A few studies have addressed the value chain evaluation criteria, but none have directly addressed the sustainability of the sugar value chain. Similarly, in Vietnam, studies on the sugar industry have been

conducted, but in-depth studies on the sugar value chain and its sustainability are not available.

### **2.3. Evaluating sustainability of a value chain**

The sustainability of the value chain can be expressed simultaneously along three dimensions: economic, social and environmental or triple bottom line (profit, people and planet) (Gebre & Rik, 2016). On the economic dimension, an existing or proposed upgraded value chain is considered sustainable if the required activities at the level of each actor or support provider are commercially profitable. On the social dimension, sustainability refers to socially acceptable outcomes in terms of the distribution of the benefits and costs associated with increased value creation. On the environmental dimension, sustainability is determined largely by the ability of value chain actors to show little or no negative impact on the natural environment from their value-adding activities; where possible, they should show a positive impact (Neven, 2014). Sustainability indicators are particularly hard to define and measure. The basic problem is that sustainability only occurs in the future while the indicators are measured in the present (USAID, 2012). Although the three sustainability dimensions (social, environmental, and economic) are treated individually here for clarity, in practice they overlap (USAID, 2012). Once the core processes of the value chain are mapped, indicators must be associated with each chain, for the three sustainability dimensions. The indicator selection depends on the level of the organization and the type of activities (Moreno & Salgado, 2012).

Previous conventional life cycle assessment models in the past often focused on sustainability indicators such as raw materials, energy, emissions, etc. These indicators are chosen because they are directly related to all stages in the value chain

and can be quantified. However, it is not simple to assess the socioeconomic impact of the value chain of a specific product. In such a context, we propose that there is a need for multiple methods of measuring socioeconomic criteria to describe the relationship between products and socioeconomic impacts, which can be successfully integrated into the traditional analysis framework. In our classification, economic and social indicators are divided into two categories: additive and descriptive. The additive indicators must meet two criteria: (1) they can be measured quantitatively, and (2) they are related to production volume so that they can be cumulative throughout the value chain. For example, production cost, labor cost, and value added per unit. In addition, some socioeconomic indicators to measure sustainability that is widely considered fail to meet the requirement to be additives because they are not directly related to production. This classification is suitable for measuring social and environmental aspects (Kruse et al., 2009). Descriptive indicators can be divided into general and specific indicators based on the viewpoints or the different social contexts. The general indicators are often used to describe widely accepted social values, such as working conditions in relation to the minimum wage, social benefits, number of working hours per week, the gender ratio, etc. On the other hand, specific indicators are those factors that cannot be widely applied in any industry. These indicators focus on measuring the economic, social, and environmental impact of a specific product or procedure. They are qualitatively or quantitatively measured, but their comparison ability of these indicators are limited to similar production system. For example, the impact of pesticide use on workers can become a major concern in the sugar industry but not in the fishery industry. From a sustainability viewpoint, specific descriptive indicators allow us to focus on

sustainability issues related to a particular product.

### **3. Methodology**

#### **3.1. Sample and procedures**

The primary data collection process is divided into two phases. At the first stage, we asked 57 experts and researchers who have grasp of knowledge of Nghe An sugar value chain to assess the suitability and feasibility of 51 triple-bottom-line-based indicators that were gathered from previous research including Balkau and Sonnemann (2021), Petit et al. (2019), Yakovleva (2007), Fearn and Garcia (2012), Warhust (2002), Hassini (2015), Tarekn et al. (2020). The sample consisted of 50% women and 46.4% men. The age of survey participants ranged from 28 to 60 years, with 91% of an age between 28 to 57. University or higher education accounted for 73.2% participants. This percentage would improve the quality of the evaluation results. Moreover, the percentage of respondents who know the value chain accounts for 83.9%, which is also another indicator of the quality of the responses.

27 out of 51 indicators are judged to be relevant and feasibility, with the percentage of raters agreeing or completely agreeing over 75%. For example, the item “Sugarcane farmers take part in training programs on planting and managing arable land” was assessed by 83.6% of experts as an appropriate indicator. The Krippendorff’s Alpha index of all the 27 indicators is greater than 0.667 (Landis & Koch, 1977), indicating consensus in the expert responses about the relevance and feasibility of the criteria. 24 indicators were excluded because they are not relevant to the condition of Nghe An sugarcane industry or not feasible to measure their impact. For example, the indicator “Discrimination between men and women in the sugarcane industry” may be not a suitable criterion for measuring sustainability. Particularly, the topographical condition for sugarcane cultivation are sloping and

scattered in Nghe An, which does not create favorable conditions for mechanization in sugarcane planting and harvesting activities. As a result, the disproportion between male and female labor is inevitable.

In the second stage, the questionnaires which consist of the 27 selected indicators in the first stage were sent out to a broader range of stakeholders, such as farmers, sugar mills, cooperatives, suppliers, distributors and public administrators to measure the sustainability of Nghe An sugarcane value chain

With the goal of evaluating the sustainability of sugar value chain in Vietnam, we decided to chose Nghe An province as an representative sample because the province demonstrates the average typical features of various sugar chain regions in Vietnam. In the crop year 2021-2022, the total area of raw sugarcane in Nghe An reaches 19,223 hectares, concentrated in the following districts: Quy Hop 4,961 hectares; Tan Ky 3,171 hectares; Nghia Dan 7,600 hectares; Quy Chau 1,158 hectares; Quynh Luu 936 hectares; Anh Son 449 hectares. The average yield of sugarcane is nearly 61.0 tons/ha; output reached 1,173,000 tons, serving 3 sugar processing factories with a total designed capacity of 15,500 tons of sugarcane/day.

To identify the target population, we gathered contact information of the sugar value chain's stakeholders through the support of officials from Nghe An Department of Agriculture and Rural Development. We randomly selected 987 stakeholders, including farmers, employees in sugar mills, cooperatives, suppliers, distributors and public administrators, and invited them to participate in both our web-based survey via email and paper-pencil-based survey. We received 482 questionnaires, which corresponds to a 48.8% response rate. After dropping questionnaires with incomplete data (missing data greater than 5%) and reckless responses, we retained

473 responses in total. Our sample consists of ten groups, including cooperative farmers (N=101), individual farmers (N=55), dealers (N=21), retailers (N=10), cooperative leaders (N=98), sugar mill employees (N=112), transport, local government officials (N=20), agricultural advisors (N=20), transporters (N=26), material and tool suppliers (N=10). The proportion of the sample represents the true proportion of the stakeholders in Nghe An sugar value chain. The education of survey respondents were primarily high school and vocational degree (66.6%). Age mostly ranges from 28 to 47 years old (72.1%) and the majority of respondents were males (71.7%).

### 3.2. Measures

Measures used in this study were adapted from established scales. We used multi-item scales based on 5-point Likert scales from "1" (strongly disagree) to "5" (strongly agree), unless otherwise stated.

We captured the economic dimension through eight items from Yakovleva (2007), and Hassini (2015). The items of the scale ask respondents to evaluate how sustainable the economic indicators are. A sample item is "Income from the value chain ensures essential needs" with a five-point Likert scale ("1" = "Strongly disagree", "5" = "Strongly agree"). Cronbach's alpha of the scale is 0.86. The social aspect was measured using twelve items taken from Mayer (2008), Labuschagne and Van Erck (2005). The items indicate how sustainable the social criteria of the sugarcane value chain are, and they are coded on a five-point Likert scale ("1" = "Strongly disagree" to "5" = "Strongly agree"). A sample item, for example, is "workers are guaranteed safety in the workplace". The scale has a Cronbach's alpha of 0.90. The environmental aspect was measured using seven items collected from Darmawan et al. (2014), Gebre and Rik (2016). The items indicate how sustainable the environmental criteria of the sugarcane value chain are. A sample item is

“Stakeholders in the value chain using renewable energy sources”. The scale has a Cronbach’s alpha of 0.76.

## **4. Results and discussions**

### **4.1. Preliminary analysis**

We conducted confirmatory factor analysis (CFA) on all multi-item scales using R to validate the scales. We conceptualised ‘economic’, ‘social’, ‘environmental’ as first-order factors, which can be freely correlated. We used Chi-square statistics and practical fit indices to evaluate model fit. In particular, standardized root-mean-square residual (SRMR) with a cut-off value of 0.08, root-mean-square error of approximation (RMSEA) with a cut-off value of .06, and comparative fit index (CFI) with a cut-off value of 0.95 were used as evidence of good model fit (Hu & Bentler, 1998). After deleting 6 items with a modification index greater than 30, the results of this analysis indicate good model fit:  $\chi^2 (186) = 567.556$ ; CFI = .951; SRMR = .0049; RMSEA = .061 (see Table 1 in the Appendix). Furthermore, all standardized loading estimates are higher than 0.50 (Hair et al. 2010) (see Table 2 in the Appendix), average variance extracted (AVE) and composite reliability (C.R) of all the factors in the model greater than 0.50 and 0.70 respectively are indicators of convergent validity. Discriminant validity was tested by a more rigorous test which requires the AVE of each of the latent constructs to be higher than the highest squared correlation with any other latent variable in the model (Fornell & Larcker 1981). These conditions were met suggesting discriminant validity (see Table 3 in the Appendix).

### **4.2. Analysis of sustainability indicators**

To evaluate the sustainability of the sugar value chain in Vietnam, we calculate the mean value of each indicator by 10 groups of respondents and sum up in total of 473 respondents ( see Table 4 in the Appendix).

As shown in Table 4, the mean values of 6 economic indicators range from 3.19 to 3.55 (higher than 3.00). Thus, we might conclude that the sugar value chain is not sustainable in terms of economic aspects. Among the 6 economic indicators, logistics cost (Q15) has the highest mean value of 3.55 and labor cost (Q13) has the lowest mean value of 3.19. Other economic indicators have a mean value of around 3.50. Thus, it is implied that the Vietnamese sugar value chain is facing many challenges to be economically sustainable. This finding is attributed to the fact that the Vietnamese sugar industry has been severely impacted by fierce competition from illegally imported sugar from Thailand and other issues such as drought, flood, and diseases. As a result, sugar companies have to sell sugar at an extremely low price, even lower than the production cost. In turn, they pay very little to farmers who grow the sugarcane. Therefore, farmers are disappointed and do not want to commit to the sugar mills to grow sugarcane and maintain the long-term input supply. This finding is typical for the case of Vietnam.

Regarding the social aspect, 11 indicators are retained in our measurement to evaluate the sustainability of the sugar value chain. Table 4 reveals that the mean values of social indicators range from 3.66 to 3.92. Notably, 8 out of 11 indicators have mean values higher than 3.80, indicating that all respondents agree that the sugar value chain is socially sustainable. Some indicators in this measurement achieve quite a high mean value (over 3.80), such as “tax payment to the government budget” (Q21), “clear regulations for recalling defective products” (Q35), “participating in training farmers on sugarcane planting and relevant skills” (Q36). The mentioned activities are taken by the sugar mills and are related to different stakeholders in the value chain, including the government, consumers, and the local community. Therefore, it is implied that sugar mills play a critical role in socially improving

the value chain's sustainability. In the case of our study, Nghe An province is a big area where the living condition and average income of the civils are still low. Thus, the appearance of big and modern sugar mills is very critical to the sustainable growth of the industry and the region.

In terms of the environmental aspect, we have 4 indicators in the measurement, of which the issue related to "improving the fertility of the soil" (Q56) achieves the highest mean value of 3.91. The lowest mean value of the environmental indicator is 3.66 (Q40), which is "using recycling packaging". These findings are in line with some previous studies of the food value chain, such as Yakovleva (2007), or the banana value chain of Gebre et al. (2020).

In addition, it is notable in our study that among the 10 groups of respondents, dealers and retailers tend to rate most indicators at a higher value than other groups, showing that they are very optimistic about the sustainability of the Vietnamese sugar value chain. On the contrary, agricultural advisors and cooperative farmers always give lower scores to all indicators than other groups. This finding implies that agricultural advisors and collective farmers are less optimistic about the sustainability of the Vietnamese sugar value chain than the remaining respondents. The doubt of these two groups regarding the sustainability of the sugar value chain might be explained by their deep engagement in the value chain and their daily exposure to the activities of sugarcane growing. Furthermore, these two groups are believed to be more knowledgeable of the sugar value chain than the dealers and retailers.

## 5. Recommendations and conclusion

In the present study, we evaluate the sustainability of the Vietnamese sugar value chain from the stakholder perspective. We

## References:

found that the sugar value chain seems to be more sustainable in terms of social and environmental aspects than economic aspect. From our findings, we suggest that some key stakeholders should be more active in promoting the sustainability of the value chain, who are the sugar mills, the local government and the supporting organizations in the industry. For example, financial shortage is one problem for farmers to maintain their growing and harvesting process. Thus, to enhance the economic sustainability of the value chain, it is essential to prioritize the loan for poor farmers so that they can invest in sugarcane growing. Banks and sugar mills should joint hand to support farmers access the loan. In addition, we strongly recommend sugar companies should also take their responsibility in promoting the sustainability of the sugar value chain. Sugar companies participate in many phases of the value chain so they have wide sphere of influences on the farmers, the input suppliers, the distributors. Thus, they will be able to guide farmers and encourage them to grow sugarcane and commit a to buy sugarcane from farmers at a stable and profitable price. Furthermore, local government should admend the policies to strengthen the relationship among farmers, sugar mills, dealers, retailers and other stakeholders. This study has some limitations. Sample size is small so that the research results might not be generalized for the whole sugar industry in Vietnam. Moreover, we have not yet applied in-depth interview method to further explore the reasons for unsustainable issues. Thus, we suggest that future study should expand the survey to other provinces in Vietnam and employ more qualitative methods.

## STUDING THE INTERRELATIONSHIP BETWEEN QUALITY MANAGEMENT SYSTEM AND INTELLECTUAL CAPITAL

**Abstract:** *The aim of this study is to analyse the relationship between the quality management system (QMS) and the intellectual capital (IC) of a company. The importance of IC results from its potential to generate value, especially in the knowledge-based economy. It reflects unique organizational resources which are hard to acquire, imitate and replace. Such resources are most often grouped using trichotomous categorization into human, structural, and relational capital. As there is scarce literature examining the interrelationship between QMS and IC, this study aims to explore the way QMS enhances IC, but also how IC impacts QMS. The role of motivation for implementing a formal QMS is examined in light of IC efficiency and value-added based on IC. The results indicate a mutually reinforcing role of QMS and IC, leading to superior company performance.*

**Keywords:** *intellectual capital, quality management system, knowledge, performance*

### 1. Introduction

Quality management system (QMS) is oriented towards improvement of business performance through reducing customer complaints, costs and errors, increasing efficiency and employee motivation, as well as through exceeding customer expectations.

Research has shown that QMS can improve business performance, while the focus was on measuring the past performance. Given that the current business environment is very dynamic, looking at the rearview mirror while driving forward is not the best option. Thus, it is necessary to analyse whether QMS helps companies to create value in the future. Intellectual capital (IC) represents a set of a company's immaterial resources, which are rather hard and time-consuming to be acquired, but as such they are hard to be

replaced or imitated by competition, thus providing the base for competitive advantage. According to the Resource Based View (RBV), companies gain competitive advantage if they possess resources which are rare, valuable, unspstiuable, and imperfectly imitable. Unlike material assets which can be easily acquired, immaterial assets need development within the company. Consequently, such assets are context-dependent and create value only in that specific environment. IC represents a company's unique capabilities and an invisible infrastructure for value creation. It is dynamic by its nature, enabling a company to evolve in a changing context.

Ruiz et al. (2018) studied the influence of total quality management (TQM) on firms' intellectual capital, finding a strong positive causal effect. Milovanović et al. (2021)

---

Corresponding author: Vesna Milovanović  
Email: [vesna.milovanovic@kg.ac.rs](mailto:vesna.milovanovic@kg.ac.rs)

assert that “IC provides key support to the QM process”, while, at the same time “through the QM process, companies exploit and increase the value of its IC”. The authors proposed further examination of IC contribution to improving the QM process.

In order to examine the contribution of QMS adjusted to the requirements of ISO 9001:2015 to the company’s ability to create value in the future, this study employs the concept of IC. Moreover, it examines the two-way relationship between QMS and IC, following the suggestions of the previous research. The results support a mutual reinforcing effect of QM and IC, leading to improved business performance on the sustainable basis. Additionally, it is found that motives for employing a formal QMS, such as ISO 9001, impact IC efficiency and value-added based on IC.

## 2. Quality management system

Oakland (2004, p. 270) defines quality management system (QMS) “as an assembly of components, such as the management structure, responsibilities, processes and resources for implementing quality management”. The author asserts that interactions between components of QMS are as important as the components themselves, and that it is important to understand the functioning of the system, instead of analyzing the individual components. QMS begins with identification of customer needs, and finishes with their satisfaction, involving all activities grouped in four major areas: management responsibility, resource management, product realization, and measurement, analysis and improvement.

According to Purushothama (2010), the concept of QMS originated from the Second World War but was kept as a military secret until 1976, when the British Standards Institution published BS 5750. It was accepted by the International Organization for Standardization (ISO) in Geneva as a

series of ISO 9000 standards, published in 1987 amended in 1994, 2000, 2008 and 2015. The amendments are a consequence of the mechanism of reviewing the adaptability of the management system to the changing business environment. The number of companies that align their management system with the requirements of the ISO 9001 standard is growing. As of December 31, 2021 the total number of valid ISO 9001:2015 certificates was 1,077,884. The reasons for the great popularity of the ISO 9001 certificate are numerous. Unlike regional or national quality awards that can be used as a framework for achieving business excellence, these standards are much more widespread. The formation of free trade zones such as EC, EFTA, NAFTA and others, imposes the need for certification according to the ISO 9001 standard. Certification can help companies to build a system that will minimize the risk of injuries and harmful effects of products, which can result in high fines for the company. Companies use ISO 9001 certificates as a basis for choosing business partners, and public tenders in many countries today are difficult to win without an ISO 9001 certificate.

ISO 9000:2015 describes contemporary business environment as profoundly different from recent decades. The family of standards for quality management recognises the role of knowledge as a principal resource in a changing environment where stakeholders are becoming more demanding. For the first time this amendment presents quality management as a strategic process, and includes risk-based thinking. The idea is to drive companies towards sustainable development, instead of concentrating on customer satisfaction and efficiency only. In earlier editions of the ISO 9001 standard, the concept of risk-based thinking was implicit and expressed through guidelines for preventive action. QMS is defined by ISO 9000:2015 as a dynamic system that evolves

through improvements. It is a set of activities by which the organization identifies its goals and determines the processes and resources required to achieve the desired results. A QMS is supposed to be “flexible and adaptable within the complexities of the organizational context” (ISO 9000:2015). It is highlighted that each organisation’s QMS is unique, and it has to be compliant to the organisational needs. The standards specify seven quality management principles as the basis for QMS: customer focus, leadership, engagement of people, process approach, improvement, evidence-based decision making, and relationship management. A cohesive QMS is a formal program of managing quality activities in order to improve business performance. Some of the benefits are reflected in customer loyalty, market share, operational efficiency, flexibility, use of resources, cost reduction, competitive advantage, employee motivation, reputation and control of all processes (Purushothama, 2010).

Besides ISO 9000 standards, there are several alternatives that can serve as guidelines for building an effective QMS, such as quality awards (Deming Prize, Malcolm Baldrige National Quality Award, European Quality Award etc.) and the European Foundation for Quality Management Excellence Model – EFQM. The awards promote performance excellence and guide businesses towards improvement of competitiveness through criteria used to evaluate organizations. Fernández Pérez and Gutiérrez Gutiérrez (2013) find that different alternatives have a different impact on the network of relationships that management achieves with the external environment, through which it accesses information and knowledge, and which has a positive impact on the company's strategic flexibility and organizational learning. Companies that do not adhere to quality management guidelines face a negative impact of the diversity of external relations networks on strategic

flexibility and organizational learning, while the aforementioned negative impact is absent if companies have implemented ISO standards.

### 3. Intellectual capital

According to Janošević (2019), IC represents a set of different types of intangible resources, which significantly contributes to the creation of value and improvement of the company's competitive position in today's knowledge-based economy or information era. The reason is that intangible resources have a greater potential for value creation because, compared to tangible resources, they are harder to imitate and unsuitable for substitution. According to this author, the key characteristics of IC are: (1) IC generates future benefits, (2) IC potency is based on intangible resources, (3) IC can be input and output of the value creation process, (4) value created by using IC is indirect, (5) IC components are connected to each other and to tangible assets (physical and financial), (6) IC is directly related to knowledge management process, (7) IC is difficult to imitate and substitute, (8) certain elements of IC can determine the competitive environment of the branch and sources of sustainable competitive advantage, (9) unlike material assets whose value decreases with use, the value of IC increases with use, and (10) IC changes the rules of competing, the process of strategy formulation and implementation, and the ways of measuring success.

The literature offers numerous definitions of IC. Stewart (1998) defines IC as the collective brain power that encompasses knowledge, information, intellectual property and experience that can be harnessed to create wealth. According to Rastogi (2003), IC can be seen as the holistic ability of a company to coordinate, manage and deploy its knowledge resources with the aim of creating value in the future. Similar to

conceptual determination of IC, there are also differences regarding its constituent elements. It has been perceived as a set of competencies of employees, internal structure and external structure (Sveiby, 1997); marketable assets, human capital, intellectual property and infrastructure (Brooking, 1997); human capital and organisational (structural) capital (Roos & Roos, 1997); human capital, organizational (structural) capital and customer capital (Stewart, 1998); research and development, advertising (brand support), capital expenditure, information systems and technology appropriation (Gu & Lev, 2001);

human capital, customer capital, structural capital, social capital, technological capital and spiritual capital (Khaliq et al., 2015); human capital, structural capital and relational capital (MERITUM, 2002).

The rising importance of IC can be best observed by looking at the components of market value of the S&P 500 in the USA over the years provided by Ocean Tomo (2020). Figure 1 illustrates this phenomenon, showing that participation of IC in total assets has grown enormously (73% for the period of 45 years). The most impressive fact is that the portion of IC is approaching the value of total assets.

#### 4. Relationship between QMS and IC

Quality management by its definition is a broader concept than IC. It is a process aiming to assure a company's competitiveness, while IC is perceived as the

main resource that can be used for achieving competitive advantage. Nevertheless, it is assumed that QMS can help in developing IC, and that IC supports QMS, leading to superior business performance. Several researchers have recognized connection between the two concepts. For example, Kim et al. (2009) proposed a framework for

managing IC based on ISO 9001 QMS. Ruiz et al. (2018) examined the influence of total quality management (TQM) on IC and found a strong positive effect. By studying the impact of IC on the firm's performance, Yousaf (2022) found that EFQM model also enhances the firm's performance. Claver-Cortes et al. (2018) found that international quality standards lead to competitiveness, as they demand adaptations to infrastructure and processes, while trainings enabled transformation of tacit into explicit knowledge. Further, organizational culture was strengthened, headed by the management's commitment and followed by employees' involvement in decision-making and teamwork. Majority of companies experienced opening of new markets and establishing alliances. Therefore, quality standards led to improvement of human, structural and relational dimensions of IC in examined companies, which observed improved innovativeness and operational and market performance.

However, to date and according to the authors' knowledge, there are no studies examining the relationship between ISO 9001 QMS and IC. This study therefore attempts to fill this research gap by proposing a model for examination of such relationship. Figure 2 illustrates assumed relationship between QMS and IC. QMS is presented through its principles defined by ISO 9001, while IC is composed of human, structural and relational capital. Elements of each IC component are systematized based on previous research (Janošević, 2019; Janošević & Dženopoljac, 2015, Martin-de-Castro et al., 2011). When having a strong focus on customers, the organization is learning about their requirements, needs and expectations, thus generating a knowledge that will be used for improving products, services and processes in order to increase customers' satisfaction, market share and improve reputation. It is thus supposed that customer focus positively impacts human

capital (relationship a).

Leadership plays a pivotal role in the QM process through goals setting, strategy formulation, resources allocation, communication and leading by example, which is essential for employee motivation and enthusiasm (relationship b). Leaders are responsible for organizational structure and culture, business strategy and management process (relationship c).

Engagement of people is concerned with their involvement, training and empowerment, contributing to improving employees' knowledge, skills and motivation (relationship d). Procedures are created to direct employees and standardize their performance and are especially beneficial for the newly employed (relationship e).

The idea of process approach is to manage interrelated processes in order to improve effectiveness and efficiency of the system, and to exploit synergy as a source of competitive advantage. This principle leads to improved awareness of the customers' needs across the organization and to improved motivation and enthusiasm of employees, as they become aware of their role in the system, but also of the importance of other positions and interdependences (relationship f). This is very effective in breaking down inter-functional barriers.

Improvement demands continuous quest for possibilities to create value, either regarding customer satisfaction or lowering costs, increasing speed, efficiency, productivity and so on. This principle is extremely important in a high competitive environment, and it may determine survival of the company. A pursuit for improvement opportunities enhances creativity of employees (relationship g), while novelties may be protected by patent, license or trademark (relationship h).

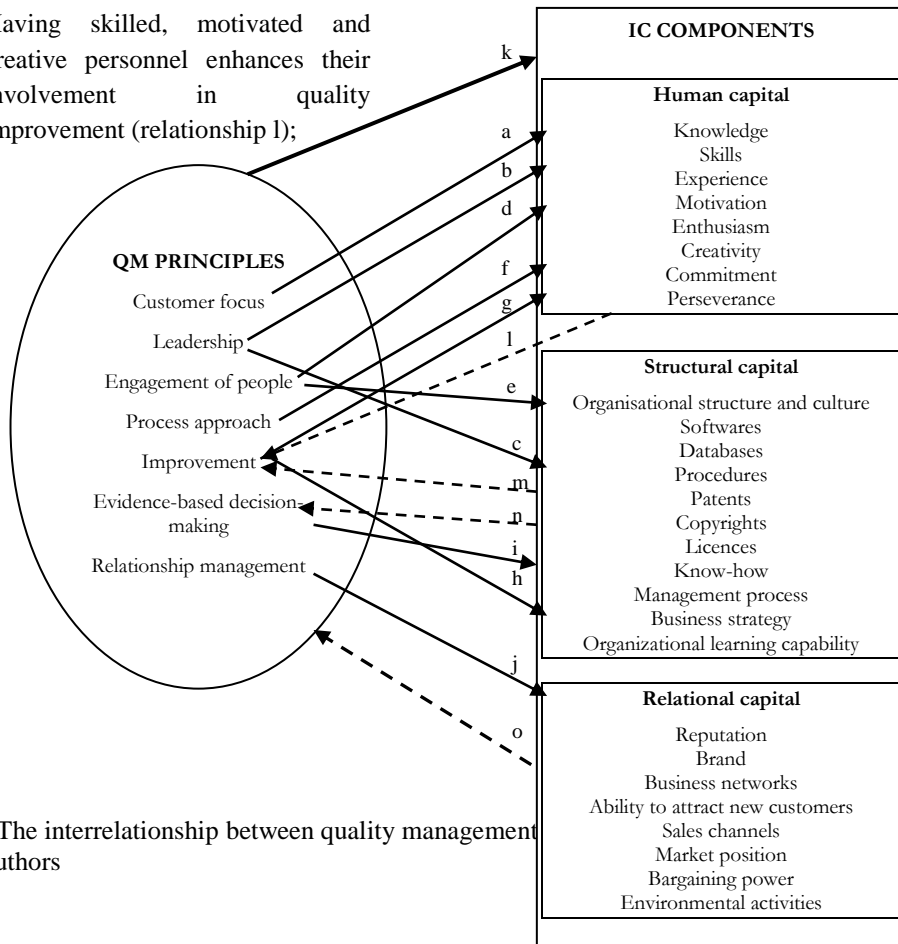

Evidence-based decision-making demands data gathering, storage and analysis in order to produce valuable facts upon which decisions will be made. For the purpose of

this principle databases are created and software developed or acquired to help managing the data (relationship i).

Relationship management aims to establish good cooperative connections with suppliers, distributors, customers and community. This principle is supposed to lead to good reputation, formation of business networks and sales channels, as well as to a higher level of corporate social responsibility. Moreover, having ISO 9001 certificate is positively reflected on the company's image (relationship j). All QM principles together are supposed to lead to increased organizational learning capability, employee commitment and market position (relationship k). On the other hand, IC is very important for the QM process:

- 2) Procedures limit errors (relationship m);
- 3) Databases and software enable analysis, finding room for improvement, but also an effective decision-making process (relationship n) and
- 4) Organisational structure and culture, and management process play an important role in enabling all of QM principles (relationship o).

- 1) Having skilled, motivated and creative personnel enhances their involvement in quality improvement (relationship l);

## 5. Motivation for ISO 9001 certificate and IC performance

There are two types of motives to certify QMS to ISO 9001 known as internal and external motives (Bravi et al., 2019). Internal certification motives refer to aspiration to improve the quality of business in order to achieve superior performance. External motives concern the pressure from customers or regulation, following the trend or using the certificate for accessing government funds, participate in bidding, as well as for marketing purposes. Certificate is useful for international cooperation to eliminate information asymmetry (Heras-Saizarbitoria & Boiral, 2013) and achieve confidence of stakeholders (Zhang et al., 2019), while it is supposed to help building QMS that will lead to improved operational efficiency, quality and productivity (Nair & Prajogo, 2009; Dias & Heras-Saizarbitoria, 2016). Chountalas et al. (2020) assert that the level of fidelity to ISO 9001 requirements vary among companies, leading to different outcomes in terms of improved performance. Some authors find that certification may not lead to improved performance if the management and employees are not committed to following the requirements in everyday operations (Oliveira et al. 2019, and others). Thus, the research documents that internal motives for ISO 9001 certification produce a greater impact on a company's performance than external ones (Chountalas et al. 2020, and others). On the other hand, Chountalas et al. (2020) find that even superficial implementation of ISO 9001 can to a certain extent initiate beneficial changes throughout the organizations and, consequently, lead to improved performance. In order to investigate the impact of motives for ISO 9001 certification on the company's efficiency in using the specific components of IC and its performance in terms of value added based on IC, the current research involves 44 ISO 9001 certified companies in

Serbia, divided into two groups, 22 companies with internal certification motives and 22 of those with external certification motives. The groups are homogenous concerning the size of companies (micro, small, medium and large) and sector (manufacturing, service and trade). The used method is Value-Added Intellectual Coefficient (VAIC), and data are gathered from the annual financial statements of ISO 9001 certified companies for the year 2021, and by interviewing quality managers from the companies that participated in the survey regarding the nature of motives for certification.

VAIC method includes two components of IC, human and structural capital, and demands calculation of human capital efficiency (HCE) and structural capital efficiency (SCE). The sum of these values is known as intellectual capital efficiency (ICE), and it shows how well a company uses these components of IC. Unfortunately, the method does not include relational capital as the third component of IC. The method also requires the calculation of capital employed efficiency (CEE) in order to finally show the value added based on IC. Table 1 presents descriptive statistics for VAIC and its components along with the Shapiro-Wilk test of normality. The Shapiro-Wilk test is significant ( $p < 0.01$ ) for most of the subsamples, indicating that the data is not normally distributed. Since the assumption of normality is necessary for parametric tests, the Mann-Whitney non-parametric test is used to establish whether there are significant differences in intellectual capital between internally and externally motivated companies. Table 2 shows the results of the Mann-Whitney test for VAIC and its components. The grouping variable is certification incentive: external vs. external.

The results indicate that there is a significant ( $p < 0.01$ ) difference in VAIC between internally and externally motivated

companies. Internally motivated companies (Mdn=2.98) have higher VAIC than externally motivated companies (Mdn=2.46), demonstrating that interest in improving the quality of processes compared to the pressure from the environment for certifying to ISO 9001, helps companies create higher value-added based on IC. The differences are also significant ( $p < 0.10$ ) for VAIC components such as HCE, SCE, and, consequently, ICE (as the sum of HCE and SCE). Internally motivated companies

(Mdn=1.74) have a higher HCE than externally motivated companies (Mdn=1.39). SCE is also higher for internally motivated companies (Mdn=0.42) than for externally motivated companies (Mdn=0.28). This means that internally motivated companies use IC more efficiently than externally motivated ones. On the other hand, CEE did not differ significantly ( $p > 0.10$ ) between internally and externally motivated companies.

## 6. Conclusion

The current study is an attempt to analyse the impact of QMS on a company's ability to create value in the future, measured by IC. Previous research has scrutinised the effects of QMS on past performance without providing insights into a company's potential to operate successfully in the long run. By indicating connections between QMS and IC, this study asserts that QMS strengthens IC as a dynamic system enabling a company to adjust to the changing environment and sustain competitive advantage. IC is company-specific, difficult to acquire, and imitate, which is why it is valuable for business success. Moreover, the study uncovers that motives for implementing a formal QMS, such as ISO 9001, have an impact on the company's efficiency in using IC, specifically human and structural capital. Namely, internally motivated companies for ISO 9001 certification, those that strive to improve the quality of processes in order to reduce errors, customer complaints and waste, to increase efficiency, employee motivation and customer satisfaction, show a higher efficiency of IC than externally motivated ones, who try to follow the trend, to have more effective marketing, or are

pressured by customers or regulation for certification to ISO 9001. Also, internally motivated companies show higher value-added based on IC, meaning that they produce superior performance by their IC compared to companies that are externally motivated for ISO 9001 certification.

Although QMS seems to contribute to IC and its efficiency, IC, on the other hand, supports the establishment of an effective QMS. It facilitates employee involvement, organizational learning, and improvement, as well as relationship management. Thus, these two concepts are mutually reinforcing, leading to a company's continuous evolution.

It is suggested for future research to empirically examine the nature and strength of relationships between specific components of QMS and IC, based on the model proposed in this study. Such examination should aim to determine the strongest predictors of yield created by the resources invested.

## THE PECULIARITY OF PLANNING THE PRODUCTION OF INNOVATIVE PRODUCTS

**Abstract:** *Most companies understand that the only way to ensure continuous competitive advantage is the constant creation and launch of innovative products on the market. However, when implementing the processes of creating new products, companies face problems in forecasting and strategic planning, since the markets of innovative products are characterized by various kinds of risks, many of which are uncontrollable.*

*The purpose of this study is to study the impact of changing consumer requirements on the technical and economic parameters of the products being created.*

*The authors propose a mathematical model of cascade diffusion, taking into account the above relationship, as well as the degree of consumer involvement in the development process and the rate of change in the quality requirements of the product.*

*The model makes allow to increase the efficiency of planning the innovation process, using a formed strategy for developing new products.*

**Keywords:** *quality, management, innovation process, diffusion, mathematical model.*

### 1. Introduction

The basis of modern research in the field of planning the technical and economic new products parameters is the theory of Evert Rogers. In his theory, it is proposed to differentiate consumers of innovative products into five basic groups: innovators, early adopters, early majority, late majority, and laggards, which has received a modern understanding (E.M. Rogers, 2003, B. Lundvall, 2010, V. Mahajan & Wind, 1985).

Later, this theory formed the basis of the mathematical model proposed by F. Bass. Unlike Rogers, he proposed to distinguish only two categories of consumers according to the principle of attitude to new products - innovators and imitators. Among the factors

that determine the speed of bringing new products to the market, Bass attributed interpersonal communications and advertising. The Bass model (F.M. Bass, 1969) is universal in nature that is, regardless of the specifics of the product (product parameters), the sales volume versus time curve will always be «bell-shaped».

A further development of this theory (D.A. Moore, 2013, L. Leydesdorff, 2006) was the introduction of the concept of a gap in the adoption and dissemination of new technologies.

According to the results of the analysis of a number of empirical data on sales of new products related to the category of electronics, the authors (J. Goldenberg, 2002, J. Mejía, 2015) found that in almost half of all

---

<sup>1</sup> Corresponding author: Nikita Tsygankov  
Email: [cyganikita@yandex.ru](mailto:cyganikita@yandex.ru)

cases, the sales curve shows a moment of decline in volumes up to 20% from the initial peak, which in the short term are restored again. Up to previous volumes and even exceed it. This phenomenon is called «saddle». This study confirmed the presence of two large consumer markets: innovators and followers, the gap between which causes a decrease in sales, and also indicated the influence of two or more developments on each other, depending on their parameters.

A fairly large number of works have been devoted to the development of mathematical models for the commercialization of new products. Many of them aim to concretize and expand the Bass mathematical model by introducing new variables into it.

Thus, in (A.R. Khasanov, 2016), a modified Basses mathematical model is proposed, which makes it possible to reflect the spread of new products in the regions of Russia using the example of cellular communications. The resulting model led to the conclusion that the speed of entering the market is determined by the methods of information dissemination about new products and the maximum capacity of the market. However, as the authors note, the model gives good approximation results in the analysis of disruptive innovations, but using the model it is impossible to estimate the change in speed as a result of the introduction of improving innovations to the market. The proposed model does not allow using it for strategic planning of a product portfolio.

Modern modeling tools make it possible to build simulation models for the development of new products that best meet the real conditions. For example, in (S. Zemtsov & Baburin, 2017, M. Günther, 2016) a simulation model was built based on the Bass model in the AnyLogic software environment. The main parameters that determine the speed of entry into the market are the effectiveness of advertising and the power of the buyer persuasion, who has already used the product, when

communicating with another potential buyer. These parameters are set as constant values and are determined by an expert. This model allows you to explore the relationship between advertising costs and the speed of commercialization in order to optimize it further. However, this model also does not take into account the impact of entering the market of innovation modifications.

Similar problems are solved in (I.V. Penkovam 2018), where the main goal of the study is to obtain a mathematical model for estimating the expected discounted cash flow from the implementation of innovations over the entire life cycle. At the same time, the mutual influence of the basic and improving innovations is evaluated, which makes it possible to explain the processes of leaving the goods from the market as a result of the release of the modification. The model has a fairly generalized form and does not include important parameters that quantify the factors that stimulate innovation processes.

A different approach is proposed in (N.A. Tsvetkova & Tukkell 2017), where the simulation model is based on econophysical analogies, namely, on the analogy between the processes of innovation dissemination, which is described by Fick's laws. Based on this analogy, a mathematical model for the commercialization of innovations is obtained, in which the determining factor is the diffusion coefficient. This model allows taking into account the mutual influence of basic and improving innovations when bringing them to the market, as well as planning the moment of their launch, which makes it possible to use it in the strategic management of the company's project portfolio.

## **2. Method for determining the technical and economic parameters of products**

As shown earlier, most models for predicting

the volume of new products sales in the market differ in approaches that explain consumer behavior. The models where the adoption of a product by various consumers categories obeys an exponential law (the so-called S-curves) are most widely used. Evidence of such a generalized pattern is given in a significant number of publications, for example (A.I. Yakimov, 2010).

When forming a digital model of the innovation dissemination process, it is more expedient to talk about the information and diagnostic type of the model, which allows monitoring, sorting, adaptation, analysis of deviations, failures and abnormal behavior of the process, that is, the need to create a digital shadow for predictive analytics (Association «Technet», 2019). To build such models, it is required to use the methods of a systematic approach and optimization modeling (V.F. Minakov, 2012).

The implementation of products based on new technologies (Skolkovo, 2019) shows

that there are periods of decline against the background of sales growth. This change is in the form of a «saddle», such as that shown in Figure 1, indicates that the development of any technology has a similar nature, which is associated with several factors:

- Increasing the speed of information dissemination due to the development of IT technologies;
- Reducing the cost of technology;
- Increasing the degree of automation of production;
- The size of the develops new products company;
- The level of competition in the industry;
- Growth rate of the company;
- Intercompany partnership and cooperation;
- The cost of using the technology;
- Technical and economic indicators of products formed by technology;
- Human capital.

**Figure 1.** The degree of adoption of consumer technologies over the past 110 years [16]

Within the framework of the study, a method was proposed for determining the

requirements for technical and economic parameters of the new products quality being developed (A.K. Moskalev & Tsygankov, 2021). Its method is based on a mathematical model for estimating the cumulative sales volume of various modifications of new products depending on the time of their

$$Y_t = V_0 * \left(1 + \frac{e^{(p_0 - r_0 * t)}}{k_0}\right)^{-1} + \sum_{i=1}^n V_i * \left(1 + \frac{e^{(p_i - r_i * t)}}{k_i}\right)^{-1} \times \begin{cases} (1 + h_i), & (p_{i+1} - S > p_i + R \geq t \geq p_i) \\ (1 - h_i), & (p_{i+1} - S \leq t \leq p_{i+1}) \\ 1, & (p_{i+1} - S > t > p_i + R \text{ or } t > p_i) \end{cases}$$

where Y(t) – the cumulative sales volume of all product modifications at a certain point in time t (day, month, quarter, year),

V<sub>i</sub> – available share, taking into account the commercial model and competition of the i-th product model (SOM model), mln roubles or in kind,

p<sub>i</sub> – time period for the start of sales of the i-th model of the product (day, month, quarter, year),

r<sub>i</sub> – diffusion coefficient of the i-th model (derived from empirical data, in particular from the optimization model built in AnyLogic based on retrospective data). This indicator is a combination of the impact of advertising on product consumers and their interpersonal communication,

t – time period (day, month, quarter, year),

k<sub>i</sub> – constant characterising the curvature of the propa

gation velocity of the i-th model (day, month, quarter, year),

h<sub>i</sub> – coefficient describing the planned lag of the current product model compared to the next product model in terms of technical parameters and price. This indicator affects the decline in sales when the next model is announced,

S – date when the next product model will be announced with regard to the planned date (days, months, quarters, years),

release, the announcement of the release, as well as the technical characteristics of this product.

The model has the following form:

R – period of increased demand for the product according to the price-performance ratio (days, months, quarters, years). Determined on the basis of market characteristics and the niche of the product in question.

The block diagram of the algorithm of the method is shown in Figure 2.

At the first step, we determine the analyzer model of the 3D printer and its modifications, and then set a number of initial data:

- Planned market size for each modification (V<sub>i</sub>);
- start of sales of modifications (p<sub>i</sub>);
- Actual and planned diffusion coefficient (r<sub>i</sub>). Determined based on sales data. This indicator is a combination of the advertising impact of and interpersonal communications of product consumers;
- Actual and planned curvature of change in the growth rate of sales volume (k<sub>i</sub>).

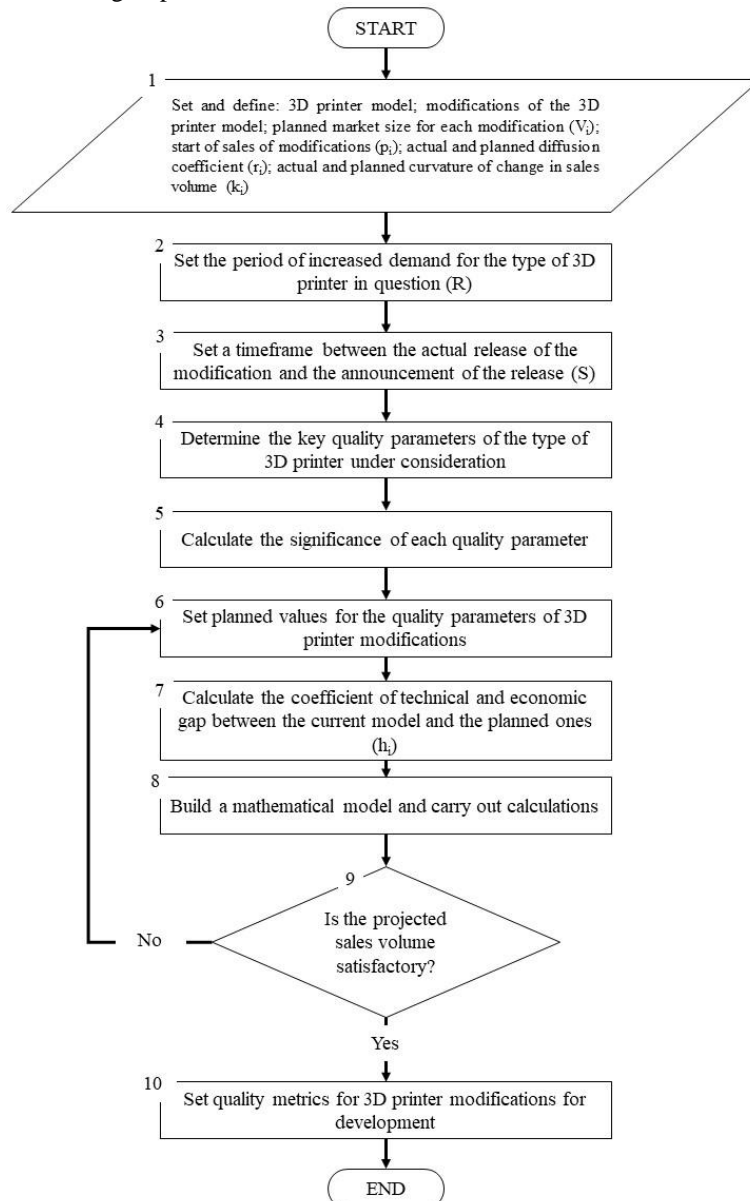

Then, based on the analysis of the enterprise's statistical data on sales of a certain type of 3D printer in the market, an average period is established during which the products are in high demand.

At the third step, the average period between the date of the announcement of the release of a new modification of the 3D printer and the

date of the actual start of sales is determined. During this period, in its first half, there is an active surge in demand for modification, which is associated with the activities of consumers from the group of «innovators»

(E.M. Rogers, 2003).

The next step is the selection of key quality parameters for the analyzed type of 3D printer.

**Figure 2.** Diagram of the method for determining the requirements for the technical and economic parameters of the quality of 3D printers

As part of the fifth step, the significance of each of the quality parameters selected in the previous step is calculated. For this purpose, an expert approach is used in the absence of statistical data, which is typical for most innovative products. If there is enough data, then the best solution is to use the methods of neural network analysis.

Then, for each modification of the 3D printer, planned indicators are set for all key quality parameters that are expected to be achieved as a result of their development.

$$h_i = \left( \frac{\sum_{j=1}^m \left( \frac{E_{j,i+1}}{E_{j,i}} - 1 \right) * g_j}{\left( \frac{C_{i+1}}{C_i} - 1 \right)} - 1 \right) * \frac{1}{(p_{i+1} - p_i)} * 100\%$$

where  $C_i$  is the market price of the  $i$ -th product modification, rubles;

$E_{j,i}$  – value of the  $j$ -th parameter of the  $i$ -th product modification. Each parameter is expressed in its own units of measurement. If there is a parameter that characterizes improvement when the value decreases, the inverse ratio should be used, i.e.  $E_{(j,i)}/E_{(j,i+1)}$ ;

$m$  – the number of parameters used to characterise the product;

$g_j$  – weighting coefficient for the  $j$ -th parameter of the product. It is recommended to use the results of market analysis (trends, customer requirements) or the Delphi method to calculate it.

At the eighth step, calculations are carried out in accordance for the entire period under consideration using automated tools with the possibility of subsequent analysis.

Then the results obtained and their compliance with the strategy and plans of the enterprise are evaluated. If necessary, a search is made for the optimal quality parameters of the 3D printer modifications planned for development. The goal of optimization may be to reduce requirements while maintaining the potential sales volume, taking into account the company's production capacity. Another goal is to conduct a

The sixth step, the coefficient of the technical and economic lag of the current modification of the 3D printer from the subsequent ones ( $h_i$ ) is calculated. This indicator affects the decrease in sales when the next model is announced.

To determine  $h_i$ , it is required to evaluate the ratio of price and quality of product modification relative to previous modifications, taking into account the interval between the outputs of modifications according to the following formula:

scenario analysis depending on the timing of the release of products, the price and quality of the products being developed.

At the last step, we obtain the final values of the required quality parameters of the products planned for development, as well as the required price ranges.

### 3. Research on the impact of consumer requirements

Consider the application of the proposed mathematical model on the example of sales of Hercules 3D printers for the period from 2014 to 2023, affecting 33 quarters based on the data on the cumulative sales volume received from the IMPRINTA company.

During the period under review, the company developed and commercialized 6 models of 3D printers from one line. The analysis considered products that are designed for one category of consumers and are similar or replacing each other. An analysis of the commercialization process for each individual 3D printer model made it possible to identify the main parameters for the model, which are presented in Table 1.

**Table 1.** Quality parameters of extrusion 3D printers

Printer modification	Parameters						R, quarter	S, quarter
	V <sub>i</sub> , pcs.	P <sub>i</sub> , quarter	r <sub>i</sub>	k <sub>i</sub>	h <sub>i</sub> , %			
First modification (i=1)	48	1	1	1,1	14%	3	3	
Second modification (i=2)	550	7	0,74	0,72	-8%			
Third modification (i=3)	900	13	0,72	0,85	-6%			
Fourth modification (i=4)	200	22	0,79	1,3	1%			
Fifth modification (i=5)	480	30	0,88	0,7	-17%			
Sixth modification (i=6)	250	31	0,826	0,934	-7%			
Seventh modification (i=7)	100	43	0,826	0,934				

As a result of studying existing desktop and professional extrusion 3D printers, feedback from users of this equipment, as well as based on the results of a survey conducted by IMPRINTA company, it was found that the following are the main product parameters:

chamber volume; print speed; minimum layer thickness; printing temperature; the presence of a heated chamber; number of extruders. In addition, their significance coefficients were determined. The results are presented in Table 2.

**Table 2.** Quality parameters of extrusion 3D printers

Parameter	Coefficient	Model №1	Model №2	Model №3	Model №4	Model №5	Model №6	Model №7
Chamber volume, liters	0,2	5,832	8	8,4	8,4	18	72	216
Print speed, cm <sup>3</sup> /hour	0,2	40	50	50	100	162	162	162
Minimum layer thickness, microns	0,2	50	50	20	10	10	10	10
Printing	0,2	260	260	260	410	420	420	420

Parameter	Coefficient	Model №1	Model №2	Model №3	Model №4	Model №5	Model №6	Model №7
temperature, degrees Celsius								
The presence of a heated chamber (0 - no, 1 - yes)	0,1	0	0	0	0	0	1	1
Number of extruders, pcs.	0,1	1	1	1	1	1	1	1
Price, thousand rubles		60	64	104	219	289	499	1 590
Release quarter		1	7	13	22	30	31	43 (план)

The results of applying the model with the identified parameters are shown in Figure 3.

**Figure 3.** Results of applying the diffusion model

The model error was 5.12%, but one can observe a deviation from the actual data when the third and fourth models of the 3D printer are released, which is associated with external market factors, namely the lack of analogues in terms of price and quality among competitors compared to the third model of the 3D printer, which positively affected the sales of the model. There were some minor technical problems at the launch of the fourth model, which led to a simultaneous increase in sales of the previous model of the 3D printer.

Consider the impact of consumer preferences when they change significantly with the release of each model. To do this, we take two extreme situations:

- 1) All changes in 3D printer models do not coincide with consumer preferences;
- 2) The company's products are developed in full accordance with the requirements of consumers, at least in one of the most improved parameters.

The results of the changing significance coefficients are presented in Table 3.

**Table 3.** The value of preferences (coefficients) at the time of release of models

Parameter	Model №1	Model №2	Model №3	Model №4	Model №5	Model №6
<b>Case №1 - Preferences are completely out of alignment with product improvement direction</b>						
Chamber volume, liters	0	0	1	0	0	0
Print speed, cm <sup>3</sup> /hour	0	0	0	0	1	1
Minimum layer thickness, microns	1	0	0	1	0	0
Printing temperature, degrees Celsius	0	1	0	0	0	0
The presence of a heated chamber (0 - no, 1 - yes)	0	0	0	0	0	0
Number of extruders, pcs.	0	0	0	0	0	0
<b>Case №2 - Preferences fully coincide with the direction of product improvement</b>						
Chamber volume, liters	0,3	0	0	1	1	1
Print speed, cm <sup>3</sup> /hour	0,3	0	0	0	0	0
Minimum layer thickness, microns	0,3	1	0	0	0	0
Printing temperature, degrees Celsius	0	0	1	0	0	0
The presence of a heated chamber (0 - no, 1 - yes)	0	0	0	0	0	0
Number of extruders, pcs.	0	0	0	0	0	0

As a result of applying the modified coefficients for each product modification, we get 2 models, which are shown in Figure

4 together with the base model, where the base model is model №.1, the model in accordance with case 1 from table 3 is model

№ 2, the model in accordance with case 2 from table 3 - model №3.

As a result of the simulation, 3 areas were identified where the largest deviation is observed - with the release of 2, 3 and 5, 6 models of a 3D printer. At the same time, it can be seen that with full compliance of product improvements with consumer requirements, an accelerated diffusion process of up to 43% is observed.

However, with the release of models 5 and 6 of the 3D printer in the 30th and 31st quarter, there is a completely opposite situation associated with the almost simultaneous release of products and such a rapid change in consumer preferences. The forecast for the period of 8 quarters shows that, depending on the changing preferences of the consumer, an increase in the absolute amount of the cumulative sales volume up to 62 units of products is possible. When this event occurs, the enterprise should be able to increase production capacity to cover additional demand.

The analysis performed shows that companies, when releasing substitutes or analogues of products, the influence of

consumers can have a significant impact on the rate of commercialization, even without taking into account the impact on other external factors, for example, the possible size of the market, which is also confirmed in a number of other studies (Yu.V. Danilova & Polyakova, 2015, D. Antipov & Smagina, 2020). Which suggests that in the face of changing product requirements, enterprises should plan and organize the development process in such a way as to be able to:

- To improve all technical parameters of products to reduce the negative impact in the event of a change in preferences;
- Make changes to products at any stage of development without a significant increase in time and financial costs;
- Reduce uncertainty in understanding consumer preferences by embedding consumers in the development process (getting feedback, increasing the number of product testing stages, etc.).

Figure 4. Changes in cumulative sales volume in extreme cases of changing consumer requirements

### 3. Conclusion

Based on the proposed model of cascade diffusion, which takes into account the mutual influence of innovative products based on their technical and economic differences and the time between release, the authors analyzed the impact of changing consumer requirements on the diffusion process using the example of 3D printers of the IMPRINTA company. The error of the resulting model was 5.12%.

The results obtained indicate the need for enterprises to form a strategy for development and commercialization, taking into account

various demand scenarios for products, depending on the susceptibility of consumer preferences to change. Depending on the degree of changes in the company, the risks of developing in-demand products and achieving sales targets for new products increase.

Further research in this area requires expanding the boundaries of the model and including in the considered contour the influence of consumer requirements on the available market volume, depending on the degree to which they correspond to the direction of changes in the product.

## UNDERSTANDING QUALITY FACTORS IN R&D ACTIVITIES: A NEW MODEL FOR QUALITY MANAGEMENT

**Abstract:** *Project quality management is one out of ten areas of project management defined by the Project Management Institute (PMI 2019). According to definition, it includes the processes for incorporating the organization's quality policy as regards planning, managing, and controlling project and product quality requirements in order to meet stakeholders' objectives. The current paper focuses on R&D (research and development) projects, whose specificity and high-uncertainty of the results requires a specific approach to quality management. In view of the lack of research efforts in this area, the objective was to propose a new, multicriteria based model for R&D project quality management. The construction of this model was based on the review of the extant knowledge and interviews with certified R&D project managers. The model includes factors influencing both the quality of project activities and the quality of R&D results. As a next step, the model was tested based on multi-criteria evaluation of the relative importance of these factors. It has potential, inter alia, to support decision-makers in selection of the optimal project quality management strategy. Finally, relevant recommendations have been provided for researchers and practitioners.*

**Keywords:** *project quality management, multicriteria evaluation, research and development, R&D*

### 1. Introduction

Research and development (further: R&D) projects serve as the cornerstone of innovation policy at both the macro level, involving the state, and the micro level, concerning the organization conducting the project. The successful execution of R&D projects is key in determining whether an organization is achieving full competitiveness. However, management of R&D projects takes place in constantly changing and extremely uncertain conditions. Thus, effectively managing R&D projects demands not only a high level of expertise, but also proficiency in advanced PM tools

(Kisielnicki 2014).

The concept of quality in R&D projects is a very complex problem, which requires incorporating different knowledge domains and approaches. They include, *inter alia*, quality management processes in project management, competencies of project managers (PMs) to implement these processes in the specific ecosystem of R&D activities (especially if they are carried out in SMEs), as well as different methods which help to operationalize quality management factors in such a complex environment. The system of quality assurance (QA) in R&D projects can be defined as the planned and systematic actions to verify whether R&D

---

Corresponding author: Anna Prusak  
Email: stradaa@uek.krakow.pl

processes are conducted in a proper manner and the R&D results satisfy customers' requirements (Kim *et al.* 2013).

Project Management Institute, an international, US-based, non-profit organization associating project managers, defines project quality management as the processes for incorporating the organization's quality policy as regards planning, managing, and controlling project and product quality requirements in order to meet stakeholders' objectives (PMI 2021).

Quality also constitutes the central (middle) element in the so-called Project Triangle (or: Iron Triangle, Triple Constraint Model). This is a key concept in project management, representing the relationship between four criteria (project constraints): budget (costs), scope, time (schedule) and quality (Pollack *et al.* 2018).

The aim of the current research is to bring together all the challenges and problems related to R&D project quality management into one, multicriteria-based model, and demonstrate how it may contribute to decision-making processes in enterprises carrying out R&D activities.

## 2. Key terms in management of R&D projects

Before we go further, it seems right to explain several important terms pertaining to R&D projects, such as the following: *innovation*, *technology readiness level (TRL)*, *industrial research*, *experimental development*, and *commercialization*.

**Innovation.** The most widely used definition of innovation, and categorisation thereof, has been provided by OECD/Eurostat (2018). It defines *innovation* as "a new or improved product or process (or combination thereof) that differs significantly from the unit's previous products or processes and that has been made available to potential users (product) or brought into use by the unit

(process)", while *innovation activities* are defined as "all developmental, financial and commercial activities undertaken by a firm that are intended to result in an innovation for the firm" (p. 20). Further, it defines eight types of innovation activities, where R&D takes the first place on the list, followed by i.a. engineering, design and other creative work activities, intellectual property (IP) related activities and innovation management. It also classifies innovations into four categories, including product, process, organizational and marketing ones. The manual also emphasizes the role of *knowledge* in innovation processes.

**Technology Readiness Level (TRL).** This is a concept introduced first by NASA (Sadin *et al.* 1989), which helps to classify the current state of technology maturity at one of the 9 levels: from "1" - beginning of fundamental research, where basic principles of a physical phenomenon were observed, to "9" - actual system tested and proven in operational environment, ready for implementation and use in real conditions.

**Industrial research and experimental development.** These terms have been defined jointly by the Commission Regulation (EU) No 651/2014. *Industrial research* is the "planned research or critical investigation aimed at the acquisition of new knowledge and skills for developing new products, processes and services, and for bringing about significant improvements in existing products, processes and services. It (...) may include the construction of prototypes in a laboratory environment or in an environment with simulated interfaces (...)" (art. 85). *Experimental development* has been defined in the same Regulation as "acquiring, combining, shaping and using existing scientific, technological, business and other relevant knowledge and skills with the aim of developing new or improved products, processes or services" (art. 86) (Prusak 2017). These are jointly called R&D activities, and they correspond to particular TRLs.

Specifically:

- TRL 1: fundamental (basic) research,
- TRL 2-6: industrial research,
- TRL 7-9: experimental development.

*Fundamental research* is “original experimental research or theoretical research undertaken primarily in order to acquire a new knowledge of the fundamentals of phenomena and observable facts, without intention of direct commercial use” (Act of January 15, 2015, amending the act of financing science in Poland).

**Commercialization.** Some authors associate commercialization as the market-facing stage of R&D activities (Godin 2006). However, it has many definitions in the literature and can be generally described as the process of introducing a new product or production method into commerce, that is, making it available on the market and offering to customers (Slok-Madsen *et al.* 2017).

**Financing R&D.** This is perhaps the most difficult aspect of R&D activities due to high costs and uncertainty of the final results, both in terms of technology and the market. These problems have been widely recognised by the EU authorities, who acknowledge the role of innovation in the global marketplace (European Parliament 2023). To stimulate private-sector innovation and motivate to undertake R&D activities, the EU provides a number of financial instruments to support entrepreneurs, such as the European Regional Development Fund or Horizon Europe 2021-2027 (European Commission: ec.europa.eu). These instruments are distributed to the European entrepreneurs through the calls for proposals, in which entrepreneurs may compete in gaining funds to finance their innovative projects. Such calls take place either at national and at the European level.

### 3. Project quality management in R&D projects

The term *project* has been defined by another project management organization, International Project Management Association, IPMA, as “a unique, temporary, multi-disciplinary and organized endeavor to realize agreed deliverables within predefined requirements and constraints” (IPMA 2015). Interestingly, this organization recognised the existence of R&D projects as a distinct category of projects, and provided sub-certification for R&D project managers. As regards R&D projects specifically, they should follow similar principles of project management, but their management is much more demanding and requires specific skills. This is due to the fact that R&D are categorized as not only the hardest, but also most significant projects for both an organization and the whole society (Kisielnicki 2014).

Project quality management addresses both the management and deliverables of the project. It was defined in PMBoK as one out of ten areas of PM, namely: integration, scope, time, costs, stakeholders, communication, resources, risk, procurement and quality. As regards the quality management, it consists of three groups of processes: Plan Quality Management, Manage Quality and Control Quality (PMI 2021). *Plan QM* is “the process of identifying quality requirements and/or standards for the project and its deliverables, and documenting how the project will demonstrate compliance with quality requirements and/or standards”; it can be done through a properly applied expert judgment, data analysis and decision making; *Manage Quality* means “translating the quality management plan into executable quality activities”; and *Control Quality* is “the process of monitoring and recording the results of executing the quality management activities to assess performance and ensure the project outputs are complete, correct and

meet customer expectations” (p. 271).

There are four main criteria that are key in project quality management (Locker and Gordon 2005):

- Maximizing satisfaction of stakeholders and other project output users, which requires proper communication systems at various stages of R&D projects.
- Ensuring proper implementation and completion of all planned activities.
- Achieving the quality of both the final products and project processes, using a proper monitoring system.
- Ensuring that the project management system constitutes a supportive environment to reach the adequate quality of project output.

As R&D activities are seen as a primary catalyst for innovation processes, and with more and more R&D being integrated into business models, they should become the focus for implementing the quality management systems into the projects (Mikulskiene 2014).

## 4. Model and method

### 4.1. Model

Based on the above mentioned processes of quality management and the review of relevant literature, supported by interviews with two R&D project managers employed in a technology start-up in Poland, the following key QM challenges have been identified.

In order to operationalize the above challenges, a model was built combining the above three project quality management processes and quality factors (criteria) in innovative, R&D projects.

**Plan QM.** Defining requirements for output technology, taking into account the unknown factors inherent in highly innovative ideas; the higher level of innovation, the higher risk

of failure. The possibility of output parameters’ simulation using professional engineering software is very important, but not enough to ensure final quality of the project. Such parameters may include technology features such as eg. resistance to temperature and humidity, which often require testing in real conditions. Defining what may possibly go wrong and affect the quality is also very important.

**Manage Quality.** Reacting to the rapidly changing marketplace and scarcity of resources required to maintain the planned level of quality of products and processes. It refers to both material and human resources (eg. specialized and poorly available components, highly trained and qualified R&D personnel). In addition, R&D staff often used to work in a remote way and/or with irregular work hours, a fact which generates significant communication problems affecting the quality of work and final product.

**Control Quality.** As R&D processes often require an iterative approach, it takes time to go through all TRLs up to commercialization. Thus, R&D projects are often long-lasting (taking more than 4 years), which makes the quality control processes difficult and often ends up in control of only the final output.

In order to operationalize the above challenges, a model was built combining the above project quality management processes and the respective criteria, specific for R&D projects (**Table 1**).

**Table 1.** Criteria for quality management in R&D projects

Process	Criteria affecting quality
Plan (P)	Output parameters to satisfy market needs and expectations (P1) Output parameters to be simulated (P2) Output parameters to go wrong (P3) Availability of resources to be predicted (P4)
Manage (M)	R&D work quality to be measured (M1) Quality of materials to be measured

	(M2) Quality of final product to be measured (M3)
Control (C)	R&D work quality to be executed (C1) Quality of materials to be executed (C2) Quality of final product to be executed (C3)

## 4.2. Method

In the next step, we discuss how the above general schema can be applied to support quality management in R&D projects. The aforementioned challenges can be translated into a hierarchical structure consisting of the main goal (“Highly demanding project in terms of quality”), processes (“Plan”, “Manage”, “Control”), their relevant criteria (factors), and possibly the R&D projects as decision variants at the bottom of the hierarchy. Thus, the analytic hierarchy process (AHP) can be applied to get the following answers: 1) which criterion is the most important in R&D project quality management, and 2) which alternative is most demanding in terms of quality management and needs particular attention.

The AHP is one of the most frequently used MCDM (*multiple criteria decision method*), described and explained by numerous researchers. Besides the manual of its creator, T. L. Saaty (Saaty 2000), publications such as Prusak and Stefanów (2014) or Kułakowski (2020) explain step-by-step how to use this procedure. It involves the following steps: 1) building hierarchy; 2) evaluating hierarchy using fundamental, 9-point pairwise comparison (PC) scale; 3) constructing PC matrices (PCM); 4) calculating local priorities (weights) using one of a dozen prioritization methods; 5) calculating consistency of judgments based on Consistency Ratio (CR); 6) calculating global priorities; 7) in group decisions, aggregating priorities into common ranking vectors.

## 5. Results and discussion

The application of AHP to evaluate quality management factors in R&D projects is demonstrated based on the expert comparisons provided by two R&D project managers. **Table 2** shows their aggregated judgments - priorities (weights) for processes (P, M, C), and their respective criteria (P1 - C3). “Local priorities” are those which reflect the importance of a given element with respect to its parent element (one level above in the hierarchical model), while “global priorities” reflect the importance of a given element in the whole system. Thus, global priorities are calculated by multiplication of the process priority by local weight of the particular criterion.

$$w_g = w \times w_l$$

For example:

$$w_g(P1) = w(P) \times w_l(P1)$$

$$w_g(P1) = 0,3971 \times 0,2097 = 0,0833$$

**Table 2.** Priorities for processes and criteria

Processes	w	Criteria	w local	w global
P	0,3971	P1	0,2097	0,0833
		P2	0,1145	0,0455
		P3	0,5837	0,2318
		P4	0,0920	0,0365
M	0,2734	M1	0,0827	0,0226
		M2	0,1635	0,0447
		M3	0,7538	0,2061
C	0,3295	C1	0,0827	0,0273
		C2	0,1635	0,0539
		C3	0,7538	0,2484

The ranking vector of global priorities is shown in the barchart (**Figure 1**). It indicates that the priorities of three criteria (C3, P4 and P1) exceed 20%, and they all together account for nearly 70% of importance in the quality management of R&D projects.

**Figure 1.** Global priorities of the criteria of quality management in R&D projects

As it was expected, the most important factor in R&D project quality management is execution of the quality of the final product ( $w(C3)=0,2484$ ). The next quality criterion in terms of the importance is planning the availability of resources ( $w(P4)=0,2318$ ). It demonstrates the contribution of resources (both human and material ones) to R&D quality management. It was especially evident during Covid-19 pandemic, and it continues due to the war in Ukraine. For example, shortages in worldwide supply of electronic components, resulting from stopping production in Chinese factories, forced many R&D project managers to lower the quality parameters of their innovative results. The interviewed experts stated that they had to redesign the product to be able to meet the deadlines and functionality, but it happened at the expense of quality. Moreover, low availability of R&D personnel was also a major problem affecting the quality of products and processes. It resulted from both the Covid-19 restrictions and rapid growth of inflation rate. The latter fact caused many entrepreneurs not being able to afford the wage requirements of their highly qualified and experienced research staff.

The third significant criterion is to plan result parameters which satisfy market needs and expectations ( $w(P1)=0,2061$ ). High score assigned to this criterion indicates the

importance of the commercialization phase following R&D activities. It also demonstrates the significance of the planning processes in R&D quality management, which received nearly 40% priority ( $w(P)=0,3971$ ).

In addition to setting the ranking of the quality criteria, the AHP can be applied to indicate which R&D project has the highest quality requirements. This would require taking into account project variants in the hierarchical model, and analyze them based on pairwise comparison against each criterion. It is also possible to establish the ranking of the specific parameters which can be modeled as sub-criteria of the relevant criterion. However, we do not present it here due to character limits, but it is a problem worth further scientific considerations.

## 6. Conclusions

The problem discussed in this paper, a multicriteria-based modeling of challenges related to R&D project quality management, is currently very important in Poland. This country is the largest beneficiary of the EU funds devoted to innovative, R&D projects, carried out in the private sector (especially by the SMEs). It is reflected in the enormous number of R&D projects co-financed from the EU funds. For example, the National Centre for Research and Development, the Polish largest agency responsible for distributing the EU funds, provided a list of nearly 14000 beneficiaries of the Operational Program Smart Growth 2014-2020, aimed at fostering R&D activities in enterprises. It raises questions about the quality of both the R&D processes carried out, as well as the quality of their innovative results. Thus, more exploration is needed in this area, and the research effort reported in this paper is one of them.

## PRINCIPLES OF CYBERNETICS IN THE INNOVATION AND INVESTMENT DEVELOPMENT OF UKRAINE

**Abstract:** *The relevance of the study consists in highlighting the principles of cybernetics in separating relatively self-sufficient whole economic systems from reality, considering their functioning and the relationship between them and the environment, and discovering analogies and general patterns of development and action in an innovative atmosphere. The purpose of this study is to identify and then apply in practice the general laws and principles governing economic processes in Ukraine, and the transformation of cybernetic information elements in innovative development. Cybernetics, which is an interdisciplinary science, studies the operation and functioning of particularly complex economic systems without regard to the material from which they are created. The cybernetic aspect represents the ability to perceive and capture the surrounding economic reality, to observe the changes occurring in it, their causes, and consequences comprehensively and dynamically. For this purpose, the article used the following methods: functional analysis, logical method, and scientific abstractions. The management principles and general laws of cybernetics look for analogies between all components of economic organisms and social systems, discovering common laws borrowed from various sciences. Cybernetics allows these laws to be transposed into a completely different field, providing a variety of practical applications. The findings indicated the potential for the development of an innovative national economy as a set of interrelated resources and opportunities for their realisation in the context of cybernetic individual, collective and societal systems. The categories of innovative development in the investment potential of Ukraine were considered. Its components are analysed predominantly from the perspective of an innovation management principle, which was implemented gradually according to the achievement of objectives at defined assessment points. The practical relevance lies in the analysis of the principles of cybernetics in the innovation segment, and the examination of the current state of the investment sphere and its policies from the perspective of the cybernetic component of the economic system.*

**Keywords:** *Laws Of Cybernetics; Principles Of Governance; Innovation; Investment Sphere; Politics; Ukrainian Economy; Emergence*

### 1. Introduction

Cybernetics as a "techno-science" about managing systems by controlling data and

information flows represents a change of perspective on concepts, a real epistemological revolution, and a profound paradigm shift in relation to classical

---

Corresponding author: Nataliia Semenchenko

science. Cybernetics and its principles seek to mimic complex laws even more effectively by accurately emphasising the logic of cause-effect relationships, communication, and interactions between the various elements of a self-regulating system. The medium then becomes a "network of messages and signs" or an autonomisation of the entire universe of practices and forms as an operational and accounting sector (Ramazani, 2010). Unlike traditional science, which studies the structure of matter and energy transformation, cybernetics also studies the process of information transformation and control of a system that consists of three elements: material, energy, and information, where it considers material and energy only as necessary prerequisites for the operation of the system and does not investigate what material the system consists of or how it is transformed energy and focuses specifically on the information. Cybernetics relies on a real electronic, mechanical, neural, or economic machine as a prototype, studying the function of all dynamic systems of matter, and revealing their behaviour in terms of functionality (Zannetos & Wilcox, 1969).

Automatic control is an interdisciplinary discipline that has its origins in engineering, mathematics and has since been applied in various social sciences, including economics, sociology, psychology, criminology, and financial systems. Automatic control is also called control theory because of its emphasis on theory. The control system consists mainly of measurements, comparisons, calculations, and corrections (Seppanen et al., 2007). The basic principle of control theory is feedback. Initially, feedback was a biological concept related to a system that can influence the continuous operation of the system, and later became the basic concept of modern science and technology. Feedback in control theory refers to the process of returning the output of the system to the input and some change

in the input, thereby affecting the output. The device performing the feedback function is called a controller, which can be a circuit, a machine, or a human brain receiving signals. The most basic characteristic and requirement of control theory is stability, where classical control theory is suitable only for linear systems with one input and one output. The control process in the control system is essentially the same as in engineering and biological structures: it uses information feedback to identify the difference between the indicators and the benchmark, taking corrective measures to stabilise the system in a given target state. Therefore, theoretically, methods suitable for engineering and biological cybernetics are also suitable for analysing and explaining management and control tasks in the aspect of the state of Ukraine (Harryson et al., 20088; Gilsing & Duysters, 2008).

In a modern management system, the combination of human, financial, material, and other elements is different, time and space change, the environment has a great influence, and the internal work and structure sometimes change greatly. In such a complex system, the process is inconceivable without controlling the attainment of the goal and development in the competition. It is based both on the development of technology and on an analysis of the various activities in which man can be assisted, controlled, or even replaced by a machine, to establish the laws of substitution that guide the programme of "technological evolution" (Thorgren et al., 2009). In this area, cybernetics can be thought of as building on the intersection of applied mathematics and automatic computation. Financial efforts and socio-economic integration are aged here, both in terms of equipment and services. Nevertheless, the sector is experiencing a renaissance driven by recent applications, the Internet, and the ubiquity of interoperable electronic components.

Information sciences and technologies combine computing, electronics, automation, telecommunications, and robotics. In this respect, one of the main theses of economics is that a modern unification strategy is neither conceivable nor achievable without the prior and social development of a new worldview directly influenced by aspects derived from cybernetics (Van der Valk et al., 2011; Riemer & Klein, 2006).

The purpose of this study is to identify and then apply in practice the general laws and principles governing economic processes in Ukraine, and the transformation of cybernetic information elements in innovative development.

## 2. Materials and Methods

The methodological basis of the study consisted of the following approaches to the study of this issue: the method of functional analysis, logical, and scientific abstractions. The method of functional analysis made it possible to explain economic phenomena in accordance with the analysis and study of the functions of cybernetic phenomena, where a function is understood as the role that the economic component plays in discourse and in its structural relations with other components. Theoretically, it underlines that cybernetics in this case is a continuum created to meet needs, and emphasises explaining dynamic economic or social phenomena from a functional point of view. In practice, the focus is on collaborative observation, which requires a deep immersion in reality, integrating all the principles of the control system. The structure of functionalism, according to which the function of Ukraine's economic system depends, allows the system to be maintained, continued, and operated. Its elements allowed focusing on the integrated development process, investment trends and the influence of the international political system.

The logical approach reflects the full application of the methodology of system sciences in economics, highlighting the transformation of political science research from traditional static analysis to dynamic and interdisciplinary. Its essence lies in the decomposition of things into various parts, aspects, attributes, and their separate study. The synthesis of the methodology consists in organically combining all the parts, aspects, and properties of things into a coherent whole according to their intrinsic relations to perceive the essence and laws of things. The components of logic are interpenetrated, transformed, and analysed under comprehensive guidance. The causal inference approach helps to understand the scientific causes and ways in which cybernetic matters change. It can be seen as an open-source mindset designed to find a causal link between the laws of cybernetics and the principles of innovation management in Ukraine's economic system. Persuasive logical reasoning allows, in this case, to shed light on the subject under study, thereby enabling it to become sufficiently complete and affirmative, characterising the relevant evidence and explanations.

The method of scientific abstractions made it possible to reveal the process of studying political economy and analysing the capitalist mode of production, where objective matters appeared in diverse and complex phenomena, which were not limited to a simple description of phenomena but revealed their essence and laws through the form of cybernetic principles. By revealing the nature of the matter under consideration, the approach made it possible to understand and transform the objective mechanisms of the system more effectively. The existing connections were investigated to establish a scientific theoretical system. The methodology of scientific abstraction presented a process of investigation from the concrete to the abstract by means of the abstract reasoning ability, revealing the

essential links and internal regularities underlying complex economic phenomena, thus forming a series of concepts and theoretical categories. The use of a number of abstract theories and concepts about the nature of cybernetic aspects for a clearer and deeper explanation of the process of economic and social evolution has led to concrete representations in the thought process, where the concrete is no longer just a perceptual thing, but a rational concreteness with a rich connotation, which is a synthesis of many rules and unity of diversity.

### 3. Results and Discussion

Ukraine's informational model of economic subjectivity seeks to embed a determinism on a par with the machine in any theory dealing with the question of the subject, which boils down to the simple status of a thing whose behaviour can be predicted because it is represented informationally. Here, other key concepts of cybernetics, such as "feedback" and "entropy", are interpreted, after a brief evocation of their genealogy, as the tools by which the "new science" was able to embrace all economic products. Cybernetic concepts induce a communicative representation of society. Having become a huge communication system, the latter exists only through the exchange of information between its participants. However, the validity of these theses about the relationship between the epistemic content of cybernetic science and the status of the subject in it will become possible only from the moment when the economic component of management integrates cybernetic formalism, its language, and its tasks. Accelerating the construction of an autonomous, managed, secure, and reliable digital infrastructure is an inevitable choice to increase the country's core competitiveness. To further expand the possibilities of technical support for digital

infrastructure, it is necessary to accelerate the joint investigation of basic and applied technologies (Olsson, 2010). At the same time, it is important to strengthen the protection of intellectual property rights in digital infrastructure, accelerate the development of key common standards and key technical standards, facilitate the establishment of a standard management system and the promotion of advanced technologies and the interconnection and sharing of facilities.

The practice of innovation management applied by Ukraine has changed radically over the past two decades. The progress recorded in information and communication technologies, along with increased competitive pressure, have prompted the economic system to deploy strategies that are increasingly based on a combination of their internal capabilities with various external resources. The functionality of strategies is characterised by an increased degree of openness in research aspects, in particular, the paradigms of open innovation popularised by H.W. Chesbrough (2006), a theory of user innovation introduced by E. von Hippel (2006), or even the ecosystem and business model approach initiated by J.F. Moore (1993; 1997). All of them consider innovations as a result of interaction and cooperation between economic organisations of the state. They involve the search, selection, combination, and integration of a wide variety of tangible and intangible resources embodied in various organisational and technological contexts distributed within the system. These interactive approaches to innovation are accompanied by a violation of the processes and methods of knowledge management applied by innovative components (Freel & de Jong, 2009). Thus, the dissemination of knowledge associated with the performance of tasks related to the invention and commercialisation of innovations leads to a change in the ways of their creation,

application, and use. They involve the adaptation of codification and integration practices, sharing and transfer, protection, and enhancement of knowledge. In addition, a knowledge that has been created at least in part externally should be exploitable to supplement the system's internal knowledge. Finally, the transformation of innovation models is changing the way the economy manages the knowledge involved in the commercialisation of innovations.

Strategic innovation indicators refer to measures used to quantify the facts related to the development of an innovation strategy and to identify, evaluate and select ideas in the innovation process. Strategic innovation indicators can be structured according to the phases of the innovation process. Innovation management and the innovation process are at the heart of the competitiveness and growth of the state. Therefore, it is the basis of the future viability of the economy and determines its success or failure. Thus, key performance indicators are central variables for monitoring Ukraine's future success. Innovation management encompasses the overall structure, including innovation strategy and business operations. In other words, it is about integrating innovation into everyday activities. Different operations go through concepts such as teams, responsibilities, resources and equipment, risk management, processes, cooperation, exchanges between different functional areas, control, and optimisation. The innovation process is a kind of performer arising from the general framework of innovation management. This innovation process should not be limited to one economic aspect but should be applied wherever it is useful and possible. Above all, the process allows for achieving perfection and provides an innovative environment for development. Therefore, financial interventions alone are not sufficient, they need to be complemented by strategic and operational key performance indicators so

that early indicators allow for timely intervention if it is found that objectives cannot be achieved (Rampersad et al., 2010; Abidian & Martin, 2009).

One of the inherent advantages of Ukraine's planned economy is the value of a long-term investment in infrastructure and strategic technology, as it can exist without fear of falling market demand or loss of confidence, which usually leads to project cancellations. This means that consumer demand can be restrained in favour of further capital investments for the economic development of a specifically desired model. For example, the state of Ukraine can start building heavy industry without waiting for many years to accumulate investment capital or necessarily choosing financial debt. British cyberneticist S. Beer (1995), believed deeply in the basic principle of cybernetic engineering, where the regulation of system variability is through planning and constant adjustment. The principle exported to the economic planning environment of Ukraine, as a process of artificial immunisation with constant feedback, is a kind of bet on regulatory intervention in the form of an attenuated aspect. Today, advanced computing developments would make it possible to create a single, global, and accurate production plan, eliminating the problem of economic calculation and mitigating sudden imbalances resulting from speculative market fluctuations. Within this conceptual framework, it is possible to formulate a political and technological germ for managing an effective and coherent European digital socialism, based on the central role of the common good of the European Union (EU) (Francois, 2004). In fact, although this label sounds difficult to implement, the preliminary plans for the so-called digital model have a planning component. It is not just a question of a way of investing in new technological infrastructure, but also of managing consumption rationally rather than

excessively, and encouraging the allocation of public resources to the sectors concerned.

It is necessary to develop various applications aimed at integrating technological and theoretical systems, creating data streams that will be supplied with information in real time for various users, which may be ministers, the presidential cabinet, companies, and various organisations. It is also important to integrate citizen participation from home into public decision-making. This is one of the first e-government initiatives and an extension of the concept of creating and encouraging action groups and development in a collaborative working environment using truly effective information management tools. Modern science and electronic computing offer the government new opportunities to tackle today's complex issues of the Ukrainian economy. Investments in the construction of digital infrastructure are huge. At the initial stage, it is worth focusing on application scenarios and engineering construction with a better foundation, wider application, and faster effect, and implementing a new application infrastructure, concentrating on sectors such as intelligent manufacturing, social management, online medicine, online education, digital life services, focused on the needs and concerns of the state (Heims, 1993). It is also important to compile and issue a list of needs for building digital infrastructure application scenarios, organise application innovation competitions and other events, and use the market mechanism of "list disclosure and team acceptance" to select excellent solutions.

In 2017, the investment attractiveness index of Ukraine reached its highest level in the last 6 years – 3.15 points on a five-point scale. This assessment was given by the European Business Association (EVA) after conducting a survey among 142 major

international and Ukrainian companies. The fact is that Ukraine has managed to improve its investment attractiveness and this growth is confirmed by the good situation in the commodity market, where the country is an active player, leading in the trade of grain, agricultural products, metals, and ore. The Ukrainian market is undoubtedly attractive to Western entrepreneurs. Its openness attracts investors, which augurs for its further imminent growth in the future. To improve the investment climate in Ukraine, a series of reforms need to be undertaken. Policy, not efficiency, is the dominant factor influencing the trend of the investment market. In the medium and long term, the direction encouraged by the policy is of greater importance, where investment opportunities, which are mainly concentrated in semiconductors, are the creation of a system of high-tech equipment, the promotion of new infrastructure, the emergence of new applications controlled by artificial intelligence and the modernisation of manufacturing industries with accelerated advancement. Facing the current market, anticipating future developments, and looking ahead to the next one or two years, the likelihood of the market making a relatively good profit is quite high. While the economy is gradually stabilising and supporting healthy development, the innovative viability of Ukraine is becoming stronger, new industries continue to appear and mark high growth rates, and traditional industries will continue to be rebuilt and updated. According to the Ministry of Finance of Ukraine (2022) for the 1st quarter of 2019, the total amount of capital foreign investment increased to \$600 million. The economy offers a fertile ground for a large number of investment opportunities, which will continue to bring investment opportunities to the stock market (Table 1).

**Table 1.** Capital Investments in Ukraine by Asset Type, for 2019

	January-March	January-June	January-September	January-December
In actual prices, UAH million				
Total	108298.0	233995.5	379203.1	584448.6

*Source: formed based on data from the Ministry of Finance of Ukraine (2022)*

However, investments in equity of cross-border investors in Ukraine have recently decreased by \$868 million, which is the first decrease in inflows since 2015. This was stated by the President of the National Bank of Ukraine (2021), pointing out that the key reasons for the low interest of foreign investors in the Ukrainian economy are the underdevelopment of the domestic market, the ongoing armed conflict with the Russian Federation and the low level of the legal protection of investments. Ukraine is still perceived by investors as an unfriendly place to invest capital in the ranking of the Global Index of Attractiveness of Countries for Foreign Direct Investment. Other challenges are also pointed out by the Ukrainian finance minister, as he acknowledges that the COVID-19 pandemic and the situation in the world economy do not encourage investors to commit capital. He believes that Ukraine still has a solid foundation in the form of domestic private investors, government

investment activity and support from international institutions. This allows for gradual improvement of the investment climate. In the regional context, a significant decrease in capital investments in April – June occurred in Volyn (by 64.1%). Kirovograd (by 17.1%). Mykolaiv (by 13.3%) Oblasts. The main source of funding for capital investment remains the equity of enterprises and organisations, which accounted for 75.2% of total investment. In 2019, the volume of capital investments in Ukraine increased, but only by 8% – up to UAH 624 billion. There has been a decline in contributions from businesses and organisations and from the public for the construction of housing. At the same time, foreign investment increased by 159% to UAH 4.7 billion (Ashby, 2015). Investments in agriculture, trade, transport, information, and communication have decreased (Table 2).

**Table 2.** Capital investment indices by economic activity for 2019 in Ukraine (in %)

	January-March	January-June	January-September	January-December

Source: formed using the data State Statistics Service of Ukraine [23] data.

The prognostic assessment of Ukraine's investment sphere development, given the principle of emergence, refers not to a specific, finite time, but to a permanent process of change. Economic emergence causes a gap, a historical and identifiable sequence of getting out of the backwardness trap. Growth causes structural, nonlinear, and unbalanced changes. The resulting concentration of activity and income causes social tension, which increases as a result of globalisation. In this context, economic emergence should be analysed as an indefinite, nonlinear and heterogeneous process that generates gaps and hides blockages, the scale of which is specific to socio-political and geographical space, but the general mechanisms of which can be

identified. Consequently, this may seem to contrast with other countries where earlier economic changes have taken place in a different context. The increasing external returns of the country, associated with the concentration of certain additional activities, can cause an acceleration of growth, and spread to the rest of the economy when there is an overflow of knowledge or sufficiently dense intersectoral relations. The dynamics of industry growth is likely to cause a movement towards convergence, first sectoral, and then more global if the sector in question maintains close relations with other sectors. Economies of scale and training, sanctioned by the size of the global market, as well as technological, logistics and marketing transfers caused by investment

ties, will allow competitive sectors of activity to quickly approach the levels of productivity of the technological front, which has implications for the entire national

production system. According to the State Statistics Service of Ukraine (2022), capital investments in Ukraine have collapsed by 38.2% by the end of 2020 (Table 3).

**Table 3.** Capital investment by economic activity asset type in 2020, in UAH thousands

In terms of emergence, Ukraine is undergoing profound structural changes that accompany high and sustained growth phases, but the cause-effect relationship between the two has not been clearly established. Economic success, first of all, is based on the often random synchronisation of national political strategies and a favourable configuration of the global economy. It is likely that, in the future, the growth of globalisation will not allow the state to be constrained by the narrowness of convergence conditions after successful integration into the world economy at the expense of investment components. This raises a more fundamental question about the emergence of production systems capable of both meeting the requirements of international competitiveness and ensuring sufficient activity for workers of all skill

levels. The study of the conditions for the possibility of a harmonious increase in the standard of living involves going beyond the purely quantitative characteristics of economic changes and diving into the core of new political regimes emerging in a globalised environment. The scientific and technical base is formed spontaneously as knowledge is acquired. Although this model seems attractive from the point of view of the principle of emergence, it assumes the fulfilment of certain conditions and therefore is not suitable for all situations. It essentially requires a minimum of skills, a sufficiently developed scientific apparatus and a skilled labour force. For an economy with a low level of scientific and technical potential, it is often unattainable and can lead to a waste of resources if the technologies transferred at great cost are not mastered within the

country. On the other hand, it may represent a relay model after reaching a certain skill level. Thus, if the investment model is regarded by regions, Kirovograd (by 33.5%), Odesa (by 29.4%) and Volyn Oblast (by 26.5%) suffered the most in 2021, similar to the period of 2020. Capital investments in

2021 increased the most in Luhansk (81.5%), Zaporizhzhia (60.1%) and Ivano-Frankivsk Oblast (47.5%). Capital investment in Ukraine in 2021 fell by 9.5% y-o-y, according to the National Bank of Ukraine (2021) (Table 4).

However, Ukraine, as a country with a rather immature system, is a candidate for emergence. Its ability to achieve the status of a developing state depends both on their initial position and on the actions taken to develop and structure the national innovation system. The nature of immature systems makes it impossible to describe a single trajectory that allows creating conditions for

emergence. Nevertheless, it has a certain number of common features that open many avenues for reflection, where one of the contributions of the concept of the national innovation system is the possibility of a synthetic vision of dysfunctions. All of them are characterised by both the weakness of knowledge production activities and a very low level of network density between

aspects of the system. Important areas for the appropriation of innovation and know-how to enter international markets, such as quality and standardisation in its various variations, are usually ignored. They should concentrate most of their scientific and technical activities in the least developed areas related to the policy of monitoring and technology selection. The strengthening of the national innovation system is accompanied by a sharp increase in gaps between regions and between industries. There is every reason to believe that to achieve a sufficient level of attractiveness it is reasonable to concentrate funds on a reduced number of centres of excellence,

which will be able to benefit from very substantial funds in terms of financial resources. This concentration will be used to attract foreign investment, which would find the conditions there favourable and thus cooperate and function. Such a process can be seen in the statistics of capital investments in Ukraine, where since 2015 the level of investment of Ukrainian enterprises has increased markedly. However, in 2020 it decreased by 38.2%, while in 2018-2019 it increased by 16.4% and 15.5%, respectively, as stated in the data of the State Statistics Service of Ukraine (2022) (Table 5).

According to Ukraine's parliamentary ombudsman for business, Algirdas Šemeta, per capita investment in Ukraine is five times lower than in Poland and ten times lower than in Estonia. The main reason for this is corruption and distrust of Ukrainian judiciary, which are the biggest obstacles to foreign investment. However, the investment market of Ukraine is characterised by dynamic development, high demand for investment resources and a fairly high level of interest from foreign investors, along with investment attractiveness, which is confirmed by statistical data on foreign direct investment. The current state of the

investment sphere and its policy in Ukraine characterizes the process of integration of the state into the globalised economy and world capitalism through strong economic growth for several years. Supporting multipolarity, emergentism has a geopolitical dimension in that it legitimises the country's representation in international institutions and is economic rather than social in nature. It is possible to expand the functionality of the principle only if it is integrated into the global capitalist system. Developing states share common characteristics, found in more or less pronounced form and with variations depending on the situation: a large

population, but completed its demographic transition; a stable but often authoritarian political regime; the emergence of a middle class able to consume and hold intermediate positions in services and administration; rapid metropolisation and often a growing wealth gap, leading to the coexistence of a rapidly enriching oligarchy with masses of people living in poverty, often in peripheral, rural or landlocked regions (Holland, 1996). Due to sufficient liquidity and constant inflow of foreign capital, the overall liquidity of the stock market is at a historically low level, which provides a good basis for creating medium- and long-term investment returns. The stock market will continue to improve with the gradual decline in corporate profits, and structural opportunities will arise.

Modern Control Theory, developed in the 1960s, is a new theory based on the concept of state variables, using modern mathematical methods and computers to analyse and synthesise complex control systems and suitable for multi-input, multi-output, time-varying and non-linear cybernetic systems of the Ukrainian economy. The application of modern control theory for analysis and synthesis can bring the effectiveness of the control system to a new level. The current reality of global capitalism increasingly reveals on a global scale the essential contradiction of an economic system which, while promoting continuous scientific and technological development with the robotisation of production, artificial intelligence, and big data, unfolds regressive social dynamics, generating unemployment and job insecurity, social polarisation and ever more serious crises. To address the basic challenges facing humanity, given the inability to manage or reform the blind logic of capital, which subordinates the entire society to the ever-increasing demands of profitability and accumulation, global alternatives to the capitalist order must be created that make

possible the modern ideal of civil self-government with social and rational control over the economic process and the only possibility to direct the development of society towards democratically chosen goals. In this perspective, the principles of cybernetics assess the possibilities of socialism and economic planning in the light of current scientific and technological possibilities in information technology (IT), telecommunications, and artificial intelligence, and propose a model for a democratically planned, viable and efficient socialist economy for discussion. In the planned economy of Ukraine, without market processes and competitive pricing, rational economic calculation is impossible, which inevitably condemns to inefficiency (Richardson, 1999).

The subject matter contained in modern control theory is very broad in the understanding of cybernetics and is characterized by the basic principles: linear systems, nonlinear systems, optimal control, stochastic control and applied control theory. The theory of linear systems is the most basic and relatively mature branch of modern control theory. It focuses on the management and observation of economic conditions in linear systems. The main method of analysis and synthesis is the state space method. According to the mathematical apparatus used, linear systems theory is usually divided into three schools: geometric theory, based on geometric concepts and methods; algebraic theory, based on abstract algebraic methods; and complex frequency theory. The nonlinear system theory is not yet perfect. The areas of investigation are mainly limited to the stability of system motion, the control and observation of a bilinear system, and the problem of non-linear feedback. A more general nonlinear systems theory has not yet been created. Since the mid-1970s, some methods derived from differential geometry theory have provided powerful theoretical

tools for the analysis of certain types of non-linear systems. From the cybernetic interpretation of the Ukrainian economy, the principles of equifinality and multifinality are derived, very far from the deterministic postulate of R. Descartes (1938) on linear direct communication, where the cause precedes the effect (Umpleby & Dent, 1999). In 1948, the American mathematician N. Wiener (1985) published his book "*Cybernetics or control and communication in the animal and the machine*" in English and French, which discusses the general method of control theory, further specifies the concepts of feedback and the mathematical definition of the regulator and gives a new meaning to the subject of control theory. At the same time, four basic principles are distinguished, namely universality, rationality, non-determinism and black box testing methods. With the assimilation of cybernetic theories systems came the understanding of the regulation mechanisms of economic structures as negative feedback processes aimed at preventing deviations (Meystel, 1996). Cybernetic systems strive to maintain a viable stable state of interactions in changing conditions through a process of trial and error. In France, Dr J. de Rosnay (1975) was one of the first to popularise the main concepts of cybernetics and to apply them to a systems approach to management: cell, body, city, economy, and ecosystem. The management of the system, in this case, is to link it to another system, the role of which will be to maintain as little variety of results as possible. The purpose of stochastic control theory is to solve stochastic control systems, analysis, and synthesis. The N. Wiener filter theory (1985) and the Kalman-Bucy filter (Kalman, 1960) are one of the foundations of stochastic control theories. A major component of stochastic control theory is stochastic optimal control, and the solution to such stochastic control problems depends on dynamic programming

concepts and techniques (Varela & Maturana, 1992). Adaptive control theory is a type of control system that can automatically adjust its own characteristics based on the idea of imitating biological adaptability. The study of an adaptive control system can often be attributed to the following three main tasks: identifying the dynamic characteristics of the managed object; choosing a solution based on the recognised object; producing a reaction or action based on a recognised object.

One of the pillars of modern management theory is the principle of optimal management. This principle has been applied in practice since the early 1960s (Klir, 2001). This process changes the design method of classical control theory, which focuses on stability and dynamic quality, and looks at system performance over the whole period of operation, selecting the optimum control law that can significantly improve the performance of the Ukrainian economic system. The theory of optimal control studies the control laws and complex methods of a controlled system at optimal specified performance indicators. In the theory of optimal control, the main methods of synthesis of optimal control systems are the maximum principle and dynamic programming. The scope of studies in optimal control theory, such as optimal control of large systems and optimal control of systems with distributed parameters, is expanding. Another core of modern management theory is the principle of optimal estimation. It provides a powerful mathematical tool for solving stochastic elements and stochastic control problems, overcoming the limitations of the filter of linear, stationary, or non-stationary random processes.

#### 4. Conclusions

Thus, the last decades of the 20th century have been characterised by the explosive

development of the Internet and the processes associated with globalisation. The concepts of cybernetics include a system of interdependencies between markets in which they are internally balanced. The economy resulting from this paradigm is looking for optimal and sustainable solutions in static and dynamic senses. A condition for sustainability in Ukraine's innovative development is that there are alternative approaches to explaining economic shocks and phenomena, where the cybernetic aspect represents an interesting alternative to an equilibrium economy. The structure of economic governance has changed over time: it has been amended in response to new economic challenges. The mechanisms and legal framework of the economic architecture in the cybernetic aspect are designed to show that the model of economic management was burdened with structural flaws from the very beginning. Ukraine's economic management principles are excessively rigid, opaque, and ineffective, often in the form of non-compliance with accepted rules and policy recommendations, a lack of adequate room for manoeuvre, and the absence of emergency management mechanisms in situations of economic shock or crisis.

Innovation is an important factor in the competitiveness of Ukraine, since it contributes to economic growth, improves living standards, and enhances the country's image in the international arena. The study diagnoses both favourable and weaker conditions for the development of innovation and investment principles in Ukraine. Particular emphasis was placed on the country's investment opportunities, given the principle of emergence. They are based on multivariate theoretical approaches with an analysis of the strengths and weaknesses of each. Living in a time of information revolution, the economic factors in a cybernetic perspective are overwhelmed by an incredible amount of content and back information. This science provides extremely effective solutions to issues which interact with the environment through feedback. Innovative controls prioritise spending on existing infrastructure to free up the resources needed for further innovation. The principles of cybernetics are not questioned but are fiercely debated, as they are deemed totally unsuitable for an economy as weak as Ukraine's, and this series of tactical errors could lead to the deindustrialisation of the country, accompanied by massive system failures.

**THE EFFECT OF HUMAN RESOURCE  
COMPETENCE AND INNOVATION ON  
EMPLOYEE COMPETITIVE  
ADVANTAGES:  
AN EMPIRICAL STUDY IN SMALL  
MEDIUM ENTERPRISE**

**Abstract:** *The purpose of this research is to understand the impact of human resource (HR) and innovation skills on competitive advantage at small medium enterprise (SME) in Yogyakarta, with entrepreneurial marketing as a moderating variable. This study uses a quantitative survey method. In Yogyakarta, 120 SME entrepreneurs were randomly selected. Sampling through non-probabilistic techniques using a criteria-based approach. The collected data was then analyzed using structural equation modelling (SEM) with the help of the Smart Partial Least Square (PLS) application. The research findings show that small doses of HR expertise and entrepreneurial marketing have a significant positive impact on competitive advantage, whereas innovation does not have such an effect. Marketing innovation and HR expertise have a huge impact on start-up businesses. Finally, evidence suggests that innovative marketing and entrepreneurship can bridge the gap between HR expertise and competitive advantage.*

**Keywords:** *Entrepreneurial Marketing, Human Resource Competence, Innovation and Competitive Advantage*

## **1. Introduction**

As a consequence of the growth of the industrial sector, the business world is experiencing an increasingly fierce level of competition (Eggers, et.al, 2018). This situation has the potential to open many doors, but in the long run it will also lead to increased business competition (Muhammad et al., 2019). As a result, it is very clear that businesses need to have a sole competitive advantage in order to survive and thrive in the current market climate. Cultivating competitive advantage is one of the key strategies by which companies can survive in the face of intense competition in the market

(Naidoo, 2020). Competitive advantage is self-confidence that comes from understanding that one's organization has superior resources and a higher level of productivity compared to other businesses operating in the same industry (Ektebang & Eniola, 2018).

There are several factors that influence competitive advantage in a business, including market orientation, product innovation, environmental adaptability, entrepreneurial orientation, training and market orientation, and management capabilities (Wahyudin, 2015); (Satria & Sulisyawati, 2018). (Satria & Sulisyawati, 2018). As SMEs play such an important role

Email:

in the Indonesian economy as a whole, the government is currently focusing a lot of attention on the country's small and medium enterprise sector (SME). The non-migration processing economy sector saw the largest increase in GDP investment, with the food and beverage industry providing up to 36.4% of the investment. The economic sector saw the greatest growth in SME investment (Edi, 2021).

To be successful in today's increasingly competitive marketplace, business owners need to work more diligently than ever before to develop cutting-edge innovations that will assist them in maintaining and improving the quality of their products and services without compromising their ability to turn a profit. In addition to the quality of the product itself, the improvement of the quality of customer service must be examined. Accurate descriptions are necessary due to the convenience of ordering and receiving food and beverages online, as well as the wide variety of goods and services available. To find a solution to this problem, you need an all-encompassing marketing strategy that incorporates entrepreneurial characteristics. Becherer (2017), Hidayatullah et al. (2019), and the work of others should be followed as a guide (Mahrous, et.al, 2020).

According to (Morrish, et.al, 2017) entrepreneurial marketing is helping proactively and taking advantage of opportunities to buy and retain customers who have subscribed and are profitable with innovative approaches in managing risk, using human resources and creating corporate value. According to Green's (2018) examination of target markets, modern consumers are more likely to consider their sentiments, desires and imaginations when making purchasing decisions, whereas in the past they were more inclined to base their decisions on rational factors. [citation needed] As a direct consequence of this, the marketing approach needed to be revised.

Contemporary marketing tactics place greater emphasis on visual intuition while paying attention to words, in contrast to earlier marketing strategies which placed greater emphasis on analysis, words and numbers. As a result, it is not surprising that many Indonesians choose to eat outside the home given the country's alluring cuisine, fashionable dining locations, and Instagrammable food (Jones, 2017). In the complex modern world, companies must be able to apply creative marketing techniques to achieve their goals in a more timely and more effective manner.

A company's ability to successfully market its products is critical to a company's success because it makes those goods more available to people who might be interested in buying them. It is this marketing strategy that will ultimately determine how successful the marketing of a product is because it is this strategy that will consistently build and maintain client demand in the long term. It is very important, when sales of a particular product start to grow above expectations, to identify whether this is due to inefficient marketing methods or whether or not this is due to changing consumer tastes and expectations.

It is very important to have knowledgeable HR professionals to carry out the responsibilities required to gain a competitive advantage. Alajmi (2016), Mitchelmore (2017), and Nemli (2018) all agree that HR is an important component of a company's most valuable asset. In the enterprise system, the success or failure of the company's goals is determined, and the company. need to pay more attention. It is not enough for organizations to simply identify the perfect employee for the position; instead, each candidate must possess the requisite abilities.

The marketing process used by SMEs is related to human resources in a number of ways. According to Alajmi, having skills in HR may be beneficial for entrepreneurial

marketing (2016). The contribution of an organization's human resources is one of the most important factors in determining how effective a program will be. The sustainable success of a company depends on access to human resources who are able to think creatively and analytically. Because of these characteristics, companies can more quickly manufacture goods tailored to customer needs and preferences.

In achieving competitive advantage through HR expertise, innovation plays an important role. Innovating is essential for those with their own businesses, and fresh concepts are essential for the kinds of forward-thinking marketing methods entrepreneurs typically use. Researchers Afriye (2019), Miles (2016), and Morrish (2017) all agree that company-led innovation can have an impact on the marketing strategies used by SMEs. To be successful in today's turbulent economic environment, companies that want to stay in business need to improve their marketing skills, broaden their customer base, and increase their sales and revenues to compete with more established businesses.

It seems that the market is becoming more and more significant in today's increasingly competitive environment. Companies are under increasing pressure from customers with rapidly changing wants and must be agile enough to keep up with the times by implementing various innovations that keep up with the changing nature of business. Customers place this pressure on businesses, which are already under increasing pressure from customers with rapidly changing wants and needs. One reason is that clients have varying demands at different points in time; consequently, they may choose to purchase products from other companies if they are not sure that one business can meet all of their requirements. Therefore, for businesses to continue to achieve their goals, they need cutting-edge innovation. Innovation has the potential to impact every aspect of a company, including the way its merchandise

is marketed.

Production techniques, product presentation and marketing strategies all have the potential to be changed by innovation. Customers examine not only the final value of the product and the benefits they will derive from its use when deciding whether to make a purchase or not, but also whether or not the price of the product is competitive with other comparable items. Research conducted by Chang (2017), Dereli (2015), Le & Lei (2018), Mathenge (2018), Varadarajan (2019), and Udriyah (2019) shows that company innovation has the potential to increase a company's advantage over its competitors. By providing creative innovation, it is hoped that the company will be able to provide goods that are different from those produced by other companies in the past and offer advantages that exceed what is offered by goods on the market today.

Enhancing a company's competitive advantage requires a large amount of HR expertise as well as new capabilities. Sandiku Dushi (2019) claims in a recent essay that entrepreneurial marketing is a realistic strategy for small and medium enterprises (SMEs) due to the fact that the majority of SMEs have limited resources and, as a result, need to be creative in order to be successful. There is great hope placed on marketing SMEs as it is anticipated that they will be able to gain a competitive advantage through leveraging HR knowledge and new solutions.

Findings from a number of studies that focus on market orientation have led researchers to the conclusion that market orientation has a considerable influence on business performance across various measures of growth, sales, and profitability (Long, 2018). A strong market orientation also requires a strong level of motivation to seek new opportunities and markets, which has a major influence on market orientation (Reijonen et al., 2017). Research conducted

by Arafah (2018:8) shows that having a strong focus on the market can greatly improve a company's performance. According to Mamun and dkk (2018: 133), additional research was carried out with the title "Effect of Entrepreneurial and Market Orientation on Consumer Engagement and Performance of Manufacturing SMEs". on the level of consumer involvement and manufacturing performance in small and medium enterprises (SMEs) and resource based view (RBV). According to the research conclusion, customer participation is the most important component, accounting for 31% of the total, followed by an emphasis on enterprise business (12.6%) and market orientation (9.2%). According to Buli (2017), in his research entitled "Entrepreneurial Orientation, Market Orientation and Performance of SME in The Manufacturing Industry: Evidence from Ethiopian Enterprises", empirical studies claim that the success of small and medium manufacturing enterprises (SMEs) is strongly influenced by market orientation. them, as much as 12 percent. Buli's research was conducted on Ethiopian businesses. Nonetheless, there is a contradiction between these findings and research conducted by Kajalo (2015) and Mahmoud (2018), both of whom came to the conclusion that market orientation has no significant correlation to company performance.

These two authors found that the correlation was weak. According to research conducted by Anwar (2018: 998) entitled "Networking and new venture's performance: mediating role of competitive advantage," competitive advantage acts as a powerful mediator between financial intermediation and business performance. Moreover, competitive advantage acts as a powerful mediator between business networks and business performance. In addition, research conducted by Asyhari (2018: 123) entitled "The Role of Competitive Superior Mediation on the Determinants of SME

Business Performance in Batik Weaving Centers in Central Java" shows that the ability of SMEs to generate competitive advantage through differentiation, durability, imitation, and cost competition is an important factor in the realization of business success.

This study intends to explore the effect of HR capabilities and innovative thinking on competitive advantage in SMEs in Yogyakarta by using entrepreneurial marketing as a moderating variable. The results of previous research and the existence of research gaps are the foundation of the research objectives.

## 2. Literature review

### 2.1 Entrepreneurial Marketing

Visionary marketing is a kind of marketing strategy that is not predetermined and used by business owners who have a broad vision, according to Morris et al. (2018). Visionary marketing is described as a type of marketing strategy that is not predetermined. Marketing on an entrepreneurial scale requires adaptability in dealing with change, openness to new concepts, concentration on developing market potential, and capacity to meet customer needs (Jones, 2017). According to Carson (2017), SME sales are truly the sales of the entire corporation. Moore (2017) argues that the foundation of effective entrepreneurial marketing consists of four pillars: concepts, strategies, techniques, and market intelligence.

According to Dushi (2019), entrepreneurial marketing is one of the best strategies for small and medium businesses because most of these businesses have limited resources and need to be creative to be successful. This is why entrepreneurial marketing is one of the best strategies for small and medium businesses. According to Morris (2018), one of the methods that can be used to build a competitive advantage in the twenty-first century is by adopting an entrepreneurial

approach in marketing. This strategy can be used to create new products or services that are rated higher than competitors.

According to the findings of research conducted by HidayatuHah (2019) and Mahrous (2020), commercial marketing influences marketing performance by influencing marketing performance measures such as competitive advantage. Again, research shows that entrepreneurial marketing has an impact on the performance of companies as well as their prominence in the market (Mahrous, 2020). According to Becherer's research, entrepreneurial marketing does have an impact on the results obtained in SMEs (2017).

According to findings published in 2019 by Autio, entrepreneurial marketing and innovation are inextricably linked in ways that help each other. Agyapong (2017) found the same results, showing that there is a correlation between innovation and marketing procedures carried out within the company. A recent study (Afriye, 2019) came to the conclusion that innovation in all four categories (products/services, processes/operations, organizational structure/functions, and marketing) has a major impact on a company's marketing success. According to Morris (2018), there are a total of twelve indicators for business marketing, and they include the following: proactiveness, risk taking while considering potential consequences, attention to opportunities, utilization of available resources, customer focus, and value creation.).

## 2.2 Competence of Human Resources (HR)

Increasing productivity is one of the goals that can be achieved through the use of human resources in a company. The strategic decision-making process (HR) is the engine that drives an organization's efforts to achieve or fulfill its vision and goals. The

process of developing skills in HR is implemented throughout the organization, starting with the recruitment stage and continuing through to awarding. According to Shahhosseini (2021), having HR capabilities will make it easier to complete a project, which will ultimately give the organization an advantage in the market. HR competence affects all aspects of the company's operations, including the marketing strategy it uses. According to Franco (2018), for SME entrepreneurial marketing efforts to be successful, the human resources currently available must be able to think creatively and not be fixated on the marketing methods of large companies. This is because SMEs have limited resources, both in terms of human resources and financial resources. HR in SMEs must be able to respond to market opportunities and needs, maintain consistency in marketing university products, and be able to communicate with a wider audience.

Adoption of HR practices has a positive and statistically significant impact on a company's competitive advantage, according to research conducted by Alajmi (2016) using data collected from employees in a thousand one hundred and thirty manufacturing companies. This data is collected from employees in one thousand one hundred and thirty manufacturing companies. Improving one's skills in HR will help the company to operate at a higher level of efficiency, which in turn will result in achieving better operational results. This shows the need to use human resources in every initiative undertaken by a company to build a competitive advantage for itself. NemII (2018) emphasized that HR competency influences the company's competitive advantage. "knowledge", "skills", "self-concept", and "motivation" are indicators of HR competency, as stated in (Gordon, 2017).

### **2.3 Company Innovation**

In order for a company to continue to maintain its leading position in an increasingly competitive business climate, innovation is absolutely necessary for the company's success. In order for a business to innovate successfully, it must apply the new concept as a whole in all of its activities (Ceylan, 2018). The process of identifying opportunities to produce goods, services, or unique methods of doing business is referred to as "innovation", and it is included under the umbrella word "innovation". The company's capacity to develop new products, services and processes can have a major impact on company performance and can be considered an investment with a long-term horizon (Andries, 2019).

Until 2016, Prajogo had completed research on business creativity by interviewing 194 business managers in Australia. According to recent research findings, technical innovations brought by technology prove to be more useful in helping businesses achieve their goals. (AtaLay, 2019) conducted a study of top-level managers in 113 Turkish vehicle assembly companies in 2011 and found results comparable to those findings. The research results show that technological innovation has a positive and significant impact on business performance, regardless of whether the impact is measured in the form of outputs or processes. According to Vaccaro (2020), a company's ability to innovate in terms of features and functional efficiency of its products can have a considerable impact on a company's profit and, as a result, on its ability to compete in the market. According to Coloson (2020), innovation is an important component of any marketing plan that can be considered effective for entrepreneurial ventures. Entrepreneurial marketing places significant emphasis on change management, opportunity analysis, and product development as its three main areas of

concentration.

According to DereII (2015), effective innovation management can generate a competitive advantage for one's company. As a result of the fact that the main goal of innovation is to meet client demands, it is widely recognized as a strategy that can help companies gain an advantage over their competitors. According to the findings of a study conducted by Udriyah (2019) which involved the participation of 150 SMEs in SeLangor, market orientation and innovation have an effect on competitive advantage. Another researcher, Ie (2018), came to a very similar conclusion. He observed that the level of innovation in an organization can affect its competitive advantage. Product innovation, process innovation, marketing innovation and organizational innovation are the four types of innovation identified by the OECD as indicators of innovation.

### **2.4 Competitive Advantage**

When a business has a "competitive edge", also known as an "advantage", it shows that the business has a more prominent position in its industry compared to its competitors (Kumar & Pansari, 2018). If the company has access to competent and unique sources of strength, it is likely that the company will have a competitive advantage in the market. An organization's internal resources and its position in the external market are the two fundamental sources of strength that determine a company's competitive advantage. Hinterhuber (2019) confirms that the most successful corporate strategy for growing new competitive resources is the most significant competitive advantage. In the business world, every company is constantly competing with each other to see which one is the most successful in the market. Every company has a strategy for growth, and that strategy usually involves delegating tasks to different departments to maximize efficiency. Formulation of an

effective strategy is very important for long-term business continuity, because to maintain market share, the strategy must be able to provide a lasting competitive advantage.

When a business consistently maintains a market share that is in excess of what its competitors have achieved, this is the best demonstration of an organization's competitive advantage. A large number of different approaches to running a company can be used to secure a long-term advantage over the competition (Poter, 2017). The goal of this tactic is to achieve significantly lower operating costs than competing firms. As a result, the focus of this tactic is on increasing productivity. It is impossible to ignore the fact that cost reduction represents greater profit potential and greater capacity to withstand the effects of price competition

(Zekiri & NedeIea, 2019). Whyudin (2015) identifies market focus, product innovation, and environmental flexibility as the three main reasons for a company's capacity to maintain a competitive advantage. According to research by Satria and SuListyawati (2018), the factors that determine a company's competitive advantage include entrepreneurial orientation, training, market focus, and management skills. According to II (2018), an organization's competitive advantage can be broken down into several criteria, some of which are price/cost, quality, delivery speed, product innovation, and market time. Given the theoretical work just discussed, a further research framework can be conceptualized as follows:

**Figure 1.** Research Concept Framework

### 3. Research methods

The research method used in this research is a quantitative survey. It seems that the actual number of Yogyakarta residents who are members of the SME is unknown, but the population consists of these residents. Variations in sampling are evaluated, and sample size is determined based on the smallest number of samples that will produce valid results. When the standard deviation is smaller than five, the number of samples required is 120, as stated by Cooper (2018). The methodology used to collect samples is called non-probability sampling, and uses a purposive sampling method. In order to meet the minimum standard, a

company must have been in operation for at least two years and generate an annual revenue of at least IDR 2.3 million.

Standard questionnaires were distributed via Google Form to SME students who are members of several student organizations in Yogyakarta to compile this information. After the information is obtained, it is evaluated with the help of the Smart PIS program through the structural equation model (SEM). According to the findings (Gozali & Iatan, 2015), the following is an overview of the data processing steps for this particular study:

1. The Mode for Evaluating Success Called the Staged Mode At this point, instruments are put through their paces in the testing

phase, where the accuracy and reliability of various indications are evaluated. The Staged Evaluation Framework is the first instruction. At this point, the instruments will live their step in the testing phase, where many indicators will be evaluated for accuracy and precision. An instrument is said to be valid and reliable if its calculated value is greater than its mean value at a significance level of 0.05 and its Cronbach's Alpha value is better than 0.6. second literacies of the Test Phase structure model. At this point in the hypothesis testing procedure, the aim is to determine whether the independent and dependent variables, as measured by the Smart PIS mode, really have a relationship that can be considered statistically significant. The statistic known as the r-squared coefficient is used to determine the extent to which the variables in the model are related to each other in some way. After that, the estimation of the radiant efficiency of the paving stones was obtained by applying the bootstrapping approach. If the t-statistic is greater than 1.96 and the p-value is less than 0.05, then the result is considered statistically significant; if the value of r is greater than r table at a significance level of 0.05, then the result is valid; and if Cronbach's Alpha value is greater than 0.6, then the result is considered reliable.

2. The evaluation of the structural model, also known as a hypothesis, is the second stage of testing. The purpose of this stage is to determine, through the application of the partial least squares statistical method, whether the hypothesized relationships between the various construct variables and nodes are significant or not (PIS). The statistic known as the r-squared coefficient is used to determine the extent to which the variables in the model are related to each other in some way. After that, an estimated line efficiency coefficient derived through bootstrapping is displayed. The results were considered statistically significant if the t-

statistic was greater than 1.96 at a significance threshold of 0.05, while the beta coefficient was used to indicate the direction of influence. Staged Mode as a Means of Evaluating Success At this stage, the instrument will be tested for its capabilities, in which various indicators will be evaluated for accuracy and precision. An instrument is said to be valid and reliable if its calculated value is greater than its mean value at a significance level of 0.05 and its Cronbach's Alpha value is better than 0.6. The second iteration of the Test Phase structure mode. At this point in the hypothesis testing procedure, the aim is to determine whether the independent and dependent variables, as measured by the Smart PIS mode, really have a relationship that can be considered statistically significant. The statistic known as the r-squared coefficient is used to determine the extent to which the variables in the model are related to each other in some way. After that, an estimated line efficiency coefficient derived through bootstrapping is displayed. The results were considered statistically significant if the t-statistic was greater than 1.96 at a significance threshold of 0.05, while the beta coefficient was used to indicate the direction of influence.

## 4. Results

### 4.1. Output Test of Validity and Reliability

The test was given to a total of 35 people using the instrument. When the significance criterion is set at 0.05 and the r-squared statistic for table is 0.372, the instrument is considered valid if the r-squared statistic is higher than the r-squared statistic for table. The reliability test can determine how consistent the readings are from a measuring instrument. Analysis whether the ranking is consistent or not using Cronbach's Alpha. Cronbach's alpha value of more than 0.6

indicates that the instrument has a high degree of dependability.

All r product moment values are greater than or equal to 0.372, which indicates that all research items for all research variables are valid. This conclusion is reached by determining the extent to which the research instrument can be relied upon. Since all variables have a Cronbach's Alpha value greater than 0.6, the entire set of variables can be trusted.

## 4.2. Structural Analysis of the PLS Equation Model

### a. Outer Model Results

The convergence validity criterion requires that each dimension in model I meets a certain threshold, which is defined as an absolute loading factor greater than 0. If this is not successful, the relevant dimension will be removed from the model. The results of the convergence test conducted to determine the accuracy of the data are presented below.

**Table 1.** Output Convergent Validity

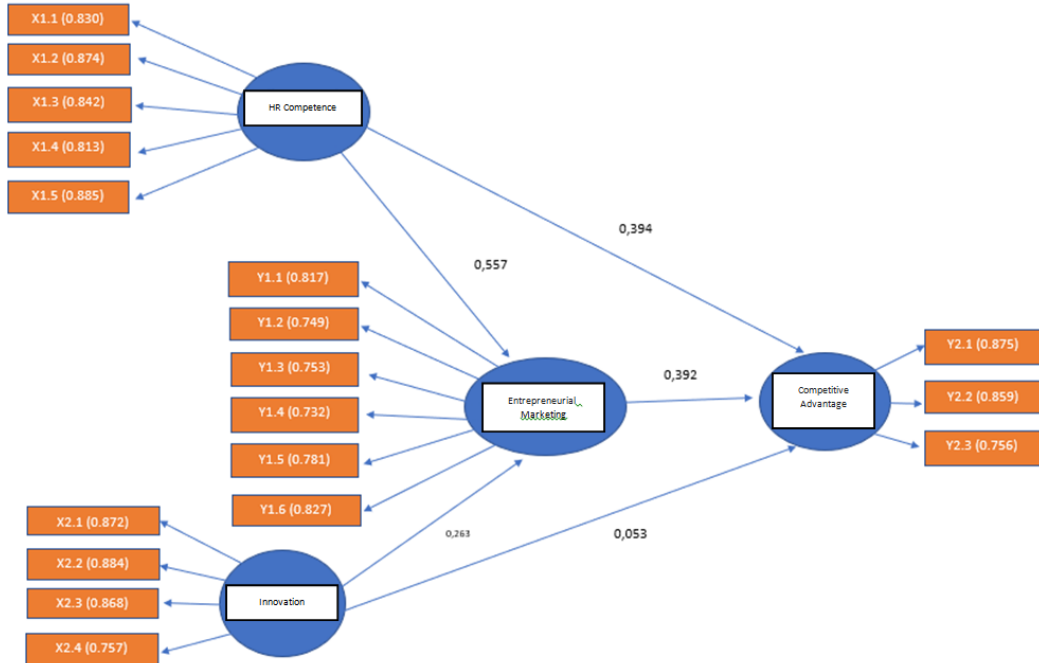

Indicator	Entrepreneurial Marketing	HR Competence	Innovation	Competitive Advantage
X <sub>1,1</sub>		0.830		
X <sub>1,2</sub>		0.874		
X <sub>1,3</sub>		0.842		
X <sub>1,4</sub>		0.813		
X <sub>1,5</sub>		0.885		
X <sub>2,1</sub>			0.872	
X <sub>2,2</sub>			0.884	
X <sub>2,3</sub>			0.868	
X <sub>2,4</sub>			0.757	
Y <sub>1,1</sub>	0.817			
Y <sub>1,2</sub>	0.749			
Y <sub>1,3</sub>	0.753			
Y <sub>1,4</sub>	0.732			
Y <sub>1,5</sub>	0.781			
Y <sub>1,6</sub>	0.827			
Y <sub>2,1</sub>				0.875
Y <sub>2,2</sub>				0.859
Y <sub>2,3</sub>				0.756

SMARTPLS 3.0 Output Data Source by Researcher, 2023.

Table 1 shows that all dimensions have outer loading > 0.700, so there are no dimensions that need to be removed from mode I. The results of convergent validity can also be seen visually as shown in the figure 2.

Model measurements can also use AVE (Average Variance Extracted) and CR (Composite Reliability), and the following are the results (table 2).

The recommended AVE value is > 0.5, while the composite reliability value is > 0.7. The AVE value obtained is above 0.5, this means that the variance that can be explained by the dimensions is above 50%. Meanwhile, the composite reliability value > 0.7 means that all of the stable variables have good reliability

**Figure 2.** Convergent Validity Model Results of SEM-PLS Entrepreneurial Marketing and Competitive Advantage

**Table 2.** Results of Average Variance Extracted (AVE)

Variable	Composite Reliability	Average Variance Extracted (AVE)
Entrepreneurial Marketing	0.895	0.593
HR Competence	0.912	0.714
Innovation	0.863	0.683
Competitive Advantage	0.934	0.728

SMARTPLS 3.0 Output Data Source by Researcher, 2023.

**b. Inner Model Results**

The following is the result of the analysis of the coefficient of determination (R<sup>2</sup>) of the inner mode.

**Table 3.** Value of the Coefficient of Determination (R<sup>2</sup>) in the Inner Model

Variable	R Square	R Square Adjusted
Entrepreneurial Marketing	0.557	0.543
Competitive Advantage	0.594	0.589

SMARTPLS 3.0 Output Data Source by Researcher, 2023.

The meanings that can be explained in table 3 are:

1. It has been determined that a value of 0.543 should be assigned to the determinant coefficient for the final stage entrepreneurship marketing variable. This shows that human resources and inventive talent can explain 54.3% of the variation in entrepreneurial marketing, while other factors outside the mode account for 45.7% of the variation in entrepreneurial marketing.

2. Second, the value of the competitive advantage of the latent variable will always be 0.589% regardless of other factors. This suggests that HR competency orientation, innovative marketing, and entrepreneurial marketing may be responsible for 58.9% of the variance in competitive advantage, while

out-of-mode factors are responsible for 41.1% of the variance.

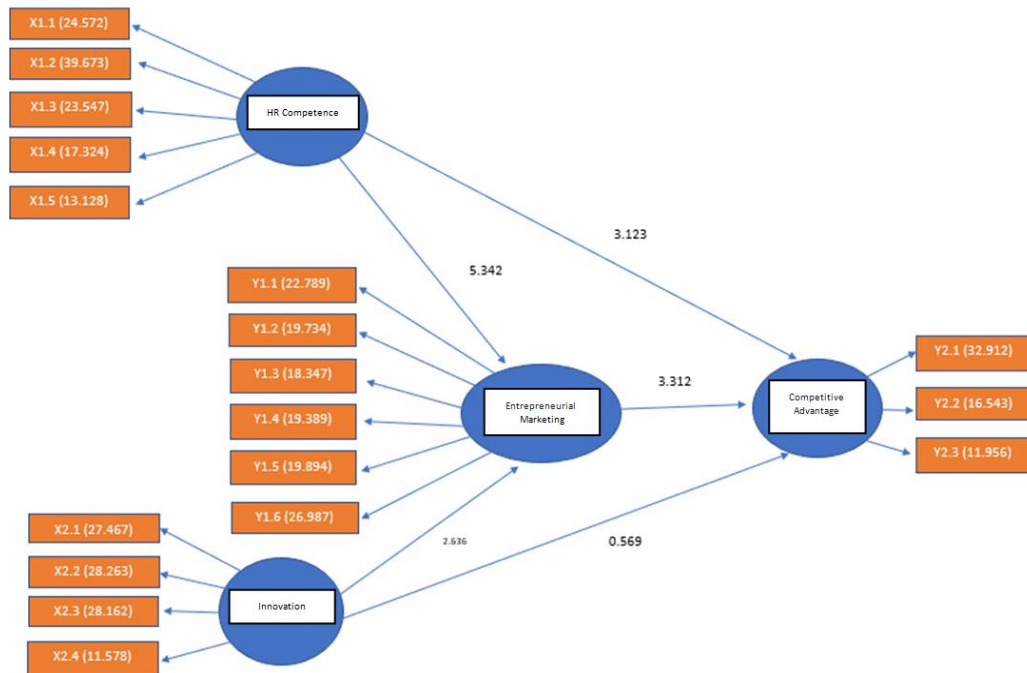

Estimation of the path coefficient of the least square model of entrepreneurial marketing and competitive advantage is shown in table 4.

The results of a causal relationship between latent variables are stated in the figure 3.

**Table 4.** Estimating Results of Partial Least Square Entrepreneurial Marketing Models and Competitive Advantage

Information	Original Sample (O)	Standard Deviation	T Statistics	P Values
Entrepreneurial Marketing to Competitive Advantage	0.392	0.115	3.312	0.001
Innovation towards Entrepreneurial Marketing	0.263	0.096	2.636	0.008
Innovation towards Competitive Advantage	0.053	0.102	0.569	0.567
HR Competence on Entrepreneurial Marketing	0.557	0.107	5.342	0.000
HR Competence on Competitive Advantage	0.394	0.125	3.123	0.003

SMARTPLS 3.0 Output Data Source by Researcher, 2023.

**Figure 3.** RESULTS OF SEM-PIS Entrepreneurial Marketing Modelling and Competitive

Advantage. The estimation results of the research model are as follows:

$$EM = 0.557 KS + 0.263 IS$$

$$KK = 0.394 KS + 0.053 IS + 0.392 EM$$

The structural equation can be explained as follows:

- a) The HR competency variable has a significant positive effect on Entrepreneurial Marketing (EM) with an estimated path coefficient of 0.557 and a p-value of 0.000. This means that the better the competence of the HR (KS), the better the Entrepreneur Marketing (EM).
- b) The latent variable of innovation has a significant positive effect on Entrepreneurial Marketing (EM) with an estimated path coefficient of 0.263 and a p-value of 0.008. This means that the better the innovation (IS), the better the Entrepreneurial Marketing (EM).
- c) The HR competency variable has a significant positive effect on competitive advantage with an estimated path coefficient

of 0.394 and a p-value of 0.003. This means that the better the competence of human resources, the higher the competitive advantage (KK).

d) Innovative innovation variable (positive but not significant effect on competitive advantage with an estimated path coefficient of 0.053 and a p-value of 0.567. This means that the more innovative, the competitive advantage will increase, but the increase that occurs is not statistically significant.

e) Entrepreneurial Marketing Identification Variable has a significant positive effect on competitive advantage with an estimated path coefficient of 0.392 and a p-value of 0.001. This means that the better the entrepreneurial marketing (EM) is, the higher the competitive advantage will be.

Table 5 below is used to see the indirect effect of HR competence and innovation on competitive advantage through Entrepreneurial Marketing (EM).

**Table 5.** Indirect Effect

Information	Original Sample (O)	Standard Deviation	T Statistics	P Values
Entrepreneurial Marketing to Competitive Advantage				
Innovation towards Entrepreneurial Marketing				
Innovation towards Competitive Advantage	0.104	0.045	2.347	0.021
HR Competence on Entrepreneurial Marketing				
HR Competence on Competitive Advantage	0.216	0.090	2.413	0.012

Data Source SMART-PIS 3.0 Output by Researcher, 2023.

According to Table 5, it can be explained that the indirect influence of HR competence and innovation on competitive advantage through entrepreneurial marketing.

a) The path coefficient of the indirect influence of HR competence on competitive advantage through entrepreneurial marketing is 0.216 with a p-value of 0.012 (significant at a level of 5%). The positive indirect path

coefficient indicates that the higher the competence of HR, the competitive advantage will also increase mediated by Entrepreneurial Marketing.

b) The path coefficient of the indirect effect of innovation (IS) on competitive advantage (KK) through entrepreneurial marketing is 0.104 with a p-value of 0.021 (significant at a level of 5%). The positive indirect path coefficient indicates that the better the innovation, the competitive advantage will also increase mediated by Entrepreneurial Marketing.

## 5. Discussion

### 5.1. The Effect of Human Resource Competence on Entrepreneurial Marketing

Examination of the available data reveals that HR capabilities have a constructive and material influence on business expansion through marketing. That is, the level of HR expertise possessed by an entrepreneur will be directly correlated with the quality of the marketing efforts carried out by the entrepreneur, and the increase will be directly proportional. Based on the findings of this study, there are four components that make up HR competence: knowledge, skills, beliefs, and motivation. Their strong level of confidence and drive has a beneficial effect on their respective business marketing activities, even though the Yogyakarta SME participants may have minimal knowledge and abilities. SME business owners looking to start their own companies have a significant demand for entrepreneurial marketing because it offers tactics that large organizations do not have. Therefore, to improve entrepreneurial marketing, SME students in Yogyakarta need to improve their HR skills as a whole. Our findings provide support for the claims made by Ahmad and Zainal (2020) and Gerardo and Alberto (2019), who argue that HR is an important

component for achieving the day-to-day operations of an organization. Therefore, acquiring related skills in business management is an important step in the process of building a strong and competitive SME. The results lend credence to the claims made by Shahhosseini (2021) and Franco (2018), who argue that the application of HR skills has a significant effect on the level of success achieved by entrepreneurial marketers.

### 5.2. The Influence of Innovation on Entrepreneurial Marketing

According to statistical research findings, innovation has a beneficial and materially significant impact on entrepreneurship in the field of marketing. The concept of innovation is dissected into four different aspects during this investigation, namely product innovation, process innovation, marketing innovation, and organizational innovation. Seeing how innovators in the food and beverage sector are increasing their market share, this conclusion has important meaning for the entrepreneurial marketing of the food and beverage business. In order to develop and expand their company in the face of increasing competition and a society whose behavior is constantly changing to meet changing social customs and advances in technology, company owners must be innovative in their approach to problem solving. One example is the COVID-19 pandemic that occurred this year.

As a result of the government rationing rules that have been in effect in Yogyakarta since the start of the latest outbreak, SME players have had to adapt to shifting customer preferences. To supply cutting-edge goods and services to consumers, business owners must be able to generate innovative innovations, creative ideas and fresh points of view. As a result, innovation is becoming increasingly important not only as a tool for ensuring business continuity but also as an

important instrument for competing successfully in the marketplace. The level of success of a company in generating positive consumer views will be directly proportional to its capacity to produce new products, services and processes. The end result of this procedure is the generation of a distinctive quality that differentiates them from their competitors. The results of this study support the findings of previous studies (Afriye, 2019; Sakhosseini, 2021; Miles, 2016; Morrish, 2017) which shows that innovation has a large influence on the marketing strategies used by entrepreneurs.

### **5.3. The Effect of Human Resource Competence on Competitive Advantage**

According to statistical investigation findings, having HR competence has a materially beneficial impact on a company's competitive advantage. Based on these facts, the competitive advantage of Yogyakarta SMEs is expected to increase in direct proportion to the level of HR knowledge possessed by the actors. HR competence can be broken down into five different components: one's knowledge, abilities, motivation, level of self-confidence, and personal philosophy. Having high HR knowledge and skills has a positive effect on the efficiency and effectiveness of task completion; having a high level of motivation increases productivity; having a high level of self-confidence makes it easy to make adjustments and take risks; and having low levels of these traits has the opposite effect. Therefore, human resources are an important asset that requires careful planning and management at every stage, from initial recruitment to permanent placement to developing skills and abilities to maintaining positive working relationships. This is necessary so that the talent of the company's employees can help the company gain a competitive advantage. For a business to have a significant advantage over its

competitors, it is necessary to have a certain level of human resource competency to fill the available roles. The results of this study provide evidence that supports the findings of Nemi (2018) and Alajmi (2016) who found that HR knowledge is related to competitive advantage.

### **5.4. Effect of Innovation on Competitive Advantage**

According to statistical research findings, innovation does have a good impact, but it does not lead to long-lasting competitive advantages. Due to a lack of substantial resources, researchers at SMEs in Yogyakarta are faced with significant hurdles. Increased capital is necessary for innovation, but small companies often have limited access to financial and human resources (Sdiku-Dushi, 2019). Due to their limited resources, small businesses have a hard time innovating as they are forced to rely more on limited internal resources when they manufacture their products. According to the data collected in this sector, the most typical type of small enterprise that develops conventionally over generations is the one that was started and developed by members of the same family. Newly established companies have difficulty realizing their full potential in SMEs because of the constraints that exist there, which include low levels of education and skills and low levels of talent. In addition, it is known that the Free Trade Agreement (FTA) between the United States and Canada which took effect in 2003, as well as the Asia-Pacific Economic Cooperation (APEC) in 2020 will have a significant impact on the ability of small and medium enterprises (SMEs) to compete in the global market. free trade market. This is what drives the government to support small businesses in the islands so that they can be productive and efficient in meeting consumer needs. This finding is in line with discussions (Afriye, 2019; Autio, 2019;

Miles, 2016; Morrish, 2017) which highlight the huge impact of direct innovation on a firm's competitive advantage.

### 5.5. The Effect of Entrepreneurial Marketing on Competitive Advantage

Findings from statistical studies show that entrepreneurial marketing has a very large influence and a positive impact on a company's advantage over its competitors. The relevance of this finding lies in the fact that the comparative advantage possessed by SMEs in Yogyakarta will increase in direct proportion to the level of entrepreneurial marketing carried out by the institution. Yogyakarta SME practitioners demonstrated their mastery in marketing by consistently being proactive, adaptive, daring to take risks, focused on customers, and intense on customers. Small businesses, as a whole, have limited resources, which means that they need to be creative with how they offer their products to be successful. The use of entrepreneurial marketing strategies is very helpful in situations like this (Sadiku-Dushi, 2019). According to Morris (2018), one way to gain an advantage over one's competitors in the twenty-first century is to implement a marketing plan that takes an entrepreneurial approach.

In this regard, it is very important for business owners to have a solid understanding of entrepreneurial marketing in order to enhance their advertising efforts and, ultimately, to realize the possibility of gaining a competitive advantage. These findings provide support for the argument that entrepreneurial marketing has a major impact on a company's competitive

advantage, which is supported by research conducted by (Becherer, 2017); (HidayatuIlah, 2019); and (Mahrous, 2020).

## 6. Conclusion

According to the findings of this study, strategic demand management (HR) skills and entrepreneurial marketing skills have a positive and significant effect on the competitive advantage of SME in Yogyakarta, while HR skills and innovation have a significant effect on SME marketing skills. This shows that HR skills and innovation have a significant impact on SME marketing skills. However, HR knowledge and innovation have a major impact on competitive advantage when entrepreneurial marketing is used as a mediator. Competence in human resources is the main component that determines the level of competitive advantage of the company, perhaps more than innovation. This highlights the importance of HR in the process of gaining an advantage over other businesses. For companies to innovate, they need to have knowledgeable human resources and adequate financial resources. This is because innovating requires an investment of money. Since most of the people working in the food and beverage industry still lack strong human resources and innovation skills, to gain a competitive advantage it is necessary to harness the entrepreneurial spirit that tends to penetrate SME workers and incorporate them into marketing. This is because most of the people working in the food and beverage industry still lack strong human resources and innovation skills.

## A SYSTEMATIC REVIEW OF GEOPOLYMER MATERIALS INNOVATIONS, PREVAILING CONSTRAINTS AND RESOLUTIONS

***Abstract:** Geopolymer is a novel eco-friendly or biodegradable cementitious material that its creation might lessen the carbon-dioxide emission created through Portland cement manufacturing companies. Geopolymer material not only possess exceptional mechanical properties, but as well possess other admirable properties like fire and corrosion or oxidization resistance. The majority of industrial solid waste (ISW) and waste smoldering bottom ash (WSBA) are stacked up, which in turn fills land mass, besides has a harmful influence on the surrounding. Reprocessing them could be utilized as materials for making geopolymers. These can efficiently adsorb heavy metals, dyes or pigments, and other radioactive contaminant, that is very helpful to humanity's future development. On the other hand, as a result of the exceptional features of geopolymer material, its functions go further than that. Specific helpful information regarding geopolymer materials was make known in this study. Likewise, this paper encompassed the source of geopolymer materials, the geopolymerization, the categories of activators, their formation techniques, and the diverse usage areas of geopolymer materials. Also, the factors influencing the mechanical features of geopolymer materials were discoursed. Conclusively, the inadequacies and usage precincts of these materials were abridged, and their evolution was abridged to prepare a theoretical or hypothetical base for the lasting improvement of geopolymer materials*

***Keywords:** Geopolymer, GGBS, Curing, Activator, Strength, Poly ethylene glycol*

### 1. Introduction

Geopolymers also well-known as alkali activated materials (AAM), is an inorganic polymer materials, that can use both waste products and natural materials as the key raw materials blended by acid activation or alkali reaction. Popular raw (natural) materials with their acronyms are displayed in Table 1. GP are very good in resisting chemical

corrosion or oxidization and fire, besides possess excellent durability, and high mechanical strength (Aike et al., 2018a; AliquesGranero et al.,2019; Lahti et al. 2019; Li et al., 2020d; Bi et al., 2017; Vafai et al., 2018a). Ever since the beginning of 1980s, GP materials have been counted as stand-ins for Portland cement, mostly on account of their functioning advantages and low carbon dioxide emissions. Investigators

successfully formulate the geopolymer glaze with exceptional features like high strength, synthetic ageing and high temperature resistance (HTR), as well as safe processing performance (SPP), which might be utilized as glazings for light-weight polystyrene sheets (LWPS) for partitions or detachments, walls, and roofs (AbdeGhani et al. 2019a; Ly et al., 2019a). Wang et al. (2016) research work on the tektite geopolymer fulfills all performance prerequisites for solar or lunar construction materials: high together with low temperature cycling, about nil water ingestion, vacuum stability, and exceptional mechanical features. Owing to its outstanding features, geo-polymer stuffs have drawn full awareness as an advance material for structure refurbishment from the time of its discovery. For instance, geopolymers have been utilized at the airfield, as well as in core railway sleepers in advance nation like Australia, likewise be utilized for vitiated concrete patch-up of rigid concrete (pavement) in army stations (Shil et al. 2020a). Recently, geopolymers have also been utilized to restrain detrimental metals. Reports have revealed that the ooze actions of numerous hazardous metals though alkali-activated urban solid waste smoldering fly ash (AUSWSFA) was efficaciously obstructed, and the leaking level was within the Chinese paradigm (Liue et al., 2020a and b). Hence geopolymers not only transform waste into paragon or wealth but as well as are eco- friendly. In recent times, viable development has been encouraged all over the globe, which necessitates us to utilize natural and ecological resources as little as doable. With this innovation, the industrial hazardous solid wastes (IHSW) discharge for instance red mud (RM), fly ash(FA), effluence of dyes, heavy metals, slags, and tablets, have stirred publics' concern.

**Table 1.** Popular materials for construction works and their acronyms

Material	Acronyms
Clay	-
Fly ash	FA
Metakaolin	MK
Laterite	-
Red Mud	RM
Mullite	-
Silica fume	SF
Diatomite	-
Cassava peel ash	CPA
Coal gangue	CG
Volcanic ash	VA
Sewage sludge ash	SSA
Ceramic grog	CEG
Rice husk ash	RHA
Glass wool residue	GWR
Kaolin clay powder	KCP
Glass powder	GP
Kaolin	-
Iron ore tailing	IOT
Bentonite	-
Bauxite	-
Zeolite	-
Ground granulated blast furnace slag	GGBS or GGBFS
Halloysite	-
High calcium fly ash	HCFA
Drinking water treatment residual	DWTR
Palm oil fuel ash	POFA
Olive bio-mass fly ash	OBFMA
High magnesium nickel slag	HMNS
Olive bio-mass bottom ash	OBMBA
Pyroclastic flow deposit	PFD
Electrolytic manganese dioxide residue	EMDR
Red clay brick waste	RCBW
Calcium carbide residue	CCR
Urban solid waste incineration fly ash	USWIFA
Pyroclastic flow deposit	PCFD
Bauxite ore tailing	BOT

The universal yearly production of FA is projected to range from seventy-one million tons to one billion tons. Lots of FA discarded of in land fillers, ash or slag ponds, as well as air entrainment of particles and leaching of contaminated materials into the water or soil propounds a major hazard to the environs (Dindi et al., 2019). Right now, there are various studies on mixed-base geopolymers. Equally, all categories of raw materials supplement each other; contrariwise, they can efficiently lessen the ingesting of natural and ecological resources. Some properties and usage of geo-polymers have been deliberated by researchers at home and overseas, however the dialogue is not broad enough presently. This scrutiny goal is to appraise the formulation and blending of geo-polymer materials, the features influencing the physiognomies of geo-polymer materials, as well as the multi-functional usage of geo-polymers. From the prevailing limitations of geopolymers discovered, the resolution progress is abridged to present a theoretical and hypothetical base for the long-term improvement.

## 2. Geopolymerization

Geopolymers are blended via the geopolymerization of alumino-silicate materials that melted in the alkali-activator mixture at very high temperature, creating and materializing an amorphous stage, as well as three-dimensional (three-D) silico-aluminate net work composition (Cong and Cheng 2020; Bondar 2019; Duxson et al., 2007). Even though investigators have different notions concerning the integration technique that happens throughout geopolymerization, like majority beliefs that the geopolymerization can be split into three main phases (Cristelo et al., 2019; Darmayanti et al. 2019; Duxson et al., 2007; De faveri et al. 2019; Chindaprasirt and Chalee 2014).

(1) The dissolution and suspension of alumino-silicate materials in the strong or distilled alkali solution develops the free-silica as well as the alumina tetra-hedron component.

(2) The displacement, solidification/ or materials gelation, the concentration of alumina reaction versus silica-hydroxyl for creating the inorganic and inert geopolymer crystallize stage. At this phase, water is released from the system as a result of the hydrolysis system.

(3) As the crystallize stage sets, it shrinks to generate a three dimensional (3-D) set-up of silico-aluminate that creates a geopolymer. It means that activators perform very crucial task in geopolymerization as displayed in Fig. 1. The concentration of 10M NaOH yielded greatest suspension rate of  $Si_4p$  plus  $Al_3p$  ions in alumino-silicate materials equated with the lesser NaOH concentration, which causes a greater rate of geopolymerization (Darmayanti et al. 2019; Duxson et al., 2007; De faveri et al. 2019; Chindaprasirt and Chalee 2014). To boot, the curing temperature is paramount to the geopolymerization, because the suspension of raw materials is augmented with the temperature and, more rapid happening of amorphous stage crest in XRD display specifies that the greater temperature is good for geo-polymerization (Cristelo et al., 2019; Zhag et al. 2017e).

## 3. The material origin

### 3.1 Raw materials

#### 3.1.1 Clay concept and its resources

Clay is an alumino-silicate salt with very tiny particles less than two millimeters (<2 mm). It is a broadly spread natural mineral resource, with cohesive as well as acquiescent down-to-earth rock structure. Also is a class of encrusted silicate from alumina octahedral layered and as well as

silicon oxygen tetrahedron composition (Cong and Cheng 2021; Chen et al., 2019). Due to its physiognomies, it has been utilized as a precursor for creating geopolymers and widely utilized are zeolite, kaolin and so forth. Kaolin is also titled dolomite, is fine, white as well as soft clay, with fire resistance and enriched plasticity. Similarly, metakaolin (MK) is an anhydrous aluminu-silicate created throughkaolin clay dehydration at standard temperature between 6000C to 9000C. Fig. 2 (a) and (b), reveals the common MK that have been comprehensively utilized in the geopolymers making. TheMK-created geopolymers show thermal insulating features (Prudhome et al. 2011; De faveri et al. 2019; Chindaprasirt and Chalee 2014; Sellam et al. 2019), very high bonding strength as well as compressive strength (Duan et al.,2016),

etcetera. Because of the exceptional mechanical features of MK-produced geopolymers, several investigators have blended other ingredients with the system to minimize costs and sustain its exceptional deed, whereas achieving resource recycle (Caiet al., 2021; Guseien et al., 2019; Tstuque et al., 2020). Likewise, the research amalgamates kaolinite-produced porous geopolymer materials (KPGM), which possess dual purposes of decreasing heat transmission and noise (Zao et al., 2021). In recent times, some researchers have publicized that ninety-five percent of raw kaolin is riveted, besides the formulate through alkali excitation have a compressive strength equal to 67.1 MPa (Kelisser et al., 2022). The usage of natural or raw kaolin rather than calcined-metakaolin lessens costs and adversative ecological effects.

**Figure 1.** Graphic illustration of the creation of (a) geopolymer materials precursor, (b) backbone of geopolymer (Cai et al., 2020).

### 3.1.2. Lateritic soil

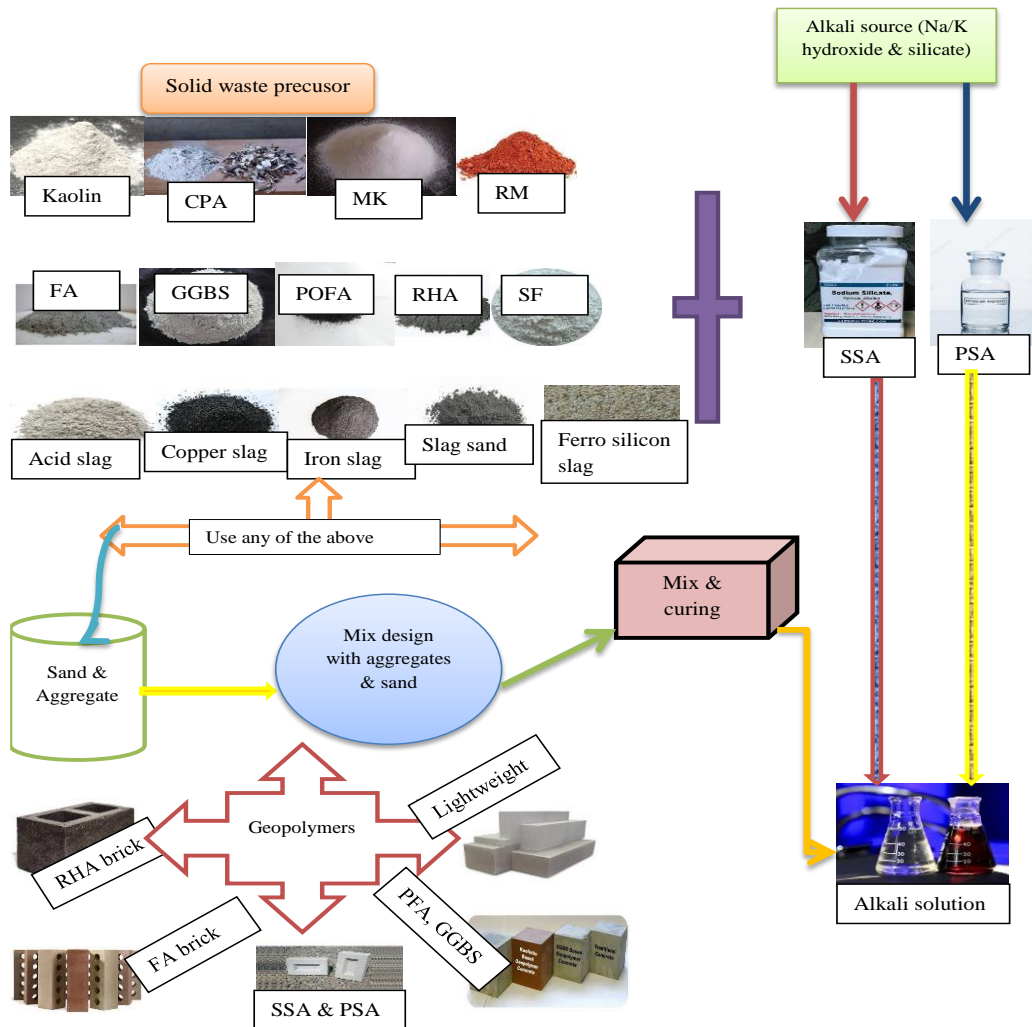

Lateritic is a mineral (soil) that is rich in aluminum, alumino-silicates and iron. Majority of lateritic soils are reddish-brown in colour and have been utilized for a very long period as a conventional building, brick, and road, due to its strong resistance to oxidization. In recent years, there is a novel trend in geo-polymer invention based on laterite, which possess high mechanical strength (Tathew and Isac, 2021; Zubaer et al., 2020). What is more, the chemical physiognomies of lateritic soil has excellent

molar corrosion ratio (SiO<sub>2</sub>/ or (Al<sub>2</sub>O<sub>3</sub>+Fe<sub>2</sub>O<sub>3</sub>)), which is utilized as raw/ or natural material for the geo-polymer class Na-poly (sialate-siloxo). Since, the molar oxide proportion of silica to alumina substantially alters the microstructure as well as mechanical physiognomies of the lateritic-soil geo-polymer (Subaer et al., 2016). Additionally, to obtain high strength, preferable mix laterite with other solidwastes. Both lateritic plus mixed lateritic-slag geopolymer is good for non-load bearing building materials. (Lemougna et al., 2017).

### 3.1.3. Others minerals

Raw or untreated minerals are precursors of GP, and the widely used are halloysite, bentonite, bauxite, mullite, diatomite, and etcetera. Some of their features are displays in Table 1, and they are observably alumino-

silicate materials. Because of the small amorphous quantities of some raw minerals, which create an unsatisfactory action, some of them must go through high temperature pre-curing as well as mechanical instigation treatment, etcetera as presented in Figure 2.

**Figure 2.** Geopolymer concept (materials, mix and curing).

### 3.2. Waste products

#### 3.2.1. BFS (Blast furnace slag)

BFS often called slag, is an iron making bi-product that can be achieved at roughly 1500°C (Amran et al., 2020). It common slag is displayed in Figure 3(a) and (b). Based on the cooling scenario, GGBFS (ground granulated blast-furnace slag), is the type of the BFS cooled in water, which is largely utilized as a part replacement for OPC after crushing as a result of its amorphous quality, high pozzolanic as well as hardness action (Defaveri et al., 2019; Cong and Cheng 2021). GGBFS is one among conventional raw materials for geo-polymers, with the

Si:Al ratio of 1.71-3.67. GGBFS is extremely reactive to the amalgamation of geopolymers and, it is promising at obtaining a good reaction rate at a temperature as small as 0°C (Derossi et al., 2019; Assi et al., 2018). Because when slag is utilized as a cement supernumerary, a lesser amount of heat is generated during hydration, and also decrease cracking threat (Duan et al. 2016; Cheng et al., 2013). GGBS might be utilized to enhance the long-term strength, the porosity or absorbency, sulfate resistances, alkali silicate reactivity (ASR) of concrete, and lessen the water needed, permeability as well as hydration heat of the concrete (Amran et al. 2020a; Bayiha et al., 2019).

Figure 3a. widely utilized slag raw (natural) materials; a) slag deposit; b) Powder form; c) Granulated blast furnace slag.

Figure 3b. SEM Images of: a) Slag; b) Steel slag and c) Granulated blast furnace slag.

#### 3.2.2. Bio-mass ash (BMA) and waste blazing bottom ash (WBBA)

Rice fibre/ or husk ash (RHA) is derives from leftover from burning rice husks. Agricultural or agro wastes are rich in silica,

especially RHA, which is regarded as a clean substitute for enriching geopolymers' properties (Baenla et al., 2019; Bondar 2019). The usage of RHA additive in geo-polymer concrete can decrease the utilization of nano SiO<sub>2</sub>, also helps lessen

the litter nuisances created by the dumping of RHA in landfills, specifically in rice producing nations (Bi et al., 2017; Cheng et al. 2003; Cong and Cheng 2021). RHA has been extensively utilized in self-compacting geopolymer concrete (SCGC) owing to its great reactivity enticed via high silicon content as well as ultrahigh specialized surface zone (Chen et al., 2012). Similarly sugar-cane bagasse ash (SCBA) is another byproduct from industries that has been utilized by several investigators for volcanic ash materials (VAM) feed-stocking that are rich in silicates as well as alumina (Dingi et al., 2019; Chen et al., 2012).

Bottom ash (BA) is the principal byproduct of metropolitan solid waste smoldering. In heavy metals BA with a tiny particle size is very high (Amran et al., 2020), besides BA has lately been progressively reprocessed as building concrete and binders (Cong and Cheng, 2020; Bi et al., 2017). More to the point, BA from the burning of metropolitan sewage slurry is utilized in concrete with ten to fifteen percent dose, which might attain greater strength compared with concrete without addition of BA (Cai et al., 2020; and Cheng, 2020).

### 3.2.3. Fly ash (FA)

FA is a byproduct from industries created through smoldering of coal, which in general classified into class C, as well as class F. The incineration of bituminous coal forms a well-known class of fly ash with a very little CaO

contents, identified as type F fly ash (FFA) (Cheng, 2020; Duxson et al., 2007). Both lignite as well as sub-bituminous coal are as well utilized as novel power fuels to create type C fly ash (CFA) with very high calcium content, and is displayed in Figure 4(a) and (b). FFA features is related to that of ecological volcanic ash (Dingi et al. 2019a). FA is readily available by-product universally since early 20th century, commonly introduced as a main ingredient of cement or concrete and is widely used raw material for preparing geopolymers, with microscopic shape of fine spherical particles (Askarian et al., 2018; Dua et al. 2016). But utmost free CaO contents restrains the usage of HCFA in OPC system, whereas in geopolymer, the usage of HCFA is far above resourcefulness (Alzebaree et al., 2020; Azsi et al., 2020; Binder et al., 2018; Chen et al., 2012). CFA and FFA is 1.82-2.52 and 1.86-3.09 respectively. Substituting cement with FA makes environment fine because it diminishes greenhouse gas emissions (GHGE), as well as lessens construction prices. FFA is advantageous at low cost, easily available, good spherical feature, high activity amorphous silicate and aluminate contents, etcetera. Similarly, high engineering strength geopolymers can be effortlessly manufactured in an alkali activator solution (AAS) (Cai et al., 2020; Cong and Cheng, 2021; Duxson et al., 2007).

**Figure 4a.** widely utilized FA raw (natural) materials; a) FA deposit; b) Powder form; c) types of FA

**Figure 4b.** Images of FA: a) Bricks; b) SEM and c) Blended composite

### 3.2.4. Red mud (RM)

RM is gotten from Bayer process by-product utilized in industrial aluminium refinement. Fig. 5 (a) and (b) displays the widely used RM. Below high temperature with pressure scenario, the Bayer activities melts the soluble portion of bauxite and sodium hydroxide. Inexorably, an in significant quantity of sodium hydroxide utilized in this

activities stays in the RM, and yielded high pH value (Ban et al., 2017; Duan et al. 2016). Utilizing RM in this type of mud conserves the energy and time needed for mud drying; it lessens the total quantities of alkali activator through using RM at extreme alkalinity level, hence help decreasing the price of the GP construction (Bhutta et al.,2019; Duan et al. 2016).

**Figure 5a.** widely utilized RM raw (natural) materials; a) raw; b) Powder form; c) made with RH geopolymer.

**Figure 5b.** SEM Images of: a) Untreated RM; b) treated RM and c) sintered RM.

For FA-created geo-polymers, the optimum substitution quantities of RM are varies, comparative to NaOH concentration as well as curing scenarios (Chindaprasirt and Rattanasak, 2020). Also from research it reveals that the GP blended with RM possess greater strength plus durability (Li et al., 2020).

### 3.2.5. Other raw materials

The most frequently utilized materials for geopolymer are metakaolin (MK) Figure 6 (a) and (b); steel slag (SS), coal gangue (CG), silica fume (SF), high magnesium

nickel slag (HMNS), volcanic ash (VA), and wasteglass (WG), etcetera. RM, FA, BFS and the materials like RHA as the main bio-mass ash, all indicated high silica as well as alumina content that are appropriate as the add-on or gelling materials. The waste catalytic agent residue released from several industrial products have abundant silicon and aluminium features as well as amorphous composition, which can be utilized for synthetic geopolymers; meanwhile it has value of compressive strength ranges from 40MPa to 85 MPa (Bhutta et al., 2019; Lee and Kang, 2016)

**Figure 6a.** widely utilized MK raw (natural) materials; a) raw; b) Powder form; c) Bonds

## 4. Categories of activators

### 4.1. Acidic activators

Some geopolymer are activated via acidic activator, while majority are through alkali activators Figure 7. The MK-created geopolymer was manufactured via an

activator called phosphoric acid solution that has excessive compressive strength of roughly 93.8 MPa (Bimdi et al. 2021; Ascensia et al., 2018). Additional report as well revealed that acid-created GP possess greater temperature resistance equivalent to 14500C, and excellent mechanical features than alkali-created geo-polymers (Celerir et

al. 2018). The scrutiny of phosphate manufactured geo-polymer samplings with various Si/ or Al as well as Al/or P illustrates that the impacts of P-poor, Al-enrich, and Si-enrich, features are safer (Chindapasirt and Rattanasak, 2020; Celerier et al., 2018).

#### 4.2. Alkali activators

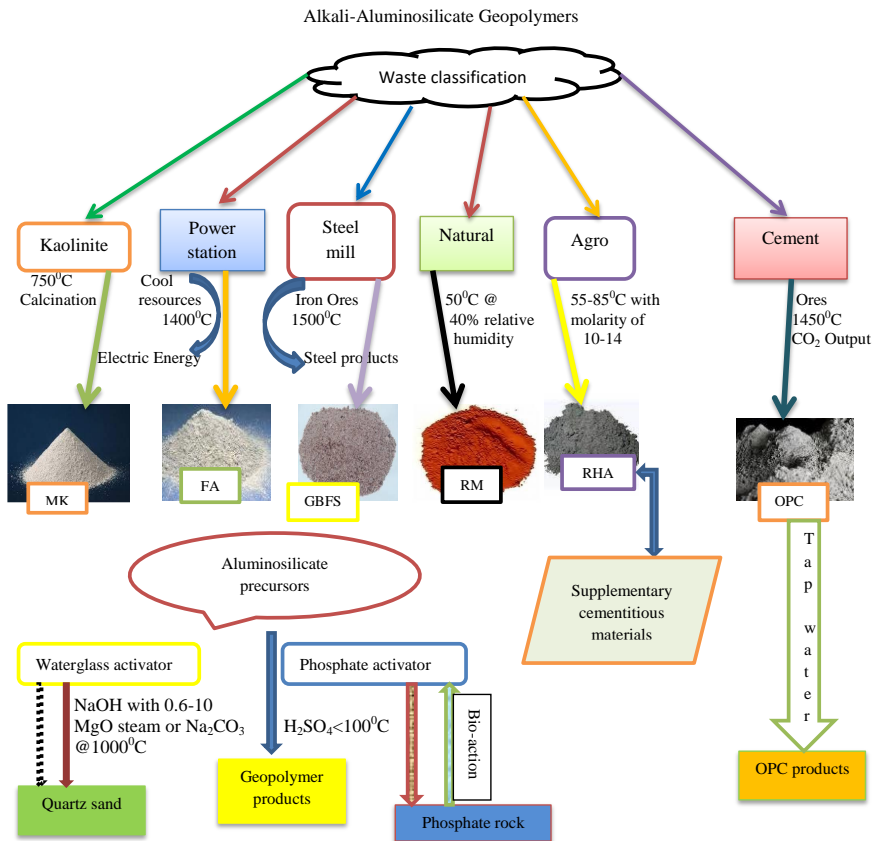

Several researches have publicized that geopolymer materials are usually activated via alkali activators, which is combination of liquid plus solid. Conversely, NaOH and Na<sub>2</sub>SiO<sub>3</sub> have been expansively utilized as activators in prior researches, but now most of substantially corrosive alkalis are hardly utilized as activators, and are steadily substituted by diverse solid activators. For example sodium water-glass was utilized as an activator to create MK-created geopolymer that has compressive strength equaled to 63.82 MPa (Ban et al., 2017; Cong and Cheng, 2021). By using hydrated lime and solid Na<sub>2</sub>CO<sub>3</sub> as activators of BFSS created geopolymer, the strength is between 50MPa and 85MPa at 28 d, with curing temperatures of 250C and 850C, correspondingly (Bi et al., 2017). Likewise, Na<sub>2</sub>CO<sub>3</sub> and Na<sub>2</sub>SiO<sub>3</sub> are activators that are substantially enhanced the overall setting time, but compressive strength lessened with Na<sub>2</sub>CO<sub>3</sub> quantities. Meanwhile the synthetic activator activated geopolymer cleans above the single Na<sub>2</sub>SiO<sub>3</sub> or Na<sub>2</sub>CO<sub>3</sub> activated geopolymer (Derossi et al., 2020). Additionally, sodium sulfate as an activator have little influence on FA with excessive Fe<sub>2</sub>O<sub>3</sub> quantities, but considerably affects the early strength of FA-created geopolymer (Duan et al., 2016). Most common utilized activator like potassium and sodium based activator. From prior investigations activation efficacy of sodium-created alkali activators is above that of potassium-created activators for F.F.A (Bi et al., 2017; Helmy, 2016). On the other hand, Askarian et al., (2018) and Antoni et al. (2016) discovered

that the usage of potassium composites in GP structures exhibited greater alkalinity than NaOH. Investigators validated the efficiency of lithium hydroxide solution as an alkali motivator that can be glazed with GP particles to lessen the suspension of active silica, as well as the probability of liquefied active silica forming ASR gel (Gong et al., 2021; Cheng et al., 2003).

#### 5. Formulation technique of geopolymers

Based on the prior formulation techniques of geo-polymers, majority of them are classified into two categories. Depend on the category of activators, first among them is used for formulation of one-portion, while the second is the formulation of two-portion geo-polymers. For the one-portion formulation, handling of activators is stress-free via averting the usage of risky alkali solution. To start with, all dry materials, comprising of the precursor material as well as the solid activator are dried up at steady or dawdling speed before blended consistently.

Then the water is introduced bit by bit to the mixture while blending at a gradual rate (Lemougna et al., 2020; Alrefei et al. 2019; Zhen et al., 2022; Cheng et al., 2003). For two-portion formulation geopolymers, the activator is made twenty-four hours (24h) before mixing. Figure 8. Then, the already made alkali solution is blended with more water. Next, the liquefied ingredients were introduced to the dehydrate blend and continued stirring till its homogenous (Zhen et al., 2022; Defaver et al., 2019; Bi et al., 2017; Duan et al., 2016; Duxson et al., 2007). Lastly, the freshly made blend is slowly transferred into the mould via vibration molding, covered with polyethene coat, then discharged after twenty-four hours for curing in accordance to specification (Dong et al., 2019; Alrefaei et al., 2019; Binder et al., 2018; Cong and Cheng, 2021; Chen et al., 2003).

**Figure 7.** Creation and reinvigoration of alkali aluminosilicate geopolymers and various features (Cong and Cheng 2021; Lahoti et al., 2018)

**Figure 8.** The formulation of bipartite geopolymers

## 6. Features of geo-polymer materials

The cement company infects the air, whereas geo-polymers are favourable to investigators

due to their exceptional cleanness. Geopolymer concrete (GC) is a novel and sustainable innovation of construction materials, equating with OPC and has numerous merits. It is understandable that

the features rest on numerous physiognomies such as geo-polymer mortar (GPM) and geo-polymer concrete (GPC) novel blending deed, microstructure investigation, as well as hardening operation.

**6.1. The fresh behaviour of geopolymer materials**

**6.1.1. Slump and workability**

Workability of geopolymer is being essentially influence by the particle shape of raw materials as showed in Table 2 and Figure 9. For instance, reduction in FA particle size enhances the fineness of FA as well as the geopolymers workability (Dohra et al., 2020; Duan et al., 2020).

**Table 2.** Compressive strength (CS) of GPC

Alumino-silicate precursor& Reference	Activator	Length /Breadth ratio	Slump (mm)	Density (kg/m <sup>3</sup> )	Curing period &T <sup>o</sup> C	Compressive strength @28days (MPA)
* FA + SF + MK (Gong and Zheng, 2022)	PH + PS	-	-	-	25 <sup>o</sup> C	80.72
*FA + GGBFS (Gong and Zheng, 2021).	SH + SS	-	131	2433	76 <sup>o</sup> C for 1 d	52.32
*GGBS (Cong and Cheng 2021).	SH	0.36	-	2248	26 <sup>o</sup> C	36.02
*GGBS (Bondat et al. 2018)	SH + SS	0.55 (w/b)	240.02	2421	22 <sup>o</sup> C	64.42
*GGBFS +RHA (Melita and Siddique 2018).	SH + SS	0.55	-	-	81 <sup>o</sup> C for 1d	59.72 for 3d
HCFA + RHA (Bi et al. 2017).	SS + SH	-	720	-	26 <sup>o</sup> C	38.21

On the contrary, slag created geopolymer ingredients is irregular because of its particle shape, thus produce poor machine ability. Another investigation stated that the activator solution oxidizes with GGBFS much quicker than FA, Figure 10, and the plasticity of geo-polymer mortar (GPM) will be lessened when the proportion of GGBFS is moderately high (Gholampouret al., 2019). Though, the GP workability was enhanced when investigators substituted GGBS with MK (Cong and Cheng 2021; Bi et al., 2017). Similarly, some findings have revealed that the introduction of calcium carbonate or silicon powder auxiliary materials might enhance the GP workability (Cong and Cheng, 2021; Zie and Tang, 2020). Moreso, the workability of GGBFS-FA created geopolymers can be stabilized by introducing a certain quantities of super-

plasticizer; when the level of alkali-activator at extreme, there is no noticeable impact on enhancing the freshness as well as hardening activities of GP mortar (Cong and Cheng 2021; Laskar and Talukdar, 2018). Numerous researches on the fiber reinforced geo-polymers (FRG), reveals impact of fiber additive on GP workability. The flow rate of GP mortar manufactured from untreated plus synthetic fibers is better than control GP mortar, which specifies that the usage of all fibers substantially lessens the flow capability of the geo-polymers (Duan et al., 2016; Bimd et al, 2019). Besides, the polyester fiber had higher impact on the workability of geopolymers (GP) than those manufactured from high performance steel fiber (Cong and Cheng, 2021; Bi et al., 2017). Regarding activators ASMS (anhydrous sodium meta-silicate) has

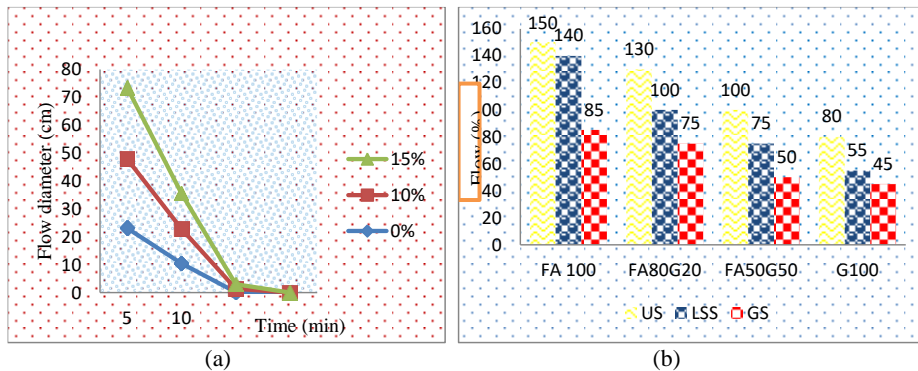

enhanced fluidity or plasticity than other activators (Laskar and Talukdar, 2018).

**Figure 9.** Illustration of various geopolymer SEM: (a) FA, (b)MK, (c)fiber, (d) Na<sub>2</sub> (e) SiO<sub>3</sub>, (f) NaO<sub>2</sub>, (g) clay, (h) Alkali-Silicate gel, (i) BA, (j) GP Concrete, (k) Temperature @ 600°C and (l) curing (Binder et al. 2018a)

Diverse activators have diverse viscosity that has impact on the viscosity or glueyness of geopolymers. Similarly, reducing in workability of mortar is triggered by increasing the viscosity of the activator solution (Cong and Cheng 2021). For instance, Mehta and Siddique affirm that Na<sub>2</sub>SiO<sub>3</sub> act as an alkali activator, without the introduction of NaOH, causes reduction

in the geopolymer concrete slump noticeably, which might be due to the extreme level of Na<sub>2</sub>SiO<sub>3</sub> viscosity (Cong and Cheng, 2021). Meanwhile, another research reveals that the slump of geopolymer concrete rises with the quantities of SiO<sub>2</sub>/Na<sub>2</sub>O in Na<sub>2</sub>SiO solution (Duan et al., 2016).

**Figure 10.** FA substitute with GGBS outcome showing: a) Diameter of flow in percentage (Bayiha et al., 2019). b) Untreated sand (US) flow, lead smelter slag (LSS) flow, together with glass sand (GS) flow (Baenla et al., 2020).

### 6.1.2. Setting time

Figure 11 exhibits the setting time of FA vs NaOH molarity. The workability of slag-produced is bad, because of the asymmetrical shape of slag constituent part, and the high slag quantity that aid the acceleration of initial as well as final setting (Cong and Cheng 2021; Bindi, 2019; Darmayanti et al., 2019). Usage of both SF and GGBS can minimize the setting time of geopolymers, though other substitute materials, like RHA, RM, HCFA, and MK, have similar effects (Askarian et al., 2018; Bai and Colombo, 2018). The optimum SF quantity of the FA-slag produced geopolymer (FSPG) is four percent of the whole binder weight (Bi et al., 2017). Consequently, volcanic ash (VA) could be utilized to lengthen the setting time or period of slag-produced geopolymer to a satisfactory level (Cong and Cheng 2021; Lemougea et al., 2020; Bindi, 2019). With the exception of the morphological

physiognomies, the chemical component of natural materials also trigger the setting time of GP. Upsurge in the quantities of calcium oxide proportion in the blend decreases the setting time of the GP mortar (Celerier et al., 2019, 2017).

### 6.1.3 Curing

Curing at high temperature might quicken the creation of concrete or mortar strength Figure 12 -14. Though, when potassium hydroxide as well as potassium silicate is utilized as activators, the strength of GPC manufactured at room temperature can up to 80.71 MPa (Cong and Cheng, 2021; Bimdi et al., 2020). It was discovered from the retrospective scrutiny of the several categories of adhesive or epoxy resin and the microstructure of the study, that time of the making of the geopolymers with diverse property, diverse molar concentration of liquid-to-binder, acid or alkali solution, and curing temperature are differs.

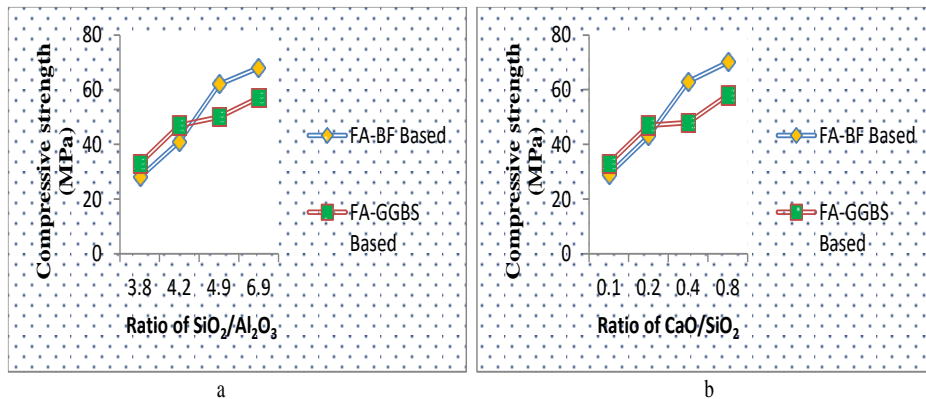

**Figure 11.** NaOH molarity versus setting time of FA-created GP, a) Source: Chen et al., (2020), b) Cong and Cheng, (2021).

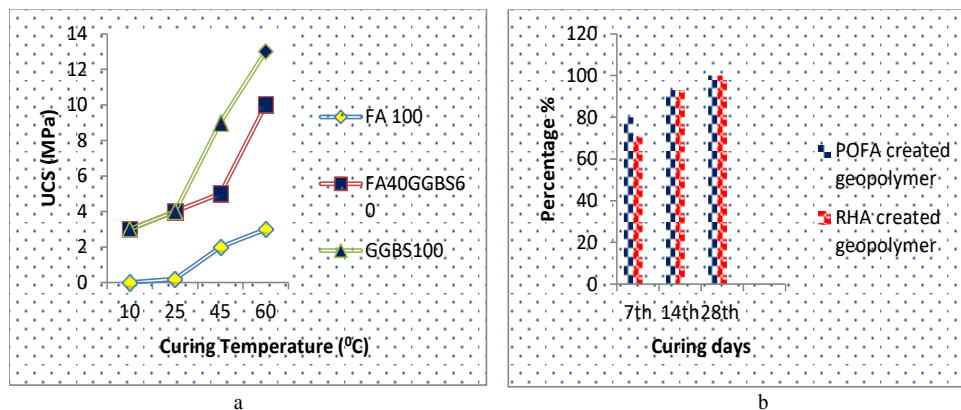

**Figure 12a.** Some geopolymers curing temperature plus early compressive strength for paste and concrete (Abridged from Cong and Cheng, (2021)).

**Figure 12b.** Some geopolymers curing temperature plus early compressive strength for mortal (Abridged from Cong and Cheng, (2021)).

**Figure 13.** Variation of basalt fibre compressive strength at different temperature. (a) SiO<sub>2</sub>/Al<sub>2</sub>O<sub>3</sub>. (b) CaO/SiO<sub>2</sub>(Chen et al., 2019; Celerier et al. 2017).

**Figure 14.** Impact of curing on the strength of blend GP. (a) one day temperature (Aini et al. 2020). (b) several days (Elyamany et al., 2018).

### 6.3. Durability features of GP materials

Strength influences the durability of GP, besides their resistance to abrasive environments, for instance chemical erosion resistance, porosity, carbonization resistance, abrasion operation, dry shrinkage, and other variables. Studies have defined this comprehensively that GP concrete are superb in durability than ordinary Portland cement concrete (OPCC) in most scenario (Alonso et al., 2019; Alrefaei et al., 2019). Dry shrinkage reduction is helpful in enhancing the durability of geopolymers. Investigation on the durability of

geopolymers exposes that gel matrix of the GP is dense and impenetrable; also integrating of nano-TiO<sub>2</sub> can hinder the interconnection of micropores as well as successfully obstruct the nanopores in the geopolymer matrix (Jindal and Sharma, 2020). Thus, the introduction of nano-materials is advantageous to the GP durability improvement.

### 7. Purposes and advance route of GPMs

Based on geopolymers purposes they can be grouped into two classes, which are those

with orthodox physical as well as engineering features, and those with unorthodox physical, chemical as well as mechanical features. Efficient applications, for example fire-prevention, quarantine, heat conservancy, adsorption of detrimental ions, could be utilized for building construction in exceptional areas, for instance insulation or sequestration walls as well as nuclear power plants.

## **7.1. Broad usage of geopolymer materials (GPM)**

### ***7.1.1. Marine constructions***

Exposure of reinforced concrete for a very long-term to saline soil, rainwater, or seawater, will harmfully influence the strength, stability and safety of the structural elements. On the other hand, the chemical resistance capability (CRC) of geopolymer concrete, specifically sulfate resistance, makes it more appropriate for marine construction works. According to the sequel research by Chindaprasit and Chale (2014a), the FA-produced geopolymer after air-dried in the geotechnical laboratory for twenty-eight days (28 d) was revealed to the tidal region of the seawater (brine) environs for three years, the infusion and oxidization of chloride ions reduced with the molarity of sodium hydroxide. Conversely, Cong and Cheng (2021) reveal that FA-based geopolymer concrete in the salt lake environs for six years is easy to carbonize than ordinary Portland cement concrete (OPCC), and also possess high diffusion of chlorides as well as sulfates.

### ***7.1.2. High-temperature and fireproof materials***

Destruction done to building by fire cannot be over looked. For examples the 9/11 terrorist attacks and the Windsor Tate Fire in Shanghai, lead to significant loss of human

properties or assets and life. Thus it is very important to select materials that are refractory in nature for construction works. Continuous enhancement of ecosystem and sustainability must be highly focused in the formulation of high temperature as well as fire-resistant materials today. Geopolymerization is means or techniques of transforming company solid waste (CSW) into chemical durability cement binder (CDCB) that are non-combustibility plus exceptional thermal strength. Gheng and Zhiu (2021) created the recalcitrant GP with GGBFS and discovered that the properties and fire-retardant ability of geopolymerization, were correlated to the features of the reaction products. Similarly, Cong and Cheng (2021) discovered that the GP cement produced from waste glass sodium water has a durable GP composition, which is very nice recalcitrant material. Additionally, RHA-RM created GPs were produced through water glass solution as an activator, then the curing of the GP samplings were at 10000C for two hours (2 h), and still displaying better fire-retardant and higher heat resistance (Armayani et al., 2016a; Duxson et al., 2007).

### ***7.1.3. Renovation materials***

Findings by Phoongernkham et al. (2015) and Alzeebaree et al. (2020) shows that addition of 10% calcium carbonate plus 14 M sodium hydroxide solution, enhanced the flexural strength as well as shear bond of geopolymer mortars. Also Yodsudja et al., (2010a), says that twenty-eight days bond, tensile strength of geopolymer mortar (GPM) and commercial concrete patch up materials are similar, and also possess the capacity to be utilized as concrete mending materials. Likewise, GP mortars possess high strength that can be utilized as a stand-in material for concrete patch-up than other repair binders. Similarly it can be utilized as high-strength geopolymer repair material

(HSGRM), novel waterproof, rapid curing, and hydrophobic (Duan et al., 2017; Alrefaie et al., 2020).

**7.1.4. Insulation materials**

Both thermal and acoustic insulators are indispensable when deliberating on building materials. Good thermal insulator can efficiently lessen energy usage and hence aid reduction of greenhouse impact as presented in Table 3. Acoustic insulators are very crucial since sound-absorbing materials improve indoor. Aural comfort for inhabitants and lessening of health threats are related to acoustic contagion exposure. Geopolymer materials are good in meeting

mentioned needs (Amran et al., 2020; Bi et al., 2017). A brand of absorbent geopolymer from industrial waste (raw or natural) material at low TOC has the capability of stumpy thermal conductivity, price, low water assimilation, biodegradable, and decomposable, which absolutely meet the prerequisites of the departments of building for thermal insulation materials (Assi et al., 2018). Prior researches have publicized that GPs can lessen electricity usage to improve interior TOC, whereas amalgamating micro-encapsulated stage can considerably enhance wall thermal performance as well as conserve energy material made with geopolymer concrete (Cong and Cheng 2021; Lahoti et al., 2018).

**Table 3.** Thermal plus acoustic features of partial geopolymer materials

Materials	Categorization	References
* Geopolymer mortal	Energy-proficient (15.02%)	Cong and Cheng (2021).
* Geopolymer and stage modification materials	Energy-proficient (28.01% -30.02%)	Cao et al. (2019).
* Vegetal geopolymer concrete.	Energy-proficient (46.02-58.01%), Thermal conductivity (0.113-0.191 Wm <sup>-1</sup> K <sup>-1</sup> ).	Cong and Cheng (2021) & Ahmad et al. (2020).
* Kaolin-based absorbed geopolymer	Sound porous coefficient (0.538 @ 5000 Hz, 0.808 @ 500Hz)	Gao et al. (2019).
* FA-based geopolymer fizzes	Sound porous coefficient (0.22@ 500Hz, 0.26@2000Hz).	Luna Galiano et al. 2021.

**7.2.3. Porous materials**

Geopolymer serves as cleanser production materials, and frequently utilized as adsorbents and porous materials to eradicate metal ions from wastewater, immobilization and control of heavy metal contagions. Utilization of these massive waste produced geopolymer adsorbent that is eco-friendly, cheap and more convenient serves as substitute to powder adsorbent earlier used in the wastewater treatment scheme (Ahmad et al. 2020; Cai et al. 2019). For example, methylene blue (MB) was produced using

FA-created geopolymers from synthetic wastewater. The permeable stuff can be utilized as the primary dye adsorbent in waste-water management. Similarly, the eco-friendly GP paste and adhesive blended from industrial plus agro waste as the porous materials might efficiently eradicate the primary dye MB from aqueous solution (Cong and Cheng, 2021). The quantitative classification of the porous effect of numerous GPs on dyes as well as heavy metals was briefly presented in Table 4.

**Table 4.** Adsorption impact of various geopolymers on dyes, heavy metals and etcetera

Porous material	Adsorption efficacy	Function	Citation
* Ca Si-Al slags-created low alkali (AAM).	97.6% Cs <sup>+</sup> , 99.91% Sr <sup>2+</sup>	Nontoxic, sustainable	Cong and Cheng (2021).

## 8. Prevailing constraints and resolutions

### 8.1. Scarcity of sodium silicate

From review of literatures, diverse techniques for assessing the features of geopolymer materials were discovered. Though the natural material elements were varies, thus an empirical scrutiny technique still needed to be abridged, so that every researcher might learn and enhance one another. On the other hand, shortage of sodium silicate is one of the crucial factors obstructing the improvement of geopolymers. The economic benefit and ecological proficiency of the geopolymer syntheses rest on the quantity of alkali activator. Never the less annual global production of sodium silicate is below ten metric tons, and the processes utilized emit high carbondioxide and energy (Cong and

Cheng 2021; Al-Mashhadani et al., 2018a). Conversely, silicon source to create industrial sodium silicate solution like RHA can may substitute sodium carbonate as well as quartz sand, which create greenhouse gas during the production technique (Abdel et al., 2019;; Aiken et al. 2018). For preparation of MK created geopolymer, sodium silicate from RHA and waste glass is the best catalyst (Cong and Cheng 2021;Granero et al. 2019a; Adollahnejad et al., 2020).

### 8.2. Efflorescence

Efflorescence which numerous industrial applications and laboratory researches identified as salt formation in surface alkali stimulated cement is another factor influencing the improvement of geopolymers, and its mechanism and main features (NaHCO<sub>3</sub>, Na<sub>2</sub>CO<sub>3</sub>, and several

sodium silicate components) are displayed in Fig. 11&12 respectively. High quantity of alkali activators of silicon rich systems, can initiate significant efflorescence. Besides, rising in the alumina content, lead to decreasing in the level of efflorescence with

alkali dosage (Cong and Cheng 2021). Also with the decrease of silica particle size, the increase of silica quantity, and the occurrence of the efflorescence in the GP lessen (Aini et al., 2019; Wang2018b).

**Figure 15.** Geopolymer efflorescence system illustration (Cheng et al., 2019; Cao et al. 2020; Chindaprasirt and Rattanasak, 2020a).

## 9. Conclusions and projections

This study presents some valuable information regarding geopolymer materials. It comprises of the reaction principle, main features of geopolymer materials, source of raw materials, kinds of exciter, formulation technique and practical applications in various areas

- (1) Geopolymerization largely comprises of three stages: the suspension of precursor, the creation of silicate network composition and initial gel.
- (2) Aluminium and silicon are the source of geopolymers raw materials which generally include RM, RHA, MK, biomass ash, FA, BFS, etcetera, also steel slag, coal gangue, SF, bauxite, waste glass, volcanic ash, diatomite, and high magnesium nickel slag.
- (3) Most popular activators for geopolymer

production are sodium silicate, sodium hydroxide, lithium hydroxide, sodium carbonate, calcium carbonate, phosphoric acid, and sodium sulfate.

- (4) There are several formation techniques of geopolymers. It is crucial to point out most widely used which is mix to solid material, and after blended with liquid methodically.

- (5) Generally, compared geopolymer with ordinary Portland cement mortars as well as concretes, geopolymer have better fire resistance, more resistant to salt erosion and acid and greater mechanical strength.

Thus, with the technology and science advancement in prospect, GPs are anticipated to be broadly utilized as cementing materials via intensification and the application will be advantageous to economy and the international environment

## **META ANALYSIS OF THE INNOVATION AND CREATIVITY IN ENTREPRENEURSHIP**

**Abstract:** *The dynamic acceleration of global change forces business actors to move quickly to build extraordinary innovative ideas. In understanding the statistical relationship related to business globalization, it is crucial to advance theory and practice in this field. This study aims to explore the innovation and creativity of business actors in defending their businesses from the waves of environmental changes. In this study, we used bibliometric analysis and the visualization tool of the VOS viewer software to display conceptions in graphical form from bibliographic data. This includes merging bibliographies, co-citing, and co-occurring keywords. This study collects relevant literature using a retrieval formula from the Scopus.com database. This study's first site conducted a literature analysis based on several aspects, including authors, journals, use of citations, journal publishers, keyword writing, and publication features. In the next step, we conducted a bibliographic analysis of the manuscript, co-citation, and co-occurrence. The results of the study show that there is a significant evolution of literature related to innovation and creativity in entrepreneurship. This study generally believes that innovation increases with the growth of high creativity from business actors. It was also found that there is a stronger relationship between creativity and innovation, especially in large companies. On the other hand, small companies with low technology are generally less balanced and less creative in increasing their productivity.*

### **1. Introduction**

At the beginning of 2020 all countries in the world were shocked by the spread of the Covid-19 infection, which was eventually designated as a widespread outbreak due to the increasingly widespread spread of the Covid-19 infection. This incident has an impact on all countries in the world, where many countries only focus on how to overcome the widespread Covid-19. In the

end, this has an impact on economic problems, including Indonesia. It is noted that the Indonesian economy is currently experiencing a short 5.3% contraction in the second quarter of 2020, but this is the same for other countries. One of the most severely affected is the Micro, Small and Medium Enterprises segment due to the implementation of Large-Scale Social Restrictions in all regions in Indonesia. Entrepreneurs really feel a very drastic

---

Corresponding author: Budi Alamsyah Siregar

decline in turnover, this requires them to do various new ways in selling their products. Entrepreneurs are required to be more creative.

Creative is another word for creating something different from what already exists. While the meaning of innovative is to create something that has never existed into existence or create something completely different from the others. Of the two activities, namely creative and innovative are the most needed or that must be owned by entrepreneurs, especially in times like today. Where the times are growing rapidly, global competition has occurred in various segments, not least in the field of business and business. Entrepreneurs are pioneers in the business world. Entrepreneurs or often referred to as entrepreneurs must have a vision for the future and have superior values in the field of business they develop. Not all entrepreneurs can be called entrepreneurs, because many entrepreneurs do not come from entrepreneurs, but get a business or business inheritance from their families.

Creativity in the innovation process serves as a generator in issuing ideas that can improve the results to be achieved. There are two important aspects of creativity, namely the process and the individual. The process in achieving goals is designed to create a solution to a problem. While the individual is a resource that can determine the creation of a solution. In the process of creativity, the same process will occur but the approach to completion is different and varied. In building a business and business, of course between entrepreneurs with one another will be different both in ways and strategies. Strategy or method is a calculation that determines the final result of creativity and innovation. Individuals who have high creativity will be able to capture and make the best use of opportunities, so that it will have an impact on the results they run. In addition to creativity, in entrepreneurship it is also necessary to be innovative. By innovating, entrepreneurs are

expected to be able to create something new so that they are able to adapt to global changes that occur. Innovation can be developed by means, among others, entrepreneurs must be able to recognize or recognize new discoveries, objects, materials, technology and people. The process of innovative creativity is related to logical thinking and analysis of up-to-date knowledge.

This study conducted an analysis based on authors, documents, most cited research, citation patterns of leading journals, institutions and countries and also analyzed graphically through the VOS viewer (Van Eck, Waltman, Dekker, & van den Berg, 2010) and (Van Eck, 2010). In addition, many bibliometric indicators were investigated including co-citation (Little, 1973), (Kessler, 1963) and co-occurrence of authors' catchphrases. Next in section 2 in this article focuses on discussing the literature review, section 3 reviews the methodology, Section 4 presents the results of analyzing publications, most cited papers, citation structure, leading authors, countries, institutions and the most used author keywords. Section 5 contains conclusions and implications.

## **2. Literature Review**

### **2.1. Innovation**

Briefly (Altshuler&Zegans, 1997) defines innovation as "interest in genuine life". From this understanding the author argues that in fact innovation is the development and implementation of something new, the meaning of the novelty, that innovation is creating and implementing something into a combination and the extent to which something provides a solution to an important problem. Innovation according to Goman (Rusdiana, 2014) is the practical application of creative ideas. Innovation can be realized with a high enough creativity. Creativity is the ability to apply something new to life. Many companies have advanced and

developed to this day because of their creativity and innovation. There are also many companies that die and do not develop because they do not innovate and be creative. Ways in terms of improving innovation capabilities in the field of products and services are: (a) learn innovation from existing experience, (b) reward employees who have innovative ideas, (c) behavior-oriented to innovate, (d) set goals innovating, (e) making innovative products in simple ways, (f) starting to make products with the most minor innovations, (g) conducting experiments and improvements, (h) following the predetermined schedule for innovation, (i) ) always work with passion and have a strong belief in innovation and risk.

The importance of innovation and creativity helps in the development of new ways to improve products or services to maximize company profits. Innovation and creativity encourage entrepreneurs to think outside the holder and look for non-standard answers. In addition, innovation and creativity help in sustainability and long-term performance of all types of companies (Baykal, 2018). Innovation can also be extended to things like coming up with business ideas, such as what to produce to satisfy customers, finding investment opportunities, deciding how to take advantage of those opportunities, formulating company goals and objectives, and conducting market research both in urban areas, and rural areas. Creating companies, starting real business operations, selling and promoting organizational products and services, planning and managing secluded people and fabrics for the achievement of company goals, risk and uncertainty management, creativity, and diversification (Gontur, Davireng, &Gadi, 2016).

## 2.2. Creativity

Entrepreneurship, according to (Clow, James, Kranenburg, & Berry, 2008), is a piece of mobilizing and sacrificing resources (land,

measured, and human resources) to take advantage of business opportunities or implement ideas in a way that meets people's needs for products and services, create jobs, and benefit business owners. Both new and established businesses are involved in these pieces, but the focus is usually on new products or services and new businesses. Therefore, in order for a country to prosper and enjoy sustainable economic growth, creativity and innovation must be injected into the entrepreneurial development arrangements that must be pursued. The economic and social consequences of todays around the world challenges affect society and the rest of the world. Many government and philanthropic efforts fail to achieve the social changes demanded by societies around the world and major social sector institutions are often seen as inefficient in solving social problems (Van der Have &Rubalcaba, 2016). Many entrepreneurs consider creativity as an important element, there is still a lack of understanding of the factors that influence these elements, as well as the relevant management processes (Finkle, 2013). Recently, an economic transition has taken place. The economy is shifting from knowledge-based activities and towards activities that require creativity, innovation, entrepreneurship, and imagination (Okay, Munshi, & Walumbwa, 2009); (Fillis&Rentschler, 2010).

Creativity can be described by generating ideas that will be used in the innovation mechanism such as being selected, assembled, rearranged, and synthesized towards the emergence of an abdicate or novel. Innovation can be defined as radical or gradual, as products or articles. The degree of radicalization or accusation is very dependent on the methods used previously, both in terms of creativity factors and structuring mechanisms, in terms of creativity variables and structuring processes (Roopsang, 2018). To support the above, innovation has been defined by (Okpara, 2007) as adding

something new to an existing product or price that has been built from the ground up and has proven to work quite well. This study establishes a positive relationship between creativity, innovation, competitive advantage, and entrepreneurial growth in Nigeria. Because creativity can be considered as the creation of raw materials, pieces of invention can be considered as the transformation and development of these materials into something concrete, such as a process or product. The relationship between creativity and innovation is neither simple nor indirect. The problem lies in the fact that this confusion can lead to imperfect process management of the two. This uncertainty causes ambivalence among researchers and practitioners, as well as confusion about the conditions that promote creativity and innovation, and the effects of established practices on individuals and the environment in general. Efficiency in this article is a major competitive advantage in industries that demand continuous creativity and innovation from their employees. The continuous innovation of certain companies that are considered creative is very attractive, given some fundamental paradoxes such as the routine/creativity pairing (Fillis&Rentschler, 2010).

### 2.3. Entrepreneurship

According to (Hadiyati, 2011) entrepreneurship or business visionary is derived from the words wira and effort. Wira means chivalry, brave, noble, while business is a productive activity. Generally, entrepreneurs do not work in the government sector, but work in their own companies. So entrepreneurs create their own new innovative businesses with existing risks and take advantage of opportunities, and face competition, so that their business grows big. Entrepreneurship is a process that involves capturing an idea, turning it into a product or service, then building a business to bring that

product to market (Johnson, 2001). The real trend in the study of entrepreneurship in recent years has been away from the subject of small business itself towards the concept of entrepreneurship (Cornwall and Perlman, 1990, Chell, 2001). Entrepreneurship represents organizational behavior. Key elements of entrepreneurship include risk taking, proactiveness, and innovation (Miller, 2014). (Slevin&Covin, 1990) argue that successful companies not only engage in entrepreneurial managerial behavior, but also have an appropriate culture and organizational structure to support such behavior.

Firms pursuing strategic entrepreneurship should engage in both the opportunity-seeking activities required by entrepreneurship and the profit-seeking activities required by the strategy (Hitt, Ireland, Sirmon, &Trahms, 2011). Creativity and innovation in entrepreneurship are needed by those of you who have just started starting a business from the ground up. Creativity and innovation are intertwined, especially in a business. Creativity means new ideas that arise when they see an opportunity in the business world and innovation means how a businessman looks for solutions to develop his creative ideas. With creativity and innovation in entrepreneurial activities, there are several benefits that you can feel as a novice businessman. In an effort to increase creativity, management must be able to create an atmosphere within the company so that creativity can develop among employees. Actions that must be taken by entrepreneurs are: a. Give permission to all employees to generate creativity, b. Tolerance to failure, c. Express curiosity d. Seeing the problem as a challenge, e. Hold creativity training f. Provide facilities in the form of equipment, g. Tolerance to time h. Reward i. Show existing examples.

## 2.4. A brief history of bibliometric analysis and its indicators

Bibliometrics emerged in the early twentieth century as a symptom of the need to study and evaluate scientific production and communication activities. Definitions that will help to understand the concept are given by (Guedes&Borschiver, 2005); according to them, bibliometrics is a set of empirical laws and principles that contribute to building the theoretical foundation of information science (Araújo, 2006). Bibliometrics is part of the mechanism for measuring production, disclosure and use of information obtained through books or other types of production (Machado Junior, Celestino, Serra, Caron, &Ponde, 2016). As the science of analysis, bibliometrics developed, empirical laws were also designed on literary behavior, which was later referred to as bibliometric theory; Araújo says bibliometrics is the law of researcher productivity or Lotka's law (Araújo, 2006); the law of dispersion of scientific knowledge or Bradford's law; and distribution of customized organization and frequency laws in text or Zipf's laws, elaborated in 1926, 1934 and 1949, respectively.

Urbizagástegui defined Lotka's law as the basis of the inverse square law, arguing that the number of authors who made "n" contributions in a given scientific field was approximately  $1/n^2$  of those who made single contributions, and that the proportion of those who made single contributions was approx. 60 percent or more (Urbizagástegui Alvarado & Suárez, 2008). In contrast, Bradford's law is used to measure the productivity of journals, the formation of nuclei and regions of dispersion on certain subjects in the same journal set (Vanti, 2002), that is, by dividing the production of certain fields into zones with the same number of documents published, the first zone will have the same number of documents. Fewer journals; when the following zones are analyzed there will be

more journals in each zone and show the dispersion mentioned. Meanwhile, Zipf's law is divided into two laws (da Costa Santos, 2009): Zipf's first law relates to high frequency individualized organization customized structures in a text, and the second law relates to low frequency individualized customized structures. The high and low frequency is based on empirical observations and analysis of the frequency of occurrence of individualized organizations in long texts that are satisfactory. The premise is that the individualized organization customized structure with a higher frequency is a sign of the central theme of the textual document. These laws provide a solution in performing complex data analysis through sociometric analysis. Among the main analyzes of bibliometric analysis are co-composing, co-reference and bibliographic coupling networks (Bizotto, Camargo, da Motta, de Oliveira, & Coelho, 2015). Co-composing analysis allows identifying linked authors, institutions, or countries based on the number of publications they produce (Van Eck & Waltman, 2014). In a co-reference network, two publications are said to be co-referred to when there is a third publication that references them simultaneously (Small, 1973). With other customized structures, the greater the number of papers in which two publications are referenced together, the stronger the co-citation relationship between them, and therefore the more

## 3. Methodology

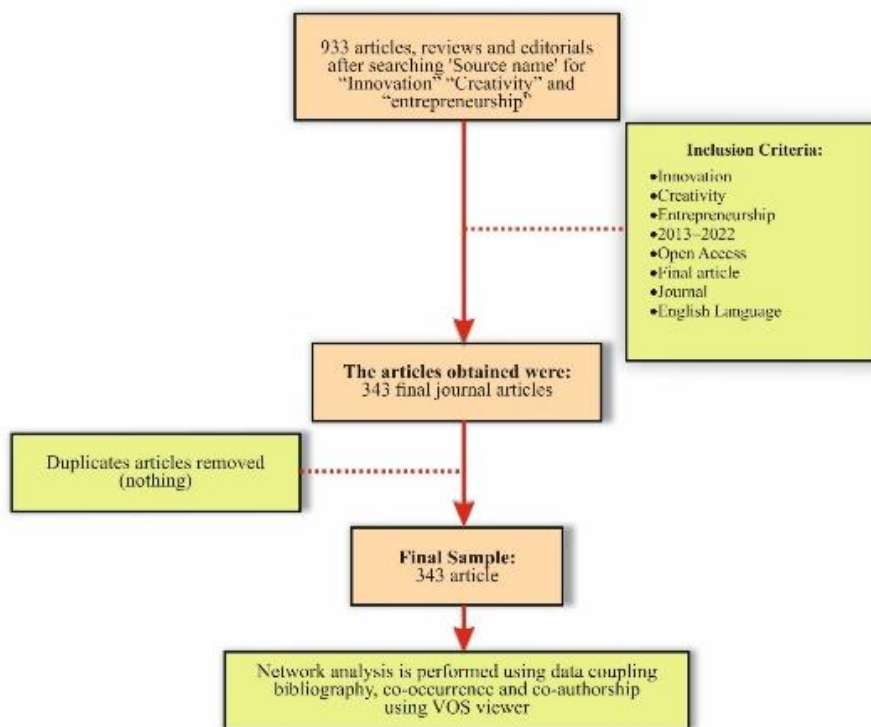

Bibliometric indicators are applied to evaluate bibliographic information, consisting of the number of authors, articles, citations, institutions, and countries. In addition, the documents used for the analysis were obtained from the largest data set of the Scopus multidisciplinary peer-surveyed literature (Mongeon& Paul-Hus, 2016). This premise information is popular and often used to obtain quantitative analysis, due to the

availability of quality articles in the fields of business and management (Verma&Gustafsson, 2020). The author prefers not to use Google Scholar due to some indexing issues as observed in notes from different sources, lack of formal integration in most cases and the need for a lot of cleanup effort which is considered cumbersome and inefficient.

The structure of the analysis used in this study is the same as that of some common bibliometric studies. In this study retrieved 343 articles, for a period of 10 years between 2013-2022 from the database using the keywords:

TITLE-ABS-KEY ("innovation" "creativity" "entrepreneurship") AND (LIMIT- TO

(PUBSTAGE, "final")) AND (LIMIT-TO (PUBYEAR, 2022) OR LIMIT- TO (PUBYEAR, 2021) OR LIMIT-TO (PUBYEAR, 2020) OR LIMIT-TO (PUBYEAR, 2019) OR LIMIT - TO (PUBYEAR, 2008) OR LIMIT-TO (PUBYEAR, 2017) OR LIMIT-TO (PUBYEAR, 2016) OR LIMIT - TO (PUBYEAR, 2015) OR LIMIT-TO (PUBYEAR, 2014) OR LIMIT - TO (PUBYEAR, 2013)) AND (LIMIT-TO (DOCTYPE, "ar")) AND (LIMIT-TO (LANGUAGE, "English")) AND (LIMIT-TO (SRCTYPE, "j")).The document is then further inspected and then forwarded to VOSviewer. The design of this study is presented in Figure 1.

**Figure 1.** Research design

Bibliographic information was mapped graphically using the VOS watcher technique to further explain the results (Van Eck et al.,

2010). This software produces co-author network analysis, co-citations (Small, 1973), co-occurrence of customized key

organization and bibliographic coupling (Kessler, 1963). However, (Martínez-López&Gualdrón-Pinto, 2018) defines co-initiation as an indicator for evaluating the most productive collections of papers, especially those with the highest co-publication rates. Co-reference is described as the process of citing two papers in a different third paper while co-occurrence of key individualized structures measuring customized organization individualized organization is observed to occur more frequently in papers other than those presented in the abstract.

#### 4. Results

In this study, it was recorded that there were 343 publications in the form of final journal articles discussing innovation and creativity in entrepreneurship published between 2013 and 2022, and from the number of articles, there were 4,808 citations. The development of research that discusses innovation and

creativity related to entrepreneurship is reflected in the analysis of the composition of the authors of the journal article. Figure 2 shows the development of journal articles on innovation and creativity related to entrepreneurship based on the composition of the number of authors according to the top 25 most cited articles (Table 2). Based on Figure 2 articles produced by more than five authors were not found in the sample. There was a decline in article writing with only one author in 2020, as well as a decrease in the number of collaborative authors between two and three authors from 2016 onwards. Based on the total published journal articles, of which there are 343 journal articles, more than 50 percent are written collaboratively by co-authorship (more than one author), with the dominance of articles written collaboratively by more than three authors. This is related to the increasing interest of the academic community on the issue of innovation and creativity in entrepreneurship in published journal articles.

Figure 2. Co-authoring feature

As shown in Table 2, several articles with the issue or key words of innovation and creativity in entrepreneurship during the last 10 years. From the beginning of 2013 to 2022 there were 343 journal articles. Given that the research data used is only up to 2022, it is important to note that the figures presented in

this study are only provisional. The trend of publication of journal articles every year shown in Figure 3 are all documents in the form of journal articles that discuss issues of innovation and creativity in entrepreneurship in published research journals.

**Table 1.** Trends in the number of articles discussing innovation and

Years	Documents
2022	4
2021	54
2020	56
2019	50

Documents by year

**Figure 3.** Trends in the number of journal articles discussing innovation and creativity issues

A total of 343 journal articles are those that directly address the issue of innovation and creativity in entrepreneurship. Innovation and creativity are things that must be done in the business world. Innovation and creativity are demands for individuals who are involved in every type of business, whether small, medium or large scale businesses. Business innovation and creativity is very important given the ever-moving economic development. In today's era, innovation and creativity are something that must be done if companies want to survive in the business

world. Not a few businesses have gone out of business due to ignoring the importance of innovation and creativity in business development. Therefore, it is very natural that the issue of innovation and creativity is often discussed in published journal articles.

Table 3 shows the top 25 most cited articles sourced from the Scopus.com database by CiteScore scores. The first order of the most cited articles in journals published in 2014 with the title “The real-time city? Big data and smart urbanism” was written by Kitchin R., in the journal *GeoJournal* and has 1,237

citations listed. The journal article that ranks second most cited is entitled “Social innovation research: An emerging area of innovation studies?” published in 2016, written by Van der Have R.P., Rubalcaba L., in the journal Research Policy, has 270 citations. The third order is an article written

by Sarooghi H., Libaers D., Burkemper A with the title "Examining the relationship between creativity and innovation: A meta-analysis of organizational, cultural, and environmental factors", published in 2015, in the journal Journal of Business Venturing which has 179 citations.

**Table 2.** The top 10 most cited articles

Based on the existing phenomena, it shows that the issue of innovation and creativity is increasingly known and has an increasing trend of discussion in management journals and other fields of science. Innovation and creativity are described as the heart and soul of the company. Innovation and creativity require effort to carry out tasks in a certain way or perform various activities. The benefits of innovation and creativity for entrepreneurs are looking for opportunities to do new things or do old things in innovative ways. Creativity and innovation inspire and drive entrepreneurship that excels in guiding the organization's operations, satisfying customers in the interests of all stakeholders. Entrepreneurship becomes value creation

where the implementation of creative inspiration is described as innovation (Anderson, Potočnik, & Zhou, 2014).

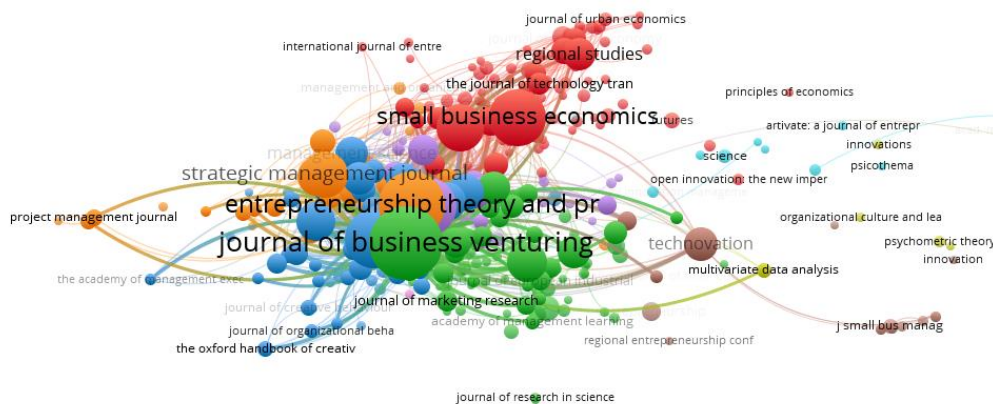

The results of the analysis based on the number of journal article citations from the VOS viewer in Figure 4 also show the same results as Table 3, where (Kitchin, 2014) as the author who has the most citations, and also as the author who collaborates the most with other authors collaborates in writing articles. A research journal about innovation and creativity, the findings in Figure 4 are illustrated in the VOSviewer application's network visualization output depicted with a larger circle than the others.

Figure 4. Citation of document

Documents with a citation threshold of 3, as well as the most representative 423 co-citation connections in the journal between 2013 and 2022 are presented in Figure 5. The results show that the Journal of Business Venturing has the highest number of citations, i.e. 315 citations in Co-citation, as well as a total of links / relationship (link

strength) as much as 13,493. Journal co-citation involves the investigation of two journals cited in the same third source (Small, 1973). This was done to determine two articles from different journals that were cited together in the same third journal (Gaviria-Marin et al., 2018).

**Figure 5.** Co-citation of journal cited

The next research is to conduct a review of authors, affiliations and countries based on keywords or issues about innovation and creativity in published journal articles, between 2013 and 2022. The analysis looks at the best achievement in publications from the Scopus database, looking at the 10 most prolific authors shown in Figure 6 based on the total articles they wrote. The top three prolific writers are Akib, H., with 3 articles, Cankar, F, with 3 articles, and Mas, S.R., with 3 articles. The articles were produced over a period of 10 years (2013-2022) and to date they are the top prolific authors in the journal. Figure 7 is a map of the combined bibliographies of the authors' names. This analysis involved determining 1 article cited by different authors in the third article. The results in Figure 6 show a minimum threshold of 1 article cited at least one hundred 889 between 2013 and 2022. Based on the results of the analysis it was found that Elia G, and

Margherita A, were the most cited authors, of which there were 1,349 citations.

While Figure 7 shows the top three most productive countries, where the United States is the most productive country with 163 articles, followed by Spain with 27 articles, while the United Kingdom is in third place with 25 articles. All journal articles published are related to or discuss the issue of innovation and creativity. Another important part is mapping out the bibliographies of these countries. This analysis involves determining 1 article cited from a different country in the third article. The results in Figure 8 show a minimum threshold of 1 article being cited at least 76 times between 2013 and 2022, the results show where the United States and United Kingdom are the most productive countries in publishing journal articles with issues of innovation and creativity in entrepreneurship.

**Figure 6.** Top earning writers of document

**Figure 7.** Top productive country

**Figure 9.** Top productive affiliation

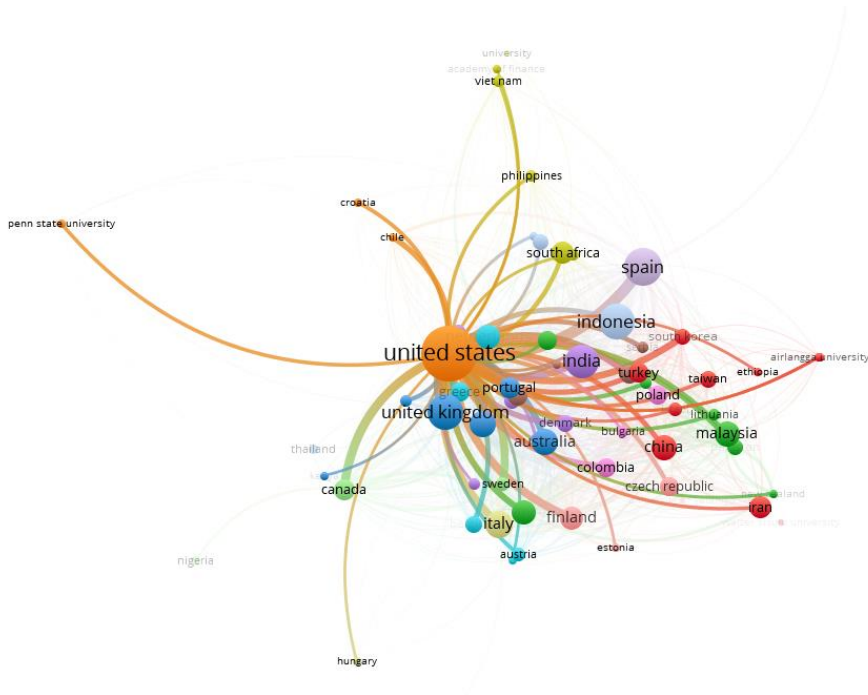

Figure 8. Bibliographic coupling country

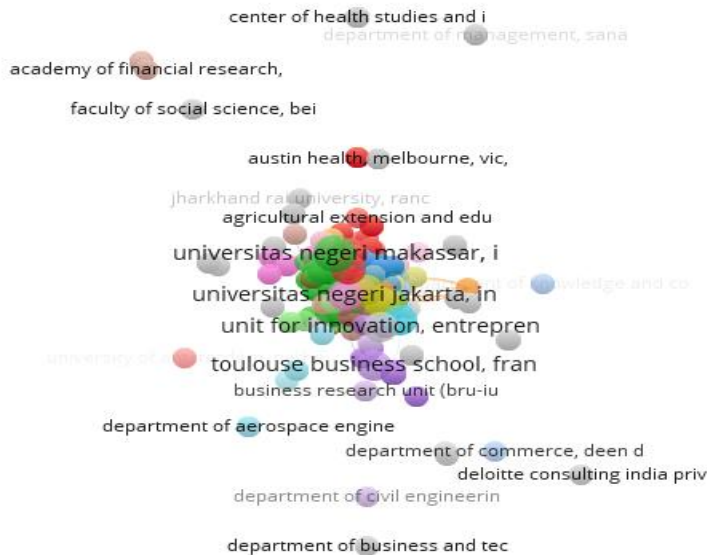

Figure 10. Bibliographic coupling institution

"innovation" are interconnected or have a network with the following sentences: "creativity", "education", "technology", "social innovation", "social entrepreneurship", "corporate entrepreneurship", "intrapreneurship", "leadership", "network", the results of this analysis show that keywords or issues about innovation and creativity have been widely discussed not only in management and business science journals, but have penetrated into journals with other sciences. VOS viewer presents a trend visualization network from the keywords innovation and creativity. In terms of the emergence of co-occurrence of author keywords in network visualization (Figure 13), the keyword Innovation became the first top topic among several other words.

## 5. Conclusion

Organizational, cultural, and environmental factors that greatly affect the level of creativity and individual innovation. The conclusion is in line with Kitchin R. (2014) with his article entitled "The real-time city? Big data and smart urbanism". Where he gives the term 'smart city' which is a city built on innovation and creativity of its residents. Sarooghi H., Libaers D., Burkemper A. (2015) believe that innovation increases innovative activities. However, empirical research on the impact of innovation on innovation, although positive, has yielded various results. In this study, a meta-analysis of 52 empirical samples consisting of 10,538 observations was conducted to examine how organizational, environmental, and cultural factors influence the creativity-innovation relationship. Until finally this research found a strong positive relationship between creativity and innovation, especially at the individual level. In addition, Sarooghi's research also finds an interesting moderating effect in which the relationship between creativity and innovation is stronger for large firms, process innovation, and low-tech

industries compared to small firms, product innovation, and high-tech industries. The next finding is that the degree of uncertainty avoidance maximizes the correlation between creativity and innovation. A study conducted by Edwards-Schachter M., García-Granero A., Sánchez-Barrioluengo M., Quesada-Pineda H., Amara N. (2015) recognizes Creativity, innovation and entrepreneurship as important things to foster an entrepreneurial culture. Empirical findings show that most of the respondents see themselves as creative people and think that creativity is strongly related to innovation and entrepreneurship. Previous studies by Ahlin B., Drnovšek M., Hisrich R.D. (2014) the results of his research show that entrepreneurs and perceived self-efficacy beliefs directly and in interactions affect product and process innovation of companies. These findings provide the basis for future work that enhances individual-level capacities that are important in the entrepreneurial process.

In the end, based on Table 3, the top 10 most cited articles in this study are generally believed that creativity can increase innovation. Innovation is based on four processes, including: 1) community psychology; 2) creativity research; 3) social and societal challenges; and 4) regional development. It was also found that there is a stronger relationship between creativity and innovation, especially in large companies. On the other hand, small companies with low technology are generally less balanced and less creative in increasing their productivity.

The conclusion of this research is to become a successful entrepreneur in difficult times, such as the Covid-19 pandemic to further increase creativity and innovation so that the products offered are competitive, and as an evaluation material it is hoped that entrepreneurs will focus more on making competitive analysis going forward. Furthermore, this research with a bibliometric approach is expected to provide insight in conducting and developing discussions on

innovation and creativity issues, especially in entrepreneurship. This study aims to determine the extent of the trend of discussing innovation and creativity issues in entrepreneurship in published journal articles. In this study, a comprehensive overview of journal articles that have been published from Scopus.com sources is presented, then collected and analyzed using the VOSviewer application. The bibliometric indicators used in this study include: best productive authors, institutions and countries, most frequently used keywords and most cited articles. The

journals used as analytical materials in this study are very credible with a database from Scopus.com. Based on the analysis, it is known that there are several journal articles that are related or directly discuss issues related to innovation and creativity, within a period of 10 years (2013-2022) around 32.2% of articles. The author based on the results of the analysis of this research can be a good opportunity for novice writers who want to write articles about innovation and see creativity in entrepreneurship.

## QUALITY ASSESSMENT OF E-COMMERCE SERVICES IN TERMS OF PROCESS DIGITIZATION

**Abstract:** Industry 4.0 is driving a massive transformation across all types of businesses, including those in the service sector. An important component of this transformation is the digitization of individual processes within organizations. The recent Covid-19 pandemic has accelerated the digitization of processes, with many businesses forced to pivot to online distribution channels in order to weather the crisis. The digitization of services, particularly in e-commerce, has been a key factor in the adaptation and survival of businesses during these challenging times. The aim of the article was to evaluate the performance of a selected e-commerce website in terms of changes related to its website functionality and the introduction of new options available to potential customers. The evaluation was conducted through surveys administered both before and after the website changes were made. Through these surveys, it was possible to identify which changes were particularly well-received by customers, as well as to gain insights into the additional changes they expect to see in the future.

**Keywords:** Service, service quality, e-commerce, digitalization, Industry 4.0

### 1. Introduction

The Fourth Industrial Revolution, commonly known as Industry 4.0, has been gaining global momentum in recent years. Its goal is the comprehensive integration of all production areas through digitization and the creation of new communication channels (Wachnik, 2022). The revolution also aims to implement modern solutions that enhance business operations, particularly in terms of automating and digitizing production processes (Kleszcz, 2018).

As a result, interest in the impact of Industry 4.0 on companies has increased. Firms are eagerly attempting to introduce new technologies into their production processes (Efimova and Briš, 2022). However, they

encounter numerous challenges along the way (Ingaldi and Ulewicz, 2020).

It is worth emphasizing that Industry 4.0 relies heavily on various technologies such as: traceability, autonomous robots, human-robot interaction, drones, cyber-physical systems, cybersecurity, renewable energy, cloud technologies and simulations, big data analysis, blockchain, internet of things analytics, virtual and augmented reality, artificial intelligence, mobile and cloud computing (Richnák and Fidlerová, 2022). All of these technologies are crucial for the development of Industry 4.0.

Currently, the digitization of processes is one of the key elements of the strategy for most businesses. This is due to the rapid development of technology, particularly the

---

Industry 4.0 revolution and the Covid-19 pandemic (Gue et al., 2020; Kmecová et al., 2021). In the initial phase of the pandemic, many businesses were forced to expand their operations and move online to continue operating. It can be observed that the Covid-19 pandemic has accelerated the digitization process of many companies, including those that were previously not interested in digitization. Automation and digitization have become not only goals, but also means enabling business development towards an intelligent company (Grznar et al., 2020; Pekarcikova et al., 2021; Wiśniewska-Sašek, 2020). Currently, there is a trend that if a company does not have its own website or is not digital, it does not exist.

Industry 4.0 is driving the integration of digitization across all production areas, with the goal of enhancing business operations and automating production processes. This has significant implications for service industries, which can also benefit from the integration of advanced technologies and data analytics to optimize and customize their offerings.

The development of e-commerce is one of the most visible effects of the trend of opening new distribution channels. Nowadays, companies use a strategy of combining sales in brick-and-mortar stores with e-commerce to increase the usability of their websites and gain a competitive advantage (Garbarova et al., 2017; Corejova et al., 2022). This strategy can help companies increase accessibility for customers and streamline sales processes, leading to revenue growth. The significant growth of e-commerce is related to the use of modern technologies such as artificial intelligence, big data, or IoT analytics, which allow companies to better understand their customers' behaviors and tailor their offerings to their needs (Bawden et al., 2020; Senthil et al., 2021).

Success in the global economy is often perceived in terms of competitiveness, risk, and innovation. Business success is based on the speed of decision-making and solid

information support in this process (Krynke and Klimecka-Tatar, 2022). Dynamic changes in the market area and intense competition are also associated with the evolution of customer expectations. Therefore, the area of product quality improvement must aim to achieve customer satisfaction (Siwec et al., 2022). The need for continuous improvement of the organization is a consequence of continuous and dynamic changes occurring in the organization's environment and within it. Introducing continuous improvement into management practice means starting the process of building an intelligent and self-improving organization continuously (Knop, 2022).

In addition to the importance of website design and functionality, e-commerce shops need to adapt to changing market conditions and customer preferences to remain competitive. One way to achieve this is by expanding access channels to include electronic ones, such as e-commerce platforms. This is particularly important in the context of Industry 4.0, where digitization of purchasing processes is becoming increasingly necessary.

To evaluate the performance of e-commerce websites and identify areas for improvement, various tools and methods can be used. One such method is the Servperf method, which measures service quality from the customer's perspective. The results of surveys conducted using this method can provide insights into how well a company meets its customers' needs and expectations and which service attributes require improvement.

Regular assessments of website performance and customer satisfaction are crucial for e-commerce stores to stay competitive and adapt to changing market conditions. By utilizing research findings, companies can make strategic decisions to improve service quality and ensure customer satisfaction, ultimately leading to increased customer loyalty and higher revenue.

As part of the evaluation of e-commerce and e-services quality, specific attributes are taken into account. According to many authors (Cristobal et al., 2007; Kim et al., 2006; Lee and Lin, 2005; Yoo and Donthu, 2012; Ghosh, 2018), attributes directly related to the e-commerce website are particularly important, as the entire transaction process takes place there. The most frequently mentioned attributes include: website design, ease of use, reliability, security, personalization, and customer service quality.

The purpose of the study was to assess the performance of a selected e-commerce website in relation to changes made to its website functionality and the introduction of new features available to potential customers. The research was conducted through a survey administered before and after the implementation of changes to the website of the e-commerce store under study. The survey allowed the identification of the areas where customers were least satisfied, which were taken into account by the company developing the new website. It also enabled the evaluation of whether the new website meets customers' requirements and preferences. Additionally, the results of the survey conducted in the second period allowed for the identification of areas where further improvements are still required for the website. Findings from this research could be utilized by other organizations to enhance their online platforms.

## 2. Literature review

Assessment of e-commerce operations is extremely important because it allows for the identification of areas that contribute to customer satisfaction as well as areas that lead to customer dissatisfaction. Therefore, conducting research in this area, especially regarding the functioning of the websites on which customers make purchases, is essential as the entire service delivery process takes

place on these platforms.

"During the evaluation of the quality of e-services and e-commerce, specific attributes are taken into account. Many authors (Cristobal et al., 2007; Kim et al., 2006; Lee and Lin, 2005; Yoo and Donthu, 2012; Ghosh, 2018) point primarily to attributes directly related to the e-commerce website platform, as it is on this platform that the entire transaction takes place. The most frequently mentioned attributes include: website appearance, ease of use, reliability, security, and personalization. One of the characteristic features of e-services and e-service quality is the departure from traditional quality dimensions. The first difference is the lack of direct contact with the service provider. A very important aspect of e-services is the internet platform on which services are offered and orders are placed. In the rest of the text, when referring to a website or web application, the term "internet platform" will be used.

During the process of providing traditional services, the customer has contact with the service provider, who advises on the choice of service, its features, and handles most of the formalities. In the case of e-services, such contact does not exist, and the customer performs individual actions on their own. They contact the service provider through various available channels, and in case of doubts or problems, there is no typical direct interaction between the customer and the company. Therefore, areas such as empathy or professionalism cannot be evaluated. The second important difference is that the customer chooses and orders e-services from any place where they have access to the Internet, without the need to visit the service provider's headquarters. Therefore, attributes such as tangibility, which are important in the case of traditional services, cannot be taken into account.

Due to the increasing popularity of e-services, a hierarchical model has also been developed for their case. This model was developed by

Blut and his colleagues (Blut et al., 2015) and subsequently verified by Blut himself (Blut,

2016). This model is presented in Figure 1.

E-service quality			
Website design: Information quality; Website organization; Purchase process; Website convenience; Product selection; Merchandise availability; Price offerings; Website personalization; System availability	Fulfilment: Timeliness of delivery; Order accuracy; Delivery conditions	Customer service: Service level; Return policies	Security: Security; Privacy

**Figure 1.** Hierarchical model of e-service quality (Blut i in., 2015, Blut, 2016)

Based on conducted research, attributes that, according to the authors, should be taken into account during the evaluation of the quality of e-services were identified and verified. Four groups of attributes were distinguished: website design (9 attributes), content (3), customer service (2), security/privacy (2). It is worth noting that the developed model includes attributes not included in existing scales. One very important detail should be noted. A lot of emphasis in this model, and therefore in the quality of services, is given to the website itself. This is an element that often influences whether a customer decides to purchase a service in a particular store. It takes into account not only the appearance of the website, but also the information that can be found on it and how to use it.

This model should be treated separately because it does not apply to traditional services that are ordered, performed, and delivered in a traditional way. It can be said that it is a kind of complement to the other

service quality models, but due to its application, it must be treated separately.

One of the authors, during her research on various service quality models and the evaluation of e-service quality, also created her own model (Fig. 2) and presented it in her work (Ingaldi, 2022b). The model was partially verified in the work (Ingaldi, 2022a). The quality of e-services consists of three elements: the physical aspect, service quality, and outcome quality. In terms of the physical aspect, it is important to consider the convenience of purchasing the e-service, as well as the appearance of the website through which the client will place the e-service order. When placing an order, the client takes into account the available offer, the possibility of personalizing the e-service, as well as the completeness of information about the offered products.

Since the customer makes the choice and order independently, they take into account

the website's functionality (e.g. availability, navigation) and capabilities (e.g. search engine, cart, registration). For online orders, customers would like to have a variety of payment options available. Some people prefer, for example, to pay cash on delivery in the case of home delivery. The last element, which is probably the most important, is potential contact with the service provider. This means that the customer knows who they are ordering the service from, can easily find the service provider's contact details and, if necessary, contact them.

The final component of the model is outcome quality. This group includes waiting time,

both for electronically and traditionally delivered e-services. In the case of the latter, the materiality, i.e. what the customer receives, will also affect the outcome quality. One cannot forget about safety either. In the case of e-services, the importance of this factor clearly increases. This is related not only to hackers or malicious software but also to the website itself, which may turn out to be fake. Customers also want to be sure about the delivery of the service and whether it will be delivered successfully (e.g. in the case of e-software purchase). The last factor that affects the outcome quality is, as in the case of traditional products, the conformity of the realized e-service with the order.

E-service quality		
Physical aspect: Convenience; website; Accessible offerings; Possibilities for personalization; Information compliancy	Quality of service: website performance; website capabilities; possible payments; possible contact with the service provider	Quality score: waiting time; tangibles; safety; delivery reliability; compliance with order

**Figure 2.** Author's hierarchical model of e-service quality (Ingaldi, 2022b)

This model is very general and can apply to various types of services offered online, including e-commerce services. It can be expanded, and the use of its elements to assess service quality can serve as the basis for selecting attributes for such an assessment.

Electronic service quality is very diverse because it involves interactions between a person and technology, and its dimensions do not correspond perfectly to the dimensions of "offline" service quality (Cotîrlea, 2011). Many scientists have tried to indicate the most important dimensions related to e-service evaluation, in most cases, they indicated the dimensions that directly relate to the functioning of the website through which

customers make purchases (Table 1).

Previous research by one of the authors on the attributes of e-services, presented in a work (Ingaldi, 2022b), based on available literature (analysis of WoS, Scopus and researchgate), allowed for the compilation of 84 attributes into 13 groups. Currently, research is underway to verify this list and create a list of approximately 30 universal attributes that could be used in studies related to the evaluation of e-services. This article used this list and selected those that directly relate to the website and its actions (Table 2), which were used to evaluate the website of the surveyed e-shop twice.

**Table 1.** Selected dimensions of e-service quality (Ingaldi, 2022b)

<b>Author</b>	<b>Proposed dimensions of e-service quality</b>
Dabholkar et al. (1996)	website design, reliability, presentation, ease of use, user enjoyment, and control
Ziethaml et al. (2002)	performance, reliability, efficiency, personalization, quick response to inquiries, communication, security, interactive honesty
Madu i Madu (2002)	Performance, appearance, structure, aesthetics, reliability, fulfillment, security, credibility, responsiveness, personalization, accessibility, reputation, pleasure
Loiacono et al. (2002)	information, interactivity, reliability, personalization, responsiveness to inquiries, appearance, interactive honesty, communication, procedural honesty
Yang i Jun (2002)	website design, security, reliability, personalization, prompt response to inquiries, accessibility
Santos (2003)	ease of use, design, links, structure, components, performance, reliability, communication, security, incentives, customer banking
Lee i Lin (2005)	aesthetic design, reliability, quick response to inquiries, credibility, personalization
Kim et al. (2006)	performance, fulfillment, accessibility, privacy, personalization, speed of response to questions, exchange, communication, accuracy of information, honesty of results
Cristobal et al. (2007)	appearance, implementation, reliability, accuracy of orders
Zavareh et al. (2012)	accessibility, interactivity, proper functioning, user-friendliness, security, attractive appearance

**Table 2.** List of evaluated attributes (Ingaldi, 2022b)

<b>No</b>	<b>Group of attributes</b>	<b>Attributes</b>
1.	Appearance and operation of the website	The website is visually attractive.
2.		The website looks professional.
3.		The website is convenient and easy to use.
4.		The website is organized in an intuitive way.
5.		The website does not experience any malfunctions.
6.		The website is designed in a way that can be used by people with different disabilities.
7.	Website content	The information on the website is current and comprehensive.
8.		The website contains a description of the ordering process.
9.		The regulations of the e-shop are accessible and understandable.
10.		The website contains the full range of e-service provider's offers.
11.		The website contains appropriately selected product categories.
12.	Products	The website contains a wide variety of products.
13.		The website contains an exact description of the products.
14.		The website contains photos of the products.
15.		The website includes price information.
16.		The website contains information about the delivery date.

17.	Search engine	The website features a product search engine.
18.		Product search is simple.
19.		The search includes option for filtering results.
20.		The website has personalized selection features.
21.		The website includes order history options.
22.	Making orders	Registration on the website is not mandatory to place an order.
23.		The process of placing an order is simple and fast.
24.	Contact with e-shop	The website contains accurate contact information for the e-service provider.
25.		The e-service provider offers after-sales support.
26.	Payment methods	The website contains accurate bank details.
27.		The customer has the option to choose the payment method.
28.		The customer has the option to choose the "cash on delivery" payment option.
29.		The customer has the option to choose various forms of electronic payment.
30.		The transaction on the website is fast and efficient.
31.	Security	The website requires a reasonable amount of personal data.
32.		The website has a security system that protects all customer information.
33.		Financial transactions on the website are secure.
34.		Information about customer's credit/debit cards is secure.
35.		The website protects all information about customer behavior during online shopping.

### 3. Methodology

The research was commissioned by an e-shop. It was conducted twice, which was related to the introduction of changes to the functioning website of the e-shop. These changes were made by an external company, also commissioned by the surveyed e-shop, and included a wide range of new solutions related to improving the appearance of the website itself, its functionality, content, as well as the purchasing process. It was decided to introduce a more subdued colour scheme, high contrast, and solutions that would facilitate the use of the website by people with special needs. Although the investigated e-commerce store is a private enterprise, the management decided that the new website would be designed according to the WCAG 2.1 standards, which would allow the e-commerce store to open up to a group of people with special needs and be more competitive on the market. Attention was also paid to user safety, and greater options were introduced regarding payment and delivery methods.

Customers of the e-shop, who used the website before and after the changes, were asked to evaluate its performance. The assessment was carried out using a questionnaire, the attributes of which were presented earlier in Table 1.

Customers were asked to assess individual attributes on a scale of 1-7, where 1 meant "completely disagree" and 7 meant "completely agree." Additionally, they had 100 points to allocate among the different groups of attributes to indicate their importance. The survey also included basic characteristics of customers, which allowed the profile of customers of the surveyed e-shop to be determined. The characteristics included gender, age, social/professional status, education, and residence. The survey was created using a Google survey form, which facilitated collecting responses from customers.

The Servperf method was used to analyze the obtained results. Due to the length of the survey, which contained 35 attributes divided into 8 groups, more commonly used methods

such as Servqual or IPA, where customer expectations are taken into account in addition to the actual service evaluation, were not used.

The Servperf method was developed by Cronin and Taylor, and its name comes from the words Service Performance (Cronin, Taylor, 1994; Anand, Selvaraj, 2013). It is considered an attempt to overcome some of the weaknesses of the Servqual method (Dziedzic, 2015; Lupo, 2015). The authors of this method questioned the measurement of customer expectations, as they believe that expectations are an ambiguous and variable category. Although the authors of the method took into account the importance of individual attribute groups during the research to indicate what is most important to customers when it comes to the functioning of e-commerce websites.

The Cronin and Taylor concept is based on the assumption that perceiving the actual service is sufficient to provide a measure of service quality evaluation (Guglielmetti Mugion, 2010). Therefore, this concept emphasizes measuring and evaluating the current state - only measuring and evaluating the level of quality of the performed service in relation to individual categories, and then relating it to the ideal image (Cronin, Taylor, 1992; Cronin, Taylor, 1994; Cronin et al., 2002; Jain, Gupta, 2004). This method is most commonly used when there is a high probability of relatively maximum customer expectations for each of the analyzed criteria (Czajkowska and Ingaldi, 2021).

The first study was conducted between May-October 2020 and involved 267 customers. Afterwards, an external firm started working on changes to the e-commerce website (between March-October 2021). The second study was conducted between September-December 2022, this time involving 327 customers. It was assumed that only responses from adults would be taken into account for the analysis, as only such persons have legal capacity. The authors decided that

the second study would not take place immediately after the website changes, but after a few months. Most people are resistant to change, including customers, so they needed time to become familiar with the new website of the e-commerce store being studied, as well as its features.

After checking the responses, only 244 surveys from the first research period and 307 from the second research period were taken into account. The analysis of the results began with conducting a Cronbach Alpha test and calculating basic statistics for all attributes together (separately for each stage of the study). The obtained results were interpreted according to the assumptions presented by (Hair et al., 2003), where data suitable for analysis were those for which the test result was at least 0.7.

Then, an analysis of respondents participating in both stages of the study was performed. The average ratings were calculated for individual attributes and groups of attributes, as well as for all responses combined. The average importance for customers was also calculated, which allowed for the calculation of the weighted average of all attributes together. The results were presented in the form of bar charts and radar charts.

#### **4. Results and discussion**

Due to difficulties in collecting results related to low willingness of customers to participate in the research, it was not possible to verify the same respondents in both research periods.

In Table 3, the results of the Cronbach Alpha test and basic statistics are presented. According to the assumptions, data with a Cronbach Alpha test result of at least 0.7 should be considered reliable. In both cases, the result was above 0.7, which means that all the dimensions obtained can be further analyzed.

The initial results of the study already allowed to indicate that the respondents assessed the e-commerce website much better after the changes were introduced (a difference of over 1.7 points). This means that the changes were well-received by the

customers and had the expected effect. However, the standard deviation decreased, which means that in the second research period, the respondents were more consistent in their answers.

**Table 3.** Cronbach Alpha and statistical analysis (own study)

	<b>Cronbach Alpha</b>	<b>No of items</b>	<b>Mean</b>	<b>Standard deviation</b>
Assessments before the website change	0,726	35	4.129	1.3901
Assessments after the website change	0,803	35	5.849	0.9188

In Table 4, data on the respondents are presented. Proportional shares were calculated for each characteristic before and after the website change.

There were some minor differences in the structure of respondents in both research periods. However, it should be emphasized that they were similar to each other. Among the respondents, women predominated, most of them were young, under 40 years of age,

with secondary or higher education, working or studying, and living in larger cities. Such a structure of respondents is dictated by the nature of the research object. It is an e-commerce platform where purchases are made online. Statistics emphasize that it is usually young, educated people from larger cities who make online purchases (Raport o stanie sektora małych i średnich przedsiębiorstw w Polsce).

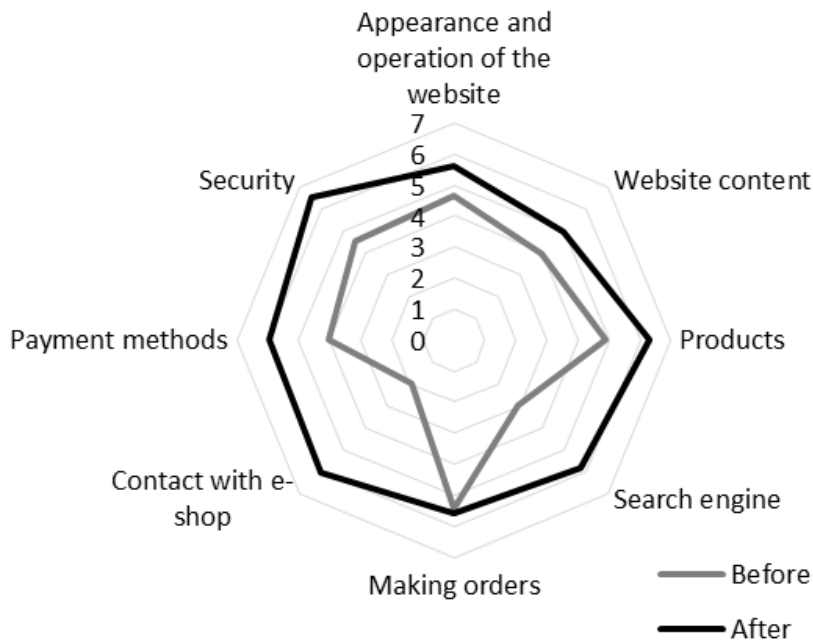

**Table 4.** Characteristics of the respondents (own study)

<b>Feature</b>	<b>Answer</b>	<b>Percentage</b>	
		<b>Before the website change</b>	<b>After the website change</b>
Gender	female	56.1	64.6
	male	43.9	35.4
Age	up to 20 years	24.2	25.4
	21-30 years	29.3	26.2
	31-40 years	28.7	29.3
	41-50 years	14.3	13.3
	51-60 years	5,4	3.2
	61-70 years	3.4	2.6
	Over 70 years old	0.1	0.0
Social / professional status	pupil/ university student	37.2	33.2
	I work	38.1	41.6
	unemployed	9.3	8.1
	entrepreneur	12.8	14.7
	pensioner	2.6	2.4
Education	primary education	0.3	0.2
	lower secondary education	2.6	2.1
	vocational education	15.8	17.4
	secondary education	47.4	43.2
	higher education	33.9	37.1

Residence	village	8.1	9.4
	city up to 50k residents	13.2	12.6
	city 51 to 100k residents	10.3	8.6
	city 101 to 200k residents	20.8	18.4
	city 201 to 400k residents	23.4	27.2
	city with over 300k residents	24.2	23.8

At the beginning, the average assessment for each group of attributes were also calculated for both research periods and presented in Figure 3. Before the changes were made to the e-shop website, respondents assessed products the highest, followed by the appearance and operation of the website. They were least satisfied with their contacts with the e-shop. After the changes were implemented, the average ratings improved significantly. Respondents assessed security

and products the highest, followed by contact with the e-shop. Thanks to the fact that the research was conducted twice, both before and after the changes, the company could take the customer's voice into account when designing the new website. It can be seen, for example, that the average rating for contact with the e-shop was lowest before the changes, but after the changes, this attribute was highly assessed.

**Figure 3.** Average assessment for individual attribute groups of attributes: a) before the website change, b) after the website change (own study)

Then, the mean values of the ratings for individual attributes for both research periods were calculated. These results were presented collectively in Figure 4.

Before the changes were introduced, only four attributes received average assessments above 6, i.e., 15. The website includes price information; 14. The website contains photos

of the products; 22. Registration on the website is not mandatory to place an order; 32. The website has a security system that protects all customer information. This meant that respondents were very satisfied with the performance of the website in these four areas. Moreover, for most of them, the changes resulted in an even greater level of satisfaction, except for attribute 22. Registration on the website is not mandatory to place an order. It should be emphasized, however, that this decrease was small and could have been due to changes in the structure of the respondents. Especially since virtually nothing changed on the website in this area.

Two attributes were assessed below 2 before the website changes, namely 21. The website includes order history options; 25. The e-service provider offers after-sales support. This information was obtained by the company responsible for the changes on the e-shop website. Importantly, in the second research period, the rating for both attributes increased to over 5. Therefore, customer satisfaction in these areas increased, and the

changes implemented can be observed, although the average rating level shows that there is still room for improvement in this area.

Analyzing the average results for the second research period, a certain correlation was noticed: 21 out of 35 attributes obtained average scores above 6, which means high or very high satisfaction with the functioning of the new website of the researched e-shop. This indicates that the changes introduced contributed to increasing its attractiveness in the eyes of customers. Two attributes received scores below 4, i.e. 7. The regulations of the e-shop are accessible and understandable; 20. The website has personalized selection features. Respondents often complained in their emails about difficulty finding the regulations of the e-shop on the website during both research periods, as it was not intuitive for them. The lack of personalization of selected features makes it difficult for customers to find and choose products offered by the researched e-shop. These are potential areas for improvement and further changes.

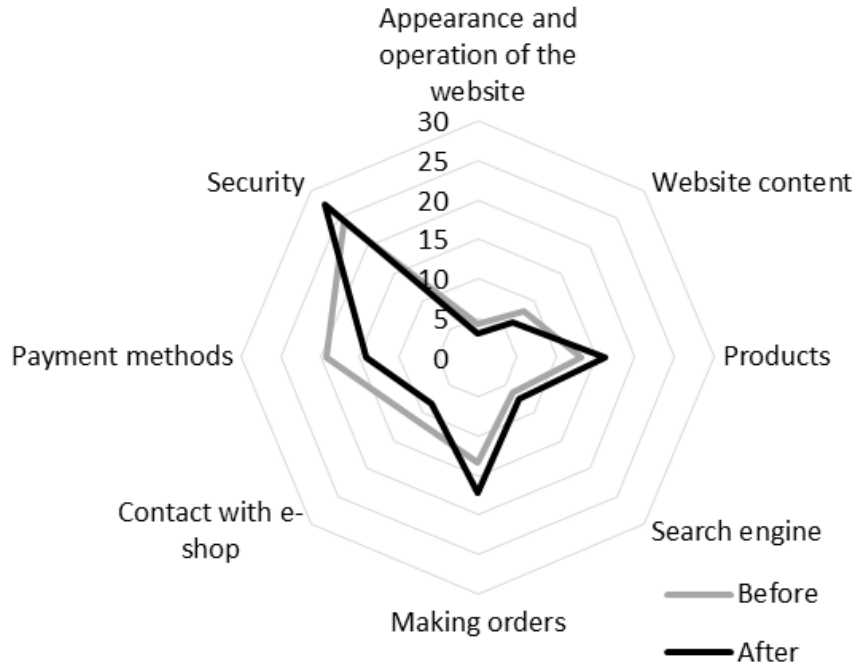

**Figure 4.** Aggregate results of survey research using the Servperf method (own study)

Next, the average weights of each group of attributes for both research periods were calculated, as shown in Figure 5. One can notice a certain correlation. In both research

periods, respondents indicated that the most important thing for them is the security of using the website. It can be assumed that this is related to frequent customer data leaks or

financial frauds on the Internet. Next, respondents pointed out payment methods, placing orders, and products as important factors. The appearance and functioning of

the online platform are the least important for customers. In both periods, despite small differences, the structure of importance is similar.

**Figure 5.** Weights of individual attribute groups of attributes: a) before the website change, b) after the website change (own study)

The mean assessments for all attributes were also calculated. These calculations were done in two ways: as the arithmetic mean  $X_A$  and as the weighted mean  $X_W$ . The means for data collected before the website change were calculated (before the website change):

$$X_{AB}=4.129$$

$$X_{WB}=4.179$$

The difference between the two averages was small. However, it should be noted that customers did not assess the e-shop's website very highly before the changes were made.

And the averages for data collected after the website change are as follows:

$$X_{AA}=5.849$$

$$X_{WA}=6.025$$

In this case, a greater difference was observed between the arithmetic mean and the weighted average. This is due to the fact that customers gave high ratings to attributes that were very important to them.

Overall, it can be said that the average rating is quite high, although it is not the maximum rating. However, it can be concluded that the investment in improving the website by the surveyed e-shop has yielded expected results. Respondents rated the website better after the changes were implemented than before the changes were made.

## 5. Conclusion

To meet the demands of today's customers and remain competitive in the marketplace, it is crucial for store owners to embrace electronic access channels and digitize various processes, including the purchasing process.

E-commerce offers a vast array of benefits, from increased competitiveness to enhanced shopping convenience, which can significantly improve customer satisfaction. Nonetheless, a well-designed and functioning website remains a critical factor in determining the success of an e-shop.

The article describes a study conducted to assess the operation of a selected e-shop's website before and after making changes to it. The study involved gathering feedback from respondents who evaluated 35 attributes related to the website's performance, and the Servperf method was used to analyze the results.

The Servperf method is a tool used to measure service quality. The overall results of surveys conducted using this method show service quality from the customer's perspective. The survey results allow for an assessment of how well a company meets the needs and expectations of its customers in terms of the services provided. Individual service

attributes as well as overall service quality are analyzed. Based on the results, it is possible to determine which attributes are most important to customers and which require improvement. The results of surveys conducted using the Servperf method are often used by companies to make strategic decisions on improving service quality. This tool allows companies to better understand the expectations of their customers and adjust their services to meet their needs.

The study's findings enabled researchers to identify the changes that were particularly well-received by customers and gain insights into the additional changes they expect to see in the future.

However, there are limitations associated with the study, such as the potential subjectivity of the survey and the small research groups used for analysis. Nonetheless, the authors believe that the amount of data collected was sufficient to conduct a reliable analysis.

To maintain the website's performance and attractiveness to customers, it is essential to conduct periodic research aimed at assessing its effectiveness and identifying areas requiring improvement. This will enable businesses to remain competitive and meet the ever-evolving needs of their customers.

## ELECTRONICS MARKETING STRATEGY OF KULIT LUMPIA BEUNTUNG BANJARMASIN BUSINESS IN INCREASING SALES VOLUME

**Abstract:** *The purpose of this study is to identify and analyze the marketing strategies implemented by Kulit Lumpia Beuntung. Using the SWOT analysis technique, we use models commonly referred to as inner and outer factor matrices, or IFAS and EFAS matrices. This study uses a non-probabilistic sampling method with an aggregate sampling technique. Based on the results of the internal factor analysis strategy (IFAS) matrix analysis, the strengths, weaknesses, opportunities, and treatments (SWOT) plots of the product, price, promotion, and location variables are known to be in quadrant I. That is, the position between the opportunity axis and the strengths axis. The External Factor Analysis Strategy (EFAS) matrix analysis results show that the SWOT diagrams for the product, price, promotion, and location variables also exist in quadrant I. This position lies between the opportunity and intensity axes.*

**Keywords:** *Marketing Strategy, SWOT Analysis, IFAS Matrix, EFAS Matrix*

### 1. Introduction

Indonesia is a resource-rich developing country with the fourth largest population of any country. A country's development certainly reflects the well-being of its people. However, the Indonesian economy experienced a very bad crisis at the end of 1997. At that time, all economic sectors experienced decline, but small and medium enterprises (MSMEs) and various industrial companies survived. To use one's own capital without capital or investment. I owe the bank (Arizal et al., 2021). The failure of a pattern of economic development centered on large firms has led economic policy makers to turn to economic development that strengthens small and medium enterprises (Rahmadani et al., 2022). SMEs are the largest group of

economic actors in the Indonesian economy and have proven to be not only the engine of economic growth after the economic crisis, but also a safety valve for the national economy during the crisis (Gunartin, 2017; Ramadhani et al., 2021).

When running a business, business people really need to understand which strategy is right for their business. According to Sunyoto (2019) in his Gultinan and Gordon (1990), this marketing strategy is a basic statement of expected effectiveness with respect to a particular target market demand (Rizal et al., 2020). Especially in the field of marketing, marketing strategy plays a very important role for business success (Fadilurrahman et al., 2021). Established marketing strategies should be reviewed and further developed according to market trends and market

environment (Rizani et al., 2022). Therefore, your marketing strategy should be able to provide a clear and focused picture of what is being done when taking advantage of each opportunity (Saputra et al., 2020). A strategy widely used by MSMEs is the marketing mix strategy (Habibah et al., 2021).

Kulit Lumpia Beuntung is a SME engaged in cottage industry located at Jalan Samudra Komplek Untung Jaya 61C, Banjarmasin. Kulit Lumpia Beuntung is Banjarmasin's first luxury spring roll (kulit) crust (Shaddiq et al., 2021). This spring roll skin is a casing made of flour, water, oil and salt and is typically used to make spring rolls and various snacks such as meatballs, chocolate bananas, martabak and samosas (Handayani et al., 2022).

Kulit Lumpia Beuntung has played a role in the development of the local economy since the start of the Kulit Lumpia business, as the Kulit Lumpia business owners have always held training courses for those who want to learn how to make spring roll wrappers (Hidayat et al., 2021; Wanidison & Shaddiq, 2021). I learned that she can use her open own business. Her business activity, which started as a hobby, has grown into this company, Kulit Lumpia. The number of requests from spring roll vendors in Kulit Lumpia has not decreased and continues to increase, not only from vendors of spring rolls, but also food products such as fried foods, maltabak and caramelized bananas, so the demand is too high. is also increasing (Surti et al., 2022). There are many things that skin owners cannot meet (Irpan et al., 2021; Shaddiq & Handayani 2021). Kulit Lumpia, due to poor management of human resources, this Kulit Lumpia production is made with limited product capacity and distribution area. Currently Kulit Lumpia Beuntung only produce about 15,000 pieces per day, but the demand of sellers is about 50,000 pieces per day for her (Iyansyah et al., 2021; Wagiono et al., 2022). Consumers of Kulit Lumpia Beuntung come not only from the

Banjarmasin area but also from outside the area such as Palangkaraya and Samarinda.

**Table 1.** Kulit Lumpia Beuntung Spring Rolls Sales Volume Data 2016-2021 period

Years	Omzet
2016	Rp 1,611,475,000
2017	Rp 1,421,675,000
2018	Rp 1,496,500,000
2019	Rp 1,275,675,000
2020	Rp 930,750,000
2021	Rp 1,235,525,000

From the above sales data, we can see that the Lumpia Beuntung leather business experienced volatile sales from 2016 to 2021. Additionally, 2020 marks the most for owners of Clitlum Pier since the outbreak of coronavirus disease (COVID-19) in 2019 and the introduction of Massive Social Restrictions (PSBB) in his April and his May. severe impact. On average, ministry of small and medium enterprises (MSMEs) recorded a decline in sales during the COVID-19 pandemic (Joko et al., 2022). This is due to reduced out-of-home activities, difficulties in sourcing raw materials due to transportation restrictions, and declining public confidence in out-of- home products (Kurniawan et al., 2021; Wijaya et al., 2021). At the end of 2021, the price of flour and oil raw materials increased again. As a result, Kulit Lumpia business owners were unable to meet the demand of too many consumers due to limited production. From our observations, it is clear that not all MSMEs will have to close their stores. There are his MSMEs surviving declining sales, like this Kulit Lumpia Beuntung shop. Product related tweaks and some marketing strategies to survive (Norrahmi et al., 2021).

The current marketing strategy for Kulit Lumpia Beuntung products is for consumers to come directly to the owner's home to purchase the spring roll skins, place an order through WhatsApp media, and have it delivered by taxi based on consumer demand.

Against the background of the above issues, the authors are interested in conducting a study titled "Marketing Strategies of Kulit Lumpia Beuntung Banjarmasin Business in Increasing Sales Volume".

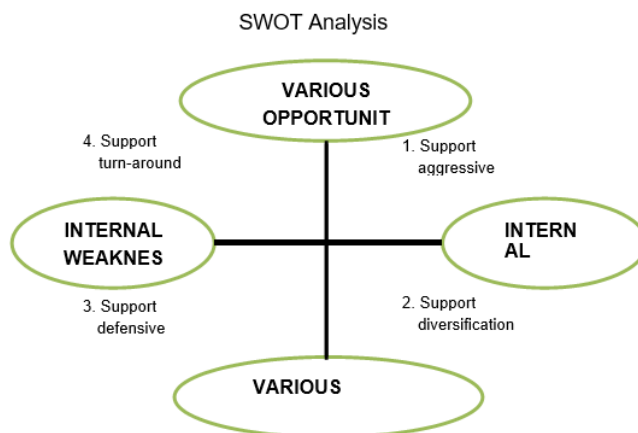

## 2. Literature review

Kotler and Keller (2009), et al. (2020:147), the American Marketing Association (AMA) provides the following formal definition: In a way that benefits the organization and its stakeholders.

Assauri (2017), a marketing strategy is a set of goals, guidelines, and rules that provide direction, references, and attributes for marketing activities at each level, particularly

as a company's response to its environment and competitive conditions. This is constantly changing.

Assauri (2017), the marketing mix is the set of variables or activities that form the core of a marketing system and variables that a company can control to influence buyers or consumers in its target market. The marketing mix consists of everything a company can do to influence demand for its products. It consists of his 4P's of product, price, location and promotion (Putera et al., 2022). According to Rangkuti (2017), SWOT represents not only the external environment of opportunities and threats facing the business world, but also the internal environment of strengths and weaknesses.

**Figure 1.** SWOT Analysis (Rangkuti, 2017)

### Quadrant 1:

It's a win-win situation. Companies have the opportunity and strength to capitalize on existing opportunities. The strategy adopted by this state is to support aggressive growth policies.

### Quadrant 2:

Despite the various threats, the company has an inner strength. The strategy to pursue is to take advantage of long-term opportunities through diversification strategies (products/markets). Quadrant 3:

The market opportunity facing the company is enormous, but it also faces some internal limitations/weaknesses.

### Quadrant 4:

It is a very unfavorable situation and the company faces various internal threats and weaknesses.

The model used in this phase consists of a matrix of internal strategy factors and a matrix of external strategy factors.

#### a. Matrix of internal strategic factors

Before creating an internal factors matrix, we first need to know the internal strategy factors (IFAS). A table was then developed to formulate the internal strategy factors within the framework of firm strengths and weaknesses. The stages are:

- 1) In column 1, identify the factors that describe your company's strengths and weaknesses.
- 2) Weight each factor on a scale of 1.0 (most important) to 0.0 (less important) based on the impact of these factors on the company's strategic position. (All of these weights should not exceed 1.00 of the total score.)
- 3) Calculate a score (3rd column) for each factor using a scale of 4 (very good) to 1 (bad) based on the factor's impact on the state of the business in question. Positive variables (all variables in the strengths category) are rated from +1 to +4 (very good) compared to the industry average or leading competitors. The variable is negative, but vice versa. For example, if the company's weaknesses are significantly greater than the industry average, the score is 1, and if the company's weaknesses are below the industry average, the score is 4.

#### External Strategy Factor Matrix

Before creating the external strategy factor matrix. You need to know your External Strategy Factors (EFAS) in advance. There are the following methods of determining external strategic factors:

- 1) Sort by Column 1 (5-10 Opportunities and Risks)
- 2) Weight each factor in column 2 from 1.0 (very important) to 0.0 (not important). These factors can influence strategic factors.
- 3) Calculate a score (3rd column) for each factor using a scale of 4 (very

good) to 1 (bad) based on the impact of these factors on the situation of the company in question. Opportunity factors have a positive rating value (larger opportunities give a +4 higher rating, smaller opportunities give a + 1 higher rating). Specifying a threat rating value is the opposite. For example, if the threat value is very high, the rating is 1. Conversely, if the threat value is low, the rating is 4.

- 4) Multiply the column 2 weight by the column 3 rating to get the column 4 weighting factor. The results are weighted values for each factor ranging from 4.0 (excellent) to 1.0 (bad).
- 5) Use column 5 to provide any comments or notes on why a particular factor was chosen and how the weighted score was calculated.
- 6) Sum the weighted points (column 4) to get the total weighted points for the company in question. This aggregate score indicates how a particular company is responding to external strategic drivers. This overall score can be used to compare this company to other companies within the same industry group. Similarly, once the strategy manager has finished analyzing the internal strategic factors (strengths and weaknesses), they should also analyze the external strategic factors (opportunities and threats). See her EFAS table below for clarity. Therefore, before implementing any strategy, strategic planners must analyze the external environment to find various potential opportunities and threats. These issues may impact your business in the future, so you should identify strategic issues that need to be monitored. For this

reason, we strongly recommend using quantitative techniques such as extrapolation, brainstorming, statistical modeling, and operations her research to make predictions and assumptions.

### 3. Research methods

The variables in this study are marketing strategies including products, prices, promotions, and locations. The data source for this study is the subjects whose data were collected, how the data was obtained and how it was created. Primary data are special data that researchers create to solve the problem they are working on. A source of data collected directly by a researcher from a research subject. The data that can be extracted in this study are: Respondent's identity, such as name, age, and address. An overview of the analysis of marketing strategies to increase the sales volume of Lumpia Beuntung Leather Banjarmasin products. Secondary data sources for research data are literature, articles, journals, and the Internet related to the research conducted.

The number of people surveyed is his 25, which consists of Lumpia Beuntung Leather business owners and Lumpia Beuntung Leather employees, and he is also 25 in this survey sample. Data analysis in qualitative research is the process of organizing data sequences and organizing them into patterns, categories, and basic descriptions. The data analysis method used in this research is a descriptive method using SWOT analysis. The analytical technique used in this study is

SWOT. An analysis of the data from this study yields the following:

- 1) Conduct an analysis of the company's internal and external environment, which is the basis for conducting a SWOT analysis.
- 2) A SWOT analysis is performed using an EFAS (External Strategic Factor Analysis Summary) matrix describing the company's external factors (opportunities and threats) and an IFAS (Internal Strategic Factor Analysis Summary) matrix describing the largest will be Write pros and cons. . Company. A SWOT matrix is a tool for formulating alternative business strategies based on a company's strengths, weaknesses, opportunities and threats.

### 4. Research results and discussion

In the first phase, an investigation conducted by Lumpia Buntong, a leather shop in Banjarmasin, revealed the problems faced by Krit Lumpia Boontung Banjarmasin's shops. Soaring material prices, difficulty in obtaining materials, lack of manufacturing facilities, etc. The current strategy is to use only direct sales through Whattshap and a pre-order system, but the packaging is still simple for the product strategy offered by Kulit Lumpia Beuntung Banjarmasin. The Internal Factor Analysis Summary (IFAS) matrix of internal strategic factors for Lumpia Buntong Leather Banjarmasin business is presented in the table below.

**Table 2. Product IFAS table (Rangkuti, 2019)**

Internal Strategy Factors	Weight	Relatively	Rating	Score	Comment
Product Strength					
1. Already have their own brand and name	5.28	0.29	1.80	0.52	Must be easy to remember Should be done

Total	18.44	1.00	9.52	2.38	

**Table 9.** EFAS place table (Rangkuti, 2019)

External Strategy Factors	Weight	Relatively	Rating	Score	Comment
Opportunity Place Open a branch	5.32	0.53	2.52	1.35	Should be done
Average number of opportunities	5.32	0.53	2.52	1.35	
Threat Place Competitors open branches in various places	4.64	0.47	3.04	1.42	Careful
Average number of threats	4.64	0.47	3.04	1.42	
Total	9.96	1.00	5.56	2.77	

**Figure 2.** Product SWOT

Using chart 4.1, it can be seen that the variable position of Lumpia Beuntung Leather Business Banjarmasin products lies between the Opportunity Axis and the Strengths Axis or Quadrant with an IFAS Total Score of 2.20 and an EFAS Total Score of 2.60 1 . So the product variable Kulit Lumpia Beuntung describes a very good situation. We encourage you to pursue progressive strategies by leveraging the company's internal strengths to seize external opportunities and drive business growth.

**Figure 3.** SWOT price

Using chart 4.2, we can see that the position of the price variable for Banjarmasin's Kulit Lumpia Beuntung business with an IFAS total score of 2.27 and an EFAS total score of 2.40 is between quadrant 1 of the opportunity axis and the strengths axis. Lumpia Consulting Business is a price variable and encourages adopting progressive strategies by leveraging the company's internal strengths to seize external opportunities and drive

business growth.

**Figure 4.** SWOT promotion

Using Chart 4.3, we can see that the position of the promotion variables for Kulit Lumpia Beuntung Business Banjarmasin lies between the Opportunity and Strengths axes with a total IFAS score of 2.40 and a total EFAS score of 2.38. That is quadrant 1. As Kulit Lumpia Beuntung business is subject to price fluctuations, it is recommended to pursue progressive strategies by leveraging the company's internal strengths to capitalize on external opportunities and drive business growth.

**Figure 5.** SWOT promotion

Referring to chart 4.4, we can see that the variable position of Lumpia Beuntung leather business in Banjarmasin with an IFAS total score of 2.33 and an EFAS total score of 2.77 lies between the opportunity axis and the strengths axis, quadrant 1. This means that Krit Lumpia Counseling is in a variable position to pursue progressive strategies by

leveraging the company's internal strengths to capitalize on external opportunities to drive business growth.

## 5. Conclusion

Based on the results of the analysis conducted at Banjarmasin's Kulit Lumpia Beuntung store, some conclusions were drawn:

- 1) As a result of SWOT analysis using IFAS (Internal Strategy Matrix Factor), product 2.20, price 2.27, behavior 2.40, location 2.33.
- 2) His SWOT analysis using EFAS (External Strategy Matrix Factor) shows Product 2.60, Price 2.40, Promotion 2.38, Location 2.77.
3. From the SWOT diagram for the variables Product, Price, Promotion and Place we can see that they have the same position in quadrant 1. That is, at the location between the Opportunity and Strength axes, the Sum Product IFAS Score is 2.20 and the Price is 2.27, promotion 2.40, rank 2.33, overall EFAS product rating 2.60, price 2.40, promotion 2.38, rank 2.77. Lumpia Beuntung Leather Business Banjarmasin describes a

very good situation for executing a progressive strategy by leveraging the company's internal strengths to capitalize on external opportunities and drive business growth . Here are some suggestions for managers of Lumpia Beuntung Leather Business in Banjarmasin:

- 1) One of the weaknesses of Banjarmasin's Kulit Lumpia Beuntung Business is that he doesn't have his own store and has only a three-day shelf life for his spring roll skin products. Longer and better packaging improvements.
- 2) Add Lumpia Beuntung Leather Business branches to new areas to meet consumer demand.
- 3) In order to make it easier for consumers to purchase spring roll wrappers, owners must provide home delivery services or be registered with GrabFood or GoFood retailers.
- 4) Maximize your promotion on social media such as Instagram, Facebook, WhatsApp, etc. to reach more people.

## CUSTOMER SEGMENTATION AND PROFILING FOR E-COMMERCE USING DBSCAN AND FUZZY C-MEANS

**Abstract:** *The Rapid Industrialization has led to a sudden overwhelming boost in business. With growing advancements in technology and the fast-paced growth of users that have access to said technology everything reaches customers faster. Businesses have also tried their hand at being better at technology and thus boosted growth by appealing to a much larger customer base. Market segmentation is an increasingly important part of a strong marketing strategy and can make all the difference for companies in competitive market landscapes, such as e-commerce. To be in business today means much more than quality of the product and a brand name. It involves the right kind of marketing to the right kind of people. This project focuses on creating a tool to enable businesses to understand the various customers it has, by segmenting them into groups and providing a detailed statistical model for analysing where the marketing is needed the most and what would be the best offers the company can afford.*

**Keywords:** *Customer Segmentation, DBSCAN, Fuzzy C-Means, Clustering, RFM*

### 1. Introduction

All businesses want to grow, develop and build a community of loyal customers who improve your business by advertising, promoting and come more often. Such a community of loyal customers can't be found naturally. Targeting an entire mass of audience is not an effective marketing strategy instead First we need to understand the customers we are selling to and therefore be able to target them effectively which drives greater loyalty. Understanding the customers will allow you to prevent the negative experience, provoke positive emotions and lets you identify the most effective marketing ways. To achieve this customer segmentation comes into picture. Customer segmentation is mainly about who you target, where you

reach them and how you talk to them. This mainly helps to understand the target audience more clearly and create customisation to them accordingly. It is more effective to target your customer by aligning your tactics and strategies which helps you market and sell more effectively. This will lead to develop a better understanding of your customer's needs and desires more efficiently.

Customer segmentation is a way of splitting customers into groups based on their similar and shared characteristics. Some basic customer segmentation categories mainly include, geography, products or service purchased, how customers found you, device used by customers including device type / brand / browser, payment method, etc. Companies may collect customer information during purchase or checkouts by which even

more segmentation can be carried out by knowing the reason for purchase, what drove them to purchase, etc which will help you increase customer lifetime value. Most obviously well implemented segmentation will improve your marketing performance. We can perform customer segmentation by using any data available about them. Creating customer profiles or buyer persona helps you understand who you're current or ideal customers are. Based on the actual data they segment customers who act and think similarly. By grouping them to different categories, we can focus on them according to their needs and desires and approach them differently.

As of today the general segmentation seems to be too narrow and a bit old fashioned. The general segmentation will be too basic to understand your customers deeply. That's when the customer profiling takes the stage. Customer profiling is mainly about the customers' experience and a better way for its improvement. In this approach we use segmentation characteristics and perform segmentation accordingly but we also pay more attention to the customer's previous experience, pain points, plus points, opinions, etc. The main aim is to understand customers more effectively, offer a better experience, services or products.

Hence in this project we are collecting the data from various resources, transferring them into understandable format. We perform data preprocessing to remove all the null missing values to make it a clean data. The preprocessed data is fed into the RFM model to carry out the recency, frequency and monetary which will segment our valuable customers. After extracting the valuable customers clustering methods are applied and characteristics of each customer groups are segmented and analyzed to which we are using DBSCAN and Fuzzy C-Means algorithm. The proposed approach is designed in python and the performance of the proposed approach is evaluated in the UK

e-commerce dataset.

## 2. Methodology

All forms of data undergo 4 main stages in their life cycle. Data Collection followed by its preprocessing. Once said data is cleaned and essential data is grouped together, data is manipulated and is analysed to produce a statistical record and observations are made on the usefulness of data and how it can impact the growth or sales of a certain product. To simplify the complicated algorithms and observations, the user is presented with a visualised model including various kinds of graphs and an attractive User Interface that helps them be in control. The project follows a similar trajectory where we utilise various algorithms and combine the power of these into a single product that aims to provide the maximum coverage of segments that can help a business owner maximise his growth and minimise his churn rate.

The dataset we will be using is from a UK e-commerce website. The workflow of the project includes the following steps:

### 2.1. Preprocessing

Data that is available to us in the raw format is corrupted and unclean, that is, data is usually very inconsistent when stored in databases. Since databases focus on minimising the redundancy they might eliminate data that is useful to conduct a thorough analysis, and thus effect the efficiency of the work done. Applying data mining algorithms on this noisy data would not give quality results as they would fail to identify patterns effectively. Data Processing hence, is crucial for maintaining data quality. Data Preprocessing can be defined as the necessary steps that are taken to transform or encode data so that it may be easily parsed by the machine. This process plays a key role in

the final results of the project and is the starting point of all data. Hence we focus on removing the null values and rid the data of missing values and other inconsistencies and outliers to make it as clean as possible and ready for the next steps.

## 2.2. RFM analysis

The pre-processed data is now fed to the RFM system. RFM stands for ‘Recency, Frequency and Monetary’. In order to track this a quantitative analysis technique used rank and group customers based on the RFM approach for the net total of their recent transactions. Thus identifying the best customers and performing targeted marketing campaigns to these segmented groups. The system assigns each customer numerical scores based on these factors to provide an objective analysis. RFM analysis is based on a belief that a few customers (about 20 percent) make up the the maximum profits of your business (upto 80 percent). Explaining the three terms Recency, frequency and Monetary and what it means in business technology.

Predictive Segments (RFM)

Figure 1. Recency, frequency and Monetary terms

Recency defines how recent was the customer’s last purchase. It targets the mentality of the customers who recently made

purchases and are in the initial stages where the product and the company is still on their mind. These customers can be targeted to make similar purchases or suggested new things from the same brand. Recency is usually measured in days but depending on the depth of the analysis a more exhaustive or relaxed system can be designed, where they may measure it in years, weeks or even hours.

v

Frequency defines how often the said customer makes a purchase in a given time period. The logic being, customers who purchased once are often are more likely to purchase again. Additionally, targeting new customers or first timers for a follow-up advertising is universally exercised to convert them into more frequent customers.

Monetary stands for how much money a customer spends in a given period. Customers who spend a lot of money are more likely to spend money in the future and in turn be valuable assets to the business.

## 2.3. Customer Segmentation

The primal techniques of boosting trade and growing a business involve maintaining an excellent customer relationship. Communication is the bridge that is to be built to ensure a business reaches its customer base and the customers believe that they are being heard on a personal level. However, in case of big e-commerce websites, creating a space for a one-on-one connection with each and every customer is not feasible. This is where Customer Segmentation comes into effect. Segmentation according to Collica is a process to categorize or classify an item into a group that has a similarity in characteristic and in CRM (Customer Relationship Management) segmentation is used to classify customer based on some similarities

by segmenting the records of customer database.1

Clustering Algorithms can be applied for grouping these customer into broadly classified segments so that the target market is created. In this project, we apply clustering methodologies on the data that is retrieved from RFM models and characteristics of each customer group is analysed. The clustering mechanism commonly known as the DBSCAN clustering is applied with Fuzzy C-Means algorithms. A detailed description of these is mentioned further in the document.

Segmentation Model:

Segmentation is the process of dividing your customer base into smaller segments. Segmentation can be of various types and there are innumerable ways to segment your customers. Some of those include the infamous:

1) *Behavioural analysis :*

This tests the way a customer purchases and tracks out details of what chronology or factors affect the purchases made by the user.

2) *Demographic analysis :*

This is the most popular kind of segmentation done. It uses the demographic description of customers to categorize them into gender, or age based groups or segments and uses different approaches on said customer.

3) *Psychographic analysis:*

This categorizes a customer on the psyche or personality traits, It traces the beliefs and values and lifestyle of a customer and provides necessary recommendations. This type of segmentation is much more difficult as compared to others.

4) *Geographic analysis :*

This analysis categorizes customers into groups based on their geographical location on the map. If a business supplies world wide a much broader classification can be done. If it is internalized in cases of businesses limited to a particular country it is more detailed.

**2.4. Evaluation of the Model**

The simulation of the proposed model will be design using python programming language and with the help of the various libraries it provides to make visualizations easier in data mining and machine learning algorithms. The cluster performance can be measured by evaluating intra-cluster performance Silhouette Index and Calinski-Harabasz Index, Iterations, Time (in seconds). Various graphs and a statistical page is provided to the admin with administrator privileges that can be accessed only with a secret code.

**3. Customer segmentation**

Customer Segmentation is carried out using the below mentioned algorithms. There are 4 main parts to this and are explained in details below.

**3.1. DBSCAN Clustering Algorithms**

DBSCAN stands for Density-Based Spatial Clustering of Applications with Noise, which is a typical representation of density algorithms. The data points are divided into multiple distinct bunches or groups using the unsupervised learning technique or clustering analysis, such that the data points within the same group have similar properties and the data points within different groups have somewhat dissimilar attributes. The reason we prefer DBSCAN clustering over the various other clustering algorithms is because unlike K-means clustering algorithm, we need not specify the number of clusters in this

algorithm. It also produces a more reasonable result over a variety of different distributions. Density-Based Clustering concept that is responsible of forming a cluster in data space that is a contiguous region of high point point density, separated from other similar clusters by contiguous regions of low point density, in an unsupervised learning approach that result in unique groups/clusters in the data.<sup>2</sup>

Density-Based Spatial Clustering of Applications with Noise (DBSCAN) is a base algorithm for density-based clustering. It can discover clusters of different shapes and sizes from a large amount of data, which is containing noise and outliers. The DBSCAN algorithm uses two parameters: minPt: The minimum number of points (a threshold) clustered together for a region to be considered dense. eps (): A distance measure that will be used to locate the points in the neighborhood of any point. The above parameters are directly related to Density Reachability and Density Connectivity. Reachability in terms of density establishes a point to be reachable from another if it lies within a particular distance (eps) from it. Connectivity, on the other hand, involves a transitivity based chaining-approach to determine whether points are located in a particular cluster.

There are three types of points after the DBSCAN clustering is complete:

- Core — This is a point that has at least  $m$  points within distance  $n$  from itself.
- Border — This is a point that has at least one Core point at a distance  $n$ .
- Noise — This is a point that is neither a Core nor a Border. And it has less than  $m$  points within distance  $n$  from itself.

The algorithm steps are as follows:

- First, we input the minimum radius along with the minimum density threshold minPt.

- The data is then sequentially read into a text file and the results are plotted along a X and Y co=ordinates that hold the Point Structure.
- The final step involves determining if the point is a core point. We first read a point (data from the dataset) and analyse if the point is marked or not. If it is marked, which means it is part of a cluster, the distance between this point and all its immediate neighbours or the Density Connectivity is found. Based on how close the value is to that of the radius . The clusters are then created and a merged result list is generated.
- Fuzzy Clustering
- Fuzzy c-means (FCM) is a data clustering technique in which a data set is grouped into  $N$  clusters with every data point in the dataset belonging to every cluster to a certain degree. For example, a data point that lies close to the center of a cluster will have a high degree of membership in that cluster, and another data point that lies far away from the center of a cluster will have a low degree of membership to that cluster.<sup>4n</sup>
- It starts with a random initial guess for the cluster centers; that is the mean location of each cluster. Next, fcm assigns every data point a random membership grade for each cluster. By iteratively updating the cluster centers and the membership grades for each data point, fcm moves the cluster centers to the correct location within a data set and, for each data point, finds the degree of membership in each cluster. This iteration minimizes an objective function that represents the distance from any given data point to

a cluster center weighted by the membership of that data point in the cluster.

- Each cluster is defined as the largest set of dense connected points, and each point in a cluster has a minimum number of neighbors of MinPts or greater in a given radius Eps. The time complexity of DBSCAN is  $O(n \cdot \log n)$  [5].

#### 4. Result and future scope

##### 4.1. Results

The primary results of the project include various graphs and analytics that are represented on a website to the administrator with only admin privileges. In this paper DBSCAN algorithm identifies objects based on bivalent logic. The existing techniques have not focused on the hybridization of DBSCAN with fuzzy if then rules. DBSCAN will be combined with fuzzy if then rules. The hybridization will allow DBSCAN to decide the cluster in more efficient manner. The simulation of the proposed approach will be designed in python. The cluster performance can be measured by evaluating intra-cluster performance Silhouette Index and Calinski-Harabasz Index, Iterations, Time Taken (in seconds).

Figure 2. DBSCAN Clustering results

Figure 3. DBSCAN Fuzzy partition coefficient

In this paper, we have tried to implement a model that will perform clustering techniques apart from the existing clustering algorithms. We also perform a comparison check against the accuracy score of all the conventional algorithms mentioned above with the accuracy score of the model that we have developed. This enables the users to understand the credibility of our enhanced model.

##### 4.2. Future Scope

The future Scope involves creating a comprehensive system to enable these companies or E-commerces to directly send targetted customers periodic advertisements and be a more evolved system to not only display the data in a static web application. However, the results obtained from our model are purely visualizations which will visualize the consumers of an e-commerce into clusters according to the information provided in the dataset. The future improvements would be to generate insightful information from the already available visualizations. This would help generate reports which could be useful for further stages.

## 5. Conclusion

Customer segregation is a way to improve customer communication, customer awareness, customer service to build effective communication. Customer segregation is required for use by businesses to maximize profits. Potential customer data can be used to provide the customer with features that include e-commerce services such as online media buying and selling. Knowing the customer base is crucial to any business. The segments result in a better understanding of where the company isn't meeting the customer demands or needs and these observations will help reduce the churn rate of the customers. This paper discusses a few aspects of performing customer segregation, namely:

- Customer segregation is the task of separating customers or an object into groups with similar characteristics.
- Data needed to differentiate between internal and external data sources

and consumers. External data comprises cookies and server logs, whereas internal data contains statistical data and data purchase history. External data can be obtained through a web server or other source, whereas internal data can be accessible on a website where a client registers or transacts.

- Customer Separation Methods can be categorized into simple method, RFM method, targeted method, and unchecked method. In Targets, the researcher focuses on one exception, either product or purchase. An unsupervised method was used when the integration process researcher had many variables
- The Customer Classification process could be simplified to describe business purpose, data collection, data preparation, dynamic analysis, data processing, and performance evaluation.

## USAGE E-WALLETS OR DIGITAL WALLET AS TOOL TRANSACTION REPLACEMENT MONEY CASH FOR UMKM PATNAM COFFEE SHOP BANJARMASIN

**Abstract:** *This study done and for know use Electronic Wallet (E-Wallet) or Digital Wallet as tool transaction replacement money cash for Micro, Small, and Medium Enterprises (UMKM) Patnam Coffee Shop in Banjarmasin. This study characteristic descriptive with technique and type of qualitative data. Data is processed with technique analysis. Results and discussion that is that UMKM Patnam Coffee Shop push development digital wallet in Banjarmasin. This study prove that digital wallet as tool transaction non-cash payments for Small and Medium Enterprises help they for apply system cashless.*

**Keywords:** *E-Wallet, MSMEs, qualitative, digital, cashless*

### 1. Introduction

Increasing technology develop mature this create breakthrough increasingly new make it easy society. Life interaction social daily, selling buy, service and finance using non-cash or digital based. Transaction this normal called Financial Technology (Fintech). According to Bank Indonesia (2019) Fintechis results combined service finance with technology is changing business models cash be cashless as well as change system transaction payment in society. One of them is the moment this currently loved is digital wallet or e-wallets. Digital wallet or e-wallet that comes in the middle public moment This very make it easy various transaction and selling process buy. The conveniences offered by digital wallet this is the end make technology and this very in demand in society (Fadilurrahman et al., 2021). Especially for those who like something practical, because with community digital wallet only need prepare sufficient balance. For transact with wallet digital and scan Quick Response/QR code then the

transaction process is complete, without need to bother removing wallet or wait change if money paid more big of the required nominal paid (Putera et al., 2022).

Current society and this already start move to digital wallet or e-wallets push efforts like SMEs for follow development in the middle society. Has many SMEs are on finally apply payment through digital wallet or e-wallet to use fulfil need consumers (Norrahi et al., 2021).

One of the current SMEs This Enough proliferated in society is Coffee Shop. Coffee Shop moment and this become wrong one choice child young for relax together friends, even do task or finish job. Food and delicious drink as well as impressed atmosphere calm and relax make many coffee shops in demand by child young with promotion (Habibah et al., 2021). Height enthusiasts among child young make Coffee Shop moment. These apply payment with digital wallet or e-wallets (cashless).

Based on exposure about digital wallet and MSMEs above so writer interested For make

work write with title “Usage E-Wallets or Digital Wallet as Tool Transaction Replacement Money Cash for UMKM Patnam Coffee Shop Banjarmasin”.

## **2. Formulation of the Problem**

- 1) How application digital wallet or e-wallet on Patnam Banjarmasin Coffee Shop?
- 2) How digital wallet helps Banjarmasin Patnam Coffee Shop in management finance the business?

## **3. Research Methods**

Method research used and the type of data collected that is technique qualitative. Studies descriptive is methodology study in objective study This because data and the analysis refer on method qualitative. According to Sugiyono (2018), method study qualitative is method based research on philosophy, which is used for researching on condition scientific (experimental) where researcher as instrument.

## **4. Discussion**

### **4.1. Digital Wallet**

In regulation (Bank Indonesia, 2016) number 18/40/PBI/2016 Article 1 Paragraph 7 concerning maintenance processing transaction payment explain that wallet the next electronic wallet called wallet electronic is service electronic For store instrument data payment these include: tools payment with use card and/or money electronic, which can also accommodate funds, for do payment.

#### ***Use E-Wallets or Digital Wallet on Patnam Banjarmasin Coffee Shop***

Patnam Coffee Shop is an established MSMEs since beginning 2022 that sells And offer various type special coffee drink

concoction they alone. This MSME still counted in scale small And Still have staff limitations. This coffee shop own quite place and no too big and also closes with schools and offices until tour area. These coffee shops suitable for all circles from young until adults want enjoy while relax in place or with takeaway. The visitors or buyer usually offered by 2 systems payment, yes do payment through cash or with Quick Response Code Indonesia Standard/QRIS (digital wallet).

Development digital wallet too develops since 2017, here means development grows rapidly in the Banjarmasin area during a number of year last. Superiority digital wallet felt practical by SMEs and usually ease buyer or consumer in do transaction payment. Although sometimes Still there is error constraints, hard signal, and disturbance system no too hinder in its application at the Patnam Coffee Shop, Banjarmasin.

### **4.2. Management Finance on Patnam Banjarmasin Coffee Shop**

Business growing coffee shop Lots caused by increasing interest public in start coffee business, because treat coffee drink can enjoyed together friend nor family. So that for business people want start it need For do bookkeeping or management good finances. Sale coffee shop for SMEs such as Patnam Coffee Shop. This no require too much capital big and also have lots profit, the price offered to buyers also vary and affordable. So that owner shop or manager can apply management appropriate finances and practical. Bookkeeping for business this coffee shop easy in its application with make notes shopping, sales daily, inventory & stock item, budget current cash until bookkeeping profit loss. After do recording the owner shop can know is currently in condition profit or loss. Besides it, also made report neat finances and easy for understand for convenience in reporting and the analysis.

## 5. Conclusion

Conclusion in this paper journal is use digital wallet or e-wallets as tool transaction replacement Money on Patnam Coffee Shop Already applied with okay. Although sometimes happen disturbance system on system payment, the easy too overcome for them. Besides that, the use of QRIS or this

digital wallet make it easy owner shop for do transaction payment, because no need accept money decent cash lots as well as make it easy for buyer for apply system cashless. Secondly, management finance in SMEs Patnam Coffee Shop already reasonable good with do recording bookkeeping, making report finance until profit make a loss and cash flow his so that make it easy the owner for analyze management finance on shop.

## HOW TO MAINTAIN A QUALITY ENVIRONMENT IN HOSPITALS

**Abstract:** *The study examined the impact of an intervention program based on cognitive-behavioral principles on improving monitoring, regulating, and self-management skills, as well as the impact on the emotional and social climate of the classroom and on student feelings and functioning. It was conducted over one year with 30 fourth grade students in an elementary school and included the purchase, establishment, and implementation of an intervention program, as well as monitoring and follow-up through interviews, questionnaires, and participant observation. The results of the study demonstrate the success of an intervention program, which includes behavioral components as well as cognitive components, on the social and emotional climate while reducing violence and increasing students' well-being, sense of protection, belonging, and classroom skills.*

**Keywords:** : *behavioral problem, behavioral disorder, classroom climate, quality of life, cognitive behavioral theory, elementary school*

### 1. Introduction

Behavioral problems and disorders are terms that combine problematic or disruptive behavior, defiant, oppositional behavior, and antisocial disorder among them. Disorder refers to the violation of social rules and negative actions toward others such as aggressiveness, lying, and stealing (Fossum et al., 2008). Evidence gathered in studies over the years indicates that a high percentage of elementary school children are at high risk of developing a conduct problem during their school years (Duchnowski, Kutash, & Friedman, 2002; Rubin & Balow, 1978). According to Loeber, Burke, & Pardini (2009) behavior problems among students in the classroom can arise for a variety of reasons. Some are related to environmental factors, others to factors related to the individual. They can be influenced by developmental background, various types of

learning disabilities, emotional state, difficulty driving, sense of competence, sense of belonging, educational challenges, mismatch of learning with the student's aptitudes, and other external and internal factors (Wells et al., 2019).

Conduct disorder in childhood can be an early sign of the development of conduct disorder in adolescence and adulthood (Liber et al., 2013). It can be associated with negative long-term outcomes, difficulties in child-parent interactions, early school dropout, vandalism, and lying (Loeber, Burke, & Pardini, 2009) and can negatively affect the child's development.

The effects of conduct disorder on the child may be manifested in impaired social status, expression of personal identity, self-image, sense of ability and belonging, shaping of interactions with peers and teachers, adjustment to the school environment, and success in developmental tasks of the age

level. Behavioral disorders can interfere with adjustment and lead to social and behavioral deficits (Smith et al. 2014), challenges, and delays in various areas of functioning. They can act like a vicious cycle and, in the absence of remedies, lead to developmental withdrawal and a steady increase in negative behaviors. A situation that increases the likelihood of school dropout and at-risk situations (Danielson et al., 2018).

Erickson sees school as a significant and crucial factor in this stage of development, as it is able to identify and diagnose deficits in cognitive and academic skills. It is also a source of discipline, requiring the mobilization of "self-control" that help develop the ability to restrain and postpone rewards, as well as organizing children into a group, changing egocentric patterns, and teaching reciprocity as a value and behavior. In addition, the school setting separates the child from the home during activity periods and challenges the child to engage with new authority figures (ibid.).

Behavior problems in the classroom present numerous and varied challenges to the educational system. Their effects are felt directly and indirectly, manifesting in both academic and emotional-social domains, classroom climate, and students' sense of safety and belonging (Mooney et al., 2005).

Cognitive-behavioral intervention is based on an approach that incorporates cognitive and behavioral components and aims to effect change in student behavior. It utilizes basic cognitive processes that are responsible for successful problem-solving processes (Smith & Daunic, 2006; Smith et al., 2012). Studies have shown that this type of intervention is able to improve self-monitoring mechanisms and thus social problem-solving skills in a variety of situations and structures. Therefore, this type of intervention helps to reduce the risk of developing behavioral problems (Daunic et al., 2006, 2012; Smith, Graber & Daunic, 2009). Several studies have found that programs of this type can be

beneficial and help with both treatment and prevention of conduct problems (Sukhodolsky, Kassinove & Groman, 2004; Waschbusch, Pelham & Massetti, 2005).

Studies of various types of school-based intervention programs have shown a small but positive effect on aggressive behavior and conduct disorders. The positive effects have also been found to be long lasting (Dymnicki, Weissberg & Henry, 2011; Wilson & Lipsey, 2007). In a study examining the effects of school-based intervention programs on student behavior problems, it was found that two types of prevention efforts were implemented within the school over the years: a classroom intervention program and a targeted individual intervention program. The latter were significant and contributed to reductions in behavioral problems. School-based interventions using the cognitive behavioral approach have been found to produce positive results in both the short and long term (Mytton et al., 2006). It was also found that interventions that focused on a specific goal showed more significant results than general school-based intervention programs (Liber et al., 2013).

The complexity of addressing behavioral disorders, their negative effects, and the importance of effective and adaptive developmental outcomes underscore the importance of studying and developing tools and responses to this complex issue.

## **2. Behavior problems in the classroom**

Externalizing behavior problems and disorders manifest in the violation of social rules and negative actions toward others (Fossum et al., 2008).

Violence is an extroverted behavior characterized by the exertion of an unpleasant stimulus, physical or verbal, toward the other (Buss, 1961; Kazdin et al., 1987). The discussion of the phenomenon of violence is

divided into two general categories: Conduct disorder, which is a disruption of social, academic, and occupational functioning and, in an adolescent who has not reached the age of 18, is characterized by patterns that have been repeated for at least 12 months and includes behaviors that are a violation of rights or norms and involve threats, fighting, cruelty, the use of weapons, theft, or forced sexual acts. (Moore et al., 2011). Oppositional Defiant Disorder is characterized by negative patterns of behavior that have been repeated for at least six months and include at least four of the following behaviors: Loss of control, persistent arguing, and lack of cooperation, bullying, accusations, anger and hostility, obsessive preoccupation with the other's behavior (APA, 1994, DSM IV). The first category emphasizes intense engagement in violating rights, norms, and laws (ibid.) and is considered more difficult (Moore et al., 2011). However, untreated oppositional behavior can develop into a conduct disorder (Scotti, Mullen & Hawkins, 1998). It is important to note that a child who struggles with a violent problem usually suffers from disorders associated with the conduct disorder, such as attention and concentration problems, hyperactivity, impulsivity, and social problems. (Moore et al., 2011).

Eliram (1982) distinguishes three types of violent behavior in children: reactive violence, which does not necessarily result from a violent personality, but from activating events that cause the child to act violently. Instrumental violence, which helps the child meet his needs when he is unable to achieve his goal in an acceptable and moderate manner; and violence for its own sake, which arises from severe emotional problems that are sometimes a consequence of his environment. Gendreau & Archer (2005) made a later subdivision, distinguishing between violence that leads to physical harm and violence that leads to psychological harm. This type of division

focuses on the secret motives that cause violence, the motivation for violent action, and the degree of harm to the other (Gendreau & Archer, 2005 in Moore et al., 2011). This division led to examining violence not only in terms of the dimensions of harm inflicted on others, but also at the level of the factors that underlie it. Ronen, Rahav & Moldawsky (2007) identified three distinct profiles of children: the aggressor who engages in violent behavior toward the other on their own initiative, the aggressed who is a victim of violence, and the neutral who is not involved in instances of violence. In the literature based on frustration-anxiety theory (Vitaro & Brendgen, 2005 in Moore et al., 2011), violence is divided into reactive and proactive violence. Reactive violence occurs in response to violence that causes anger and frustration and aims to reduce the level of anger and frustration by hitting the perpetrator. This type of violence has a more positive prognosis than initiated violence (Ibid.).

Initiated violence depends on a relationship that exists between two independent behaviors. Through past experiences, the individual has learned that a violent response helps him or her achieve various goals, and thus it is activated whenever the child wants to achieve his or her goals (Crick & Dodge, 1996; Hubbard et al., 2001; Vitaro & Brendgen, 2005). Other subdivisions refer to the differences between the behaviors that characterize violence, distinguishing between direct violence and indirect violence, and between verbal violence and physical violence (Bjoerkqvist et al., 2001; Yudofsky et al., 1986; Ronen et al., 2007).

### **3. Patterns of victimization during the elementary school years**

Victimization is a common stressor in school-aged children and can affect the child's future development (Giesbrecht et al., 2011). Children who suffer from persistent bullying

and an unprotected social-emotional climate (Rudnicka et al., 2020) are at increased risk of developing psychological and behavioral adjustment problems such as loneliness, low self-esteem, anxiety, depression, externalizing problems, and school dropout (Hanish & Guerra, 2002; Kochenderfer-Ladd & Skinner, 2002; Leadbeater & Hoglund, 2009). Violent behavior is detrimental not only to the violent child's environment, but also to the development and functioning of the violent child, who is at risk of social rejection, dropping out of school, and developing criminal patterns (Loeber & Farrington, 2000; McGinnis & Goldstein, 1997; Pope & Bierman, 1999).

A relationship has been found between an early victimization experience during the elementary school years and the continuation of the pattern of bullying victimization in later years (Kochenderfer-Ladd & Wardrop, 2001; Schwartz, Proctor & Chien, 2001). The early years of elementary school are a significant and important time to observe the child's developmental process and understand why certain children are victimized and others are not, and how the change in victimization patterns is related to their behavior and its context over time (Giesbrecht et al., 2011). In addition, the early years of elementary school are of great importance for social, emotional, cognitive, and personal development. Intervention programs can have a positive impact on reducing peer victimization before it takes root (Ladd, 1996; Olweus, 1994).

Research today seeks to understand the components of personality development, focusing on the emotional and cognitive factors that predispose a child to violent behavior (Tremblay et al., 2005). Several studies have shown that the social biological basis of certain children influences the way they interpret their behavior, the behavior of others, and the extent of their influence on a given situation, exposing them to risk and dangerous situations early in life (Anderson

& Bushman, 2002; Dodge & Pettit, 2003). The child's information processing model in these situations influences the interpretation they give to the social situations around them, tends to attribute negative intentions and hostility to them, and influences the development of violent behavior (Crick & Dodge, 1996). Examining the individual versus the effects of the environment in relation to violent behavior assumes that an individual has an innate personality tendency toward violence that may predict violent behavior later in life (Brendgen et al., 2006). Therefore, individuals must acquire tools and skills to help them control their tendency (Moore et al., 2011). A somewhat more moderate approach also asserts that there is an innate tendency toward violence. At the same time, it believes that after age six, environmental influences and cognitive abilities determine the developmental trajectory (Rhee & Waldman, 2002). Another study considers violence as a tendency rather than a personality trait or hidden instinct. According to this study, the social environment, skills, and tools acquired by the child during his integration into that environment determine whether his violent traits will be reinforced and influence his behavior and social affiliation (Nagin & Tremblay, 2005). Another model to explain violent behavior assumes that this behavior contains behavioral, emotional, and cognitive components that are interconnected. According to this model, the anger people feel mediates between their hostile thoughts and their violent behavior. The behavioral component is expressed physically in physical violence and verbally in violent verbal behavior. The emotional component is expressed in anger in response to a particular stimulus and the cognitive component is expressed primarily in thoughts that manifest in negative thinking, a negative attitude, and a negative perception in relation to people and situations (Buss, 1961, Buss & Perry, 1992).

As the child progresses through the

developmental stages of acquiring complex cognitive skills, patterns of violence decrease. It is likely that there is a relationship between these two processes (Seguin & Zelazo, 2005). Cognitive skills are related to mechanisms of self-control, information processing, and emotion control. These mechanisms enable individuals to control and regulate their behavior and moderate the relationship between sensitivity and aggression (Apple, 2007; Weisbrod, 2007). Violence control and behavior regulation become possible for a child when he or she acquires tools and skills that enable him or her to behave socially.

The development of self-control skills enables the child to activate mechanisms of observation, monitoring, and self-reinforcement, to use accepted social models, and to control his or her behavior (Moore et al., 2011).

The presence of behavior problems in the classroom poses a significant challenge to the educational system, affects the emotional and social climate, academic achievement, and students' sense of safety and belonging in the classroom (Mooney et al., 2005).

The complexity of dealing with behavior problems, their negative effects, and the importance of effective and adaptive developmental outcomes underscore the importance of studying and developing tools and methods

#### **4. Body of the paper**

Cognitive-behavioral intervention relies on an approach that incorporates cognitive and behavioral components to change student behavior through its influence on basic cognitive processes responsible for successful problem-solving processes (Smith & Daunic, 2006; Smith et al., 2012). Studies have shown that this type of intervention is able to improve self-monitoring mechanisms and thus social problem-solving skills in a variety of situations and structures. Therefore, this

type of intervention helps reduce the risk of developing behavior problems (Daunic et al., 2006, 2012; Smith, Graber & Daunic, 2009), contributes to positive social functioning, and promotes a visible and/or hidden impact on individual development (Kazdin et al., 1992; Lochman & Wells, 2004). Several studies have found that programs of this type can be beneficial and help in the treatment and prevention of behavioral disorders (Ukhodolsky et al., 2004; Waschbusch et al., 2005). Studies of school-based intervention programs have shown a small but positive impact on aggressive behavior and conduct disorders. The positive effects have also been found to be long lasting (Dymnicki et al., 2011; Wilson & Lipsey, 2007). In a study examining the impact of these programs on student behavior problems, it was found that two types of prevention interventions were implemented in schools over the years: a classroom intervention program and a targeted individual intervention program. The latter were significant and contributed to the reduction of behavior problems. School-based interventions using the cognitive-behavioral approach have been shown to produce positive results in both the short and long term (Mytton et al., 2006). Interventions that focus on a specific goal have also been found to show more significant results than general school-based intervention programs (Liber et al., 2013).

The complexity of dealing with behavioral disorders, their negative effects, and the importance of effective and adaptive developmental outcomes underscore the importance of studying and developing tools and responses to this complex issue.

The first wave of behavior therapy was, in part, a revolution of sorts against existing clinical concepts and their scientific weakness (Hayse, 2004). This wave involved the application of learning principles to develop an established method aimed at changing overt behavior (Hayse & Hoffman, 2017) by focusing on learning theories based

on stimulus-response and classical and operant conditioning (David & Hofmann, 2013). Behavioral therapy interventions focused directly on behaviors and feelings that were perceived as problematic and aimed to achieve adaptive behaviors (Hayse, 2004). In the late 1960s, the second wave began to develop after neo-behaviorists realized that stimulus-response theory was unable to provide an adequate empirical analysis of language and cognition. They began to adopt more flexible principles for learning based on the metaphor of a computational mechanism. The failure of the behaviorist streams to provide insights into cognition and human language led to a second wave that used the seeds sown by Bandura (1969) for a cognitive approach to behavior change. This soon evolved into the cognitive therapy movement (Beck et al., 1979; Mahoney, 1974; Meichenbaum, 1977). Skinner's (1974, via behaviorism) radical understanding that objectivity can occur in the analysis of private events and scientific subjectivity can occur in the analysis of observed public events led to changes in perception. His analysis of language and cognition led him to conclude that scientifically valid exploration of emotions and thoughts was possible but not necessary to visibly understand behavior. This conclusion led behavioral therapists to recognize that they needed to address thoughts and feelings more centrally and directly (Hayes, 2004). Early proponents of the cognitive-behavioral stream treated cognition from a direct and clinically relevant perspective. Researchers in this stream identified specific cognitive errors and their prevalence in therapeutic groups. Studies began to address the identification of these errors and methods to correct them. Some of the central tenets of the first wave of behavior therapy were adopted by the second wave, including an emphasis on changing the content of thoughts or behaviors, their form or frequency, the so-called "first-order change" (Hayes 2004).

Behavior therapy expanded, behavioral principles became much less emphasized and cognitive principles much more emphasized, and so the first wave was largely assimilated into the second wave. Behavioral therapy methods and conditioning models were replaced by cognitive change methods and models that focused on cognitive variables. The emergence of constructivism and similar postmodern theories weakened the notion that scientific theories identify discrete parts of reality that can be organized into a comprehensive model (Hayes et al., 1993). This shift in the philosophy of science gradually weakened the assumptions that underpinned the first and second waves of behavior therapy and cognitive therapy and their underlying theories in favor of integrated tools and approaches that emphasize the broader context (Moore, 2000). The classic "cognitive-behavioral" model was developed in recognition of the interrelationships between cognition and behavior, as well as the emotional state and general functioning of the organism, and assumes a connection between the way individuals perceive events in their lives and their feelings, physiological responses, and behavior. According to this concept, a person's feelings and behavior are influenced by the interpretation he or she gives to the events in his or her life, rather than by the events themselves (Beck, 1964; Ellis, 1962). Cognitive-behavioral intervention methods use strategies aimed at bringing about change in thinking, feelings, and behavior (Kendall, 2012). Their foundation is the individual's belief system, behavioral strategies, and the person's understanding of the beliefs and behaviors that characterize them (Alford & Beck, 1997). A cognitive-behavioral intervention program addresses the acquisition and establishment of a cognitive change in the thinking and belief system to bring about stable emotional and behavioral change (Beck, 2014). The model represents a combination of cognitive strategies based on

reflexive and metacognitive skills, behavioral strategies, emotion-focused strategies, and social strategies to build a cognitive infrastructure that leads to effective behavior (Kendall, 1993).

Cognitive behavioral Intervention with children focuses on the acquisition, practice, and assimilation of cognitive strategies that help the child cope effectively with events and solve problems. The child acquires cognitive strategies through experience, observation of experience, and interaction with the environment (Ingram, Miranda & Segal, 1998). The differences between creating an intervention plan for children and implementing it with adults arise mainly from the significant involvement of environmental factors in shaping the way the child interprets and responds to various situations, as well as the fact that children usually come to the intervention at the initiative of their environment, often without being aware of the problem that requires it (details in Moore et al., 2011). One of the main issues in child care is the issue of cognitive processing and the distinction between "cognitive impairment" and "cognitive distortion." Processing impairment is caused by a lack of attention to information and a lack of foresight that affects behavior and its outcomes. Cognitive distortion means a disturbance in the thinking processes (Kendall, 2015). The terms impairment and distortion both refer to a disturbance in cognition (Kendall, 2000). According to Spivack & Shure (1982), deficits in processing interpersonal situations are etiological in nature. Barkley (Barkley, 1997) refers to impulsivity as a consequence of mediation deficits (Kendall, 2015). According to him, impulsive behavior results from cognitive impairment manifested by an inability to let thought precede action, as opposed to cognitive bias indicating active but distorted processing (ibid.).

Studies have shown that by applying cognitive-behavioral principles, self-

monitoring processes and problem-solving strategies can be accomplished. These processes lead to the improvement of self-management and self-regulation skills (Daunic et al., 2006; Daunic et al., 2012; Smith, Graber, & Daunic, 2009).

Self-management is a general term that refers to a variety of components used to outline an internal locus of control (Chafouleas et al., 2011). Self-management is expressed in the influence a person has on events and situations around them and their outcomes (Barlow, & Chorpita 1998) and includes actions on reality (Ajares, 2007a). Self-regulation is an active process of self-management (Pintrich, 2000).

According to Baumeister & Heatherton (1996) and Carver & Scheier (1981), self-regulation includes three main components: setting standards for thoughts, feelings, or behaviors that individuals commit to and self-monitor in order to achieve them; motivation to make an effort to reduce the discrepancy between norms and actual behavior; the ability to achieve goals despite failures and temptations along the way.

The self-regulatory system is at the heart of any daily process. Its components mediate the influence of the external environment on the individual and provide him or her with the basis for goal-directed action. (Bandura, 1991).

Consistent, reliable, and frequent self-observation leads the individual to success in self-regulation (Bandura, 1991). The use of self-observation can enable individuals to evaluate the relationship between thoughts, behaviors, physiological sensations, and emotions and their consequences (Moore et al., 2011).

The self-regulatory system is at the heart of every daily process. Its components mediate the influence of the external environment on the individual and provide him or her with the basis for goal-directed action. (Bandura, 1991).

Consistent, reliable, and frequent self-observation leads the individual to success in self-regulation (Bandura, 1991). Through self-observation, individuals can evaluate the relationship between thoughts, behaviors, physiological sensations, and emotions and their consequences (Moore et al., 2011).

The child's self-regulation skills can influence his or her adjustment to the school environment in which he or she must function independently without dependence on the presence of his or her primary caregivers (Sawyer et al., 2015).

The experiences the child has in his or her first years of school can have long-term effects on his or her behavior, mental health, relationships with children and teachers, and sense of belonging and attachment to school (Belsky & MacKinnon, 1994; Entwisle & Alexander, 1989; Finn, 1989; Hamre & Pianta, 2001; Ladd & Dinella, 2009; Luster & McAdoo, 1996). Studies indicate a negative relationship between the child's level of self-regulation and behavior problems (Belsky et al., 2007; Eisenberg et al., 2010; Hill et al., 2006; Kochanska & Knaack, 2003; Murray & Kochanska, 2002; Olson et al., 2005; Riggs et al., 2004).

Self-management strategies have been shown to be effective for both the individual and the class as a group for adjustment and success (Glynn & Thomas, 1974).

The development and building of self-monitoring skills and abilities allow the child to activate mechanisms of observation, monitoring, and self-reinforcement. By activating the acquired mechanisms, the child is able to self-regulate and conform to accepted social models while controlling his or her behavior (Moore et al., 2011).

## **5. Quality of life**

The concept of quality of life refers to the degree of well-being and happiness of the individual. It is defined by the WHO (1996)

as an individual's perspective on his or her life in the context in which he or she lives and in relation to the goals, expectations, values, and standards he or she sets for himself or herself. In childhood, quality of life is defined as subjective perceptions of well-being and happiness (Davis et al., 2008)

Almost all definitions of quality of life refer to physical, social, cognitive, and psychological dimensions (Hutting et al., 2022). Quality of life is influenced by both close indicators, such as family and friends, and more general indicators, such as socioeconomic status and culture (ibid). Physical or emotional-mental disabilities have been found to have the greatest impact on quality of life (Kourkouta et al., 2021).

Lack of support, protection, emotional and behavioral difficulties, and lack of infrastructure to realize potential are considered factors that significantly affect quality of life (Wallander, 2015). The child is considered an individual with equal rights and a future citizen who has influence in shaping society, and therefore there is concern for his or her quality of life (Ben-Arieh et al., 2014). The quality of life is considered his natural right and is considered an important factor in his development and future prognosis (Ben-Arieh & Frønes, 2011).. According to the World Health Organization, mental health and emotional well-being are factors that affect the quality of life of the student and his ability to achieve his developmental goals in school (Rudnicka et al., 2020).

At school age, the child is at a developmental stage where he or she is confronted with the demands of learning together in society, following rules and routines, and participating in a group. Achievement, a sense of competence, and the ability to control become essential to the self-image the child builds (Tiano, 2010).

School provides developmental opportunities for the child, but it can also present challenges that can interfere with normal development.

Classroom climate has an impact on student achievement in the classroom.

In the study of Hachoen & Ronen (2011) school climate is defined as the quality of school life. According to the researchers, students' perception of the quality of school life represents their satisfaction with the school and classroom, their sense of their social place, their emotional attitude towards the educator and teachers, and their emotional and behavioral attitude towards studying, showed a relationship between students' perception of class climate and sense of belonging, educational process development, personal development, integration, and effective behavior in the school environment and routine (Zedekiah, 1988; 1996. Urdan et al., 2004) found that positive interaction between class members increased students' social competence in the lower grades of elementary school (Hoglund & Leadbeater, 2004). School climate is based on norms, relationships, goals, values, and organizational structure (Cohen & Geier, 2010). In addition, it influences students' social, psychological, and academic outcomes (Glisson, 2007). Interpersonal interactions, as a key component of school climate, influence behavioral norms and a sense of protection. A relationship has been found between positive interactions, avoidance of disruptive behavior, and good academic performance (Crosnoe, 2004; McNeely, Nonnemaker, & Blum, 2002; Powers, Bowen, & Rose, 2005; Whitlock, 2006) when the student perceives the school as a protected place where he or she can develop optimally. Similarly, the social-emotional climate creates insecurity, and the presence of verbal or physical violence poses the risk of interfering with student development and achievement, even if they are not directly affected by violence (Rivers et al., 2009)

## 6. Body of the paper

### *The purpose of the study*

The purpose of this study was to examine the extent to which a classroom intervention program based on cognitive behavioral principles affects students' acquisition of self-regulation skills, behavioral problems, social and academic emotional climate in the classroom, and quality of life in the classroom.

### *Study Population*

The sample consisted of thirty 4th grade students in an elementary school in the city of Jerusalem. The vast majority of children in the class have been learning together as a group for about five years, i.e., since pre-compulsory kindergarten. Of these, 8 are girls and 22 are boys, aged 9-10 years, who live in or around Jerusalem. 16 of the children in the class were diagnosed with learning disabilities or ADHD, and 14 of the children were not diagnosed (Table 1).

**Table 1.** Study Population – children

	N	%	Mean
Gender			
Girl	8	26.66	
Boy	22	73.33	
Age			9.4
Origin

**Research tool**

*In-depth interviews:* semi-structured in-depth interviews to capture and observe staff feelings towards the class before and after the intervention program. In addition, open-ended face-to-face interviews were conducted on predetermined general topics to understand students' feelings and needs.

*Participant observation:* participant observation was conducted in the classroom, involving directly and personally in the lives and processes of the students and experiencing the reality in the classroom together with them. Observations focused on events that took place during common class time related to self-management and self-regulation, as well as in the general atmosphere of the classroom during class time and extracurricular activities.

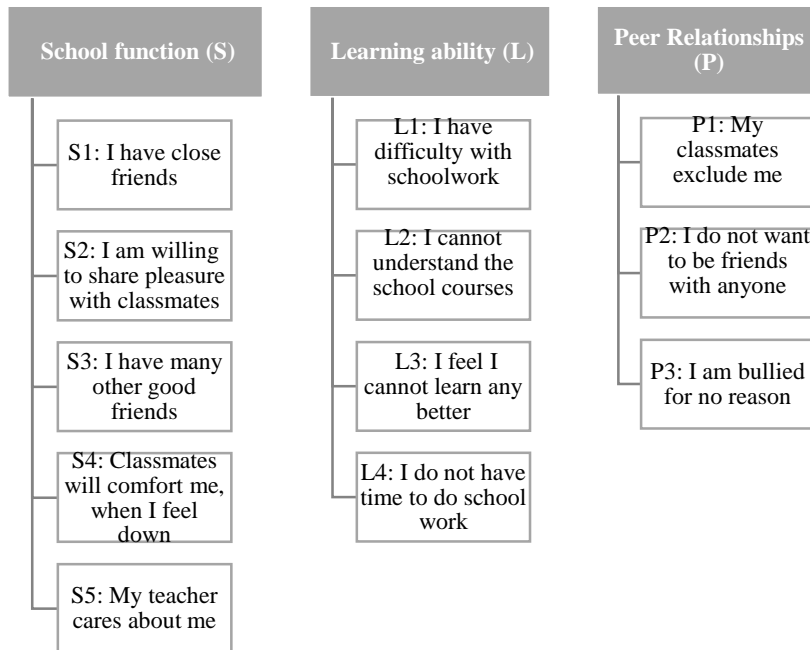

In addition, class discussions were recorded with students during designated class periods to implement and monitor the program and its outcomes.

*Open-ended questionnaires:* open-ended questionnaires were distributed twice a year before the end of each semester. Students were asked to rank various verbs on an axis

according to their personal feelings and to put their choice into words.

*Quality of life questionnaire components:* the ESQoL questionnaire (Yuen et al., 2022) is a 21-item questionnaire developed and validated for elementary school students in Taiwan. The questionnaire was developed with the aim of bringing to light the differences between age levels and the impact that developmental stage may have on quality of life (Wee, Chua, & Li, 2006). The components of the questionnaire help assess factors related to students' emotional well-being and relate to functioning in school and other areas of the student's life. This study examined the effects on 12 of the 21 components of the questionnaire that relate directly to the educational framework. The questionnaire was developed in Taiwan, a culture where the academic achievement of their children is very important to parents (Chan et al., 2014, Tzeng, 2007), similar to Israel. The questionnaire proved to be an effective instrument for measuring the quality of life of elementary school students and has high validity and reliability.

**Figure 1.** Quality of life 12 components

## Research process

Initial data collection occurred during the academic year prior to the year in which the study was conducted through information collected in reflection sheets completed by students at the end of the year, classroom observations, and information provided in a final team meeting. The data collected indicated an abusive climate in the classroom. This manifested itself in reports of an impaired sense of safety, ability, and motivation among students and teachers teaching in the classroom. All teachers reported that, in their opinion, the academic level in the current class did not reflect its potential. There were also reports of verbal and physical bullying and social boycott.

A joint analysis of the members of the educational staff along with the behaviors that emerged from classroom observations and routine student complaints led to the hypotheses that: Classroom challenges are affected by difficulty in postponing a response and impulsivity.

Dealing with challenges on a daily basis affects students' quality of life and their ability to use resources for optimal development.

At the outset of the study, open-ended face-to-face interviews were conducted with the students and with five staff members who provide regular support to the class, including the principal, who was personally involved in the implementation of the program.

The course of the investigation included the implementation of a classroom intervention program based on cognitive-behavioral principles with the students, as well as scheduled meetings with staff for the purpose of induction, assimilation, ventilation, and implementation.

During the intervention, regular classroom meetings were held and recorded to practice and monitor assimilation.

Reflective questionnaires were distributed at the end of the program to capture the personal

process and general feeling in the classroom. The pages contained a limited number of closed-ended questions on a response scale as well as open-ended explanations. The use of behavior mapping charts helped to observe the behavioral changes that occurred in the class throughout the period. Pre-intervention and end-of-intervention questions were asked about feelings in the school setting to observe changes in students' quality of life related to their functioning and feelings in the classroom.

### **The components of the intervention program**

The intervention included the use of cognitive and behavioral therapy tools. The goal was to teach strategies and tools to strengthen and develop monitoring, management, and self-regulation skills in the first phase.

In the second phase, they were to be applied to defined goals that would support the creation of a positive social and emotional classroom climate and improve the quality of life for students in the classroom.

This, while continuing the processes of establishing and assimilating tools and semantics.

The program was established and implemented using a variety of tools:

Tools for assimilation: with the beginning of the school year, the schedules, the system of hours and the accompanying lessons were created in terms of the intervention plan to create a unified and consistent language and a sense of framework and security.

Permanent Lessons: Three permanent weekly lessons were incorporated into the system to learn and use program language, role play, learn tools and strategies, learn through stories, practice social discourse, practice reflection skills, reflect, and create daily report pages.

Monitoring boards: behavior boards were created and posted in the classroom for consistent, orderly, and mandatory

monitoring of the behavior process.

Self-management wheel board: based on the cognitive behavioral model derived from the emotional-rational method a self management board was created. The board is divided into quarters to distinguish between an event, a thought, an emotion/feeling, and a reaction.

To allow the model to be applied using routine events and role-plays, each quarter was assigned its own color and a set of cards of the same color was included. The cards included events, thoughts, emotions/feelings, behaviors, and blank cards for self-completion (figure 2).

Reaction stages: A reaction stages axis was placed below the circle for the practice of monitoring behaviors and responses (figure 3).

Board of Sentences and proverbs: the board with the collected Sentences and proverbs was placed under the level of the answers and on it the Sentences and proverbs were hung throughout the year to support and perfect the internal dialog. The Sentences and proverbs helped students solve events and situations. In addition, the board included alternative verbs for practiced situations.

Throughout the process, a goal was set once a month to guide the class according to the goals - based on the needs established in advance. Each goal was assigned a time range. The first overarching goal was familiarity with the plan and ways to implement it. Familiarity with the auxiliary panels that accompany the behavioral program, experience with pre-dictated chance events, experience with the panels in everyday situations, experience in role-playing and using the auxiliary panels and the semantics derived from them in everyday behavior in real time. Another overarching goal was proper speech and included using navigation tabs to monitor speech patterns in real time, behaving according to the speech rules used in the classroom, speaking in class when given permission to speak, developing

the ability to listen to each other, listen to what adults say, express oneself clearly and in an appropriate tone of voice, respond to what friends say out of respect and politeness, treat a friend's words with respect and politeness even when there is an argument, and use language appropriate to the time and place. Another overarching goal was defined as reflection as a foundation for behavior regulation and included familiarity with the concept of restraint, reflection on situations and situations where students have had to restrain themselves in the past, knowledge of different ways to help avoid an immediate reaction, familiarity with the concepts of self-management, self-regulation, reflection, and self-control, identification of past thoughts and physiological signs of behavior that may lead to an impulsive response, application of behaviors and phrases that help students choose and manage their thinking and behavior in real time, understanding of the emotional impact of success in regulating behavior as opposed to an impulsive response. Another overarching goal was a positive classroom climate and included: learning about the concepts of empathy and intervention, practicing recognizing and expressing the feelings and thoughts of others through role-playing, intervening in a social situation in an appropriate way, acting from the perspective of others, understanding the differences between different individuals' feelings and thoughts about the same situation while having respect for others and their feelings.

Each objective was composed of the phases of the program: Defining a need, identifying automaticity at the level of feelings, thoughts, and actions, suggesting possible responses, choosing a behavior, choosing a word that supports the behavior, and reinforcements.

During the year, specific goals were also defined, based on specific needs - individual and group - that came up in discussions with the group of children.

Reinforcement plan for defined goals: A pool of High goals and personal and group goals are set and rewarded according to progress. Blackboards accompanied the program and allowed for the accumulation of reinforcers of various types and to varying degrees individually or in groups.

Individual processes were conducted with a number of children that were found to have a significant impact on the atmosphere and feeling in the classroom. These processes included phases that were identical to the phases of group work and related to personal goals, goal refreshment, monitoring, and regular updating of all staff involved in the program.

Work with educational staff included recruitment of appropriate staff, ongoing dialog, maintaining consistency in classroom work, and regular meetings within the system. The meetings included acquiring the principles of the program, a discussion of possible courses of action, and airing, sharing, and brainstorming. Times were also set aside for regular and periodic reporting on classroom behavior.

Figure 2. Self management wheel

## 7. Results

The results obtained combine data suggestive of qualitative processes that indicate a change

in perceptions and experiences with measurable data that indicate a reduction in maladaptive behaviors, an improvement in adaptive behaviors, and an increase in the quality of life for individuals in the classroom.

*Analysis of social climate results:*

The results describe a comparison between the responses on the reflection questionnaires completed by the children at the end of third grade before the intervention program and at the end of fourth grade after the program

The questionnaires completed by the children contained closed and open-ended questions. The closed questions were rated on a scale of 1-5: 1 - never, 3 - sometimes, 5 - always, 2,4 - intermediate situations between always and sometimes or between sometimes and never.

**Table 3.** Reflection sheets comparison

	<b>Mean - Before</b>	<b>Mean - After</b>
"I choose my friends by myself"	1.76	4.33
"My friends respect me and my opinions"	2.63	4.43
"I manage to avoid conflicts and arguments with friends and reach a solution in pleasant ways"	1.53	4.36

The results describe a comparison between the answers to the reflection sheets filled out by the children at the end of the third grade before the intervention program and at the end of the third grade after it. The questionnaires included closed and open questions. The closed questions are given a quantitative score on a scale of 1-5: 1 - never 5 - always respectively.

In reference to the saying "*I choose my friends and girlfriends*"

**Figure 3.** Reaction stages

**Numerical results :** in 70% of the students a numerical increase was observed in legitimacy and in their ability to choose their friends, in 30% the group was ranked at the beginning of the program with the highest score and the result was kept. 60% of the children rated the statement with the maximum number of points at the end of the year compared to 30% at the beginning of the year.

**Literal results:** at the beginning of the year, 70% of the subjects reported a certain difficulty in connecting with a friend with whom they would like to play. At the end of the year, all the children testified about an improvement in their feeling towards their social status in the class. 40% of the children

testified about a personal process they went through regarding their personal responsibility in choosing friendships. In reference to the saying "My friends respect me and my opinion"

**Numerical results:** in 80% of the subjects a numerical increase in the feeling of being respected was observed, in the remaining 20% no change was observed, while in 10% of them from the beginning the saying was rated with the highest score and in another 10% it did not apply Improvement in the feeling that they are respected in the classroom. 60% of the subjects scored the statement with the maximum number of points at the end of the year compared to 10% at the beginning of the year.

**Literal results:** at the beginning of the year, 80% of the subjects expressed dissatisfaction with the degree of respect they receive among their classmates and 10% stated that they do not know how to refer to a verb. At the end of the year, 80% of the subjects indicated that a change could be felt in the general classroom climate. 10% reported that their feeling in the class is not good.

In reference to the saying "I manage to avoid fights and arguments with friends and reach a solution in pleasant ways".

**Numerical results** 50% of the subjects observed a numerical increase in the feeling that they manage to conduct themselves better in conflict situations. In the remaining 50%, no change in the result was observed. 60% of the subjects rated the statement with the maximum number of points at the end of the year compared to 10% at the beginning of the year. No drop in score was observed in any of the subjects.

**Literal results:** At the beginning of the year, 50% of the subjects testified about the lack and need for conflict management tools. 30% did not see personal responsibility in their involvement in fights. 30% referred to their personal responsibility. 20% stated that they have tools that help them solve problems. 10% referred to their general feeling regarding interactions and communication in the classroom. At the end of the year, all the subjects reported an improvement in dealing with conflicts. 70% of the subjects testified to purchasing tools that help them manage conflicts and solve problems. 30% of the subjects responded positively to the process and the general atmosphere in the class and said that they expanded their social circles.

In the next question, the students were asked to say what they would preserve in the class and what they would improve in it. The question included only a verbal description without a numerical representation. At the beginning of the year, 90% of the subjects thought that there was something to improve

in the class in the social aspect. 60% of them experienced the class as an unsafe place and reported bullying behavior towards them or their classmates. 10% reported feeling disrespected. 20% stated that they would like to expand their social circles and the possibilities of playing with friends.

20% reported noise and anger affecting the atmosphere. 10% said they did not know what they would like to improve. 10% said they would like to improve everything in the classroom. At the end of the year, 30% of respondents felt there was nothing left to improve. 10% felt everything should be improved and 60% mentioned specific changes that should be made. Compared to the beginning of the year, only 10% said that the attitude of the children towards each other should be improved.

In terms of things students wanted to keep in the classroom: At the beginning of the year, 70% of subjects wrote that they would keep their best friends. 30% did not find anything on the social level in the class that they would like to keep. At the end of the year, 70% of the children referred to the flow in the class and the general social climate, 40% of the subjects described the improvement of the children's behavior towards each other. 20% of the subjects the presence and effectiveness of the acquired tools for self-management and problem solving. 30% mentioned the good atmosphere and pleasant feeling in the class. 75% of the 30% who did not find what they wanted to preserve at the beginning of the year found things they would preserve.

At the level of the defined goal of social climate and social communication, there was a significant improvement in how children felt about their social status and an increase in their overall good feeling in the classroom. 20% reported noise and rioting affecting the atmosphere. 10% said they did not know what they would like to improve. 10% said they would like to improve everything in the classroom. At the end of the year, 30% felt there was nothing left to improve. 10% felt

everything should be improved and 60% mentioned specific changes that should be made. Compared to the beginning of the year, only 10% said that the attitude of the children towards each other should be improved.

In terms of things students wanted to keep in the classroom: At the beginning of the year, 70% of subjects wrote that they would keep their best friends. 30% did not find anything on the social level in the class that they would like to keep. At the end of the year, 70% of the children referred to the flow in the class and the general social climate, 40% of the subjects described the improvement of the children's behavior towards each other. 20% of the subjects the presence and effectiveness of the acquired tools for self-management and problem solving. 30% mentioned the good atmosphere and pleasant feeling in the class. 75% of the 30% who did not find what they wanted to preserve at the beginning of the year found things they would preserve.

At the level of the defined goal of social climate and social communication, a significant improvement was observed in the children's feeling of social status and an increase in their overall good feeling in the classroom.

*Results of a circle for self-management, guided discovery, and mantras:*

The results describe a comparison between the content brought up during observations, conversations with children, and class discussions at the end of third grade before the intervention program and at the end of fourth grade after the program.

At the level of the defined goal of habituation and internalization and application of the principles of the program and the reference tables: At the end of the year, most children had acquired the circle of self-management and the tools for observation, internalized the stages at the cognitive level and the emotional level, and used them to achieve defined behavioral goals, such as: social climate, rules of discourse, social play.

At the defined goal level of rules of discourse, significant improvement was observed in the ability to engage in attentive, appropriate, and respectful classroom discourse. Prior to the intervention, classroom discourse was characterized by outbursts and speaking without permission, rejecting the opinions of others, language that was not respectful and appropriate to the time and place, and verbal violence towards class members and staff. In the observations conducted at the end of the implementation of the intervention program, students in the class waited for permission to speak to express their opinions in class, listened to their classmates and the teacher, expressed themselves clearly, in an appropriate tone of voice and in appropriate and respectful language, and the level of verbal violence decreased significantly.

At the level of the defined goal of a social game, the intervention helped in acquiring tools to manage a social game: observations conducted prior to the intervention found that students were disrespectful of the rules of the game, failed to divide into game groups, gave up the game before they lost, and many conflicts occurred. After the intervention, observations showed that students invited friends to play, managed to play together for a long time, enjoyed playing together, cooperated, followed the rules, lost respectfully, and won without humiliating the other person.

*Reaction stages results:*

according to students' reports, using the Reaction stages as an available, practical and clear tool has helped them avoid impulsive and violent behavior. At the beginning of the year, 51.7% of the children reported being victims of verbal violence, expressed in humiliation, insults, threats, social ostracism and boycott, compared to 17.24% at the end of the year.

At the beginning of the year, 24.13% of students reported suffering physical violence, compared to 10% at the end of the year.

At the beginning of the year, the percentage of children who required repeated treatment and activation of personal programs due to violent behavior was 30%, compared to 6% at the end of the year.

**Table 5.** Violent and victims compression

	Percent – before	Percent – after
Violent behavior (physical or verbal)	30%	6%
victims of physical violence	24.13%	10%
victims of verbal violence	51.7%	17.24%

**Figure 4.** Violent and victims compression

In terms of behavior, the reinforcement program was implemented: Throughout the intervention program, the process of self-monitoring became more accurate, honest, and realistic through written reflections. Students received more and more positive reinforcements for achieving the set goals. After goals were met and behaviors improved, the demand for positive behaviors was increased to maintain the reinforcements.

*Table Results Quality of life:*

The impact of the intervention program on students' quality of life and well-being was measured using student reports and twelve items related to three quality of life indicators related to the school environment. The indicators were selected from the QQL

questionnaire, which contains 21 items and a total of six quality of life indicators

**Table 6.** School function 5 -High QoL

School function (S)	Mean - Before	Mean - After
S1: I have close friends	3.6	4.13
S2: I am willing to share pleasure with classmates	3.6	4.1
S3: I have many other good friends	2.6	3.03
S4: Classmates will comfort me, when I feel down	2.9	3.86
S5: My teacher cares about me	3.6	4.23

**Table 7.** Learning ability (L) & Peer Relationships (P)

Learning ability (L) & Peer Relationships (P)	Mean – before	Mean – after
L1: I have difficulty with schoolwork	3.03	3
L2: I cannot understand the school courses	3.03	3.03
L3: I feel I cannot learn any better	3.1	3.06
L4: I do not have time to do school work	2.5	2.3
Peer Relationships (P)		
P1: My classmates exclude me	3.16	2
P2: I do not want to be friends with anyone	3.1	2.53
P3: I am bullied for no reason	2.73	2

1 -High QoL

*In terms of quality of life:*

Indicators related to functioning in school. Answer 5 means a high level of quality of life (Table 6).

For the index: I have close friends, the average of students' responses before the intervention program was 3.6. After the intervention program, the average of responses increased to 4.13.

In the index: I am willing to share joy with classmates, the average of students' responses

before the intervention program was 3.6. After the intervention program, the average of responses increased to 4.1. In the index: I have many other good friends, the average of students' responses before the intervention program was 2.6. After the intervention program, the average of responses increased to 3.03. In the index: classmates comfort me when I feel down, the average of students' responses before the intervention program was 2.9; after the intervention program, the average of responses increased to 3.86. For the index: my teacher cares about me, the average of students' responses before the intervention program was 3.6; after the intervention program, the average of responses increased to 4.23.

In all indicators of school functioning (s), an increase was observed after the intervention program. For the indices related to learning skills ((l) and relationship with peer group ((p), the response 1 indicates a high standard of living. (Table 7) In the indicators related to the ability to learn: For the index: I have difficulty with schoolwork, the average of students' responses before the intervention program was 3.06, and after the intervention program, the average of responses decreased to 3. The average response of the index: I cannot understand school subjects was 3.03 before the intervention program and remained unchanged after the program. In the index, I feel I cannot learn better, the average of students' responses before the intervention program was 3.1. After the intervention program, the average of responses decreased to 3.06. In the index I do not have time for school, the average of students' responses before the intervention program was 2.5. After the intervention program, the average of responses decreased to 2.3.

For the indices related to the relationship with the peer group. For the index: my classmates exclude me, the average of students' responses before the intervention program was 3.16. After the intervention program, the average of responses decreased to 2. In the

index: I do not want to be friends with anyone, the average of students' responses before the intervention program was 3.1. After the intervention program, the average of responses decreased to 2.73. In the index: I get bullied for no reason, the average of students' responses before the intervention program was 2.53. After the intervention program, the average of responses increased to 2.

## **8. Discussion**

School climate is influenced by a sense of support and responsiveness to individual needs, as well as fair and clear rules, order, discipline, organization, and care for the physical environment. Disorder, disciplinary problems, and a sense of alienation and lack of protection significantly affect the climate and do not allow the school to achieve its goals for development, teaching, and learning (Benvanishti et al., 2008). The intervention program primarily required the organization of the classroom, that is, the creation of the weekly and daily schedule and the creation of regularities and routines in the classroom. The organized and orderly structure of the environment is an important and central element in building a framework that facilitates productive learning academically and socially (Allen, 2010). Studies have shown a clear relationship between classroom organization, the establishment of clear and consistent rules and expectations, and an infrastructure that allows for student participation in decision-making, and a decrease in violence and bullying (Safran & Oswald, 2003). It can be concluded that maintaining an organized and orderly work environment has helped to improve classroom climate, which is reflected in the improvement of how students feel in the classroom by making more connections to learning and having a sense of safety.

The uniqueness of action research was demonstrated by activating a cognitive-

behavioral intervention program in a school setting with a large group of 30 students. Studies point to the power of the group and its influence on the effectiveness of any cognitive-behavioral intervention program (Wiborg, et al., 2015; Skjemov, et al., 2015). In addition, intervention programs that work at the level of groups of children have been shown to be particularly effective intervention tools for reducing behavior problems and improving prosocial behavior (Yavuzer & Karatas, 2013; Bowman-Perrott, et al., 2015).

Giesbrecht, Leadeater & Macdonald (2011) attribute great importance to the influence of the early elementary school years and the sense of security during those years on children's social, emotional, cognitive, and personality development. Many studies have found that in a situation where there is no protection, both the victim and the bully are at increased risk of developing social, emotional, and behavioral problems (Hanish & Guerra, 2002; Kochenderfer-Ladd & Skinner, 2002; Kochenderfer-Ladd & Wardrop, 2001; Leadbeater & Hoglund, 2009; Loeber & Farrington, 2000; McGinnis & Goldstein, 1997; Pope & Bierman, 1999). At the beginning of the year, prior to the start of the program, there was a significant disconnect between the high cognitive and academic abilities of the group and the students in it and their lack of implementation. This, along with social, emotional, and behavioral skills that were below their age. According to Apple (2007) and Weisbord (2007), there is a relationship between cognitive skills and self-control, information processing, and control over emotions as mechanisms that allow an individual to control and regulate their behavior and moderate the relationship between emotions and aggression. Behavior regulation and control of violent behavior allow individuals to acquire tools that help them behave socially using accepted social models (Moore et al., 2011). Going through

the process and internalizing the language resulted in significant improvement in the level of violence in the subject and feelings of protection. The reflective and metacognitive work impacted automatic responses and the system of beliefs and perceptions. It also helped students discover for themselves, for the first time, skills and potential in several areas, including mastering appropriate social discourse and finding a place in the social group.

The goal of the intervention program was to develop self-management skills in students through cognitive and behavioral tools to improve classroom climate and the quality of life and well-being of students in the class.

The intervention program led to an improvement in the students' regulation and self-monitoring skills. Something that expanded their awareness and personal responsibility (Kaniel, 2013). The results of the intervention plan illustrate the importance of teaching effective problem solving skills in various situations through a self-management circle. According to Smith & Daunic (2004), problem-solving skills can help monitor thoughts, i.e., act according to reality, monitor the results of monitoring, and manage the results of responding accordingly. The use of cognitive behavioral principles has the potential to change the way students think. Changing thinking and learning thinking and observation skills allow for the development and implementation of an independent self-management system and the learning of new behaviors (Harris & Pressley, 1991).

The results of the study show how through a slow and structured process, through small successes and reinforcements, self-management skills were acquired in the students. Self-management skills are a tool that students can use to deal with different situations and work on different defined goals. Through these skills, students were able to create a calm climate, regain a sense of protection and belonging compared to the stormy climate that characterized the class at

the beginning of the year.

Kaniel (2006) defines self-reflection in terms of "metacognition" or "inner eye." It can be assumed that the writing of daily reflections, monitoring, and daily use by students helped to acquire and internalize the tools. According to Kaniel (2006), the need for reflection and metacognition arises in complex situations that require a combination of cognition, emotion, and behavior. The requirement to conduct daily and aggressive reflections helped to internalize and work on reflective observation as a tool to examine thoughts, feelings, and behaviors. Several studies indicate the relationship between negative automatic thoughts and feelings of anger and violent behavior (Yavuzer & Karatas, 2013). The process of internalization and establishment involved regular classes in the system in which automatic thoughts, belief systems, perceptions, and cognitive patterns, feelings, and emotions that arise as a result and their effects on behavior were brought into awareness. Research results show that by changing automatic thoughts, students were able to moderate the emotion of anger and, as a result, moderate behavioral responses according to the level of reactions and broaden the range of possible responses in a given situation. This contributed to a positive classroom climate and an increase in the feeling of safety. The improvement in climate was reflected in student reports, a reduction in the percentage of physical and verbal violence, and a positive change in quality of life indicators related to school functioning.

## **9. Conclusion**

The purpose of the study was to examine the effect of an intervention program based on cognitive-behavioral principles on classroom climate, classroom interactions, the sense of safety of the students in the class and the teachers who teach in the class, the quality of life and well-being of the students in the class,

and the extent to which the students relate to social-emotional development and learning.

Prior to the start of the program, the classroom climate was turbulent, unyielding, and disrespectful. Students in the class reported a lack of a sense of belonging and a sense of protection, as well as a constant feeling of noise and disorder. These feelings prevented the implementation of interventions that would enable and promote learning. Students in the class and teachers reported a lack of legitimacy to express themselves in front of the class and a violation of their sense of competence, self-esteem, and ability to express skills in the cognitive domain. Students indicated that they found it difficult to initiate and sustain social activities in the classroom, such as conversations or social games. This reality caused a sense of constant frustration and a lack of appropriate response. Behaviors indicative of cognitive deficits and biases led to misinterpretation of everyday situations and maladaptive and disruptive behavioral responses, as well as a noticeable lack of reflective and metacognitive strategies. Over the years, the struggles described led to the development of negative social roles and images, associations based on a false background and having a negative and offensive effect. These reinforced the behavioral problems and created a closed circle that determined the fate and place of the individual in the class and the class as a group.

The intervention plan developed for the class was based on cognitive behavioral principles. The initial goal of the program was to build and establish a management and self-regulatory system in the students to provide them with tools to monitor their goals versus their actions, monitor the cognitive and emotional factors that influence behavior, and advocate for intentional self-change based on their will and their personal and group goals.

Through a long and consistent process, consistent semantics were established, tools were practiced and their use adapted, group

and personal goals were established, all with shared thinking, clear definition, and limited time. All children in the class acquired management and self-regulation skills at different levels. The individual work built the group and the group work supported the individuals.

There was an improvement in class climate, sense of security, quality of life indicators related to the school environment, legitimacy and belonging of the children in the class, and motivation to maintain and act for a positive atmosphere. Social interactions were created on a positive basis, social circles were expanded, and appropriate and respectful discourse skills and rules were established. Consistent facilitation improved feelings of support and belief in the ability to handle conflict and challenges, calmed the classroom atmosphere, and allowed for learning, initiative, and personal expression.

The study was conducted over one year and demonstrated the positive results of an intervention program based on cognitive behavioral principles for management and self-regulation skills, as well as the impact of the program, along with the acquired skills, on student performance in various domains. The approach proved to be appropriate, the process was successful and provided resolution. In addition, the degree of effectiveness of the group intervention program varied among the children and about 10% of the students in the class needed an individual intervention program at the same time.

The study did not include a control group to examine the effectiveness of another program or the natural developmental processes of puberty without the implementation of a program

The initiative to set up the program, its creation, implementation, monitoring, and analysis and drawing of conclusions were in the hands of the researcher. However, it must be remembered that this is one of the limitations of any action research (Shakdi, 2011).

In the future, it would be worthwhile to examine the impact on the specific group over time to assess long-term reasonableness and to examine the acquisition and implementation of the tools and their independent use. In addition, to provide continuity, self-management skills will need to be adjusted and the possible tools to manage additional situations will need to be expanded as students mature and enter adolescence.

It would also be interesting to adapt and study the functioning of the intervention program and its outcomes at different levels and for groups with different needs, as well as for prevention in groups without behavior problems

In addition, it is important to conduct a comparative study that examines the effectiveness of the specific intervention program compared to other intervention programs.

## **DETERMINANTS OF SUPPLY CHAIN MANAGEMENT PRACTICE IN HEALTH CARE: EVIDENCE FROM MIZAN-TEPI UNIVERSITY TEACHING HOSPITAL**

**Abstract:** *Supply chain management practices play a significant role in improving organizations' service delivery performance and keeping them competitive in the global marketplace. Taking this into account, the primary goal of this research is to examine the factors that influence supply chain management practice at Mizan-Tepi University's teaching hospital. This is the only study on supply chain management practices that has been conducted in the teaching hospital where the current study is being conducted. To achieve the study's goal, data was collected from 249 sample respondents using a simple random sampling technique. Furthermore, the data was examined using a variety of linear regression models. With the exception of transportation management, the research reveals that the explanatory variables: customer relationship management, quality information sharing, inventory management, and facility management all have a positive and statistically significant relationship with supply chain management practice. Distribution management, on the other hand, has been found to have a negative impact on supply chain management practices. Following the study's findings, the organization under consideration must prioritize the acquisition of reliable information in order to make the best supply chain management decisions. Furthermore, the hospital should use cutting-edge technology and implement an inventory control system. Finally, employees at Mizan-Tepi University Teaching Hospital involved in supply chain management practices should be trained about supply chain management, forecasting, and acquiring essential materials for teaching programs, medical services, and other laboratory equipment in order to apply effective supply chain management practices.*

**Keywords:** *Customer Relation, Supply Chain, Quality information, inventory management*

### **1. Introduction**

The supply chain is a subject that has been discussed inside institutions due to its importance in corporate management. By seeking out devoted suppliers,

manufacturers, and distributors who can assist them optimize their revenue, they seek to integrate the organization's internal divisions. A supply chain is typically described as an integrated system that coordinates a number of interconnected

Email: [zerihune@mtu.edu.et](mailto:zerihune@mtu.edu.et)

processes in order to: generate demand for products; acquire raw materials and parts; transform these raw materials and parts into finished products; add value to these products; distribute and market these products to either retailers or end-customers; and facilitate information exchange among various interrelated organizational entities (like suppliers, manufacturers, distributors, third-party logistics providers, and retailers (Ledlow, Professor, Manrodt, & Schott, 2016). A supply chain is a network of businesses, individuals, events, information, and assets used to move goods from a supplier to a customer. Every production system needs a flawless method of supplying its goods to customers and retailers (Bhuniya, Pareek, & Sarkar, 2021). Many healthcare organizations over the years have become involved in the routine tasks of acquiring the necessary medical tools and supplies, storing the necessary medications, distributing the proper medical supplies, and scheduling patient services without properly coordinating and synchronizing those tasks. When these tasks are handled as distinct organizational responsibilities, we run the risk of overspending on pharmacies and medical supplies, maintaining antiquated technology and medical equipment, and underutilizing healthcare personnel. In other words, by duplicating organizational efforts and resources, a lack of connectedness among various operations can result in the sub-optimization of corporate goals and inefficiency. It is must to recognize the strategic significance of planning, controlling, and creating a healthcare supply chain as a whole if we are to fully achieve the synergy of inter-functional and inter-organizational integration and harmonization across all healthcare activities (Al-Saa'da et al., 2013a).

### 1.1 Statement of the problem

Hospitals all around the world are under increasing pressure to save expenses and better manage their operations while still meeting the requirements of an increasingly demanding population. Logistics activities, which can account for up to 46 percent of the hospital budget, account for a major amount of hospital costs (Ledlow et al., 2016).

To deal with financial challenges in the midst of an economic downturn and budget cuts, many healthcare organizations have made deliberate efforts to cut costs by lying off healthcare workers; deferring investment in equipment and technology modernization; and improving the accuracy of demand forecasts for medical supplies and pharmaceuticals.

Although it sounds plausible, this traditional way of saving healthcare costs can backfire because staff reductions through layoffs can exacerbate worker (especially nurse) shortages; the failure to upgrade necessary medical equipment and technology can undermine productivity; and a reliance on forecasts can increase risk and uncertainty associated with the volatile and unpredictable aspects (e.g., emergent care and massive disease outbreaks) of medical supplies and pharmaceuticals. People must develop "more inventive and leaner" substitutes in light of the aforementioned possible drawbacks of conventional cost-saving techniques.

By removing non value-adding practices like "never events" (such as redundant medical procedures, unnecessary surgeries, excessive inventories of medical supplies, and outdated drugs), administrative red tape, and ambiguous healthcare pricing mechanisms, these alternatives should be created to improve patient value.

Adopting supply chain concepts is a possible approach that has just been suggested. Simply put, supply chain principles seek to

eliminate wasteful spending, investments, and activities in order to streamline all healthcare processes related to locating required medical supplies or pharmaceuticals, producing healthcare goods or services, marketing (selling) healthcare, and delivering healthcare goods and services. The supply chain principle is regarded as a new method of conducting business because it no longer heavily relies on forecasts; fulfills medical orders as they are needed rather than requiring patients to follow predetermined routine but unnecessary medical procedures; and enables both patients and healthcare professionals to make informed healthcare decisions(Souza, Guilherme, Antunes, & Grutzmann, 2022). With the goal of enhancing operations, enhancing service delivery, and lowering costs, supply chain management includes actions involved in regulating the flow of information, products, services, and finances among supply chain participants (Odhiambo, 2014).

In the healthcare industry, supply chain management is a complex system that handles the resources and services associated with patient care. Enabling product visibility in the distribution network and ensuring timely delivery are the two main goals of supply chain management in the healthcare industry. The healthcare industry consists of businesses that produce drugs and medical devices, offer healthcare services and insurance, and support the delivery of healthcare to patients. The healthcare industry has two purchasing alternatives depending on the type of supplies. One option is to buy through a primary distributor with a contract, and the other is to buy through a government medical organization that contracts with a manufacturer and purchases on behalf of a number of people(Achuora, Arasa, Ochiri, & Muangangi, 2010).

The total end-to-end visibility of information among suppliers, manufacturers, distributors,

and customers should be guaranteed via supply chain management in the healthcare industry. The health care supply chain is more complex due to the involvement of the government, regulatory bodies, and insurance providers(Phyllis, 2021). A well organized and connected supply system must be in place in order for the healthcare service providers to be able to get treatment supplies and the equipment required for the patients' healthcare.

The supply chain is an important platform to deliver daily life necessities in the current abnormal situation(Management, 2021). Understanding Supply chain Practice is essential in the modern world if you want to increase supply chain performance. Supply chain Practice Metrics Clearly Demonstrate How Well An Institution Handles Its Customers In Terms Of Quality And Efficiency To Increase Customer Value For Goods And Services, An Institution's Ability To Meet Their Needs(Wong, Tan, Lee, Ooi, & Sohal, 2020).

In order to fully satisfy a customer's desire and request, a supply chain that includes all levels of manufacturers and suppliers, transporters, warehouses, retailers, as well as the end users, is ultimately linked to customer satisfaction and meets their needs, which in turn generates profits for the company itself. Service sectors in Africa and Ethiopia in particular, are currently facing challenges similar to those that exist anywhere else in the world where competition is fierce. As a result, multinational corporations and other import-substitute businesses, whose profitability is significantly influenced by the caliber and standard of the supply chain, are required to improve the quality of their products, reduce costs, offer better services, and supply a wider range of products, all fulfilled at competitive price (Farzianpour, Hosseini, Amali, Hosseini, & Hosseini, 2012).

According to the statement (Babbar, Addae, Gosen, & Prasad, 2008) of many businesses

are unable to expand the potential of their supply chains since performance indicators and metrics intended to integrate the chain more effectively were not implemented, which might have improved the efficacy and efficiency of the businesses. Despite the fact that many people are aware of the advantages of supply chain management in the normal course of business, there are still many more who are unaware of just how crucial and helpful it is to connect chains and monitor performance using metrics. According to household surveys conducted in southern Africa, about 20% of patients who visit public health facilities are discharged without receiving any medication as a result of stock outs and shortages.

Numerous studies have been conducted to examine how supply chain management practices affect how well organizations perform. From these studies, (Refera, 2019) examined the impact of service supply chain management practices on the organizational performance of the public health care sector and discovered a favorable correlation between them (Refera, 2019) investigated the impact of supply chain management on the caliber of healthcare services.

With regard to supply chain management practice, Mizan-Tepi University Teaching Hospital has various problems. The following are the main issues with the Mizan-Tepi university teaching hospital supply chains management practice, as identified by the hospital's SWOT analysis. The work is not patient-centered because there is a lot of paper work for the auditable pharmaceutical transaction service, which results in a high work load on the professionals. Most of the time, essential medicines for the hospital are out of stock, bin cards are not properly filled out, there is a shortage of qualified staff at the supply position, there is inadequate storage space for the medicines, there are no standardized shelves for the medicines, there is forecasting, procurement, and quantification

problems.

Therefore, the hospital's practice of efficient and effective supply chain management is hampered by this and other unmentioned issues. As a result, the focus of this research is to analyze the factors that affect Supply chain management Practice: evidence from Mizan-Tepi University Teaching Hospital. Moreover, this study is framed with three major objectives; the first objective is to analyze factors affecting supply chain management practice of the study organization. The second is to describe which factors highly influence supply chain management practice in the study area. Finally, the research's practical implications should be communicated to relevant stakeholders. The researcher attempted to fill the following gap: some of the explanatory variables included in this study were not considered in previous studies. Furthermore, prior research did not consider how the variables listed in this manuscript interact; as a result, the researcher does so in this manuscript. Due to the region's recent establishment and a lack of research, this is the only study on the supply chain management practices of Mizan-Tepi University's teaching hospitals in south-west Ethiopia.

The fact that professionals in the sciences, technology, and business must collaborate with great expertise and coordination to provide cutting-edge medications to service organizations motivates the researcher. However, by beginning to consider supply chain management (SCM) at the very beginning of the service delivery cycle, it may be possible to significantly improve the success of those efforts. The researcher hopes to help the management of the Mizan-Tepi University teaching hospital and other readers realize their full potential by focusing on a variety of levels.

The study's contribution is that appropriate supply chain management aspects must be designed and implemented by managers.

Second, the study can be used by managers to develop strategic plans for hospital supply chain management in general, and specifically for Mizan-Tepi University Teaching Hospitals. Furthermore, the study may pave the way for additional research by other researchers and the scientific community in the future.

## 2. Literature Review

### 2.1 Definition of supply chain Management

The goal of industry managers is to increase profit while maintaining client satisfaction. In modern times, a shorter lead time is one of the most important criteria for client satisfaction. Lead time and variance are regarded as controllable factors that can be altered in order to acquire a precise cost rather than a rough estimate. To produce more accurate findings, the marginal inventory and marginal backorder were estimated (Dey, Bhuniya, & Sarkar, 2021). So do get benefit of all those things the managers of organization should understand the determinants of supply chain management practice.

The term "supply chain management" became popular after a flurry of articles and books on the subject were published in the mid-1990s. Supply chains were originally defined as all activities associated with the flow and transformation of goods from raw materials to the end user, as well as the associated information flows. Supply chain management was defined as the integration of supply chain activities through improved supply chain relationships to gain a competitive advantage (Alhassan & Akudugu, 2020)

Supply chain management in business refers to the regulation of the movement of goods and services between organizations and locations. This can involve the transportation and storage of raw materials, inventories for

work-in-progress and finished goods, and the complete order fulfillment process from the point of origin to the site of consumption. Networks, channels, and nodes that are interconnected, interrelated, or linked operate together to deliver goods and services to end users in a supply chain (TA, BUI, CANH, DANG, & DO, 2020).

Supply chain management has been defined as the "design, planning, execution, control, and monitoring of supply chain activities with the objective of creating net value, building a competitive infrastructure, leveraging worldwide logistics, synchronizing supply with demand, and measuring performance globally" (Hrinchenko & Economics, 2017). SCM practice is heavily influenced by industrial engineering, systems engineering, operations management, logistics, procurement, information technology, and marketing (Parfenov, Shamina, Niu, & Yadykin, 2021) and it aspires to be an integrated, multidisciplinary, multi method approach (Blecker, Kersten, & Ringle, 2015)

The Council of Supply Chain Management Professionals (CSCMP) defines supply chain management as the planning and management of all activities related to sourcing, procurement, conversion, and logistics management. Coordination and collaboration with channel partners, who could be suppliers, intermediaries, third-party service providers, or customers, is also included. The integration of supply and demand management within and across organizations is referred to as supply-chain management. The Extended Enterprise is a network of companies that work together to provide loosely coupled and self-organizing goods and services (Prakash et al., 2021).

### 2.2 Historical Development of SCM

Keith Oliver coined the term "supply chain management" in 1982. The concept of a supply chain, however, was important in

management long before that, particularly with the invention of the assembly line in the early twentieth century. The need for large-scale changes, re-engineering, and downsizing driven by cost-cutting programs, as well as widespread attention to Japanese management practices, define this era of supply-chain management. However, the term became widely used following the publication of the seminal book *Introduction to Supply Chain Management* by (Schredelseker & Hauser, 2008).

The era of supply chain management integration began in the 1960s with the introduction of electronic data interchange (EDI) systems and ended in the 1990s with the introduction of enterprise resource planning (ERP) systems. With the expansion of Internet-based collaborative systems, this era has continued into the twenty-first century (Techt, 2015).

Higher value-added and cost reduction through integration distinguishes this stage of supply chain evolution (Alifia, 2021). A supply chain network has three stages: stage 1, stage 2, and stage 3. In a stage 1 supply chain, systems such as production, storage, distribution, and material control are not linked and operate independently. In a stage 2 supply chain, these are combined into a single plan, and enterprise resource planning (ERP) is used (Becker et al., 2021)

The globalization era, the third stage of supply-chain development, is distinguished by a focus on global systems of supplier relationships and the expansion of supply chains beyond national boundaries and into other continents. Despite the fact that global sources have been used in organizations' supply chains for decades (for example, in the oil industry); it wasn't until the late 1980s that a significant number of organizations began to integrate global sources into their core business (Wood & Duong, 2022). This era is defined by the globalization of supply-chain management in organizations with the goal of increasing competitive advantage,

adding value, and lowering costs through global sourcing (Fitoussi & Saraceno, 2013).

In the 1990s, businesses began to emphasize "core competencies" and specialization. (Wood & Duong, 2022) They abandoned vertical integration in favor of third-party outsourcing of non-core operations. Management requirements changed as the supply chain expanded beyond the company's walls and management was distributed across specialized supply-chain partnerships. This transition also refocused the fundamental perspectives of each organization (Aminata, 2017).

### 2.3 Supply chain Management theories

#### Theory of Constraints on Supply Chain

Goldratt's Theory of Constraints is by far the most popular approach to supply chain management (Triestch 2005). The theory of constraints is a management paradigm that views any manageable system as being limited in achieving more of its goals by a very small number of constraints. As such, TOC employs a focusing process to identify the constraints and restructure them in order to increase system throughput (Jell-Ojobor & Raha, 2022) This is consistent with the views of (Al-Saa'da et al., 2013b), an early proponent of the theory of constraint, who identified bottlenecks as the underlying inefficiencies of most processes. The theory of constraints is based on the premise that a goal-oriented system's ability to achieve its goals is limited by at least one constraint (Junge, 2020).

Overall output and system goals can only be achieved by increasing flow through the constraint(s) (Fung, Korhonen, Li, & Ng, 2012). Assuming the system's goal and measurement have been articulated, the steps include identifying the system's constraint, deciding how to exploit the constraint, subordinating everything else to align the

entire system, and making changes (Prakash et al., 2021). According to Jell-Ojobor & Raha, (2022), constraints can be external or internal to the system and include phenomena such as equipment constraints, policy and regulation, a lack of skilled people, and so on. The theory of constraints has been used in supply chain management to provide solutions for increased inventory availability and flow by identifying and managing constraints such as replenishment time, lead time, and late deliveries (Brzeziński & Cyplik, 2020). Any advancement in these areas will increase the availability of products and services to customers.

### General Systems Theory on Supply Chain

Helou & Caddy, (2006) indicated that Von Bertalanffy 1969 developed the general systems theory in the field of biology, and (Yourdon, 2006) extended it into management paradigms. (Helou & Caddy, 2006), a biologist who discovered that given the interaction between a system's components, a system was frequently more than just the sum of its components; it involved the interaction of components differently within the larger system.

Most real-world systems, according to (Helou & Caddy, 2006), are open systems that interact with, and are frequently influenced by, the external environment. Another crucial system concept is the definable boundary, which separates a system from its surroundings while allowing inputs and outputs into and out of the system (Ullman & Kleidon, 2019) The general systems theory, according to (Wang, Heng, & Chau, 2006) identifies four general systems principles. These are the guiding principles: The more specialized or complex a system is, the less adaptable it is to its environment; the larger the system, the more resources are required to support the system; systems frequently contain other systems and

are components of larger systems; and systems grow in proportion to the resources allocated to the system.

Supply chains are defined as systems that provide a continuous flow of goods, products, or services to consumers (Schredelseker & Hauser, 2008). The contribution of general systems to the supply chain can be seen from the perspective that the supply chain is a system with inputs and expected outputs to inform supply chain management. According to Sangode, (2016), the supply chain includes the management of information systems, sourcing and procurement systems, logistics systems, and order and customer service systems, and integration of these activities can be used to gain a competitive advantage through improved relationships between these systems. The general systems theory allows for the differentiation of subsystems and variables that operate within a supply chain, resulting in a better understanding of the supply dynamics for further study and improvement.

### 2.4 Empirical Review

Global markets offer a diverse range of products of varying quality and price. As a result, organizations are constantly competing to reduce costs while improving quality. Customers want more options, better service, higher quality, and faster delivery, according to (Donaldson, 2012) Relationships with customers have evolved into a strategic issue for today's businesses. In order to meet the demand for smart products on the worldwide market and increase profits, the supply chain members look at a number of difficulties, including producing goods, transporting them, and delivering them to customers on time (Management, 2021).

The most important performance driver in the SC is information sharing (Fawcett, Osterhaus, Magnan, Brau, & McCarter,

2007). Information links various SC partners and enables them to coordinate their activities. Information is critical to daily operations at each stage of the SC. An information system can assist a business in quickly delivering a wide range of customized products to customers as well as understanding changing customer tastes and preferences (Marinagi, Trivellas, & Reklitis, 2015).

Continuously sharing new information with key individuals in a timely and qualitative manner assists managers in making better decisions, which leads to improved performance (Kembro, 2015). Many benefits of information sharing in SCs include reduced bullwhip effect, better coordination among various activities, making better decisions, and reducing uncertainties in SCs (Yucel, Cebi, Hoege, & Ozok, 2012). By making information available and sharing it with partners, an organization can increase the flow of information within SC, improve productivity and effectiveness, and reduce response time to market.

As a result, information sharing provides a competitive advantage to SC partners (Fawcett et al., 2007). Sharing information reduces uncertainty in SC, reducing the need for safety stock. Lee, Lee, & Schniederjans, (2011) investigated the impact of information sharing in a divergent SC and discovered that it reduced costs by 22% on average.

Inventory control entails ensuring that the correct goods are on hand to avoid stock-outs, shrinkage, and incorrect accounting. The costs incurred must be balanced against the costs saved by stockpiling the material. There are two basic decisions that must be made for each item kept in inventory (Brzeziński & Cyplik, 2020). These decisions concern both the timing and size of orders for the item. As a result, decisions about "when" and "how much" to order are included in the inventory control mechanism. Independent-demand inventory

systems are classified into two types: periodic review and continuous review. The inventory position is reviewed at regular intervals (during review periods) in the periodic review system, and an appropriate quantity is ordered. So, periodic inventory review entails counting and documenting inventory at predetermined intervals (Philippines, 2019). A retail store with a periodic review policy, for example, might count inventory at the end of each month. Periodic inventory reviews reduce the amount of time a business owner or manager spends analyzing inventory counts, giving them more time to focus on other aspects of the business (Parfenov et al., 2021). However, for businesses with high-volume sales, it may not provide accurate inventory counts. Between inventory review periods, the owner or manager must make assumptions about inventory counts (Brzeziński & Cyplik, 2020).

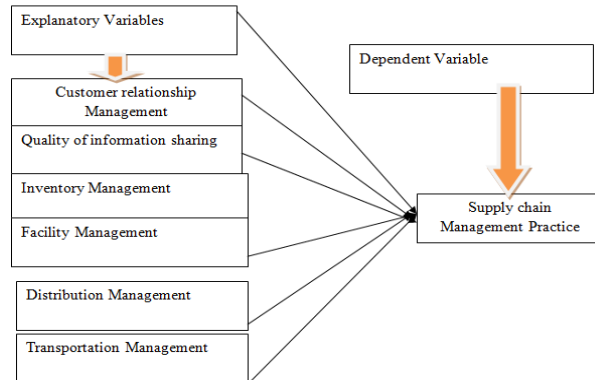

In Ghana and Guatemala, researchers compared the inventory performance of centralized and decentralized warehouse management models. The findings indicate that using centralized guidelines and standardized processes such as SOPs and clear stock cards improved performance (Fung et al., 2012). The findings are consistent with those of Postacchini, Ciarapica, Bevilacqua, Mazzuto, & Paciarotti, (2016) who discovered that inventory management is critical to the function of commodity management because a bullwhip effect is likely to occur and impede health service delivery without proper inventory systems.

Limited funds for vehicle purchase, maintenance, repairs, fuel, and driver salaries are some of the transportation and distribution challenges (Brilka & Clausen, 2021). Logistics costs account for 13% of the stock value of essential health commodities in Ghana. Low distribution costs and high service quality are competing interests. When distribution frequency is

high, transportation costs are high, but the demand planning horizon is more reliable,

with fewer stock-out situations (Parfenov et al., 2021).

**Figure 1.** Conceptual frame work

### 3. Method and Materials

This study was conducted at Mizan-Tepi University teaching hospital, which is located in Bench-Sheko zone, Mizan-Aman city administration, SNNPRS. The hospital staff members who participated in this study are the respondents, and they range from front-line employees to senior managers. Medical professionals, office personnel, procurement department employees, budget and planning program office, cafeteria workers, instructors, and head department.

According to, explanatory research designs "attempts to clarify why and how there is a relationship between two aspects of a situation or phenomenon." The purpose of this research was to examine factors affecting supply chain management in Mizan-Tepi University teaching hospital and their effect on hospital performance. The study adopted a descriptive and inferential mixed research approach (both quantitative and qualitative) to gain information about research in the organization. According to (Muthoni & Maitho, 2019), mixed approach research involves combining or integration of qualitative and quantitative data. Qualitative data tends to be open-ended without predetermined responses.

Quantitative data usually includes closed-ended responses, such as those found on questionnaires or instruments, such as in epidemiological studies.

A structured questionnaire was used to collect data, and it contained pertinent questions about the Mizan-Tepi University teaching hospital's supply chain management practice. Besides, interviews with employees of the teaching hospitals, supply chain management, procurement department, and each department head were asked to acquire information on the topic. A questionnaire makes it possible to structure the questions and gather responses without directly speaking to each respondent. It is a very adaptable instrument with the benefits of a structured style, ease of use for responders, affordability, and speedy administration for a large number of cases (Almalki, 2016). In order to gather data for this study, the researcher constructed Likert scale questionnaires. Interviews made more sense for questions that needed to be probed in order to get enough information. Interviews assist in collecting both verbal and nonverbal inquiries and maintaining concentration while gathering data. The benefit of employing interviews is that they enable the introduction of variance and on-the-spot

explanations (Betcheva, Erhun, & Jiang, 2021).

Thus, interviews were given purposively to some selected hospital employees in order to supplement the data gathered through questionnaires. It was employed to translate the information gathered via questionnaires. Additionally, it was utilized to supplement data that was not gathered through the use of a questionnaire or secondary sources.

### 3.1. Population, Sample and Sampling Techniques

Out of the 660 total populations, 249 employees were chosen using the Yamane formula cited by (Sustainability, 2014). The employees had to be selected as respondents because of the nature of sampling techniques, which give equal chance to all respondents.

$$n = \frac{N}{1 + N(e)^2} = \frac{660}{1 + 660(0.05)^2} = 249$$

### 3.2. Method of Data Analysis

When assessing the items on the questionnaire for validity, the researcher used a five-point Likert scale. The researcher additionally used the interview method of data collection to triangulate with the findings of the data acquired via the questionnaire in order to validate the final results. Reliability is the quality of a measurement tool's consistency or dependability. The internal consistency of the instrument's parts was assessed using Cronbach's alpha. The reliability was then evaluated in light of the estimated means for each variable. The reliability of the instrument was evaluated using the SPSS program and the Cronbach's coefficient-alpha. If the measurement is reliable, there is a lower chance that the resulted score is the consequence of random factors and measurement error as (Ayalew, 2021) cited

Kothari 2004. Depending on the objective of the study, a variety of regression, correlation, and descriptive models were utilized in the analysis. The data to be gathered from the respondents was examined using the Statistical Program for Social Science (SPSS) version 24.

The collected data was analyzed using descriptive statistics and empirical statistics. Before analyzing the data, it was sorted and entered into SPSS software. Of the interview were analyzed using triangulation with the findings of questionnaires and document analysis. Through the use of correlation analysis, the relationship between two or more variables was determined in this study. A statistical technique called correlation can be used to ascertain whether there is a relationship between two variables.

The amount, direction, and severity of the association (from -1 to +1) are revealed by the Pearson correlation coefficient. The researcher could use the outcome to calculate the regression on the dependent variable. Because Pearson correlation coefficient approaches typically produce statistically accurate findings, they are one of the most widely utilized types of correlation coefficients. The symbol for the person correlation coefficient is r. The following correlation coefficient value ranges illustrate the strength of correlation according to (Samuels, n.d.) Suggestions: Both descriptive statistics and empirical statistics were used to analyze the data that was gathered. The data from the interview was triangulated with the results of questionnaires and document analysis before being analyzed using SPSS software. In this study, the association between two or more variables was established using correlation analysis. To determine whether there is a relationship between two variables, correlation statistical analysis can be employed. The Pearson correlation coefficient reveals the size, direction, and strength of the link (ranging from -1 to +1).

The results could be used to calculate the regression on the dependent variable by the researcher. One of the most commonly used types of correlation coefficient is the Pearson correlation coefficient technique, which typically yields statistically reliable results.

The letter *r* is used to represent the Pearson's correlation coefficient. The following correlation coefficient value ranges demonstrate the strength of correlation, in accordance with (Canberra Group, 2011) recommendations: A method for estimating or forecasting the value of some dependent variables based on the value of one or more independent variables is called linear regression analysis. Similar to correlation, statistical regression looks at how different variables are related to one another. But prediction is the main goal of regression. Multiple regressions were used in this

analysis the inter-correlation of all the variables involved is considered in multiple regression analysis.

The dependent variable (organizational performance) and the six determinants make up the majority of the regression equation used in this study (inventory management, quality of information sharing, facility management, distribution management, customer relationship management, and transportation management). Regression analysis is being used in this study with the primary goal of improving the study's ability to describe, comprehend, and forecast the stated variable. The following equation represents the multiple regression equation for the chosen variable:

$$\text{Model equation: } Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \beta_4 X_4 + \beta_5 X_5 + \beta_6 X_6 + e$$

**Table 1.** Comparison Table with the previous work

Variables			Model					
Dependent variable			Supply chain Management practice			$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \beta_4 X_4 + \beta_5 X_5 + \beta_6 X_6 + e$

**Note:** - ((Yes) indicates that the previous researcher took the variable into account, and (No) indicates that they did not include the variable in their respective model.

**4. Analysis and Discussion**

**4.1 Descriptive Analysis**

In order to show the degree of agreement or disagreement among respondents with reference supply chain management determinants and their effect on booming hospital performance in the case of Mizan-Tepi University teaching hospital, descriptive statistics is presented in the form of mean and standard deviation. On a five point Likert scale, the respondents' responses to the variables listed below were evaluated. According to the (Mulugeta, Gsd, & Chane, 2017) cited (Zaidatol and Bagheri 2009), summary, using Likert scales, mean values of less than 3.39 are considered low, 3.4 to 3.79 are considered moderate, and greater than 3.8 are considered high. Thus Given the precise description of collective elements in table 1 below, the mean score indicated that these factors had an impact on Supply chain management Practice. According to the table, the overall perceived mean value and its standard deviation for customer relationship management are 4.09 and 0.604; for quality information sharing it is 3.98 and 0.459; for inventory management it is 4.09 and 0.499; for facility management it is 3.74 and 0.562; for distribution it is 3.89 and .947; and for transportation it is 3.75 and .484. In keeping with the aforementioned premise, the six components' overall perceived mean score is 3.95. The hospital's Logistic and Supply chain management Practice is described by the descriptive result of 4.12. Summarized by (Mulugeta et al., 2017) mean values of greater than 3.8 are considered high. As a result, the Mizan-Tepi University Teaching Hospital's Supply chain management Practice is high. According to the results of descriptive statistics, the following elements might be ranked in the order of importance for supply chain management in hospitals: management support, reward, employee perception,

teamwork, communication, and training.

**Table 2.** descriptive statistics of factor affecting Supply chain management Practice

Statistics	Descriptive		
	N	Mean	Std. Deviation
Customer relationship management	249	4.09	.604
Quality of information sharing	249	3.98	.459
Inventory management	249	4.09	.499
Facility management	249	3.74	.562
Distribution management	249	3.89	.947
Transportation management	249	3.75	.951
Supply chain management Practice	249	4.12	.484
Valid N (listwise)	249

**4.2 Inferential Analysis**

**4.2.1 Correlation Analysis**

The association between the two sets of data is stronger when the correlation value is larger. A perfectly linear positive or negative relationship exists when the correlation is 1 or -1. There is no association between the two sets of data when the correlation is 0 (Bušatlić & Musić-Kilic, 2018). The Pearson's Product Moment method was used to obtain the inter-correlation coefficients (r). According to (Gu, Schniederjans, & Cao, 2015), the correlation coefficient (r) indicates no correlation if it is between + 0.00 and + 0.20; weak correlation if it is between + 0.21 and +0.40; moderate correlation if it is between + 0.41 and +0.60; strong correlation if it is between + 0.61 and +0.80; and very strong correlation if it is between + 0.81 and + 1.00. The association between the two sets of data is stronger when the correlation value is larger. A perfectly linear positive or negative relationship exists when the correlation is 1

or -1. There is no association between the two sets of data when the correlation is 0 (Fakhimi & Raisy, 2013). The Pearson's Product Moment method was used to obtain the inter-correlation coefficients (r).

**Table 3.** Pearson's product Moment correlation coefficient

Range	Relationship strength
±0.81 to ±1.00	very strong
± 0.61 to ± 80	Strong
± 0.41 to ±60	Moderate
± 0.21 to ±0.40	Weak
± 0.00 to ±20	None

Source: (Guilbault & Hjelm, 1989) and (Gu et al., 2015)

The following section presents the results of Pearson's product moment correlation on the relationship between Customer Relationship Management, Quality Information Sharing, Inventory Management, Facility Management, Distribution Management, and Transportation Management with Hospital

Supply chain management Practice. The study tried to measure the relationship between predictor variables and Supply chain management Practice. The correlation reveals that inventory management (r = 0.907), quality information sharing, and customer relationship management (r = 0.867 and 0.835) are strongly correlated with Supply chain management Practice, respectively. This implies that improvement given in the areas of inventory management, quality information sharing, and customer relationship management can bring remarkable results in Supply chain management Practice in the study area. Similarly, facility management was moderately correlated with Supply chain management Practice with an r = 0.564. And distribution management is weakly correlated with Supply chain management Practice (r = 0.342).

Where: SCMP (Supply chain management practice), CRM (Customer Relationship Management), QISH (Quality Information Sharing), IM (Inventory Management), FM (Facility Management), DM (Distribution Management), and TM (Transportation Management).

The customer relationship management and Supply chain management Practice correlation analysis in Table 3 was ( $r = 0.835$ ,  $p < 0.000$ ), indicating a favorable and significant link with supply chain performance. This suggests that variables will be crucial in improving future supply chain performance. This study's findings were supported by earlier research done by (Nwachukwu & Hieu, 2021). Their study found that Supplier and customer relationship management practices are significantly related to financial health, market and sales performance, and operational performance. Furthermore (Gu et al., 2015) found the perception of direct and indirect network externalities has the potential to moderate technology adoption relationships in supply chain organizations, suggesting the impact of other moderating variables should be considered as factors in adoption and diffusion of technologies in supply chains.

The correlation analysis between quality information sharing and Supply chain management Practice on Table 3 was positive and very strong relationship ( $r = 0.867$ ,  $p < 0.000$ ). This indicates that quality information sharing has great role to enhancing Supply chain management Practice. This finding is in line with finding of (Marinagi et al., 2015), they suggests that Higher overall performance is made possible by partners along the supply chain sharing information. Information quality and reliability have improved as a result of essential supply chain management practices. Whereas, (Gebisa & Ram, 2021)'s analysis reveals that there is no direct relationship between information sharing and organizational effectiveness. Its linkage is mediated by supply chain partners' collaborative activities. This implies that although information sharing is important, it is not sufficient to enhance performance significantly by itself.

The correlation analysis between Inventory management Supply chain management Practice was positive and strong with ( $r = 0.907$ ,  $p < 0.000$ ). Inventory management also have great role for increasing Supply chain management Practice as previous variable. (MENG, 2006) as recommend in 2006 Inventory management that is efficient allows for speedy achievement of the procurement objective. Inventory serves as the link in the supply chain as a whole. When inventory management is optimized, upstream activities will operate efficiently and downstream activities will continue without interruption.

The correlation analysis between Facility management and Supply chain management Practice is ( $r = 0.564$ ,  $p < 0.000$ ) the positive and moderate relationship results. This indicates that the variables are plays a moderate role to enhancing for Supply chain management Practice in the future. The correlation analysis between distribution Management and Supply chain management Practice is ( $r = 0.342$ ,  $p < 0.000$ ) the positive and weak relationship results. This indicates that the variables are plays a minor role in enhancing Supply chain management Practice. The finding is supported by researchers like Distribution and Supply Chain Management (Stobbe, 2008) a strategic collaborative approach with customers and suppliers can deliver even greater benefits. Distribution can also play a major role in making the firm more environmentally responsive. All channel and supply chain efforts are designed to increase customer service. The intent is to delight the customer.

The correlation analysis between transportation and Supply chain management Practice is ( $r = 0.033$ ,  $p < 0.602$ ) is not correlated. This indicates that these variables do not have impact on Supply chain Practice in the study area. But the study conducted by (Crainic & Laporte, 2016) stated that we wish to focus on the distribution

management activities of the supply chain that happen between manufacturing sites and end users in "Transportation in Supply Chain Management." This is a rapidly expanding field with major economic and scientific implications.

### Multiple Regression Analysis

Major assumptions should be used to test multiple regression models. The outcomes of the researcher's testing of the main hypotheses, including the linearity assumption, multi co linearity, outliers, normality, and Homoscedasticity assumption, are as follows.

Assumption #1: Linearity test the relationship between IVs and the DV is linear.

**Figure 1.** Scatter plot dependent variable with one of independent variable

SPSS output (2022)

According to the scatter plot created by SPSS, a straight line might be used to model the relationship between the IV and DV, indicating that it is a linear relationship. The assumption of linearity is that there is a linear relationship between two variables. In a scatter plot, the data will fall in a straight line or a cluster that is nearly straight if the

variables are linearly connected (Nancy, Karen, and George, 2005). With this thought in mind, it would be possible to comprehend the data in Fig. 4.1, which depicts a relatively shaped fall in a cluster rather than a curve or bend line. The data is linear as a result.

Assumption #2: Multicollinearity Test

**Table 5.** Multicollinearity Statistics

		Coefficients <sup>a</sup>	
Model	Co linearity Statistics	Tolerance	VIF
		1	Customer relationship management
	Quality of information sharing	.356	2.806
	Inventory management	.226	4.418
	Facility management	.712	1.405
	Distribution management	.640	1.563
	Transportation management	.978	1.022

a. Dependent Variable: Supply chain management Practice  
 Source: SPSS result (2022)

If your predictors are correlated, the VIF quantifies the increase in variance of an estimated regression coefficient (De Leeuw, 2009) Multicollinearity (also known as collinearity and inter-correlation) the researcher used the variance inflation factor approach to determine whether the explanatory variables were multicollinearity. When VIF is greater than 10 and tolerance is less than 20%, there is a chance of multicollinearity. The VIF value for this study is 4.41, which is lower than the 10 and tolerance greater than 0.27. As a result, there is no multicollinearity issue, even though variables have a loose correlation.

Assumption #3: The values of the residuals are independent

The Durbin-Watson statistics showed that this assumption had been met, as obtained the value range from 1.5- 2.5 ,Durbin Watson =1.831 (Chatfield, 2014).

Assumption #4: Homoscedasticity test

At every point along the model, the same basic assumption is tested to determine how much the residual (or amount of error in the model) varies. The scatter plot that was generated at the outset can help us understand this. Plotting the standardized value our model would predict against the standardized residuals found will allow us to evaluate the assumption.

**Figure 2.** Scatter plot of supply chain performance  
 Source: SPSS output (2022)

Our plot of the standardized residuals vs the standardized predicted values revealed no strong indications of funneling, indicating the Homoscedasticity assumption has been satisfied. Plotting the residual versus the expected value is one way to identify Homoscedasticity. Consequently, look for a modification in the distribution of the

depicted dots (La Moreaux & Doe, 2012).

Assumption #5: Normality test

Normality relates to the shape of the data distribution for an individual metric variable and its relationship to the normal distribution. One of the methods that will determine normality is the assessment of the variable level of skewness and kurtosis.

**Figure 3.** Histogram  
Source: SPSS output (2022)

When the curve does not pass through either the left or the right side of the data distribution, as it is described in histogram presentation, normality is present (Gujirati,

2004). The data indicated that it was normally distributed, as shown in the histogram.

**Figure 4.** P-P plot of standardized predicted value  
Source: SPSS output (2022)

A P-P plot (probability–probability plot) is another helpful graph that the researcher can check to see if a distribution is normally distributed. The plots, according to Hair, (Hair, Anderson, Babin, & Black, 2010) differ from residuals plots in that the normal distribution is used to compare the

standardized residuals. The plotted residuals are compared to the normal distribution's diagonal, which is typically a straight line. In the event of a normal distribution, the residual line will nearly resemble the diagonal (Pan, 2013). Therefore, the data was normally distributed, as shown in the picture

below. The residual values are normally distributed. The P-P plot for the model indicated that the residuals' assumption of normality was fulfilled.

**Reliability test**

Cronbach's alpha was utilized as the indicator in a reliability analysis to evaluate the reliability of the Likert scale that was employed in this study. A reliability coefficient of 0.7 was deemed to be sufficient. The reliability coefficient from Table 5 under was reported in this case, showing that the Likert scale had a sufficient level of internal consistency.

Reliability Statistics	
Cronbach's Alpha	Number of Items
.752	7

**Figure 5.** Reliability test  
 Source: SPSS output (2022)

Just by looking at the items, the researcher

**Table 6.** Model summary

Model Summary <sup>b</sup>				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.953 <sup>a</sup>	.909	.907	.148

a. Predictors: (Constant), Transportation management, Quality of information sharing, Distribution management, Facility management, Customer relationship management, Inventory management  
 b. Dependent Variable: Supply chain management Practice

Source: Data output (2022)

The aforementioned regression model shows how much variance in the kaizen implementation measure can be accounted for by the underlying independent variables. R: This value, which ranges from 0 to 1, represents the value of the various correlation coefficients between the predictors and the outcome. A bigger value denotes a stronger correlation, and a value of 1 denotes an equation that accurately predicts the observed value.

R square (R<sup>2</sup>) indicates the proportion of variation that can be explained in the

would conclude that the test is a reliable indicator of the concept being assessed. The majority of the items included in the instrument were matched to the concept, according to the researcher's evaluation of how well each measuring item matched the idea's provided conceptual domain. As a result, it demonstrates appropriate instruments for this investigation to reach an acceptable conclusion.

**4.3 Multiple regressions**

Since a multiple regression equation determines the best-fitting line based on the method of least squares, multiple regressions was also employed to determine the degree to which the explanatory factors explain the variance in the explained variable (Gujirati, 2004). In order to assess how well the five independent variables predict the dependent variables, we treated them as independent variables.

dependent variable by the linear combination of independent variables. In other words, adjusted R<sup>2</sup> is a measure of how much of the variability in the outcome is accounted for by predictors. The value of R square also ranges from 0 to 1 (Sekaran, 2003). The linear combination of supply chain management variables They explain 90.9% of the variance in supply chain management at the study area, along with transportation management, quality information sharing, distribution management, facility management, customer relationship

management, and inventory management, and the remaining 9.1% is explained by

extraneous variables that were not included in this regression model.

**Table 7.** ANOVA Table

Model		ANOVA <sup>a</sup>				
		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	52.711	6	8.785	403.100	.000 <sup>b</sup>
	Residual	5.274	242	.022		
	Total	57.986	248			

a. Dependent Variable: supply chain management practice  
 b. Predictors: (Constant), Transportation management, Quality of information sharing, Distribution management, Facility management, Customer relationship management, Inventory management  
 Source: SPSS output (2022)

The overall statistical significance and acceptability of the model are displayed in ANOVA table 6 (Sekaran, 2003). The variance explained by the model, as shown in table 4.8 above, is not random, according to the p-value of 0.05 or 0.0001. Therefore, the ANOVA table above illustrates the model's acceptance. The model's fit to the data is assessed using the F-ratio. The

dependent variable's 403.1 percent significance level in the ANOVA F-test ratio meant that (p 0.01). (G. Maddala, 1992) states that the estimated value of F has to be bigger than 5. The value of -F- (403.1) is higher than the cited number, according to the researcher's summary in the table 6 above.

**Table 8.** Regression analysis result of influencing factors and Supply chain management Practice

Coefficients <sup>a</sup>						
Model		Unstandardized Coefficients		St. Coefficients	T	Sig.
		B	Std. Error	Beta		
1	(Constant)	.132	.094		1.405	.161
	Customer relationship management	.194	.031	.243	6.332	.000
	Quality of information sharing	.336	.035	.319	9.509	.000
	Inventory management	.447	.041	.461	10.953	.000
	Facility management	.066	.020	.077	3.257	.001
	Distribution management	-.046	.012	-.090	-3.695	.000
	Transportation management	-.012	.010	-.023	-1.161	.247

a. Dependent Variable: Supply chain management Practice  
 Source: SPSS output (2022)

The standardized regression coefficient Beta ( $\beta$ ) can be used in multiple regressions to compare the relative strength of each independent variable's influence on the

dependent variable, and the standardized regression coefficient Beta ( $\beta$ ) can be used to interpret the impact of each predictor variable on the dependent variable (Sekaran,

2003). The constant beta value ( $\beta$ ) and the p-value of the variables are shown in table 7 above to assess the significance of the hypothesis. The significance level (p-value) standardized coefficients of customer relationship management, quality information sharing, inventory management, facility management, distribution management, and transportation management variables are: 0.000, 0.000, 0.000, 0.001, and 0.000, and standardized coefficients of 0.243, 0.319, 0.461, 0.077, and -0.090, respectively. Except transportation management, all Independent variables have p-values that are less than 0.05. This indicates that either all the factors are effective predictors of the dependent variable or that there is a substantial relationship between the independent variables and the dependent variable (Supply chain management Practice).

## 5. Discussion of Results

This study sought to investigate the variables that influence Supply chain management Practice in the Mizan-Tepi University Teaching Hospital. Supply chain management variables include customer relationship management, quality information sharing, inventory management, financial management, distribution management, and transportation management. As mentioned in the discussion section above, all of the regression coefficients (Beta coefficients) between the predictor variables and the application of supply chain management have positive values and are significant at  $p = 0.05$ , with the exception of transportation management. As a result, distribution management had a negative relationship with the dependent variable (Supply chain management Practice).

Customer relationship management is the most significant factor of Supply chain management Practice because it has the ( $\beta =$

0.243,  $p < 0.000$ ). The Beta coefficient result of 0.243 signifies that for every 1 unit change in the independent variable (customer relationship management), the dependent variable (Supply chain management Practice) will change by 0.243. It is apparent from this result that customer relationship management is a decisive factor that affects Supply chain management Practice. The result of this study is consistent with the study conducted by (Nwachukwu & Hieu, 2021) and (Das & Hassan, 2021) Hassan. Their conclusion shows the significance of customer relationship management and Supply chain management Practice to improve product quality and customer satisfaction in Malaysian manufacturing enterprises. The study by, titled (Khan, Professor, & Ahmad, 2014) "The Power of Customer Relationship Management in Enhancing Product Quality and Customer Satisfaction," was done. He comes to the conclusion that online shopping greatly benefits from the integration of supply chain management and customer relationship management. Its impact on other areas, like aviation and offline retail, hasn't yet been felt. Therefore, from the finding, it can be said that customer relationship management at Mizan-Tepi University teaching hospital could get attention from the body concerned to achieve its strategic objective

The impact of shared quality information on Supply chain Practices significant ( $= 0.319$ ,  $p < 0.000$ ). The Beta coefficient result of 0.319 signifies that if 1 unit change in the quality of information sharing occurs, the supply chain management will change by 0.319. This implies that quality information sharing leads to good supply chain performance. These companies and industries can use knowledge of quality information sharing to develop and improve information sharing cultures and use sound inventory management techniques in supply chain practices for the improvement of

organizational performance. This study found that beyond the theoretical implications, the study gives the teaching hospital under consideration the opportunity to recognize the important impacts that information sharing and inventory management practices have on the Supply chain Practice of the teaching hospital. This is also supported by other empirical evidence like (Omar, Lo, Tan, & Siron, 2010, Omar et al., 2010, Gebisa & Ram, 2021)<sup>1\*</sup>, and Prof. Gebisa & Ram, 2021 concludes that "The study's results convincingly show how crucial it is for organizations to develop efficient information sharing amongst supply chain partners in order to improve performance."

Inventory management is another predictor that has a positive and significant influence on Supply chain management Practice ( $\beta = 0.461$ ,  $p < 0.01$ ). The Beta coefficient result of 0.461 signifies that for every 1 unit change in inventory management, the Supply chain management Practice will change by 0.461. According to (Nzioka & Were, 2017) study, the results showed that inventory control assisted the Ministry in delivering services at a high level of efficiency. Besides, (Musau, Namusonge, Makokha, & Ngeno, 2017)'s study found that inventory management has the potential to have a positive impact on the performance of textile companies. As a result, firms have invested in current material flow systems and established clear procedures to manage the orderly and transparent flow of materials that can be tracked through a supply chain.

This study shows that facility management is positive and significantly influences Supply chain Practice ( $\beta = 0.077$ ,  $p < 0.001$ ). The Beta coefficient result of 0.077 signifies that for every 1 unit change in the facility management, the Supply chain Practice will change by 0.077. The finding is supported by researchers like you. This variable was added to this model by the researcher. Therefore, no prior research supported this

research. But this variable should get attention because of its positive effect on Supply chain management Practice.

Supply chain management is positively influenced by distribution management ( $\beta = -0.09$ ,  $p < 0.000$ ). The Beta coefficient result of 0.09 signifies that for every 1 unit change in the distribution management, the Supply chain management Practice will decrease by 0.09. The finding shows Supply chain Practice is affected by facility management. Study conducted furthermore, because transportation is more difficult to monitor, it is rarely considered when determining the sustainability of supply chains, neither for Chinese nor for international businesses. This finding is supported by (Rask & Gustafsson, n.d.).

## 5.1 Summary of Major findings

The result of the correlation analysis has shown that the five independent variables: customer relationship management, quality information sharing, inventory management, facility management, distribution management, and transportation management factors were positively correlated with the dependent variable Supply chain management Practice with a 95% confidence interval and at a 0.01 p-value 2 tailed by a Pearson correlation coefficient "r"-value of 0.835, 0.867, 0.907, 0.564, 0.6342, and 0.033 respectively. Even though all variables were correlated with the dependent variable, there was a difference in the strength of the relationships. As a result, inventory management, quality information sharing, and customer relationship management were found to have stronger relationships with kaizen Supply chain management Practice at Mizan-Tepi University teaching hospital than the other variables.  $r = 0.907$ ,  $0.867$ , and  $r = 0.835$  at  $p < 0.01$  respectively. The remaining factors have moderate to weak relationships with the dependent variable. Finally, the results of the

regression analysis revealed that, with the exception of transpiration management, all independent variables were statistically significant at p value 0.05. The score of the coefficient correlation determination (R<sup>2</sup>) is 0.907, which indicates that 90.7% of the variability of the overall Supply chain management Practice of Mizan-Tepi University teaching hospital was explained by the five independent variables. The other variables that were not considered in this study contribute about 9.3% of the variability of Supply chain management Practice. In this study, the Beta weight score indicated that the effects of inventory management and quality information sharing variables are greater than other independent variables.

## 5.2 Conclusion

Following discussions of the study's findings and conclusions, the researchers came to the final conclusion that, in this specific study, customer relationship management, quality information sharing, inventory management, facility management, distribution management, and transportation management are the most crucial factors influencing the performance of the Supply chain management Practice in Mizan-Tepi University Teaching Hospital. To boost Supply chain management Practice and to decrease waste, which also improves customer happiness and the performance of the company, these elements should be carefully taken into account. The respondents in this study were chosen at random using the Yamane formula and both primary and secondary data were used to gather the study's information. In addition, questionnaires and interviews were used to address every goal of this study. The data was also examined using both descriptive and inferential statistics. A mean and standard deviation were applied from descriptive statistics, and Pearson correlation

and multiple linear regressions were applied from inferential statistics. Before analysis, every piece of data was checked and verified. The relationship between independent and dependent variables can thus be inferred from both descriptive and inferential statistics.

## 5.3 Managerial insight

Since customer relationship management is significantly correlated with supply chain performance. Mizan-Tepi University teaching hospitals should improve their customer relationships to a higher level by evaluating their customer satisfaction on a timely basis and giving on-the-job training to increase the ability and commitment of the hospital professionals, instructors and other healthy officers.

The hospital should use modern technology, implement a maximum minimum inventory control system, and provide staff training and supportive materials to aid in forecasting and acquiring essential and vital materials for teaching programs and medicine, as well as other medical laboratory equipment by which the patients will be treated. Additionally, since the university student's attachment is at this institution, the materials must be delivered on time by using scientific inventory management techniques. It was advised that the management at the department employ suitable inventory control measures to ensure high-quality goods are available in the outlets. This was done to make sure the hospital kept the necessary inventory.

It is extremely important to invest time and energy into creating favorable relationships with the supply chain partners in order to proceed toward information quality and information sharing promotion. Because of this, the Mizan-Tepi Teaching Hospital needs to focus on acquiring trustworthy data to aid senior management in making the optimal supply chain management choices.

The government must also stay updated on how the institution conducts its normal operations, particularly in regards to the delivery of supplies, medications, lab equipment, and supplies for the cafeteria and dorms. The zone and transportation authorities are also in charge of planning every supportive vehicle since the required supplies shouldn't be carried anywhere outside the hospital and the teaching hospital. This is because the purpose is to satisfy the community's wish.

#### 5.4 Limitation of the study

The findings of the research are not without

limitations. This means this study did not cover all of the factors that influence supply chain management practice, so more research is needed to identify any other factors that influence supply chain management practice. Such factors could include geographical challenges, poor infrastructure, politics, and even a legal mandate. The list is intended to be illustrative rather than exhaustive. The other limitation is that this research has been done at only one teaching hospital, which is Mizan-Tepi University Teaching Hospital. Thus, any other researcher should include as many hospitals as possible.

## PROPOSAL OF A DYNAMIC MODEL FOR PLANNING AND MANAGING STRATEGIC OIL RESERVES

***Abstract:** Sustainable supply of essential energy resources is a priority for the economy of every country. With the increasing interdependence of economies at a global level, it is of great importance to recognize the existence of risks in key supply chains: food, products, and energy resources. One of the crucial supply chains for the daily functioning of the economy is the supply chain of crude oil and oil derivatives. This paper analyzes the concept of strategic oil reserves (SOR) as a tool for mitigating a series of disruptions in the sustainable supply of crude oil and oil derivatives. The aim of the conducted research is to find an optimal approach to modeling the national oil supply chain and the structure of strategic oil reserves. The created simulation model enables the analysis of the state of oil reserves at the national level, and provides opportunities for analyzing different management policies in conditions of interruptions in the supply of crude oil or oil derivatives. The goal of the model is to analyze the resilience of the national supply chain under the influence of various external and internal stressors. **Keywords:** System dynamics, Risk analysis, Strategic oil reserves, Energy policy, Supply chain simulation*

### 1. Introduction

National energy security, manifested through reliable access to energy for the population, economy, and public sector, represents a priority for every state. In the early 1970s, one of the first integrations of risk management and national energy security strategy emerged through the formation of the concept of strategic energy reserves (Leffler, Melvyn, 1985). The concept of strategic energy reserves involves the procurement and preservation of various energy fractions, which have a defined usage cycle according to the security and economic circumstances in which a state finds itself. These reserves serve as a buffer to mitigate the effects of unwanted events, in case of uncontrolled volatility of energy prices or uncertainty from producers or suppliers of a particular energy source. The most

frequently analyzed energy reserves by regulatory bodies and economic agents are strategic oil reserves (SOR). The formation of strategic oil reserves became an essential state policy at the global level in the 1970s (Davis, Ruth, 1981).

Due to the energy crisis caused by the Arab oil embargo, which lasted from 1973 to 1974, the United States Congress approved the formation of strategic oil reserves (SOR) and a series of regulatory bodies aimed at preserving national energy security (Andrews, Pirog, 2012). With the establishment of the SOR in 1975, the United States launched a strategic state project on its territory to ensure the country's energy resilience. The adopted US Energy Policy and Conservation Act strictly defines the conditions under which strategic oil reserves can be used (Hubbard, Weiner, 1985). The United States also commits to

---

Email: milos.jovicic@ivi.ac.rs

using its strategic oil reserves according to the need of establishing energy stability for the member states of the International Energy Agency (IEA). In accordance with the defined IEA regulations, all member states are required to establish a strategic oil reserve system that ensures the availability of 90 days of net oil imports (Van de Graaf, Lesage, 2009). All forms of SOR (strategic oil reserves) are considered a risk mitigation strategy, or insurance policy for national energy security. In addition to the direct importance of establishing an energy reserve system for a country, SOR and other energy reserves can have a significant impact on maintaining economic stability and cooperation among different states in a region. There are several ways in which a country's strategic oil reserves and other energy reserves can be formed. The main factor in determining the structure of the energy reserve system is the level of capital investments that a state is willing to allocate for ensuring energy security. The research paper proposes a simulation model for analyzing energy resilience on a country level and provides planning capabilities for forming or improving existing SOR. The study examines the concept of strategic energy reserves as a tool for mitigating various risks in the energy sector. The aim of the designed model is to enable the simulation of the effects of different socio-economic crises and natural disasters and the ability of the energy system to respond reliably to market needs.

## **2. Energy System Resilience and Risk Assessment**

From 1950 to the second decade of the 21st century, more than 30 energy crises related to the availability of crude oil and oil derivatives have been recorded. The duration of these disruptions varies from two consecutive quarters to multi-year periods

(Chen, et al., 2020). In addition to the occasional uncertainty in oil price and availability, it is important to highlight the significance of energy stability in the natural gas supply. Global natural gas supply for industrial and household needs is experiencing significant annual growth due to its cost-effectiveness and low impact on the global warming process (Yousaf, Lin, 2022). However, energy risks related to the supply of this energy source came to the forefront with the onset of the Russo-Ukrainian War in 2022 (Mbah, Wasum, 2022). European Union countries have established a legal system for dealing with crisis situations caused by energy crises (Mastropietro, 2022). Unwanted events in global energy markets, besides legal infrastructure, require an adequate approach to risk management in achieving national energy security. Recognizing trends that affect national energy security, as well as a sustainable energy supply in regional complexes, is of crucial importance for establishing an energy risk methodology (Stanojević, 2022).

Methods for energy risk must indicate strategies: measurement, mitigation (alleviation), and further prevention of unwanted stressors, which come from volatile events in global energy markets. Tools and methods for energy security planning must be able to encompass the entire energy system of a country and, with an adequate level of reliability, display the dynamic behavior of the system under different conditions. Understanding the limitations of each risk analysis tool for the analysis of complex systems such as the oil supply chain is crucial in the planning process, i.e., the planning process itself must be adjusted according to the limitations in accurately predicting how the dynamic system will respond to an unwanted event. Global oil supply chains are greatly influenced by political decisions, which

require frequent political risk analysis in the decision-making process (Gebelein, Pearson, Silbergh, 1978). Tools for determining political risk, due to their often dependence on expert opinion input, which represents an unreliable tool for risk analysis (Shiller, 2002), can jeopardize the integrity of the rest of the model.

Most tools for measuring and mitigating risk within the energy market are adapted for the needs of financial institutions in creating value through financial transactions related to energy prices (Eydeland, Alexander, Wolyniec, 2002). Although these tools can be used for specific aspects of national energy security, there is a need to develop methodologies specialized for national energy security challenges. The energy system of each country can be classified as a complex system, and therefore, analyzing risk using conventional methods such as VaR (value at risk) is inadequate (Sadeghi, Mehdi, Shavvalpour, 2006) and carries a range of drawbacks and potential hazards (Geman D, Geman H, Taleb, 2015). The high degree of unreliability of often-used econometric tools should be considered when analyzing complex nonlinear systems (Taleb, 2009). There are several risk management studies that point to the shortcomings of highly complex statistical models in their practical application compared to simpler models based on good heuristics (Makridakis, Taleb, 2009).

### **2.1. Concepts of resilience and anti-fragility of systems**

One of the drawbacks of traditional risk analysis methods for complex systems can be seen in their failure to recognize the phenomena of resilience and anti-fragility of systems. Resilience defines the ability of a system to recover its capacities to its original state after an unwanted event or stressor (Afgan, Veziroglu, 2012). The concept of

anti-fragility is significantly more complex than resilience and is based on an established approach to modeling and mapping dynamic behavior in complex systems (Taleb, Douady, 2013). Anti-fragility defines the ability of a system to reach a superior state to the initial one after an unwanted event or stressor (Aven, 2015). Anti-fragile systems, like biological organisms, are in a continuous phase of adaptation, i.e., learning from previous mistakes and stressors. One of the common criticisms of strategies for achieving resilience in companies or supply chains is the lack of preparation of the system for the next risk, which may have greater intensity and complexity than already realized events. Biological systems, after exposure to an unwanted event, tend to enter a state of overcompensation (Tomov, 2019), i.e., they create reserve capacities to overcome an unwanted event of greater intensity in the future.

The subject of research is to examine the optimal approach for modeling and simulation of the oil supply chain, formation of the structure of strategic oil reserves, and analysis of system resilience. In addition to the conventional approach to creating the ability of the system to be resilient, the possibilities and strategies for achieving a certain level of anti-fragility of the national oil supply chain must be analyzed. The concept of strategic oil reserves is viewed as a dynamic system that requires continuous adaptation to better enable a country's energy security. The reason for proposing that the national oil supply system must be more than resilient stems from the belief that unwanted events in the future for the analyzed system will not have the same dynamics as already realized risks (Taleb, 2012).

### **3. Modeling the Oil Supply Chain**

Global oil supply chains (OSC) consist of 3 operationally dependent segments: upstream

production, midstream logistics and transportation sector, and the downstream processing and marketing sector (Hadi, Nickel, Ashayeri, 2014). All three mentioned segments involve different forms of oil or oil derivative storage, requiring reliable logistical coordination between agents located in different sectors of the supply chain. Operators in different segments of the supply chain, i.e., extraction, processing, transportation, and distribution sectors, differ significantly in the infrastructure and operations they carry out, as well as in the risks they are exposed to.

Upstream production encompasses all primary extraction and storage systems for oil and gas, with economic entities in this segment facing the highest degree of risk and uncertainty in finding and efficiently extracting the energy source. The process of evaluating potential investments represents a complex and uncertain endeavor, however, the risk-reward ratio in this sector is extremely high compared to other segments of the oil supply chain (Surbhi, 2012). Other OSC segments carry significantly lower risks and are based on the process of transportation, storage, processing, and marketing operations of oil and oil derivatives. Regardless of their position in the OSC, state and private economic entities are interdependent, and the efficient functioning of the entire system depends on avoiding disruptions in any part of the chain.

Complex systems like the oil supply chain, in terms of mathematical modeling by their structure, are nonlinear, and composed of a series of feedback loops and delay functions. One approach to analyzing a complex system like the oil supply chain is the use of simulation technologies. Modeling and simulating systems of different levels of abstraction can be carried out through the use of 3 simulation approaches: system dynamics, discrete-event simulations, and

agent-based simulations (Borshchev, et al., 2014). These approaches offer opportunities in simulating low abstraction segments in the energy system, such as physical oil pipeline networks and energy storages (Bauer, et al., 2019), up to the possibilities of numerical analysis of high abstraction elements like energy policy and supply-demand systems (Daneshzand, et al., 2018). It is important to note that complex phenomena in supply chains, such as the bullwhip effect, were initially conceptualized after the emergence of simulation methodologies, such as system dynamics (Hadžimetović, Vujošević, 2017). The creation and development of simulation methodologies provided a range of possibilities for simulating and optimizing systems such as: health systems (Stainsby, Taboada, Luque, 2009), supply chains (Angerhofer, Angelides, 2000), infrastructure projects (Han, Love, Peña-Mora, 2013), municipal systems (Winz, Brierley, Trowsdale, 2009), etc. Simulation methodologies offer the possibility to conceptualize any complex system graphically and numerically, with the aim of implementing optimization or the desired form of analysis.

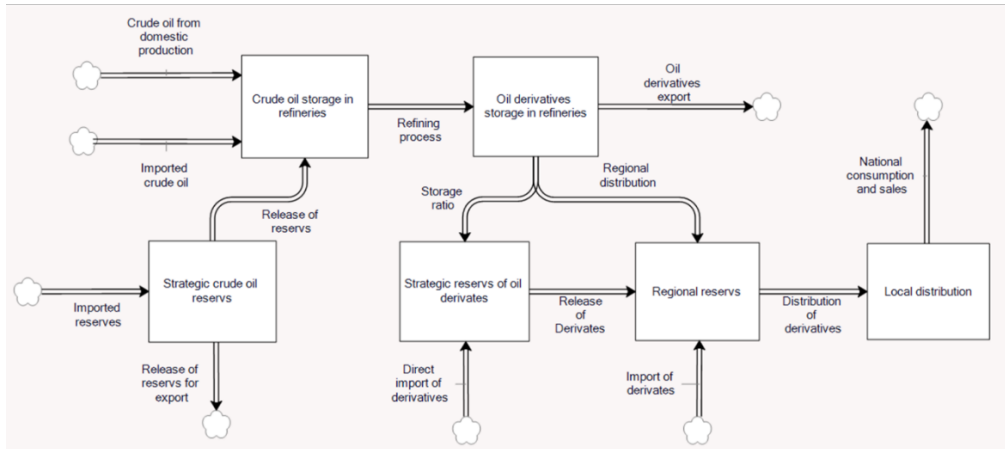

### 3.1 Model Proposal for Analyzing SOR

The strategic oil reserve management model should encompass the operations of an entire country's energy supply chain, i.e., the Strategic National Reserve (SNR) model represents only part of the model structure simulating the broader system. In the case that a country's energy system includes oil and gas production, the model can have several benefits in covering that segment of the supply chain as well. The designed model consists of multiple levels of abstraction of the oil and oil derivatives supply chain. Figure 1 shows a macro-model of strategic oil reserve operations and the overall supply chain. The macro-model encompasses the consideration of strategic

reserves of crude oil and oil derivatives, with great importance placed on adequately defining the structure of SNR flows within

the oil supply chain.

**Figure 1.** Macro-model of SOR supply chain

The flow of oil and oil derivatives in the macro model functions from the left side of oil production and imports towards the right side of exports and sales. In the macro-model, the Strategic National Reserves (SNR) is defined with two levels: Strategic Crude Oil Reserves (SCOR) and Strategic Oil Derivative Reserves (SODR). The value of the SCOR level is regulated by changes in the Crude Oil inflow from imports for SCOR and outflows for stock release and export stock release. The stock release outflow allows crude oil from the SCOR to be released into the national system, i.e., refilling crude oil stocks in refineries.

The designed oil supply chain model contains populations of different agents. The model is designed to contain a population of state entities for: oil storage, processing, transportation, and sales. Therefore, the model differentiates between state-owned oil and oil derivative stocks within the system and privately-owned stocks. Figure 2 shows the values of crude oil stocks in state-owned (red) and privately-owned (blue) refineries. It is important to emphasize that the model

The model uses experimental data on refinery capacities in the European energy sector for 2022 (Klepikov, Pavlovich, Klepikova, 2022).

In Figure 2, a strategy is simulated requiring state and private refineries not to let their crude oil stocks fall below a certain amount, with values expressed in barrels of crude oil.

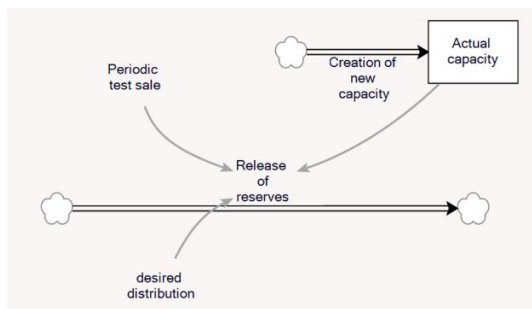

**Figure 2.** Value of crude oil storage levels at refineries.

can calculate different policies towards

strategic oil reserves, from using and expanding state capacities to creating SNR within the private sector. There are several structures for organizing strategic oil reserves, from a system of state ownership over reserves to integration with the private sector (Colgan, 2009). The macro model in Figure 1 shows the outflow, i.e., stock release for export, indicating the sale of crude oil stocks or exchanges with other countries. The model itself can simulate different policies toward releasing crude oil reserves into the system and policies toward oil derivative reserves. The policy of releasing oil derivative reserves into the system in case of disruption should be specifically analyzed both at the local micro-level and the macro-level of the state.

The macro-model in Figure 1 is defined with multiple sub-models that calculate the values for inflows and outflows in the macro-model. The outflow of stock release shown in Figure 1, which determines the quantities of crude oil to be released into the system in the event of a disruption, obtains values from the sub-model shown in Figure 3. The variable Periodic Test Sale aims to initiate smaller sales/releases of crude oil reserves. The Periodic Test Sale of Strategic National Reserve (SNR) is used as a tool to analyze the efficiency of system operations, i.e., identifying all irregularities, blockages, and bottlenecks during SNR operation. It is essential to identify all problems in distributing crude oil from the Strategic Crude Oil Storage (SCOS) in smaller releases. The importance of implementing test sales is potentially highest in the case that a state has designed its strategic energy reserves in partnership with private sector companies, making the system potentially more complex to manage. Another form of smaller crude oil release from SCOS is the implementation of Crude Oil Exchange. The variable Crude Oil Exchange simulates the process of distributing smaller amounts of

crude oil reserves to private entities that are in short-term blockages in servicing the market. This process aims to mitigate short-term problems in the distribution of oil and oil derivatives in the market. Crude Oil Exchange can be viewed as a form of "short-term credit" that the state enters into with a private distributor, so that the exchange is exclusively conducted with oil, and the distributor is expected to return crude oil to the SNR and pay the prescribed premium.

**Figure 3.** Sub-model for calculating the value of stock release outflow.

The release of oil stocks from SCOS is primarily done to remedy major disruptions in the supply chain, representing the primary goal of this system. The model is designed for entering different types of disruptions, where the calculation of the extent of interruptions and available distribution capacities from SCOS determines the numerical value for the outflow variable Release of oil stocks.

An essential segment of the model is the sub-model for calculating the supply and demand ratio, primarily in analyzing the "bullwhip" effect in the supply chain. The sub-model has a similar structure to existing simulation models for analyzing the "bullwhip" effect in oil supply (Zhang JH, Zhang QQ, 2013). The sub-model consists of 4 levels: Crude oil demand balance, Refined product demand balance, Refined product inventory balance, and Refined product sales balance. The sub-model analyzes the

demand for oil derivatives from the market and the system's ability to meet market requirements. Each level in the sub-model calculates the supply and demand balance, and thus, the new value can be negative. Balances do not represent the physical stocks of oil in the system, where in that case, any of the 4 levels could not have a value below 0.

The flow of information in the model proceeds from right to left, i.e., the market creates a pull effect. Each of the levels represents a segment of the supply chain: import of crude oil, storage, processing, and further storage and distribution.

**Figure 4.** Sub-model for calculating the supply and demand ratio.

During the analysis of the bullwhip effect in the supply chain, it is of great importance to determine the precise delay time between the chain segments. Processing time or delay time between entities in the distribution chain plays a crucial role in the function of the entire chain. For the purposes of this work, experimental values from studies that have investigated this phenomenon using system dynamics were used (Zhang JH, Zhang QQ, 2013). Figure 5 shows the values for the crude oil demand balance at the beginning of the sub-model. Market demand is defined by the function  $\text{RandomUniform}(135000, 160000)$ , with the units for the function being barrels/day.

**Figure 5.** Crude oil demand balance

**Figure 6.** Refined product sales balance

Figure 6 shows the refined product sales balance, which exhibits significant instability in the first 20 days of operations. The oscillations shown in the sub-model indicate significant blockages in the supply chain and inadequate inventory holding in the chain. It is important to note that the general economic interest of stakeholders in supply chains is to avoid holding excessive inventory, as this policy leads to a deterioration of the company's cash flow and creates a range of operational risks. As already noted, the sub-model does not display the values of physical oil or refined product stocks, so the stocks themselves cannot be negative. The importance of this segment of the model is to point out potential oscillations in the supply chain to which the SNR system can respond.

## 4. Conclusion

A dynamic model for strategic planning of state energy policy has been designed. Through the use of the model, it is possible to determine the resilience of the national oil supply chain to various disruptions. The dynamic model examines the flow and

storage of state and private reserves of crude oil and oil derivatives. From the model, it can be concluded how long the national economy is able to function under conditions of limited oil supply and different policies regarding strategic oil reserves. The model allows for testing different policies towards strategic oil reserves, as well as the possibility of considering alternatives for reconstructing the entire system, through increasing private sector participation in the SNR system. Future research can be directed

towards expanding the model to analyze reserves of other energy sources, as well as the functioning of distribution capacities in various emergency situations.

## QUALITY CRITERIA IN UNIVERSITIES

**Abstract:** *The increase in the number of universities in all countries in recent years has necessitated a rethinking of the criteria for evaluating education. It is important to keep in mind that no single indicator can capture all the factors that contribute to the quality of a university and different institutions may prioritize different factors depending on their strengths and objectives. It is important to note that university quality is a multifaceted concept and cannot be assessed based on only one indicator. A comprehensive assessment of a university's quality may require consideration of multiple indicators and contextual factors in order to get a holistic picture of its overall performance. Creative and innovative thinking is at the heart of this. As a result, many different criteria emerge. Quality is undoubtedly the first criterion that comes to mind. There have been great developments in this regard in Turkey. Every institution has started to create strategic plans targeting quality. In this sense, the Higher Education Council in Turkey has taken a new step in higher education with YÖKAK (Higher Education Quality Authority). Now, all universities are subjected to external evaluation, monitoring and accreditation by preparing KIDR (Internal Evaluation Report). It is observed that this is a great quality move for our country. In this sense, YÖKAK is making efforts to realize the desired quality indicators in universities not only on a formal basis but also on the basis of practice. In this sense, YÖKAK has been working on 4 basic issues (Leadership, Governance, Quality-Education, Teaching-Education, Teaching-Research Development-Social Contribution) which are addressed in quality in all universities. A systematic structure has been established to monitor quality. Each university now has a Quality main heading on its web pages, and the studies carried out are explained to the society. Of course, these studies find an increasing place not only on the web page but also in the application areas. In this study, quality criteria in Turkish universities are explained in a basic sense and suggestions are given about what needs to be done.*

**Keywords:** *Image, innovation, business*

### 1. Introduction

Quality is generally defined as "the degree to

which a set of inherent properties (attributes) of an object satisfies a set of requirements".

The quality of an object is therefore

determined by comparing a set of predetermined characteristics against a set of requirements. If these characteristics conform to the requirements, high quality is achieved. A traditional definition of quality includes literacy, numeracy and life skills and is directly linked to critical components such as content, methodologies, curricula, examination systems, policy, planning and management.

Academic quality is a way of describing how well the learning opportunities offered to students help them reap the rewards. It is about making sure that appropriate and effective teaching, support, assessment and learning opportunities are provided for them. A common policy debate in countries around the world is whether education is public or private. Students recognize that the benefits are individual. Quality education helps in finding a job, raising social status, etc. Policy makers assume that the benefit is sociopolitical. Quality education has to be in place to increase national productivity and social equality or social cohesion and political solidarity. Depending on one's perspective, quality education should be measured by its cost-effectiveness relative to employment; and from another perspective, it should be measured by overall intellectual output. Although quality has become the center of attention, neither its meaning nor its use is consistent. Indeed, there is no agreed technical side to the concept of quality in higher education. Its meaning and use often involve a heavy contextual overlay of some political or educational position" (Lindsay, 1992). Although quality has come into the limelight, neither its meaning nor its implications are always clear. Indeed, there is no agreed technical specification of the concept of quality in higher education. Its meaning and use often involves the overlay of some political or educational issues (Lindsay, 1992). Quality in higher education encompasses all its functions, activities, teaching and academic programs, research

and scholarship, staff, students, buildings, facilities, equipment, services to the community and the academic environment (UNESCO.1998).

The world knows that the economic success of states is directly determined by the quality of their education systems and that the most influential factor of production is human capital, expressed in the knowledge, skills, creative abilities and moral qualities of individuals in society. In the last decade, higher education institutions have come to be considered within the growing importance of knowledge-driven economies that place them at the center of national competitiveness agendas all over the world. Higher education institutions are increasingly viewed by policy makers as "economic engines", enabling the generation of knowledge through research and innovation and the continuous training of the workforce. As a result, higher education policy on quality in higher education is becoming increasingly important on European and national agendas. The widespread recognition that higher education is the main driver of economic competitiveness in an increasingly knowledge-driven global economy has made higher education more important than ever. The imperative for countries is to increase higher levels of employability skills, maintain a globally competitive research base and improve knowledge dissemination for the benefit of society.

When it comes to global trends in higher education, universities are caught in the middle of the public-private debate. This has led to the desire to contribute to human development and career skills; to attract highly qualified students, which also raises the institutional status; and to be seen as key social institutions in their countries. Therefore, the most important indicators in recent times include student selectivity, reputation and research output. These indicators assume that at least a good university will be an elite university, whether

or not it meets various individual and societal expectations of universities.

Increasingly, research impact is seen as the most important quality indicator in higher education. Research impact is typically measured by rewards such as the Nobel Prize, research grant income and article citations (good research papers are more often cited by other researchers). While research impact does not directly affect the quality of education, it serves a university's educational mission in two different ways: First, it informs teaching with the latest and most advanced knowledge; second, it enhances university reputation, thus making research-intensive universities more selective. But research does not have a direct and immediate impact on teaching quality, and in many highly ranked research universities, the faculty members who do the best research are the ones who teach the least. Thus, countries that focus on building their higher education systems and institutions solely through increasing research productivity may still face significant challenges in increasing employment and income for their citizens. Other countries are therefore looking instead at measures that focus on teaching quality, intellectual rigor and workforce skills.

Such measures include employer reputation, student retention, percentage of international faculty and the like. But when it comes to global university rankings, research still trumps education. Such metrics include employer reputation, student retention, percentage of international faculty and the like. But when it comes to global university rankings, research still trumps education. Such metrics include employer reputation, student retention, percentage of international faculty and the like. But when it comes to global university rankings, research still trumps education.

In order to raise the social and intellectual level of students and raise their level of awareness, universities make use of quality measures and even link this measure with the

transition of students into business life, such as the entrepreneurship index.

University quality indicators are quantitative or qualitative measures used to assess the overall quality of a university. These indicators can vary depending on the context and purpose of the assessment. In the case of academic rankings, various organizations such as Times Higher Education, QS World University Rankings and Academic Ranking of World Universities (ARWU) interpret available data in terms of publications, research output, international reputation, faculty qualifications and student-faculty ratio. It is important to note that university quality is a multifaceted concept and cannot be assessed based on only one indicator. Quality in universities should be seen as an area that can be continuously improved.

Universities should aim for excellence in education and training processes. Factors such as up-to-date and innovative curricula, effective teaching techniques, classroom interaction, real-world applications and internship programs should be considered to improve the quality of education. Qualified and experienced academic staff is an important factor determining university quality. Universities should attract academics who are experts in their fields and have up-to-date knowledge, support them and encourage their continuous development. Factors such as research support programs, research infrastructure, scientific publications and projects can help improve university quality. Universities should improve the support services provided to students. Services such as academic advising, career planning, scholarships and financial support, guidance and psychological counseling can help students improve their success. Strengthening physical and technological infrastructure: Up-to-date and adequate physical infrastructure, laboratories, libraries and technological resources can improve quality. It is important to strengthen infrastructure through investments and to adapt to modern

technologies.

Increasingly, research impact is seen as the most important quality indicator in higher education. Research impact is typically measured by rewards such as the Nobel Prize, research grant income and article citations (good research papers are more often cited by other researchers). While research impact does not directly affect the quality of education, it serves a university's educational mission in two different ways: First, it informs teaching with the latest and most advanced knowledge; second, it enhances university reputation, thus making research-intensive universities more selective. But research does not have a direct and immediate impact on teaching quality, and in many highly ranked research universities, the faculty members who do the best research are the ones who teach the least. Thus, countries that focus on building their higher education systems and institutions solely through increasing research productivity may still face significant challenges in increasing employment and income for their citizens. Other countries are therefore looking instead at measures that focus on teaching quality, intellectual rigor and workforce skills. In order to raise the social and intellectual level of students and raise their level of awareness, universities make use of quality measures and even link this measure with the transition of students into business life, such

as the entrepreneurship index.

University quality indicators are quantitative or qualitative measures used to assess the overall quality of a university. These indicators can vary depending on the context and purpose of the assessment. In the case of academic rankings, various organizations such as Times Higher Education, QS World University Rankings and Academic Ranking of World Universities (ARWU) interpret available data in terms of publications, research output, international reputation, faculty qualifications and student-faculty ratio. It is important to note that university quality is a multifaceted concept and cannot be assessed based on only one indicator. Quality in universities should be seen as an area that can be continuously improved.

Universities should aim for excellence in education and training processes. Factors such as up-to-date and innovative curricula, effective teaching techniques, classroom interaction, real-world applications and internship programs should be considered to improve the quality of education. Qualified and experienced academic staff is an important factor determining university quality. Universities should attract academics who are experts in their fields and have up-to-date knowledge, support them and encourage their continuous development. Factors such as research support programs, research infrastructure, scientific publications and projects can help improve university quality. Universities should improve the support services provided to students. Services such as academic advising, career planning, scholarships and financial support, guidance and psychological counseling can help students improve their success. Strengthening physical and technological infrastructure: Up-to-date and adequate physical infrastructure, laboratories, libraries and technological resources can improve quality. It is important to strengthen infrastructure through investments and to adapt to modern technologies

.In addition, universities should implement quality assurance and evaluation mechanisms. Within the continuous quality improvement cycle, performance evaluations, accreditation processes, peer review and other quality assurance methods should be used to assess the performance of the university and identify opportunities for improvement. In short, universities should have a strategy for quality improvement.

## **2. Where to start to create quality in universities**

In order to create quality in universities, a quality management system must first be established. This system ensures that the university is managed in accordance with its quality policy, objectives, strategies and quality standards. This should start with analyzing the strengths, weaknesses, opportunities and threats of the university. This analysis provides a basis for how the university's quality management system will be established and in which areas improvements need to be made, which should already be set out in the quality policy. The quality policy should include a clear statement of the university's quality objectives and commitments. Quality objectives should be set in accordance with the quality policy and should be measurable. The university's activities, processes and procedures should be identified and the quality of these processes should be assessed to ensure that they comply with standards. If existing processes need to be improved and redesigned to ensure better performance, these processes should be studied.

The resources of the university include elements such as human resources, financial resources, physical resources and technological resources. Effective management of these resources is important for the quality management system. Measurable objectives should be set for the quality management system and a set of

indicators should be defined to measure performance. Performance measurements provide information on the effectiveness of the quality management system and help identify opportunities for improvement. The quality management system is based on a philosophy of continuous improvement and development. The university's quality management system should be regularly reviewed and improved in accordance with quality management standards. These steps provide a framework to help a university establish a quality management system. By establishing a quality management system, universities can improve the quality of education and training

Quality education increases students' success. A good education provides students with the necessary knowledge, skills and abilities to increase their academic success. Thanks to quality education, students have a better educational experience and start their careers with a better foundation after graduation. A good education provides students with a wider range of career opportunities. Students who receive a quality education gain a competitive advantage in the business world. Graduating from a good university offers students better job prospects, higher salaries and greater opportunities for career progression. Universities produce leaders, experts and professionals who contribute to society. Graduates with a quality education make a more valuable contribution to society. By supporting social development, universities reinforce a sense of social responsibility. They also play an important role in research and development (R&D) activities and innovation. Quality education and research capabilities help universities foster scientific, technological and social innovations.

R&D activities lead to new knowledge and findings and contribute to the scientific literature.

High-quality R&D activities at universities ensure a respected place in the academic world and help the university to gain more prestige at national and international level. Universities that provide a good education have a higher reputation nationally and internationally. This enables them to attract more students, academics and resources

.As a result, the quality of education at universities has many important impacts on student success, career opportunities, social contribution, R&D and innovation activities, and university reputation. A quality education increases the success and impact of universities and offers students a better future.

### **3. The impact of social contribution on quality in universities**

Universities engage in education, research and service activities to respond to the needs of society. Universities develop quality education programs and research projects by responding to the expectations of society. Thus, they train qualified graduates in line with the needs of society and offer solutions to social problems. contribute to social development through education and research activities. Graduates who are trained with quality education become leaders in different areas of social development and contribute to the economic, social and cultural development of society. Universities increase their social contributions by cooperating with society. Universities collaborate with stakeholders such as the public and private sectors, non-governmental organizations and local governments to develop educational programs, research projects and social services that meet the needs of society. These collaborations enhance the quality of universities and strengthen their social contributions.

### **4. Conclusion**

Quality assurance in higher education also has a responsibility to frame and articulate core values to students, government, employers and the public. This is part of the dimension of social responsibility. This can be done by using quality review to articulate and examine the social responsibility efforts of higher education, calling on colleges, universities and emerging providers to take meaningful steps in areas such as access, equity, diversity and inequality, for example. It can be done by demonstrating that academic freedom and autonomy are part of the foundation on which social responsibility rests. In many ways, 'social responsibility' relates to the role of both quality assurance and higher education in ensuring social justice in a country, region or internationally. Nowadays, universities are confronted with rankings based on certain criteria, but rankings in universities are constantly criticized by some. The main problem with rankings is their homogenizing effect on universities. Instead of allowing universities to adapt to student markets, local economies, cultural preferences, etc., rankings have led universities to follow almost identical paths. Ideally, a country should encourage a mix of institutional types in its higher education landscape: research schools/community colleges and the differences between them. To answer this question in a different way, rankings in general are important as a benchmark if a university wants to improve its ranking. But university rankings emerged because of the desire of students, their families, employers and governments to identify (and in a sense reward) universities that have always been of high quality. Journalists were the first to take note, and several publications quickly realized how popular and profitable university rankings could be. Some countries and a few universities have also developed new ranking programs in an effort to prioritize different

measures. To date, there are several widely cited global ranking schemes, each weighing certain measures slightly differently. From a regional perspective, only one publisher ranks universities in the Middle East, and this publisher focuses only on research impact, but it is troubling that it is done from a very narrow perspective and unfortunately based on an extremely limited publication database. As is well known, most of these rankings were developed without significant input from universities, employers or governments. Typically, when a ranking scheme emerges, intense criticism of the methodology, often by universities, can eventually lead to change. It is tempting for rankers to base their assessment on easily accessible data, so research is often the first criterion. Equally, data from universities themselves or from employers is difficult to obtain and therefore less attractive to rankers.

In terms of research quality, rankings can give us valuable insights into the impact and productivity of the best universities. Indeed, the criteria considered in the rankings have created a self-reinforcing system. If a university ranks well one year, its reputation with peers and employers will be maintained, often because peers and employers see the high ranking. In other words, we are all subconsciously influenced by rankings, whether we agree with their methodology or not. Beyond that, I find that ranking schemes provide very little useful information. From personal experience, the differences between universities on a global level are never accurately portrayed in point differences, even if they are ranked several hundred places apart. I have visited universities ranked in the 100s in certain programs that clearly have terrible teaching quality and very low student satisfaction. Conversely, I have visited universities not even ranked that have extremely strong employer reputations, high student satisfaction, innovative teaching, etc. The advice I would give to someone looking for a good university is to focus with great

care on what they want to get out of it. Universities are never designed to be one-size-fits-all.

focus. Universities were never designed to be one-size-fits-all. In practice, American research universities still follow the paradigms of the liberal arts by mandating breadth before depth, such as basic or general education courses before specialization in majors. A traditional humanities university would tend toward smaller classes, and faculty members would be encouraged to place more emphasis on their teaching than on their research, although research (i.e. publishing in peer-reviewed journals or academic publications) is still necessary to ensure that knowledge within the institution is current and relevant. A research institution in the United States will need a broad-based curriculum before specialization, and many of the principles of a liberal arts education can still be seen in research institutions. The main difference is that faculty members are encouraged to publish much more and therefore spend a little less time teaching. In contrast, very few teaching or research institutions in Europe require a broad curriculum before specialization. As mentioned in the answer to the previous question, universities are not one size fits all. Every student will always want something special and unique from a university education.

Many students want more independence and may therefore choose a large research institution. But others may want a more personalized approach and therefore choose a liberal arts institution. And there are many variations in between. Increasingly, liberal arts universities are adding professional programs or research centers and master's degrees. Likewise, many large research universities have created smaller programs that mimic the liberal arts mission.

The point is that universities are constantly evolving and in many ways quality is in no way related to institutional type. Diversity of

types is a very good thing in itself. The question should be whether the university is achieving what it says it aims to achieve. Unfortunately, if we were to just look at the rankings, we would get the message that diversity of species is not welcome. quality has nothing to do with institutional type. Diversity of types is a very good thing in itself. The question should be whether the

university is achieving what it says it aims to achieve. Unfortunately, if we were to just look at the rankings, we would get the message that diversity of species is not welcome. quality has nothing to do with institutional type. Diversity of types is a very good thing in itself. The question should be whether the university is achieving what it says it aims to achieve

## TIPS FOR A SUCCESSFUL APPLICATION OF INNOVATION IN A BUSINESS

**Abstract:** For a company, the innovation process can be very costly in terms of time and resources if not planned properly. Therefore, companies must take the right steps for innovation and lay the right foundation for a successful innovation process. Businesses that determine innovation as a strategic goal in their companies and add this purpose to all their employees have always been successful in innovation. It should not be forgotten that innovation in businesses is everyone's responsibility and this purpose is critical to the success of the company. You can consider the following tricks to develop a successful innovation strategy in companies:

1. *Make innovation a part of your culture:* Explain that innovation is not just a department's responsibility, but a process that everyone can contribute to. Create a culture that values innovation.

2. *Motivate your employees:* Value and reward your employees' innovation ideas. Encourage employee engagement by using tools like innovation contests or idea boxes.

3. *Do research:* Keep up with innovations in your industry and do research to understand customer needs. In this way, ideas that you haven't thought of before may come up.

4. *Build strategic partnerships:* Explore technological or collaboration opportunities by forming strategic partnerships with other companies. In this way, you can discover new ways in the innovation process.

5. *Don't be afraid to take risks:* Recognize that some ideas can fail in the innovation process. But that shouldn't stop you from generating new ideas. By taking risks, you can contribute to the growth and development of your company.

6. *Innovative leadership:* Lead your employees to adapt to the innovation culture by adopting an innovative leadership approach. You can also increase your company's innovation capacity by establishing a management structure that encourages innovation.

7. *Invest in new technologies:* Follow new technologies and invest according to your company's needs. Thanks to new technologies, you can make your business processes more efficient and improve the customer experience. In this paper, it is explained which points an enterprise should pay attention to

*while implementing innovation. Examples related to the subject are given.*

**Keywords:** *Image, innovation, business*

## 1. Introduction

Today, companies prefer to follow a certain set of rules for every step they take. This series of rules includes experiences and experiences. This can be considered as the first beginning of a culture of innovation. The implementation of innovation ideas in companies has become an important element of being successful in a competitive market and achieving sustainable growth. Businesses must continuously adopt and implement innovative ideas to adapt to changing customer expectations, discover new market opportunities and increase productivity. These are;

1. **Fostering an Innovative Culture:** It is important for companies to create an innovative culture. Employees should be given the opportunity, appreciated and encouraged to share innovative ideas and make suggestions. Internal communication channels, environments that encourage collaboration and open feedback processes should be established.
2. **R&D and Innovation Investments:** Companies should allocate sufficient resources to R&D and innovation activities to develop innovative ideas. This includes providing the infrastructure needed to develop new products, services or processes.
3. **Evaluating External Ideas:** Companies should evaluate external ideas and implement them internally. Collaborations, joint ventures or collaborations with startups can encourage new ideas to enter the company.
4. **A Culture of Risk Taking:** Implementing innovative ideas may require taking risks. Companies should encourage a culture of risk-taking and give employees the opportunity to make mistakes. Successful innovations often require several

unsuccessful attempts before trying.

5. **Training and Talent Development:** Innovation relies on employees' skills and knowledge. Companies should offer training and development programs to help employees develop innovative thinking and problem-solving skills.

6. **Evaluating Customer Feedback:** Customer feedback can help companies improve their innovative ideas.

Innovative culture means that a company creates a work environment that encourages innovative thinking, supports creative solutions and encourages risk-taking. An innovative culture encourages employees to share ideas, generate new and effective solutions, and continuously improve and progress. Here are some steps for creating an innovative culture:

1. **Leadership and Pioneering:** One of the most important steps in creating an innovative culture is leadership and leadership from senior management. Leaders embrace innovation values, demonstrate exemplary behavior and inspire employees. They also set, support and pursue innovation goals.

2. **Open Communication and Collaboration:** Communication and collaboration is one of the cornerstones of an innovative culture. Open, effective and continuous communication channels should be established between employees. Environments that encourage collaboration should be created and teamwork should be emphasized. Information sharing and collaboration between different departments and teams should be encouraged.

3. **Risk Taking and Mistake Tolerance:** Risk taking and tolerance for mistakes are important in an innovative culture. Employees should be encouraged to try new ideas and should not be penalized for making

mistakes. The understanding that failures are learning opportunities should be promoted and the process of trial and error should be encouraged.

4. Reward and Recognition: Reward and recognition mechanisms should be established to encourage innovative ideas. Successful innovations and contributions should be identified and employees should be rewarded accordingly. This can be in the form of financial or moral incentives, praise or career opportunities.

5. Training and Development: Training and development opportunities should be offered to employees to develop innovation skills. Training can be organized on innovation skills such as creativity, problem solving, design thinking, etc.

Companies that are formed by human-based structures can reach their goals in a short time with an innovative culture and fulfill their installation objectives. Innovative culture is a business culture in which innovative thoughts and behaviors are encouraged among the employees of a company and an environment open to change is created. Innovative culture is important for a company to maintain its competitive advantage, seize new opportunities and continuously improve. The following steps are taken to realize this.

1. Leadership and Vision: The role of leaders in creating an innovative culture is critical. Top management should create a vision that supports innovation and communicate this vision to employees. Leaders should encourage innovative ideas, support a culture of risk-taking and reward innovative thinking.

2. Communication and Collaboration: Create a culture of effective communication and collaboration within the company.

3. Risk Taking and Mistake Tolerance: Risk taking and tolerance for mistakes are important in an innovative culture. Employees should be encouraged to try new ideas and should not be penalized for making mistakes.

The understanding that failures are learning

opportunities should be promoted and the process of trial and error should be encouraged.

4. Reward and Recognition: Reward and recognition mechanisms should be established to encourage innovative ideas. Successful innovations and contributions should be identified and employees should be rewarded accordingly. This can be in the form of financial or moral incentives, praise or career opportunities.

5. Training and Development: Training and development opportunities should be offered to employees to develop innovation skills. Training can be organized on innovation skills such as creativity, problem solving, design thinking, etc.

With an innovative culture, companies formed by human-based structures can achieve their goals in a short time and fulfill their installation objectives. Innovative culture is a business culture in which innovative thoughts and behaviors are encouraged among the employees of a company and an environment open to change is created. Innovative culture is important for a company to maintain its competitive advantage, seize new opportunities and continuously improve. The following steps are taken to realize this.

1. Leadership and Vision: The role of leaders in creating an innovative culture is critical. Top management should create a vision that supports innovation and communicate this vision to employees. Leaders should encourage innovative ideas, support a culture of risk-taking and reward innovative thinking

2. Communication and Collaboration: A culture of effective communication and collaboration should be established within the company. Exchange of ideas between employees should be encouraged, teams should be formed for innovative projects and information sharing should be supported. Transparent communication channels should

be established and employees should be encouraged to share their ideas.

3. Policies Supporting Innovation: The company's policies should encourage innovative thinking. For example, policies can be established that allocate time and resources to employees for innovative projects. At the same time, it is important to create an environment that allows for the process of making mistakes and trial and error.

4. Reward and Recognition: Rewarding and recognizing employees is important to encourage the emergence of innovative ideas. Rewards, incentive programs and career opportunities can be offered for successful innovative projects. This increases employees' motivation to innovate.

5. Training and Development: Training and development opportunities should be provided for employees to develop their innovative thinking skills. Training programs that support skills such as creative thinking, problem solving and teamwork can be organized.

6. Risk Taking Culture: An innovative culture should encourage a culture of risk-taking.

## 2. The formation of innovative culture in companies

It should be viewed as a business culture in which innovative thinking and behaviors are encouraged among a company's employees and an environment open to change is created.

An innovative culture is important for a company to maintain its competitive advantage, seize new opportunities and continuously improve.

Leadership should be seen as an important factor in creating an innovative culture. Top management should create a vision that supports innovation and communicate this vision to employees. Leaders should encourage innovative ideas, support a culture of risk-taking and reward innovative thinking.

Exchange of ideas between employees should be encouraged, teams should be formed for innovative projects and information sharing should be supported. Transparent communication channels should be established to encourage employees to share their ideas.

The company's policies should encourage innovative thinking. For example, policies can be established that allocate time and resources to employees for innovative projects. It is also important to create an environment that allows for the process of making mistakes and trial and error. It is important to reward and recognize employees to encourage the emergence of innovative ideas. Rewards, incentive programs and career opportunities can be offered for successful innovative projects. This increases employees' motivation to innovate. Training and development opportunities should be provided for employees to develop their innovative thinking skills. Training programs that support skills such as creative thinking, problem solving and teamwork can be organized.

## 3. R&D and innovation investments in companies

R&D (Research and Development) and innovation investments in companies are important investments made to gain competitive advantage, develop new products and services, increase productivity and ensure future growth. By investing in R&D and innovation, businesses aim to stay ahead of other players in the sector and offer innovative solutions that meet customer needs. Here are some important points of R&D and innovation investments in companies:

1. Developing Innovative Products and Services: R&D and innovation investments focus on the development of new products and services. These investments aim to expand the customer base, increase market

share and increase revenues by offering new and competitive products to consumers.

2. Efficiency and Cost Savings in Business Processes: R&D and innovation investments are used to optimize business processes and increase efficiency. Through new technologies and innovative approaches, business processes are made more effective and efficient, resulting in cost savings.

3. Gaining Competitive Advantage: R&D and innovation investments give companies a competitive advantage. Innovative products and services differentiate companies from their competitors and offer unique solutions to customers. This enables them to stand out in the market and gain competitive advantage.

4. Investing in the Future: Investments in R&D and innovation help companies ensure future growth and sustainability. Discovering and developing new technologies prepares companies to adapt to future trends and meet changing customer needs.

5. Collaborations and Knowledge Sharing: R&D and innovation investments are often built on collaborations and knowledge sharing. By building partnerships with companies, universities, research organizations and other industry stakeholders,

R&D (Research and Development) and innovation investments in companies are made to gain competitive advantage, develop new products and services, increase operational efficiency and support sustainable growth. Through R&D and innovation, businesses can explore new ideas, develop new technologies and adapt to changes in the market. In addition, R&D and innovation investments provide companies with the opportunity to explore new markets and grow in existing markets. They can reach new customer segments with innovative products and services. On the other hand, innovation

investments can increase operational efficiency and reduce costs. Improved business processes and new technologies enable businesses to operate more efficiently. This leads to customer satisfaction: R&D and innovation make it possible to offer better products and services to customers. By better understanding customer needs, it can offer them innovative solutions and increase customer satisfaction. It is important to remember that investments in R&D and innovation support sustainable growth. The development of new environmentally friendly technologies and the adoption of sustainable business practices enable companies to meet future demands. These small but impactful acts of R&D and innovation investment foster collaboration and partnerships. Collaborations with academic institutions, other companies and entrepreneurs enable the discovery of new ideas and the realization of innovative projects.

R&D (Research and Development) and innovation investments in companies are made to gain competitive advantage, develop new products and services, increase operational efficiency and support sustainable growth. Through R&D and innovation, businesses can explore new ideas, develop new technologies and adapt to changes in the market. Ultimately, R&D and innovation give companies a competitive advantage. By developing new products and services, they can lead the market and differentiate themselves from their competitors. Market expansion: R&D and innovation investments provide companies with the opportunity to explore new markets and grow in existing markets. They can reach new customer segments with innovative products and services: Innovation investments can improve operational efficiency and reduce costs. Improved business processes and new technologies enable businesses to operate more efficiently. Customer satisfaction: R&D and innovation make it possible to offer better products and services to customers. By better

understanding customer needs, they can offer them innovative solutions and increase customer satisfaction.

On the other hand, R&D and innovation investments support sustainable growth. The development of new environmentally friendly technologies and the adoption of sustainable business practices enable companies to meet future demands. R&D and innovation investments encourage collaboration and partnerships. Collaborations with academic institutions, other companies and entrepreneurs enable the discovery of new ideas and the realization of innovative projects.

Innovative culture has such a positive impact; companies should create a long-term vision and strategy to allocate resources for investments in R&D and innovation. Companies can use various methods to evaluate ideas from outside and find innovative solutions: innovation networks and partnerships: Companies can establish collaborations and partnerships with universities, research institutions, entrepreneurs and other companies. These partnerships enable the sharing of new ideas, access to the innovation ecosystem and the evaluation of external ideas.

1. Participation in the entrepreneur ecosystem: By participating in the startup ecosystem, companies can engage with startups and explore innovative ideas. Steps such as participating in entrepreneurship competitions, investing in incubators and accelerators, or collaborating with startups can be effective in this process.

2. Innovation calls and open innovation: Companies can encourage the submission of external ideas by organizing innovation calls or participating in open innovation platforms. These platforms provide access to a broad base of participants and allow for the evaluation of rich ideas from different perspectives.

3. Customer feedback and market research: Customer feedback and market research

provide companies with important information to evaluate external ideas. Understanding customer demands and needs, keeping abreast of changes in the market and taking customer feedback into account can help discover innovative ideas

4. Innovation culture and processes: Companies should foster a culture of innovation and establish innovation processes. It is important to create an environment that values innovation, encourage employees to share ideas and systematically evaluate innovative ideas

5. Evaluation and selection processes: Companies should define a process for evaluating external ideas and establish evaluation criteria

Companies should establish an open communication and feedback process when evaluating external ideas. A culture of risk-taking in companies means that businesses adopt an entrepreneurial and innovative approach. A risk-taking culture creates an environment where employees are encouraged and innovation and new ideas are fostered. This culture can help the company maintain its competitive advantage and grow. When businesses are ready to take risks and evaluate innovative ideas, they can explore new market opportunities, gain competitive advantage and improve business processes. However, in order to successfully create and sustain a risk-taking culture, some important factors need to be considered: These are;

1. Leadership and Senior Commitment: The company's senior executives must take a leadership role to encourage and support a risk-taking culture. Leaders should have the ability to manage risks and set an example for employees.

2. Open Communication and Feedback: There should be an open communication environment for employees to suggest new ideas and share concerns about risks. At the same time, managers and senior executives should listen to employees' ideas and provide feedback.

3. A Culture of Success and Failure: It is important to strike a balance between success and failure within the company. Successful risks should be rewarded and failures should be encouraged as learning opportunities. Employees should be provided with a safe environment where they can learn from their experiences rather than being penalized for failure.

4. Training and Support: Training and support should be provided for employees to develop their risk management and innovation skills. This can help foster a culture of risk-taking and help employees better understand risks.

5. Appropriate Processes and Resources: Companies should ensure appropriate processes and resources for assessing, managing and monitoring risks. Appropriate audit and control mechanisms should be in place to minimize the impact of risks.

#### 4. TRAINING AND TALENT DEVELOPMENT

Training and talent development is an important element for companies because it is necessary to keep employees' knowledge and skills up to date, adapt to new trends and help the company achieve its goals.

First, a training needs analysis should be conducted based on the company's needs and objectives. This analysis will help determine in which areas employees need to develop their skills and which training programs are most appropriate. Companies should create individual development plans that focus on employee development. These plans should assess employees' current skill sets and goals and identify necessary training and development opportunities. Companies can meet employees' training needs by getting support from internal resources (e.g. internal trainers, mentors) or external resources (e.g. training organizations, consultants). Internal trainers can share their experience within the company and offer employees the opportunity to develop their skills.

With the advancement of technology, online training and e-learning has become a popular

option for companies. This method provides flexibility to employees and offers training accessible from anywhere. Companies can invest in online training platforms or in-house training platforms, but they should also regularly assess employees' skills and provide feedback. This allows employees to understand which areas need improvement and makes training programs more effective

#### 4. Conclusion

Taking innovative steps in business is important for competitive advantage, growth and sustainability. Today, businesses are accelerating efforts to create an environment to encourage and support a culture of innovation. This includes giving employees opportunities to propose ideas and develop new projects, encouraging risk-taking and rewarding successful innovations. On the other hand, by investing in R&D activities, new products, services and processes can be developed, R&D departments or projects can be created, and employees have taken important steps towards encouraging them to participate in R&D activities.

On the other hand, customer feedback is a valuable resource for businesses to take innovative steps. Understanding customers' needs and expectations can guide the development of new products and services. Businesses have now made it a priority to collaborate with other companies to take innovative steps. As a result, partnerships or strategic alliances, entering new markets, technology transfer and knowledge sharing are considered as important achievements. Today, businesses should closely follow technological developments and use the appropriate ones to improve processes or develop new products. Businesses can take innovative steps by forming innovation-oriented teams. These teams can consist of employees with different skills and can work on developing, testing and implementing new ideas. As a result, businesses should be ready

to take risks when taking innovative steps, emergence of successful innovations.  
create a risk-taking culture, and encourage the

## THE EFFECT OF A CBT-BASED INTERVENTION PROGRAM ON THE QUALITY OF LIFE OF ELEMENTARY SCHOOL STUDENTS

**Abstract:** *This study examined the effects of an intervention program based on cognitive behavioral principles on improving monitoring, regulatory, and self-management skills, as well as the effects on emotional and social climate in the classroom and on students' quality of life, well-being, and functioning. The intervention was conducted for one year with thirty 4th grade students in an elementary school and involved learning, implementing, and performing CBT principles and practices. The implementation process included monitoring and follow-up through interviews, questionnaires, and participant observation. The results of the study showed positive effects on classroom climate while reducing violence and improving students' well-being, sense of protection and belonging, and self-regulation skills.*

**Keywords:** *behavioral problem, behavioral disorder, classroom climate, quality of life, cognitive behavioral theory, elementary school*

### 1. Introduction

Behavioral problems and disorders are terms that combine problematic or disruptive behavior, defiant, oppositional behavior, and antisocial disorder among them. Disorder refers to the violation of social rules and negative actions toward others such as aggressiveness, lying, and stealing (Fossum et al., 2008). Evidence gathered in studies over the years indicates that a high percentage of elementary school children are at high risk of developing a behavior problems and disorders during their school years (Duchnowski, Kutash, & Friedman, 2002; Rubin & Balow, 1978). According to Loeber, Burke, & Pardini (2009) behavior problems among students in the classroom can arise for a variety of reasons. Some are related to environmental factors, others to factors related to the individual. They can be

influenced by developmental background, various types of learning disabilities, emotional state, difficulty driving, sense of competence, sense of belonging, educational challenges, mismatch of learning with the student's aptitudes, and other external and internal factors (Wells et al., 2019).

Conduct disorder in childhood can be an early sign of the development of conduct disorder in adolescence and adulthood (Liber et al., 2013). It can be associated with negative long-term outcomes, difficulties in child-parent interactions, early school dropout, vandalism, and lying (Loeber, Burke, & Pardini, 2009) and can negatively affect the child's development.

The effects of conduct disorder on the child may be manifested in impaired social status, expression of personal identity, self-image, sense of ability and belonging, shaping of

Email: [hila.ariel@gmail.com](mailto:hila.ariel@gmail.com)

interactions with peers and teachers, adjustment to the school environment, and success in developmental tasks of the age level. Behavioral disorders can interfere with adjustment and lead to social and behavioral deficits (Smith et al. 2014), challenges, and delays in various areas of functioning. They can act like a vicious cycle and, in the absence of remedies, lead to developmental withdrawal and a steady increase in negative behaviors. A situation that increases the likelihood of school dropout and at-risk situations (Danielson et al., 2018).

Erickson sees school as a significant and crucial factor in this stage of development, as it is able to identify and diagnose deficits in cognitive and academic skills. It is also a source of discipline, requiring the mobilization of "self-control" that help develop the ability to restrain and postpone rewards, as well as organizing children into a group, changing egocentric patterns, and teaching reciprocity as a value and behavior. In addition, the school setting separates the child from the home during activity periods and challenges the child to engage with new authority figures (ibid.).

Behavior problems in the classroom present numerous and varied challenges to the educational system. Their effects are felt directly and indirectly, manifesting in both academic and emotional-social domains, classroom climate, and students' sense of safety and belonging (Mooney et al., 2005).

Cognitive-behavioral intervention is based on an approach that incorporates cognitive and behavioral components and aims to effect change in student behavior. It utilizes basic cognitive processes that are responsible for successful problem-solving processes (Smith & Daunic, 2006; Smith et al., 2012). Studies have shown that this type of intervention is able to improve self-monitoring mechanisms and thus social problem-solving skills in a variety of situations and structures. Therefore, this type of intervention helps to reduce the risk of developing behavioral

problems (Daunic et al., 2006, 2012; Smith, Graber & Daunic, 2009). Several studies have found that programs of this type can be beneficial and help with both treatment and prevention of conduct problems (Sukhodolsky, Kassinove & Groman, 2004; Waschbusch, Pelham & Masetti, 2005).

Studies of various types of school-based intervention programs have shown a small but positive effect on aggressive behavior and conduct disorders. The positive effects have also been found to be long lasting (Dymnicki, Weissberg & Henry, 2011; Wilson & Lipsey, 2007).

The complexity of addressing behavioral disorders, their negative effects, and the importance of effective and adaptive developmental outcomes underscore the importance of studying and developing tools and responses to this complex issue.

## 2. Behavior Problems in the Classroom

Externalizing behavior problems and disorders manifest in the violation of social rules and negative actions toward others (Fossum et al., 2008).

Violence is an extroverted behavior characterized by the exertion of an unpleasant stimulus, physical or verbal, toward the other (Buss, 1961; Kazdin et al., 1987). The discussion of the phenomenon of violence is divided into two general categories: Conduct disorder, which is a disruption of social, academic, and occupational functioning and, in an adolescent who has not reached the age of 18, is characterized by patterns that have been repeated for at least 12 months and includes behaviors that are a violation of rights or norms and involve threats, fighting, cruelty, the use of weapons, theft, or forced sexual acts. (Moore et al., 2011). Oppositional Defiant Disorder is characterized by negative patterns of behavior that have been repeated for at least

six months and include at least four of the following behaviors: Loss of control, persistent arguing, and lack of cooperation, bullying, accusations, anger and hostility, obsessive preoccupation with the other's behavior (APA, 1994, DSM IV). The first category emphasizes intense engagement in violating rights, norms, and laws (ibid.) and is considered more difficult (Moore et al., 2011). However, untreated oppositional behavior can develop into a conduct disorder (Scotti, Mullen & Hawkins, 1998). It is important to note that a child who struggles with a violent problem usually suffers from disorders associated with the conduct disorder, such as attention and concentration problems, hyperactivity, impulsivity, and social problems. (Moore et al., 2011).

Gendreau & Archer (2005) distinguishes between violence that leads to physical harm and violence that leads to psychological harm. The= division focuses on the secret motives that cause violence, the motivation for violent action, and the degree of harm to the other (Gendreau & Archer, 2005 in Moore et al., 2011). This division led to examining violence at the level of the factors that underlie it. Ronen, Rahav & Moldawsky (2007) identified three distinct profiles of children: the aggressor who engages in violent behavior toward the other on their own initiative, the aggressed who is a victim of violence, and the neutral who is not involved in instances of violence. In the literature based on frustration-anxiety theory (Vitaro & Brendgen, 2005 in Moore et al., 2011), violence is divided into reactive and proactive violence. Reactive violence occurs in response to violence that causes anger and frustration and aims to reduce the level of anger and frustration by hitting the perpetrator. This type of violence has a more positive prognosis than initiated violence (Ibid.).

Initiated violence depends on a relationship that exists between two independent behaviors. Through past experiences, the

individual has learned that a violent response helps him or her achieve various goals, and thus it is activated whenever the child wants to achieve his or her goals (Crick & Dodge, 1996; Hubbard et al., 2001; Vitaro & Brendgen, 2005). Other subdivisions refer to the differences between the behaviors that characterize violence, distinguishing between direct violence and indirect violence, and between verbal violence and physical violence (Bjoerqvist et al., 2001; Yudofsky et al., 1986; Ronen et al., 2007).

### **3. Patterns of Victimization During the Elementary School Years**

Victimization is a common stressor in school-aged children and can affect the child's future development (Giesbrecht et al., 2011). Children who suffer from persistent bullying and an unprotected social-emotional climate (Rudnicka et al., 2020) are at increased risk of developing psychological and behavioral adjustment problems such as loneliness, low self-esteem, anxiety, depression, externalizing problems, and school dropout (Hanish & Guerra, 2002; Kochenderfer-Ladd & Skinner, 2002; Leadbeater & Hoglund, 2009). Violent behavior is detrimental not only to the violent child's environment, but also to the development and functioning of the violent child, who is at risk of social rejection, dropping out of school, and developing criminal patterns (Loeber & Farrington, 2000; McGinnis & Goldstein, 1997; Pope & Bierman, 1999).

A relationship has been found between an early victimization experience during the elementary school years and the continuation of the pattern of bullying victimization in later years (Kochenderfer-Ladd & Wardrop, 2001; Schwartz, Proctor & Chien, 2001). The early years of elementary school are a significant and important time to observe the child's developmental process and understand why certain children are victimized and

others are not, and how the change in victimization patterns is related to their behavior and its context over time (Giesbrecht et al., 2011). In addition, the early years of elementary school are of great importance for social, emotional, cognitive, and personal development. Intervention programs can have a positive impact on reducing peer victimization before it takes root (Ladd, 1996; Olweus, 1994).

Research today seeks to understand the components of personality development, focusing on the emotional and cognitive factors that predispose a child to violent behavior (Tremblay et al., 2005). Several studies have shown that the social biological basis of certain children influences the way they interpret their behavior, the behavior of others, and the extent of their influence on a given situation, exposing them to risk and dangerous situations early in life (Anderson & Bushman, 2002; Dodge & Pettit, 2003). The child's information processing model in these situations influences the interpretation they give to the social situations around them, tends to attribute negative intentions and hostility to them, and influences the development of violent behavior (Crick & Dodge, 1996). Examining the individual versus the effects of the environment in relation to violent behavior assumes that an individual has an innate personality tendency toward violence that may predict violent behavior later in life (Brendgen et al., 2006). Therefore, individuals must acquire tools and skills to help them control their tendency (Moore et al., 2011). A somewhat more moderate approach also asserts that there is an innate tendency toward violence. At the same time, it believes that after age six, environmental influences and cognitive abilities determine the developmental trajectory (Rhee & Waldman, 2002). Another study considers violence as a tendency rather than a personality trait or hidden instinct. According to this study, the social environment, skills, and tools acquired by the

child during his integration into that environment determine whether his violent traits will be reinforced and influence his behavior and social affiliation (Nagin & Tremblay, 2005).

As the child progresses through the developmental stages of acquiring complex cognitive skills, patterns of violence decrease. It is likely that there is a relationship between these two processes (Seguin & Zelazo, 2005).

Cognitive skills are related to mechanisms of self-control, information processing, and emotion control. These mechanisms enable individuals to control and regulate their behavior and moderate the relationship between sensitivity and aggression (Apple, 2007; Weisbrod, 2007). Violence control and behavior regulation become possible for a child when he or she acquires tools and skills that enable him or her to behave socially.

The development of self-control skills enables the child to activate mechanisms of observation, monitoring, and self-reinforcement, to use accepted social models, and to control his or her behavior (Moore et al., 2011).

Birchmeter's (2009) study confirms previous studies showing a negative relationship between bullying and students' quality of life. Negative effects on the well-being of students involved in bullying and students who suffer from bullying at school were found. In addition, students who are not affected by bullying report a higher quality of life and receive more support from their friends and teachers.

The presence of behavior problems in the classroom poses a significant challenge to the educational system, affects the emotional and social climate, academic achievement, and students' sense of safety and belonging in the classroom (Mooney et al., 2005).

## 4. Cognitive - Behavioral Intervention

Cognitive-behavioral intervention relies on an approach that incorporates cognitive and behavioral components to change student behavior through its influence on basic cognitive processes responsible for successful problem-solving processes (Smith & Daunic, 2006; Smith et al., 2012). A cognitive-behavioral intervention addresses the acquisition and establishment of a cognitive change in the thinking and belief system to bring about stable emotional and behavioral change (Beck, 2014). The model represents a combination of cognitive strategies based on reflexive and metacognitive skills, behavioral strategies, emotion-focused strategies, and social strategies to build a cognitive infrastructure that leads to effective behavior (Kendall, 1993).

Studies have shown that this type of intervention is able to improve self-monitoring mechanisms and thus social problem-solving skills in a variety of situations and structures. Therefore, this type of intervention helps reduce the risk of developing behavior problems (Daunic et al., 2006, 2012; Smith, Graber & Daunic, 2009), contributes to positive social functioning, and promotes a visible and/or hidden impact on individual development (Kazdin et al., 1992; Lochman & Wells, 2004). Several studies have found that programs of this type can be beneficial and help in the treatment and prevention of behavioral disorders (Ukhodolsky et al., 2004; Waschbusch et al., 2005). Studies of school-based intervention programs have shown a small but positive impact on aggressive behavior and conduct disorders. The positive effects have also been found to be long lasting (Dymnicki et al., 2011; Wilson & Lipsey, 2007). In a study examining the impact of these programs on student behavior problems, it was found that two types of prevention interventions were implemented in schools over the years:

a classroom intervention program and a targeted individual intervention program. The latter were significant and contributed to the reduction of behavior problems. School-based interventions using the cognitive-behavioral approach have been shown to produce positive results in both the short and long term (Mytton et al., 2006). Interventions that focus on a specific goal have also been found to show more significant results than general school-based intervention programs (Liber et al., 2013).

Cognitive-behavioral intervention methods use strategies aimed at bringing about change in thinking, feelings, and behavior (Kendall, 2012). Their foundation is the individual's belief system, behavioral strategies, and the person's understanding of the beliefs and behaviors that characterize them (Alford & Beck, 1997).

Cognitive behavioral Intervention with children focuses on the acquisition, practice, and assimilation of cognitive strategies that help the child cope effectively with events and solve problems. The child acquires cognitive strategies through experience, observation of experience, and interaction with the environment (Ingram, Miranda & Segal, 1998). The differences between creating an intervention plan for children and implementing it with adults arise mainly from the significant involvement of environmental factors in shaping the way the child interprets and responds to various situations, as well as the fact that children usually come to the intervention at the initiative of their environment, often without being aware of the problem that requires it (details in Moore et al., 2011). One of the main issues in child care is the issue of cognitive processing and the distinction between "cognitive impairment" and "cognitive distortion." Processing impairment is caused by a lack of attention to information and a lack of foresight that affects behavior and its outcomes. Cognitive distortion means a disturbance in the thinking processes

(Kendall, 2015). The terms impairment and distortion both refer to a disturbance in cognition (Kendall, 2000). According to Spivack & Shure (1982), deficits in processing interpersonal situations are etiological in nature. Barkley (Barkley, 1997) refers to impulsivity as a consequence of mediation deficits (Kendall, 2015). According to him, impulsive behavior results from cognitive impairment manifested by an inability to let thought precede action, as opposed to cognitive bias indicating active but distorted processing (*ibid.*).

Studies have shown that by applying cognitive-behavioral principles, self-monitoring processes and problem-solving strategies can be accomplished. These processes lead to the improvement of self-management and self-regulation skills (Daunic et al., 2006; Daunic et al., 2012; Smith, Graber, & Daunic, 2009).

Self-management is a general term that refers to a variety of components used to outline an internal locus of control (Chafouleas et al., 2011). Self-management is expressed in the influence a person has on events and situations around them and their outcomes (Barlow, & Chorpita 1998) and includes actions on reality (Ajares, 2007a). Self-regulation is an active process of self-management (Pintrich, 2000).

The self-regulatory system is at the heart of any daily process. Its components mediate the influence of the external environment on the individual and provide him or her with the basis for goal-directed action. (Bandura, 1991).

The use of self-observation can enable individuals to evaluate the relationship between thoughts, behaviors, physiological sensations, and emotions and their consequences (Moore et al., 2011).

The child's self-regulation skills can influence his or her adjustment to the school environment in which he or she must function independently without dependence or the

presence of his or her primary caregivers (Sawyer et al., 2015).

The experiences the child has in his or her first years of school can have long-term effects on his or her behavior, mental health, relationships with children and teachers, and sense of belonging and attachment to school (Belsky & MacKinnon, 1994; Entwisle & Alexander, 1989; Finn, 1989; Hamre & Pianta, 2001; Ladd & Dinella, 2009; Luster & McAdoo, 1996). Studies indicate a negative relationship between the child's level of self-regulation and behavior problems (Belsky et al., 2007; Eisenberg et al., 2010; Hill et al., 2006; Kochanska & Knaack, 2003; Murray & Kochanska, 2002; Olson et al., 2005; Riggs et al., 2004).

Self-management strategies have been shown to be effective for both the individual and the class as a group for adjustment and success (Glynn & Thomas, 1974).

## **5. Quality of Life**

The concept of quality of life refers to the degree of well-being and happiness of the individual. It is defined by the WHO (1996) as an individual's perspective on his or her life in the context in which he or she lives and in relation to the goals, expectations, values, and standards he or she sets for himself or herself. In childhood, quality of life is defined as subjective perceptions of well-being and happiness (Davis et al., 2008)

Almost all definitions of quality of life refer to physical, social, cognitive, and psychological dimensions (Hutting et al., 2022). Quality of life is influenced by both close indicators, such as family and friends, and more general indicators, such as socioeconomic status and culture (*ibid.*). Physical or emotional-mental disabilities have been found to have the greatest impact on quality of life (Kourkouta et al., 2021).

Lack of support, protection, emotional and behavioral difficulties, and lack of

infrastructure to realize potential are considered factors that significantly affect quality of life (Wallander, 2015). The child is considered an individual with equal rights and a future citizen who has influence in shaping society, and therefore there is concern for his or her quality of life (Ben-Arieh et al., 2014). The quality of life is considered his natural right and is considered an important factor in his development and future prognosis (Ben-Arieh&Frønes, 2011).. According to the World Health Organization, mental health and emotional well-being are factors that affect the quality of life of the student and his ability to achieve his developmental goals in school (Rudnicka et al., 2020).

At school age, the child is at a developmental stage where he or she is confronted with the demands of learning together in society, following rules and routines, and participating in a group. Achievement, a sense of competence, and the ability to control become essential to the self-image the child builds (Tiano, 2010).

School provides developmental opportunities for the child, but it can also present challenges that can interfere with normal development. Classroom climate has an impact on student achievement in the classroom.

In the study of Hachoen& Ronen(2011) school climate is defined as the quality of school life. According to the researchers, students' perception of the quality of school life represents their satisfaction with the school and classroom, their sense of their social place, their emotional attitude towards the educator and teachers, and their emotional and behavioral attitude towards studying, showed a relationship between students' perception of class climate and sense of belonging, educational process development, personal development, integration, and effective behavior in the school environment and routine (Zedekiah, 1988; 1996. Urdan et al., 2004) found that positive interaction between class members increased students' social competence in the lower grades of

elementary school (Hoglund&Leadbeater, 2004). School climate is based on norms, relationships, goals, values, and organizational structure (Cohen &Geier, 2010). In addition, it influences students' social, psychological, and academic outcomes (Glisson, 2007). Interpersonal interactions, as a key component of school climate, influence behavioral norms and a sense of protection. A relationship has been found between positive interactions, avoidance of disruptive behavior, and good academic performance (Crosnoe, 2004; McNeely, Nonnemaker, & Blum, 2002; Powers, Bowen, & Rose, 2005; Whitlock, 2006) when the student perceives the school as a protected place where he or she can develop optimally. Similarly, the social-emotional climate creates insecurity, and the presence of verbal or physical violence poses the risk of interfering with student development and achievement, even if they are not directly affected by violence (Rivers et al., 2009)

## 6. Methodology

### The purpose of the study

The purpose of this study was to examine the extent to which a classroom intervention program based on cognitive behavioral principles affects students' acquisition of self-regulation skills, behavioral problems, social and academic emotional climate in the classroom, and quality of life in the classroom.

### Study Population

The sample consisted of thirty4th grade students in an elementary school in the city of Jerusalem. The vast majority of children in the class have been learning together as a group for about five years, i.e., since pre-compulsory kindergarten. Of these, 8 are girls and 22 are boys, aged 9-10 years, who live in or around Jerusalem. 16 of the children in the class were diagnosed with learning

disabilities or ADHD, and 14 of the children were not diagnosed (Table 1).

Five school employees also participated in the study. 3 women and 2 men, all with academic degrees and working at the school. 4 with more than 10 years of experience in education and one with 2 years of experience. 4 of them were born and raised in Israel. 3 of them are married and 2 are not married (Table 2).

**Research tool**

*In-depth interviews:* semi-structured in-depth interviews to capture and observe staff feelings towards the class before and after the intervention program. In addition, open-ended face-to-face interviews were conducted on predetermined general topics to understand students' feelings and needs.

*Participant observation:* participant observation was conducted in the classroom, involving directly and personally in the lives and processes of the students and experiencing the reality in the classroom together with them. Observations focused on events that took place during common class time related to self-management and self-

regulation, as well as in the general atmosphere of the classroom during class time and extracurricular activities.

In addition, class discussions were recorded with students during designated class periods to implement and monitor the program and its outcomes.

**Open-ended questionnaires:open-ended**

questionnaires were distributed twice a year before the end of each semester. Students were asked to rank various verbs on an axis according to their personal feelings and to put their choice into words.

Quality of life questionnaire components: the ESQoL questionnaire (Yuen et al., 2022) is a 21-item questionnaire developed and validated for elementary school students in Taiwan. The questionnaire was developed with the aim of bringing to light the differences between age levels and the impact that developmental stage may have on quality of life (Wee, Chua, & Li, 2006). The

components of the questionnaire help assess factors related to students' emotional well-being and relate to functioning in school and other areas of the student's life. This study examined the effects on 12 of the 21 components of the questionnaire that relate directly to the educational framework. The questionnaire was developed in Taiwan, a culture where the academic achievement of their children is very important to parents (Chan et al., 2014, Tzeng, 2007), similar to Israel. The questionnaire proved to be an effective instrument for measuring the quality of life of elementary school students and has high validity and reliability.

### Research process

Initial data collection occurred during the academic year prior to the year in which the study was conducted through information collected in reflection sheets completed by students at the end of the year, classroom observations, and information provided in a final team meeting. The data collected indicated an abusive climate in the classroom. This manifested itself in reports of an impaired sense of safety, ability, and motivation among students and teachers teaching in the classroom. All teachers reported that, in their opinion, the academic level in the current class did not reflect its potential. There were also reports of verbal and physical bullying and social boycott.

A joint analysis of the members of the educational staff along with the behaviors that emerged from classroom observations and routine student complaints led to the hypotheses that: Classroom challenges are affected by difficulty in postponing a response and impulsivity.

Dealing with challenges on a daily basis affects students' quality of life and their ability to use resources for optimal development.

At the outset of the study, open-ended face-to-face interviews were conducted with the students and with five staff members who

provide regular support to the class, including the principal, who was personally involved in the implementation of the program.

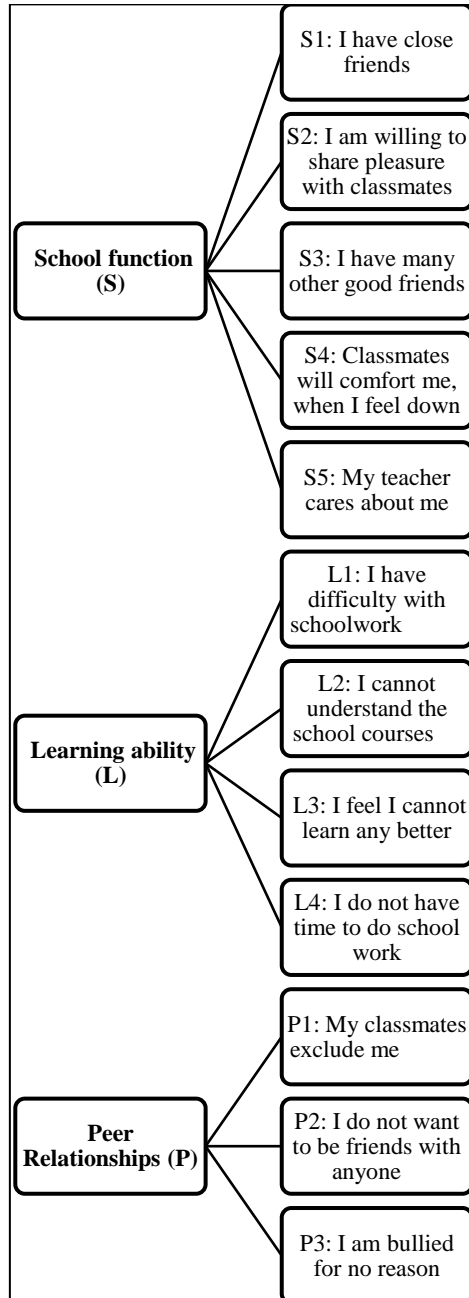

Figure 1. Quality of life 12 components

The course of the investigation included the implementation of a classroom intervention program based on cognitive-behavioral principles with the students, as well as scheduled meetings with staff for the purpose of induction, assimilation, ventilation, and implementation.

During the intervention, regular classroom meetings were held and recorded to practice and monitor assimilation.

Reflective questionnaires were distributed at the end of the program to capture the personal process and general feeling in the classroom. The pages contained a limited number of closed-ended questions on a response scale as well as open-ended explanations. The use of behavior mapping charts helped to observe the behavioral changes that occurred in the class throughout the period. Pre-intervention and end-of-intervention questions were asked about feelings in the school setting to observe changes in students' quality of life related to their functioning and feelings in the classroom.

The components of the intervention program

The intervention included the use of cognitive and behavioral therapy tools. The goal was to teach strategies and tools to strengthen and develop monitoring, management, and self-regulation skills in the first phase.

In the second phase, they were to be applied to defined goals that would support the creation of a positive social and emotional classroom climate and improve the quality of life for students in the classroom.

This, while continuing the processes of establishing and assimilating tools and semantics. The program was established and implemented using a variety of tools:

Tools for assimilation: with the beginning of the school year, the schedules, the system of hours and the accompanying lessons were created in terms of the intervention plan to create a unified and consistent language and a sense of framework and security.

Permanent Lessons: Three permanent weekly lessons were incorporated into the system to learn and use program language, role play, learn tools and strategies, learn through stories, practice social discourse, practice reflection skills, reflect, and create daily report pages.

Monitoring boards: behavior boards were created and posted in the classroom for consistent, orderly, and mandatory monitoring of the behavior process.

Self-management wheel board: based on the cognitive behavioral model derived from the emotional-rational method a self management board was created. The board is divided into quarters to distinguish between an event, a thought, an emotion/feeling, and a reaction.

To allow the model to be applied using routine events and role-plays, each quarter was assigned its own color and a set of cards of the same color was included. The cards included events, thoughts, emotions/feelings, behaviors, and blank cards for self-completion (figure 2).

Reaction stages: A reaction stages axis was placed below the circle for the practice of monitoring behaviors and responses (figure 3).

Board of Sentences and proverbs: the board with the collected Sentences and proverbs was placed under the level of the answers and on it the Sentences and proverbs were hung throughout the year to support and perfect the internal dialog. The Sentences and proverbs helped students solve events and situations. In addition, the board included alternative verbs for practiced situations.

Throughout the process, a goal was set once a month to guide the class according to the goals - based on the needs established in advance.

Each goal was assigned a time range. The first overarching goal was familiarity with the plan and ways to implement it. Familiarity with the auxiliary panels that accompany the behavioral program, experience with pre-

dictated chance events, experience with the panels in everyday situations, experience in role-playing and using the auxiliary panels and the semantics derived from them in everyday behavior in real time. Another overarching goal was proper speech and included using navigation tabs to monitor speech patterns in real time, behaving according to the speech rules used in the classroom, speaking in class when given permission to speak, developing the ability to listen to each other, listen to what adults say, express oneself clearly and in an appropriate tone of voice, respond to what friends say out of respect and politeness, treat a friend's words with respect and politeness even when there is an argument, and use language appropriate to the time and place. Another overarching goal was defined as reflection as a foundation for behavior regulation and included familiarity with the concept of restraint, reflection on situations and situations where students have had to restrain themselves in the past, knowledge of different ways to help avoid an immediate reaction, familiarity with the concepts of self-management, self-regulation, reflection, and self-control, identification of past thoughts and physiological signs of behavior that may lead to an impulsive response, application of behaviors and phrases that help students choose and manage their thinking and behavior in real time, understanding of the emotional impact of success in regulating behavior as opposed to an impulsive response. Another overarching goal was a positive classroom climate and included: learning about the concepts of empathy and intervention, practicing recognizing and expressing the feelings and thoughts of others through role-playing, intervening in a social situation in an appropriate way, acting from the perspective of others, understanding the differences between different individuals' feelings and thoughts about the same situation while having respect for others and their feelings.

Each objective was composed of the phases of the program: Defining a need, identifying automaticity at the level of feelings, thoughts, and actions, suggesting possible responses, choosing a behavior, choosing a word that supports the behavior, and reinforcements.

During the year, specific goals were also defined, based on specific needs - individual and group - that came up in discussions with the group of children.

Reinforcement plan for defined goals: A pool of High goals and personal and group goals are set and rewarded according to progress. Blackboards accompanied the program and allowed for the accumulation of reinforcers of various types and to varying degrees individually or in groups.

Individual processes were conducted with a number of children that were found to have a significant impact on the atmosphere and feeling in the classroom. These processes included phases that were identical to the phases of group work and related to personal goals, goal refreshment, monitoring, and regular updating of all staff involved in the program.

Work with educational staff included recruitment of appropriate staff, ongoing dialog, maintaining consistency in classroom work, and regular meetings within the system. The meetings included acquiring the principles of the program, a discussion of possible courses of action, and airing, sharing, and brainstorming. Times were also set aside for regular and periodic reporting on classroom behavior.

Figure 2. Self management wheel

Figure 3. Reaction stages

## 7. Results

The results obtained combine data suggestive of qualitative processes that indicate a change in perceptions and experiences with measurable data that indicate a reduction in maladaptive behaviors, an improvement in adaptive behaviors, and an increase in the quality of life for individuals in the classroom.

*Analysis of social climate results:* The results describe a comparison between the responses on the reflection questionnaires completed by the children at the end of third grade before the intervention program and at the end of fourth grade after the program. The questionnaires completed by the children contained closed and open-ended questions. The closed questions were rated on a scale of 1-5: 1 - never, 3 - sometimes, 5 - always, 2,4 - intermediate situations between always and sometimes or between sometimes and never.

The results describe a comparison between the answers to the reflection sheets filled out by the children at the end of the third grade before the intervention program and at the end of the third grade after it. The questionnaires

included closed and open questions. The closed questions are given a quantitative score on a scale of 1-5: 1 - never 5 - always respectively.

In reference to the saying "I choose my friends and girlfriends"

Table 3. Reflection sheets comparison

	Mean - Before	Mean - After
"I choose my friends by myself"	1.76	4.33
"My friends respect me and my opinions"	2.63	4.43
"I manage to avoid conflicts and arguments with friends and reach a solution in pleasant ways"	1.53	4.36

**Numerical results :** in 70% of the students a numerical increase was observed in legitimacy and in their ability to choose their friends, in 30% the group was ranked at the beginning of the program with the highest score and the result was kept. 60% of the children rated the statement with the maximum number of points at the end of the year compared to 30% at the beginning of the year.

**Literal results:** at the beginning of the year, 70% of the subjects reported a certain difficulty in connecting with a friend with whom they would like to play. At the end of the year, all the children testified about an improvement in their feeling towards their social status in the class. 40% of the children testified about a personal process they went through regarding their personal responsibility in choosing friendships. In reference to the saying "My friends respect me and my opinion"

**Numerical results:** in 80% of the subjects a numerical increase in the feeling of being respected was observed, in the remaining 20% no change was observed, while in 10% of them from the beginning the saying was rated with the highest score and in another

10% it did not apply Improvement in the feeling that they are respected in the classroom. 60% of the subjects scored the statement with the maximum number of points at the end of the year compared to 10% at the beginning of the year. **Literal results:** at the beginning of the year, 80% of the subjects expressed dissatisfaction with the degree of respect they receive among their classmates and 10% stated that they do not know how to refer to a verb. At the end of the year, 80% of the subjects indicated that a change could be felt in the general classroom climate. 10% reported that their feeling in the class is not good.

In reference to the saying "I manage to avoid fights and arguments with friends and reach a solution in pleasant ways".

**Numerical results** 50% of the subjects observed a numerical increase in the feeling that they manage to conduct themselves better in conflict situations. In the remaining 50%, no change in the result was observed. 60% of the subjects rated the statement with the maximum number of points at the end of the year compared to 10% at the beginning of the year. No drop in score was observed in any of the subjects.

**Literal results:** At the beginning of the year, 50% of the subjects testified about the lack and need for conflict management tools. 30% did not see personal responsibility in their involvement in fights. 30% referred to their personal responsibility. 20% stated that they have tools that help them solve problems. 10% referred to their general feeling regarding interactions and communication in the classroom. At the end of the year, all the subjects reported an improvement in dealing with conflicts. 70% of the subjects testified to purchasing tools that help them manage conflicts and solve problems. 30% of the subjects responded positively to the process and the general atmosphere in the class and said that they expanded their social circles. In the next question, the students were asked to say what they would preserve in the class

and what they would improve in it. The question included only a verbal description without a numerical representation. At the beginning of the year, 90% of the subjects thought that there was something to improve in the class in the social aspect. 60% of them experienced the class as an unsafe place and reported bullying behavior towards them or their classmates. 10% reported feeling disrespected. 20% stated that they would like to expand their social circles and the possibilities of playing with friends.

20% reported noise and anger affecting the atmosphere. 10% said they did not know what they would like to improve. 10% said they would like to improve everything in the classroom. At the end of the year, 30% of respondents felt there was nothing left to improve. 10% felt everything should be improved and 60% mentioned specific changes that should be made. Compared to the beginning of the year, only 10% said that the attitude of the children towards each other should be improved.

In terms of things students wanted to keep in the classroom: At the beginning of the year, 70% of subjects wrote that they would keep their best friends. 30% did not find anything on the social level in the class that they would like to keep. At the end of the year, 70% of the children referred to the flow in the class and the general social climate, 40% of the subjects described the improvement of the children's behavior towards each other. 20% of the subjects the presence and effectiveness of the acquired tools for self-management and problem solving. 30% mentioned the good atmosphere and pleasant feeling in the class. 75% of the 30% who did not find what they wanted to preserve at the beginning of the year found things they would preserve.

At the level of the defined goal of social climate and social communication, there was a significant improvement in how children felt about their social status and an increase in their overall good feeling in the classroom. 20% reported noise and rioting affecting the

atmosphere. 10% said they did not know what they would like to improve. 10% said they would like to improve everything in the classroom. At the end of the year, 30% felt there was nothing left to improve. 10% felt everything should be improved and 60% mentioned specific changes that should be made. Compared to the beginning of the year, only 10% said that the attitude of the children towards each other should be improved.

In terms of things students wanted to keep in the classroom: At the beginning of the year, 70% of subjects wrote that they would keep their best friends. 30% did not find anything on the social level in the class that they would like to keep. At the end of the year, 70% of the children referred to the flow in the class and the general social climate, 40% of the subjects described the improvement of the children's behavior towards each other. 20% of the subjects the presence and effectiveness of the acquired tools for self-management and problem solving. 30% mentioned the good atmosphere and pleasant feeling in the class. 75% of the 30% who did not find what they wanted to preserve at the beginning of the year found things they would preserve.

At the level of the defined goal of social climate and social communication, a significant improvement was observed in the children's feeling of social status and an increase in their overall good feeling in the classroom.

*Results of a circle for self-management, guided discovery, and mantras:*

The results describe a comparison between the content brought up during observations, conversations with children, and class discussions at the end of third grade before the intervention program and at the end of fourth grade after the program.

At the level of the defined goal of habituation and internalization and application of the principles of the program and the reference tables: At the end of the year, most children had acquired the circle of self-management

and the tools for observation, internalized the stages at the cognitive level and the emotional level, and used them to achieve defined behavioral goals, such as: social climate, rules of discourse, social play.

At the defined goal level of rules of discourse, significant improvement was observed in the ability to engage in attentive, appropriate, and respectful classroom discourse. Prior to the intervention, classroom discourse was characterized by outbursts and speaking without permission, rejecting the opinions of others, language that was not respectful and appropriate to the time and place, and verbal violence towards class members and staff. In the observations conducted at the end of the implementation of the intervention program, students in the class waited for permission to speak to express their opinions in class, listened to their classmates and the teacher, expressed themselves clearly, in an appropriate tone of voice and in appropriate and respectful language, and the level of verbal violence decreased significantly.

At the level of the defined goal of a social game, the intervention helped in acquiring tools to manage a social game: observations conducted prior to the intervention found that students were disrespectful of the rules of the game, failed to divide into game groups, gave up the game before they lost, and many conflicts occurred. After the intervention, observations showed that students invited friends to play, managed to play together for a long time, enjoyed playing together, cooperated, followed the rules, lost respectfully, and won without humiliating the other person.

*Reaction stages results:*

according to students' reports, using the Reaction stages as an available, practical and clear tool has helped them avoid impulsive and violent behavior. At the beginning of the year, 51.7% of the children reported being victims of verbal violence, expressed in humiliation, insults, threats, social ostracism

and boycott, compared to 17.24% at the end of the year.

At the beginning of the year, 24.13% of students reported suffering physical violence, compared to 10% at the end of the year.

At the beginning of the year, the percentage of children who required repeated treatment and activation of personal programs due to violent behavior was 30%, compared to 6% at the end of the year.

**Table 5. Violent and victims compression**

	Percent – before	Percent – after
Violent behavior (physical or verbal)	30%	6%
victims of physical violence	24.13%	10%
victims of verbal violence	51.7%	17.24%

**Figure 4. Violent and Victims Compression**

In terms of behavior, the reinforcement program was implemented: Throughout the intervention program, the process of self-monitoring became

more accurate, honest, and realistic through written reflections. Students received more and more positive reinforcements for achieving the set goals. After goals were met and behaviors improved, the demand for positive behaviors was increased to maintain

the reinforcements.

**Table Results Quality of life:**

The impact of the intervention program on students' quality of life and well-being was measured using student reports and 12 items related to three quality of life indicators related to the school environment. The indicators were selected from the QQL questionnaire, which contains 21 items and a total of six quality of life indicators.

**Table 6: School function**  
5 -High QoL

School function (S)	Mean - Before	Mean – After
S1: I have close friends	3.6	4.13
S2: I am willing to share pleasure with classmates	3.6	4.1
S3: I have many other good friends	2.6	3.03
S4: Classmates will comfort me, when I feel down	2.9	3.86
S5: My teacher cares about me	3.6	4.23

*In terms of quality of life:*

Indicators related to functioning in school. Answer 5 means a high level of quality of life (Table 6).

For the index: I have close friends, the average of students' responses before the intervention program was 3.6. After the intervention program, the average of responses increased to 4.13.

In the index: I am willing to share joy with classmates, the average of students' responses before the intervention program was 3.6. After the intervention program, the average of responses increased to 4.1. In the index: I have many other good friends, the average of students' responses before the intervention program was 2.6. After the intervention program, the average of responses increased to 3.03. In the index: classmates comfort me

when I feel down, the average of students' responses before the intervention program was 2.9; after the intervention program, the average of responses increased to 3.86. For the index: my teacher cares about me, the average of students' responses before the intervention program was 3.6; after the intervention program, the average of responses increased to 4.23.

In all indicators of school functioning (s), an increase was observed after the intervention program. For the indices related to learning skills (l) and relationship with peer group (p), the response 1 indicates a high standard of living. (Table 7) In the indicators related to the ability to learn: For the index: I have difficulty with schoolwork, the average of students' responses before the intervention program was 3.06, and after the intervention program, the average of responses decreased to 3. The average response of the index: I cannot understand school subjects was 3.03 before the intervention program and remained unchanged after the program. In the index, I feel I cannot learn better, the average of students' responses before the intervention program was 3.1. After the intervention program, the average of responses decreased to 3.06. In the index I do not have time for school, the average of students' responses before the intervention program was 2.5. After the intervention program, the average of responses decreased to 2.3.

For the indices related to the relationship with the peer group. For the index: my classmates exclude me, the average of students' responses before the intervention program was 3.16. After the intervention program, the average of responses decreased to 2. In the index: I do not want to be friends with anyone, the average of students' responses before the intervention program was 3.1. After the intervention program, the average of responses decreased to 2.73. In the index: I get bullied for no reason, the average of students' responses before the intervention program was 2.53. After the intervention program, the

average of responses increased to 2.

**Table 7.** Learning ability (L) & Peer Relationships (P)  
 1 – High QoL

<b>Learning ability (L) &amp; Peer Relationships (P)</b>	<b>Mean – before</b>	<b>Mean – after</b>
L1: I have difficulty with schoolwork	3.03	3
L2: I cannot understand the school courses	3.03	3.03
L3: I feel I cannot learn any better	3.1	3.06
L4: I do not have time to do school work	2.5	2.3
<b>Peer Relationships (P)</b>		
P1: My classmates exclude me	3.16	2
P2: I do not want to be friends with anyone	3.1	2.53
P3: I am bullied for no reason	2.73	2

## 8. Discussion

School climate is influenced by a sense of support and responsiveness to individual needs, as well as fair and clear rules, order, discipline, organization, and care for the physical environment. Disorder, disciplinary problems, and a sense of alienation and lack of protection significantly affect the climate and do not allow the school to achieve its goals for development, teaching, and learning (Benvanishti et al., 2008). The intervention program primarily required the organization of the classroom, that is, the creation of the weekly and daily schedule and the creation of regularities and routines in the classroom. The organized and orderly structure of the environment is an important and central element in building a framework that facilitates productive learning academically and socially (Allen, 2010). Studies have shown a clear relationship between classroom organization, the establishment of clear and consistent rules and expectations, and an

infrastructure that allows for student participation in decision-making, and a decrease in violence and bullying (Safran& Oswald, 2003). It can be concluded that maintaining an organized and orderly work environment has helped to improve classroom climate, which is reflected in the improvement of how students feel in the classroom by making more connections to learning and having a sense of safety.

The uniqueness of action research was demonstrated by activating a cognitive-behavioral intervention program in a school setting with a large group of 30 students. Studies point to the power of the group and its influence on the effectiveness of any cognitive-behavioral intervention program (Wiborg, et al., 2015; Skjemov, et al., 2015). In addition, intervention programs that work at the level of groups of children have been shown to be particularly effective intervention tools for reducing behavior problems and improving prosocial behavior (Yavuzer&Karatas, 2013; Bowman-Perrott, et al., 2015).

Giesbrecht, Leadeater& Macdonald (2011) attribute great importance to the influence of the early elementary school years and the sense of security during those years on children's social, emotional, cognitive, and personality development. Many studies have found that in a situation where there is no protection, both the victim and the bully are at increased risk of developing social, emotional, and behavioral problems (Hanish& Guerra, 2002; Kochenderfer-Ladd & Skinner, 2002; Kochenderfer-Ladd & Wardrop, 2001; Leadbeater&Hoglund, 2009; Loeber& Farrington, 2000; McGinnis & Goldstein, 1997; Pope & Bierman, 1999). At the beginning of the year, prior to the start of the program, there was a significant disconnect between the high cognitive and academic abilities of the group and the students in it and their lack of implementation. This, along with social, emotional, and behavioral skills that were

below their age. According to Apple (2007) and Weisbord (2007), there is a relationship between cognitive skills and self-control, information processing, and control over emotions as mechanisms that allow an individual to control and regulate their behavior and moderate the relationship between emotions and aggression. Behavior regulation and control of violent behavior allow individuals to acquire tools that help them behave socially using accepted social models (Moore et al., 2011). Going through the process and internalizing the language resulted in significant improvement in the level of violence in the subject and feelings of protection. The reflective and metacognitive work impacted automatic responses and the system of beliefs and perceptions. It also helped students discover for themselves, for the first time, skills and potential in several areas, including mastering appropriate social discourse and finding a place in the social group.

The goal of the intervention program was to develop self-management skills in students through cognitive and behavioral tools to improve classroom climate and the quality of life and well-being of students in the class.

The intervention program led to an improvement in the students' regulation and self-monitoring skills. Something that expanded their awareness and personal responsibility (Kaniel, 2013). The results of the intervention plan illustrate the importance of teaching effective problem solving skills in various situations through a self-management circle. According to Smith & Daunic (2004), problem-solving skills can help monitor thoughts, i.e., act according to reality, monitor the results of monitoring, and manage the results of responding accordingly. The use of cognitive behavioral principles has the potential to change the way students think. Changing thinking and learning thinking and observation skills allow for the development and implementation of an independent self-management system and the learning of new

behaviors (Harris & Pressley, 1991).

The results of the study show how through a slow and structured process, through small successes and reinforcements, self-management skills were acquired in the students. Self-management skills are a tool that students can use to deal with different situations and work on different defined goals. Through these skills, students were able to create a calm climate, regain a sense of protection and belonging compared to the stormy climate that characterized the class at the beginning of the year.

Kaniel (2006) defines self-reflection in terms of "metacognition" or "inner eye." It can be assumed that the writing of daily reflections, monitoring, and daily use by students helped to acquire and internalize the tools. According to Kaniel (2006), the need for reflection and metacognition arises in complex situations that require a combination of cognition, emotion, and behavior. The requirement to conduct daily and aggressive reflections helped to internalize and work on reflective observation as a tool to examine thoughts, feelings, and behaviors. Several studies indicate the relationship between negative automatic thoughts and feelings of anger and violent behavior (Yavuzer&Karatas, 2013). The process of internalization and establishment involved regular classes in the system in which automatic thoughts, belief systems, perceptions, and cognitive patterns, feelings, and emotions that arise as a result and their effects on behavior were brought into awareness. Research results show that by changing automatic thoughts, students were able to moderate the emotion of anger and, as a result, moderate behavioral responses according to the level of reactions and broaden the range of possible responses in a given situation. This contributed to a positive classroom climate and an increase in the feeling of safety. The improvement in climate was reflected in student reports, a reduction in the percentage of physical and verbal

violence, and a positive change in quality of life indicators related to school functioning.

## 9. Conclusion

The purpose of the study was to examine the effect of an intervention program based on cognitive-behavioral principles on classroom climate, classroom interactions, the sense of safety of the students in the class and the teachers who teach in the class, the quality of life and well-being of the students in the class, and the extent to which the students relate to social-emotional development and learning.

Prior to the start of the program, the classroom climate was turbulent, unyielding, and disrespectful. Students in the class reported a lack of a sense of belonging and a sense of protection, as well as a constant feeling of noise and disorder. These feelings prevented the implementation of interventions that would enable and promote learning. Students in the class and teachers reported a lack of legitimacy to express themselves in front of the class and a violation of their sense of competence, self-esteem, and ability to express skills in the cognitive domain. Students indicated that they found it difficult to initiate and sustain social activities in the classroom, such as conversations or social games. This reality caused a sense of constant frustration and a lack of appropriate response. Behaviors indicative of cognitive deficits and biases led to misinterpretation of everyday situations and maladaptive and disruptive behavioral responses, as well as a noticeable lack of reflective and metacognitive strategies. Over the years, the struggles described led to the development of negative social roles and images, associations based on a false background and having a negative and offensive effect. These reinforced the behavioral problems and created a closed circle that determined the fate and place of the individual in the class and the class as a group.

The intervention plan developed for the class was based on cognitive behavioral principles. The initial goal of the program was to build and establish a management and self-regulatory system in the students to provide them with tools to monitor their goals versus their actions, monitor the cognitive and emotional factors that influence behavior, and advocate for intentional self-change based on their will and their personal and group goals.

Through a long and consistent process, consistent semantics were established, tools were practiced and their use adapted, group and personal goals were established, all with shared thinking, clear definition, and limited time. All children in the class acquired management and self-regulation skills at different levels. The individual work built the group and the group work supported the individuals.

There was an improvement in class climate, sense of security, quality of life indicators related to the school environment, legitimacy and belonging of the children in the class, and motivation to maintain and act for a positive atmosphere. Social interactions were created on a positive basis, social circles were expanded, and appropriate and respectful discourse skills and rules were established. Consistent facilitation improved feelings of support and belief in the ability to handle conflict and challenges, calmed the classroom atmosphere, and allowed for learning, initiative, and personal expression.

The study was conducted over one year and demonstrated the positive results of an intervention program based on cognitive behavioral principles for management and self-regulation skills, as well as the impact of the program, along with the acquired skills, on student performance in various domains. The approach proved to be appropriate, the process was successful and provided

resolution. In addition, the degree of effectiveness of the group intervention program varied among the children and about 10% of the students in the class needed an individual intervention program at the same time.

The study did not include a control group to examine the effectiveness of another program or the natural developmental processes of puberty without the implementation of a program

The initiative to set up the program, its creation, implementation, monitoring, and analysis and drawing of conclusions were in the hands of the researcher. However, it must be remembered that this is one of the limitations of any action research (Shakdi, 2011).

In the future, it would be worthwhile to examine the impact on the specific group over time to assess long-term reasonableness and to examine the acquisition and implementation of the tools and their independent use. In addition, to provide continuity, self-management skills will need to be adjusted and the possible tools to manage additional situations will need to be expanded as students mature and enter adolescence.

It would also be interesting to adapt and study the functioning of the intervention program and its outcomes at different levels and for groups with different needs, as well as for prevention in groups without behavior problems

In addition, it is important to conduct a comparative study that examines the effectiveness of the specific intervention program compared to other intervention programs.

## INNOVATION AS A TOOL FOR IMPROVING PUBLIC SERVICES QUALITY

**Abstract:** *The aim of the article is to diagnose citizens' expectations regarding innovations implemented in the public services sector. The authors present the results of survey research conducted among students of Krakow universities. Respondents answered questions about the need for innovation in the public sector and the purposes they should serve. Based on the obtained results, the conclusion was drawn that an increasing number of citizens expect innovative activity in the public services sector. Therefore, the action of demand factors can be observed, although the mechanisms of their influence on the course of innovative processes in this sector are different from those in companies. The empirical research presented in the article was preceded by a theoretical introduction in which the authors describe the essence of innovation in the public sector, the conditions for their implementation, and the importance of citizens' participation in this process.*

**Keywords:** *innovation, public services, citizen participation*

### 1. Introduction

The scope and costs of operating the public sector, as well as the quality of services it provides, have been an important topic of scientific discourse and public debate for many years. Determining the appropriate size of this sector and its role in meeting the needs of citizens will likely remain a controversial issue. However, there is consensus in the literature that as economic and social development progresses, citizens' expectations for the quality of public services continue to rise. Therefore, diagnosing these expectations, identifying trends, and even shaping attitudes in this area is becoming an increasingly challenging task for public authorities, including at the local level (James, 2009; Song, An, Meier, 2021). Public opinion research typically focuses on diagnosing citizens' needs, while their expectations for problem-solving methods are less frequently studied. This creates an information gap in this area, particularly

regarding the diagnosis of residents' expectations for the innovativeness of the public sector. Public management specialists have long listed innovation as a tool for improving the quality of public services (Gallouj, Savona, 2009), but social perceptions of these innovations are rarely studied.

The aim of this article is to partially fill this gap by diagnosing the expectations of Krakow residents regarding innovations implemented in the public sector. The authors present the results of survey research conducted among students at Krakow's universities, which is one of the largest groups of recipients of public services available in the city. The authors of the study aim to justify the thesis that social support for innovations implemented in the urban space is showing a growing trend. The empirical research presented in the article is preceded by a theoretical introduction in which the authors describe the essence of innovation in the public sector, the conditions for their

implementation, and the importance of citizen participation in this process.

## **2. Theoretical background**

For several decades after the concept of innovation became widespread in the literature on economics and management, it was primarily used in the context of the private sector. The public sector was mentioned in discussions on innovation, but in a specific role - as a component of the innovation process (basic research) and as a creator of conditions conducive to innovation in businesses (innovation policy). Individual public institutions, both government and local, were not seen as active agents in implementing innovative services for customers. However, this approach has been gradually changing. About four decades ago, the problem of innovation began to be discussed in the context of public sector entities. This was largely inspired by criticism of traditional management methods in public administration and the emergence of concepts for its reform (e.g. New Public Management) (Hughes 1994, Ferlie et al. 1996). The growing interest in innovation in the public sector was also influenced by the popularization of the concept of Corporate Social Responsibility (CSR), which emphasizes the social dimension of innovation (McGregor, Fontrodona 2008, Luo, Du 2012). Recently, a systemic approach to implementing innovation in public services has become increasingly popular, developed within the concept of smart cities (Ratten 2017).

The definition of innovation in the public sector does not differ significantly from the typical approaches used in business analysis. Regardless of whether the private or public sector is being considered, innovation is defined as changes that have certain characteristics. Firstly, an innovation is a change that has been implemented in practice (a project or concept is not yet an innovation).

Secondly, innovation requires positive effects. For entrepreneurs, these are primarily economic benefits (cost reduction, sales growth, improved profitability). In the case of public entities, the focus is primarily on social benefits, such as improving the quality of life of stakeholders (e.g. through streamlining administrative services, optimizing public transportation, etc.). Economic benefits (e.g. cost reduction) in the public sector are also desirable, but they do not have to be of primary importance (Mulgan, Albury 2003). The private and public sectors differ in terms of the types of innovations that are most commonly implemented. In the private sector, new products and services are important. Public sector entities introduce new services relatively infrequently, and new products are exceptions. The public sector is fundamentally service-oriented, and the range of tasks it performs is limited or closed (e.g. local government tasks may arise directly from legal regulations). Therefore, innovations in the public sector are focused more on improving the quality of services provided, rather than expanding their range (Walker 2006, Thenint 2010). The specificity of the public sector also means that it rarely develops technological innovations. These usually arise in commercial entities, while the public sector is their recipient.

Although the nature of innovation in the private and public sectors is similar, the set and significance of factors influencing the implementation process can vary significantly. The basic difference concerns the impact of demand determinants on innovative activity. In companies, demand factors affect their economic condition in a quite obvious way, through the market mechanism. Innovations that reduce costs allow for price reduction, and as a result, increase sales and market share; product innovations provide a differentiation advantage resulting in high demand and profit, and this effect is supported by image benefits. In the public sector, the

implementation of innovations meeting stakeholders' expectations does not bring such economic effects. While cost benefits may arise, satisfaction with the quality of public services does not always translate into the number of customers or revenue growth. For example, a satisfied customer of an office will not visit it more often than necessary, nor will they leave more funds than, for example, a legally established administrative fee.

This does not mean that customer expectations regarding the innovation of public services should not be taken into account as a factor stimulating the innovative activity of public entities. These expectations are important, but the way they influence innovation is different than in the private sector. Demand for innovation expressed by citizens indirectly affects the decisions of public sector entities, using political mechanisms. This concerns involvement in the framework of representative democracy (choice of authorities demonstrating an innovative attitude), as well as direct participation (e.g. decisions on the implementation of specific innovative projects made using the procedure of participatory budgeting).

The political pressure exerted on the authorities, especially local ones, is just one of the channels through which citizens influence innovation processes in the public sector. Equally important is non-political participation, which means direct involvement of citizens in the process of developing and implementing innovative solutions (Dameri, Ricciardi, 2015; Berntzen, Johannessen, 2016; Grab, Ilie, 2019). The form of citizen participation may vary. The most obvious form is citizens' participation in the evaluation of introduced solutions. They do this while using them, providing feedback that is useful for making corrections and modifications. Residents can also be involved a bit earlier by acting as testers in the implementation phase of an innovative solution. The most advanced and increasingly

popular formula for such participation is the so-called living labs, in which citizens are engaged in designing and testing innovations even before they are fully implemented (Nguyen, Marques, Benneworth, 2022). Citizens can take on even more creative roles by co-creating innovative ideas, for example, through city-initiated crowdsourcing platforms (Gooch, Wolff, Kortuem, Brown, 2015; Shahrour, Xie, 2021). The extent of citizen participation in innovative projects depends on whether they are convinced of the benefits of the projects being implemented. Therefore, it is important to monitor their opinions and take informational action in this regard.

### 3. Research methods

Information on the expectations of Krakow residents regarding innovation in public services available in the city was obtained through survey research (questionnaire interview). The respondents were students from Krakow universities. Such a selection of respondents resulted from several premises. Firstly, Krakow is an academic city, so students constitute a large percentage of public sector clients. Secondly, their high and diverse activity means that they commonly use the full range of public services in the city. Finally, thirdly, students can be considered a group fully aware of the currently ongoing technological changes, which increasingly affect the public sector.

The survey was conducted in three rounds: in 2019, 2021, and 2023. In the first round, respondents filled out a traditional paper questionnaire, and in the two subsequent rounds, an online questionnaire. To ensure similar conditions, each time the survey was completed during teaching sessions in the presence of lecturers.

In this study, information from the 1st and 3rd rounds of research was used (in the 2nd round, the questionnaire was modified to take into account circumstances related to the

pandemic, so it contained fewer questions about innovation). In the first round, 1750 people completed the questionnaire. The third round is still ongoing, and so far, 501 questionnaires have been collected. This analysis can therefore be treated as preliminary. However, it should be emphasized that for a population of 143,000 students at Krakow universities, the required sample size is 383 people (assuming the following parameters: 95% confidence level, maximum error of 5%, fraction size of 0.5).

#### 4. Results

The survey results indicate that already in 2019, over half of the respondents recognized the need for implementing innovation in the public sector. Over 42% even stated that they should be implemented unconditionally. The percentage of people who claimed that there was no room for innovative solutions in the public sector was negligible (3.1%). It is noteworthy that almost one-third of the respondents had no opinion on this matter (see Table 1). Therefore, it can be concluded that there was no clear division between supporters and opponents of innovation in the public sector, but rather a division into engaged and indifferent individuals. This information can be seen as a signal of the challenges facing the city in terms of education and promotion of innovative solutions. It is worth emphasizing that Krakow is involved in many such projects, and one of the strategic goals of its development is the implementation of the smart city concept.

The results of a later round of research (in 2023) indicate clear changes in the attitudes of the respondents. The direction of these changes is in line with expectations. In terms of their scale, they can be considered radical. The proportion of students supporting innovation in the public sector has increased by almost one-third. As a result, almost 80% of respondents currently expect innovative

activity from the public sector, and almost 2/3 believe that such innovations should be introduced unconditionally. The percentage of students who have no opinion on this subject has dropped by half. Only 1% of respondents described innovation in the public sector as undesirable.

**Table 1.** Expectations of respondents regarding innovation in the public sector

	odsetek odpowiedzi	
	2019	2023
Innovation in the public sector: <i>should be absolutely introduced</i>	42.5%	61.3%
<i>are needed, but not necessary in this sector</i>	12.6%	17.9%
<i>are indifferent to the functioning of this sector</i>	10.7%	4.0%
<i>are undesirable in this sector</i>	3.1%	1.0%
<i>I have no opinion</i>	31.2%	15.7%

The analyzed period also saw a change in respondents' preferences regarding the goals that innovation in the public sector should serve. The percentage of respondents who identified two desired effects of these innovations - improving the quality of public services and reducing the cost of providing these services - significantly increased. In 2023, over ¾ of respondents pointed to the improvement of the quality of services (compared to about 46% in 2019). The percentage of respondents indicating cost reduction as the goal of innovation in the public sector increased even more. In 2019, this direction of innovative activity in the public sector was indicated by every third respondent, while in 2023, their share almost doubled. The percentage of respondents expecting the introduction of additional, innovative public services increased from about 30% in 2019 to 40% in 2023. However, the percentage of people claiming that innovation in the public sector should have an ecological character did not change.

significantly over the four years. Young people are usually sensitive to environmental problems, so it may be surprising that a relatively small percentage of respondents indicate ecological effects of innovation as particularly desirable. This is probably due to the fact that Krakow is quite actively implementing and promoting such solutions

(e.g., in public transport). Perhaps respondents emphasized other areas where there is more to be done. The emphasis on the need to reduce costs, especially in the last round of surveys, may result from a general belief in the deteriorating financial condition of local governments in Poland in recent years.

**Figure 1.** Expected effects of innovation in the public sector in the opinion of respondents

## 5. Conclusion

Citizens' opinions and expectations have a significant impact on the course of innovative processes in the public sector. Firstly, residents interested in innovation can exert pressure on public institutions using direct and indirect democratic tools. Secondly, citizens aware of the benefits of implementing modern technologies in the public sector can participate in the process of their development, testing, and implementation in various ways. For these reasons, it is important to diagnose public opinions on innovation in the public sector.

The research presented in this study indicates that the vast majority of surveyed residents of Krakow expect the implementation of innovations in public services provided within the city. They also have specified

expectations regarding the outcomes of such innovations: they should primarily contribute to improving the quality of public services and lowering their costs. Based on this, it can be concluded that in Krakow, there are social conditions that favor the innovative activity of local authorities. This increases the chances of success for implemented projects, especially those aimed at implementing the concept of a smart city.

However, it is worth noting that only students from Krakow universities participated in the study. They were representatives of a very large but specific group of public service users. It can be suspected that support for innovation in other groups of residents, especially in the older generation, may be lower. Conducting broader research, covering the entire cross-section of society, is recommended. They could answer the

question of whether the promotion of innovative solutions in the city is effective and whether there are educational needs in this area.

## **MATURITY OF THE QUALITY MANAGEMENT SYSTEM AND DEALING WITH CRISIS SITUATIONS**

**Abstract:** *The aim of this article was to analyze how organizations with an implemented ISO 9001 quality system responded to the crisis caused by the Covid-19 pandemic. For the purpose of the study, a set of questions was developed to enable a simplified assessment of the QMS maturity level. Next, it was verified how organizations with different levels of quality culture coped with the reorganization forced by the restrictions associated with the outbreak of the pandemic. As a result, it was confirmed that there is a relationship between QMS maturity and the implementation of actions that can be described as systemic. It was also found that the involvement of top management and the motivating and supporting role of the quality management representative were the factors that had the greatest impact on taking action in a crisis situation.*

**Keywords:** *quality management system, pro-quality culture, restrictions, crisis.*

### **1. Introduction**

Quality management system (QMS) is planned and established by documenting procedures for the processes of organization to fulfill the needs and expectations of internal and end customers. The international standard, ISO 9001, specifies the requirements of quality management system (QMS) to consistently provide products that meet customer and applicable statutory and regulatory requirements (Natarajan, 2017). It provides a framework for organizations to establish, implement, maintain and continually improve their quality management system. By implementing ISO 9001, organizations can improve their processes, reduce errors, increase efficiency, and ultimately enhance customer satisfaction (ISO - ISO 9001 and related standards - Quality management, 2021). However, in contemporary times, it appears that one of the

most significant advantages of implementing a quality management system is the necessity to review organizations from a new, pro-quality perspective.

Effective and efficient quality management, resulting in a high level of product quality, requires the development of a specific organizational culture with a pro-quality character, referred to in literature as a culture of quality (Gołębiowski, 2014). Quality culture encompasses everything that employees possess, think, and do as members of an organization to ensure that the product (or service) meets the needs or expectations of customers that have been established, conventionally accepted, or mandatory (Bugdol, 2018). The notion of quality culture is understood as comprising shared values, beliefs, expectations and commitments toward quality that are supported by structural and managerial elements and processes that enhance quality (Rapp, 2011). Quality culture

---

Email: [dziadkoj@uek.krakow.pl](mailto:dziadkoj@uek.krakow.pl)

can also be understood as a set of values, policies, behaviors, and decision-making in which there is positive, visible, and shared commitment to quality, with an emphasis on continuous improvement (Wiśniewska & Grudowski, 2022). It also involves the development and implementation of organizational improvement strategies, the use of information for continuous improvement, the correlation between competencies and quality responsibility, collaboration in achieving company goals, and reward systems that take into account work outcomes (Skrzypek et al., 2019). The condition for shaping a culture of quality is a change in the management model from traditional, highly hierarchical and functional to an approach characterized by an active attitude of employees and employee responsibility in the organization's management process (Karaszewski, 1999).

When referring to organizations that have implemented the ISO 9001 system, the concept related to a pro-quality culture of management is the maturity of the quality management system. The maturity of a quality management system refers to its level of development and effectiveness in meeting the organization's quality objectives.

The level of maturity of quality management system is a crucial factor, along with the organizational culture and professional involvement. The QMS maturity signifies how the organization creates and executes the system, evaluates the processes and outcomes, and most importantly, utilizes it as a foundation for ongoing enhancement (Prasnati & Wardhani, 2020). The QMS maturity can be measured quantitatively, in such context it is related to a time dimension, indicating a more advanced state over the years (Sousa & Voss, 2001). However, it is also closely linked to best practices of quality management and can be measured by customer-perceived quality, as well as the effectiveness and efficiency of process management (Nascimento et al., 2016).

Therefore, it can be said that QMS maturity refers to the depth of the organization's experience with quality management system (Novokmet & Rogośić, 2017). A level of maturity is a valuable tool in identifying areas of improvement. This knowledge can be used to fill gaps and ultimately support organizations in reaching strategic and operational objectives (Vanalle et al., 2016).

There are many models for measuring the QMS maturity, most of which are based on self-assessment by the organization. These models are usually related to quality management tools and are linked to models of excellence and quality awards. The three most commonly used models for assessing the level of maturity and functioning of quality management systems are: the SO 9004 standard, the EFQM Model, and the guidelines of the ISO 10014 standard. (Wolniak, 2011). A literature review shows that researchers also create their own maturity assessment models, either by combining existing approaches or developing their own tools. Nascimento et al. (2016) developed a maturity model for quality management systems with 5 levels by combining other recognized maturity models, namely Crosby Maturity Grid, PNQ Quality Award, and JIS Q 9005 standard. Grabowska & Takala (2018) combined QMS maturity with quality costs and proposed a technique for assessing QMS maturity, where QMS maturity is the variable and quality costs are the output measure. Wolniak (2019) developed their own tool to measure the level of QMS maturity, based on the requirements of the ISO 9001 standard modified using the expert method. Xiaofen (2013) proposed a tool based on Crosby's Evaluation Model of Quality Management Maturity, ISO 9004 and criteria for performance excellence of Baldrige National Quality Program. On the other hand, Odważny et al. (2019) developed their own maturity model by building upon the ISO 9004 standard and adding KPI proposals for tracking and measuring

individual activities.

All above models, both basic and modified by researchers to achieve specific research goals, enable the measurement of QMS maturity. Their undeniable advantage is comprehensiveness and the possibility of precisely determining the level of maturity. On the other hand, the research process is usually long and demanding for organizations, which limits the possibilities of its use.

Particularly unexpected and crisis situations make it difficult, and sometimes even impossible, to conduct comprehensive research. Such a situation was the outbreak of the Covid-19 pandemic, which forced drastic changes in organizations. On the one hand, this situation provided extremely instructive observations for researchers, but on the other hand, the possibility of conducting research in organizations struggling with the crisis was significantly limited. Therefore, in the current study, a simplified questionnaire was chosen, containing 10 variables determining the QMS maturity, determined by an expert method. This was aimed at reducing the time that respondents had to dedicate to participating in the study, but above all, to ask during survey a wide range of questions about the phenomena that occurred in organizations during the pandemic.

The aim of this article is to present and analyze data on how organizations with an implemented ISO 9001 quality system responded to the crisis of the Covid-19 pandemic. Providing international best practice, ISO standards are designed to help organizations build their resilience, improve their processes and achieve greater efficiencies. Therefore, organizations with a higher level of QMS maturity should be better able to cope with crisis situations - verifying this relationship was the main idea of this article.

## 2. Materials and methods

The data analyzed in this article is a part of a project aimed at analyzing the behaviors of pro-quality managed organizations in the face of the Covid-19 pandemic crisis (Kafel, 2021). The aim of the project was to diagnose the organizational behaviors of companies with an implemented quality management system compliant with the ISO 9001 standard. Particular emphasis was placed on the functioning of the quality management system in case of a sudden crisis, with special consideration given to the possibility of transitioning to remote work. Organizations that met the following criteria were selected for the study: (1) at least some employees worked remotely in 2020, (2) organizations had implemented and certified a management system compliant with ISO 9001. The database developed for the study contained data from 1200 companies with a certified quality management system. Additionally, PF ISO 9000, the association of organizations with an implemented quality management system supported the survey by providing a link to the CAWI survey to members of the association. So, several certification bodies have agreed to send emails containing a survey link and a letter of recommendation to the companies they are in contact with.

The survey started in January 2021, after a pilot study, it was conducted using the CATI technique. Due to a large number of refusals resulting from respondents' lack of time and low effectiveness of telephone contacts, a mix-mode technique was included in the survey. In some cases, representatives of companies informed interviewers that contact with decision-makers was possible only by email. In such situations, CAWI surveys were sent by email using research agency software. In the final stage of the survey, a single system reminder email was sent to encourage organizations to complete the online survey and telephone interviewers contacted those companies that had

previously expressed a desire to participate in the survey but had delayed completing it. As a result, 205 organizations participated in the survey, which is 17.1% of the target group. Characteristics of the participants are presented (Table 1).

**Table 1.** Characteristics of participants (own elaboration)

Variable (N=205)	Frequency (%)
Number of employees	
up to 9	7,30%
10-49	22,00%
50-249	37,60%
more than 249	33,20%
Annual income (PLN)	
less than 2 mln	15,60%
above 2 to 10 mln	13,70%
above 10 to 50 mln	14,60%
1% more than 50 mln	8,30%
no response	47,80%
Scale of the operations	
local / regional	17,10%
all-Poland	28,80%
international	53,20%

The research form consisted of 5 parts focusing on various aspects related to the quality management in enterprises during the pandemic. The complete questionnaire consisted of 32 closed-ended questions and 11 open-ended questions. The closed-ended questions mainly used a 5-point Likert scale, a dichotomous scale with the option to add comments, and a dropdown list. Additionally, custom scales were created for some sections of the survey.

This article presents a part of the project aimed at investigating the impact of a pro-quality management culture on how organizations respond to crises. This part of the questionnaire contained two sections with

different response scales. The first section focused on the functioning of the quality management system before the outbreak of the pandemic. Respondents evaluated the degree of implementation of listed activities influencing the pro-quality culture on a 5-point Likert scale. The second section focused on the actions taken by the surveyed organizations in response to the pandemic outbreak, using a dichotomous scale. Metric data characterizing the surveyed organizations were also used in the analysis.

Hierarchical clustering using Ward's linkage method and k-means clustering multivariate grouping technique were used to segment consumers. Kruskal-Wallis H test and Mann-Whitney U were used to identify statistically significant differences among the observed groups. Additionally, Spearman's correlation coefficient was used to identify relationships between the level of maturity and actions taken in response to pandemic restrictions. The data analysis was conducted using Statistica (ver. 13.3).

### 3. Results

#### 3.1. Segmentation Based on the Degree of Implementation of Quality Management System

The analysis was based on 10 items that are necessary for the proper functioning of the quality management system. The surveyed organizations performed the self-assessment, measured on a five-point Likert-type scale (where 1=strongly disagree and 5=strongly agree). The statements concerned the functioning of the quality management system before the pandemic and were as follows:

- 1) Employees showed commitment to actions carried out within the quality management system.
- 2) The system documentation was tailored to the company's needs.

- 3) Audits had a significant impact on improving the organization's functioning.
- 4) The document flow within the company was efficient.
- 5) There was an atmosphere in the organization that can be described as a "quality culture".
- 6) The quality management system positively influenced the development of a quality culture.
- 7) The top management was involved in activities related to the quality management system.
- 8) Company trainings were held regularly.
- 9) The QMS representative motivated employees to carry out improvement activities.
- 10) Employees always kept up to date with changes introduced in the company.

As a first step, hierarchical clustering with Ward's linkage method was used to identify the number of clusters adequate to the purpose of the study. To determine the optimal number of clusters, the dendrogram produced by the algorithm was analyzed. The level at which merging two clusters leads to a significant increase in the sum of squared distances were interpreted as the optimal number of clusters. The preliminary substantive analysis showed that the four-cluster solution was the most meaningful and interpretable.

Next, in order to segment the surveyed organizations based on degree of implementation of quality management system, the k-means clustering multivariate grouping technique was used, according to the number of clusters identified through the hierarchical clustering procedure. Figure 1 presents the results.

**Figure 1.** Segmentation of surveyed organization due to QMS maturity (own elaboration)

As a result of the segmentation procedure, organizations were identified in which the maturity (level of implementation) of the quality management system is: (1) excellent, (2) very good, (3) good and 4 (basic).

The “excellent” cluster is the largest, with 97 organizations (46.3%). The average scores for all 10 surveyed items were in the range of 4.7-4.9, which indicates the high maturity of the quality management system.

The second cluster includes 49 organizations (23.9%) and presents a slightly lower level of implementations of some components of the quality management system. The average result for most surveyed items (8 out of 10) is in the range of 4.3-4.6, while the method of conducting ISO system training was definitely rated low (3.2). On the other hand, the adequacy of system documentation was rated on average at 4.8, which means that organizations from a "very good" cluster have a very good basis for achieving a higher degree of quality management system maturity.

The third cluster, labeled as “good” consists of 44 organizations (21.0%) with average score for most surveyed items in the range 3.5-3.9. Only the adequacy of the system documentation to the needs of the organization was rated slightly higher. An average rating of just under 4.0 means that most of the components of the quality management system are implemented and maintained, but at the same time each item still has the potential for improvement.

The fourth cluster is the smallest, containing only 18 organizations (8.8%). Compared to the rest of the respondents, these organizations present the lowest degree of implementation of the quality management system, the average score for most of the surveyed items is 3 or less (2.4-3.1). The degree of maturity of the QMS can be described here as "basic", which means that the organization has implemented the requirements of quality management system, but the system has not yet been fully operational.

### 3.2. Factors Affecting the Maturity of the Quality Management System

The current study investigated the potential impact of five variables on the effectiveness of Quality Management Systems (QMS), namely company size, range of operations, annual income, and number of QMS recertification cycles. The objective was to determine whether these variables resulted in statistically significant differences between groups with varying levels of QMS maturity, which were categorized as excellent, very good, good, and basic.

The Kruskal-Wallis H test was employed to identify statistically significant differences among the observed groups, while the Mann-Whitney U test was used to determine between which groups statistically significant differences in mean values exist. Table 2 presents the results.

**Table 3.** Factors influencing QMS maturity – Kruskal Wallis test (own study )

Factors influencing QMS maturity	Clusters				chi <sup>2</sup>	Sig.
	Excellent	Very good	Good	Basic		
	<b>Kruskall Wallis H</b>					
	median obs.-median exp.					
company size	-0,049	-1,146	0,683	0,512	0,158	0,984
range of operations	-2,780	1,805	0,976	--	3,375	0,337
annual income	-1,202	-2,495	3,936	-0,239	2,268	0,519
number of QMS recertification cycles	13,293	-3,659	-9,634	--	26,947	<b>0,000</b>

The Kruskal-Wallis H test enables the assessment of significant differences in mean values across multiple groups. Based on the findings presented in Table 3, it can be inferred that the mean values were not equal among the various clusters for only one variable, namely the number of QMS recertification cycles. However, statistical analysis indicates that the other three variables did not show significant differentiation among the identified clusters.

In order to identify statistically significant differences between clusters, the Mann-Whitney U test with Bonferroni correction of alpha value was used. The findings indicate that there are no statistically significant differences between the "excellent" and "very good" clusters ( $p = 0.945$ ), as well as between the "good" and "basic" clusters ( $p = 0.727$ ). However, the number of QMS recertification cycles is a significant factor that distinguishes the remaining clusters at a statistically significant level ( $p = 0.000$ ).

### 3.3. Actions Taken by Organizations in Response to Crisis Situation

The analysis was conducted using the case of the crisis represented by the Covid-19 pandemic. Actions that organizations had to implement to ensure continuity of their operations during a crisis were analyzed. Respondents answered 12 questions using a dichotomous scale (yes/no), with the option of adding comments.

In accordance with regulations implemented to prevent the spread of pandemics, organizations had been required to implement three critical measures to prevent the transmission of infectious diseases: distance, disinfection and masks (DDM). The table 3 provides an overview of action implemented by surveyed organization to deal with these restrictions.

All surveyed organizations implemented measures to ensure a sanitary regime (DDM). Notably, the vast majority of them (94.6%)

also developed internal procedures for implementing sanitary recommendations. The majority of organizations approached this problem systematically, with 68.4% of them also establishing crisis teams (only 4 organizations had such teams prior to the outbreak of the pandemic).

Further actions taken by these organizations included the reorganization of internal activities to reduce the risk of virus spread and the transition to remote work. Approximately one quarter of the surveyed companies did not see the need for a change in work organization. The remaining organizations, comprising 74.6% of the survey, implemented changes such as shift work or dividing employees into smaller groups working in separate rooms without contact between workers from different groups. Additionally, they introduced or extended work breaks for ventilation and disinfection of premises, or organized breaks at different times to avoid contacts among employees. Almost all organizations (94.6%) restricted access to meeting places for employees, such as break rooms, employee kitchens, conference rooms, or meeting rooms. The majority (89.9%) also implemented a rotational work schedule or on-call duties for administrative personnel, frequently combined with partial or full transition to remote work.

As part of the transition to remote work, organizations also implemented online activities such as employee training (84.9%), board meetings and other employee group meetings (98.5%), meetings with contractors and stakeholders (98.5%), as well as interviews with job candidates (94.6%). Slightly over half of the respondents (54.6%) decided to conduct internal audits remotely, with an additional 21.5% incorporating newly established remote work areas into the auditing procedures. During the pandemic, remote document circulation was implemented in 69.8% of the surveyed organizations, with 14.6% of organizations

having established remote circulation procedures prior to the pandemic, and 55.1% introducing them as a response to the need for work reorganization caused by the pandemic.

**Table 4.** Factor influencing action taken by organisation in response to crisis (Spearman correlation coefficient) (own elaboration)

Actions	Organizations basic characteristics				QMS Maturity	Factors that constitute QMS Maturity*			
	company size	annual income	range of operations	number of QMS recertification cycles		Positive impact of audits on the functioning of QMS	Efficient document flow	Involvement of top management	Motivating role of QMS representative
Implementation of mandatory sanitary restrictions (DDM)	<b>0,153</b>	0,030	0,033	-0,028	-0,006	0,045	-0,026	-0,010	0,019

\*the table includes only those maturity factors that demonstrate a relationship with the implemented measures

\*\*statistically significant correlations at  $p < 0.05$  are in bold

To verify the factors that influenced the actions taken by organizations in response to the pandemic outbreak, the Spearman correlation coefficient was employed. The analysis considered factors that constitute QMS maturity, as well as elements such as organization size, annual revenue, and company scope of operations. The results are presented in Table 4.

For the majority of actions taken by organizations in crisis situations, no correlation with the level of QMS maturity was found. The type of measures taken in response to restrictions was most likely determined by the type of activity conducted by the organizations. Based on the analysis of Spearman correlation coefficients, it can be concluded that there was a statistically significant relationship ( $p > 0.05$ ) between the adaptation of organization to pandemic conditions and variables such as the size of the organization, income level, and scope of activity. The implementation of certain elements of remote work, such as online training, meetings, and recruitment, was also impacted by the income level. Conversely, the decision to form a crisis team and initiate remote audits was influenced by the size of the organization. Additionally, the implementation of an electronic document flow system was positively correlated with the scope of the company's activities.

As predicted, the level of QMS maturity was statistically significantly correlated ( $p > 0.05$ ) with actions that can be defined as "systemic". The higher the level of organizational maturity, the greater the tendency to form crisis teams ( $r=0.543$ ), implement electronic document flow systems ( $r=0.207$ ), transition (partially or completely) to remote audits ( $r=0.255$ ) and include remote work in the auditing system ( $r=0.291$ ).

Among the factors forming the QMS maturity construct, the involvement of top management and QMS representative proved to be significant. A higher level of engagement by these individuals (prior to the

pandemic) was associated with a greater tendency to conduct remote audits ( $r=0.254/ r=0.432$ ; management/ QMS representative) and to forms crisis teams ( $r=0.238/ r=0.320$ ; management/ QMS representative). According to the research findings, there was also a positive correlation ( $r=0.175$ ) between the involvement of top management and the tendency to undertake audits of remote work areas.

The second significant factor of the QMS maturity construct was found to be the functioning of the auditing system. Organizations that valued audits and used them to improve their QMS before the pandemic were more likely to establish crisis teams ( $r=0.349$ ) and include remote work areas in their auditing system ( $r=0.467$ ) during the pandemic. Surprisingly, no statistically significant correlation was identified between the efficient functioning of the auditing system and the tendency to partially or completely switch to remote audits. On the other hand, the implementation of remote audits was supported by efficient document circulation ( $r=0.128$ ). As expected, there is also a strong correlation between the efficient functioning of the documentation system (prior to the pandemic) and the implementation of electronic document circulation in response to the crisis ( $r=0.360$ ).

## 4. Discussion

The implementation of a quality management system is a significant step towards shaping a culture of quality within the organization. The requirement for continuous improvement means that the organization progressively implements and improves actions and strategies that allow for a better tailored QMS to meet internal and external organizational needs. This increases the QMS maturity, which means that system is well-established, documented, and consistently applied throughout the organization. It is also continuously improved based on feedback

from customers and stakeholders. As mentioned in the introduction, there are many QMS maturity assessment models that enable a comprehensive assessment. However, due to the number and detail of the criteria, conducting such an assessment can be complicated and time-consuming for organizations.

Therefore, this study proposes a simplified tool for estimating the level of QMS maturity. The motivation for proposing such a solution was primarily the research goal, which was to verify how organizations with an implemented ISO 9001 quality system responded to the crisis of the Covid-19 pandemic. In this context, determining the level of QMS maturity was only an auxiliary factor, enabling differentiation of study participants. Nevertheless, the obtained results provide some insight into the topic of QMS maturity in Polish organizations with an implemented ISO 9001 system.

A review of the literature reveals that in Poland, analyses are being conducted on the maturity of quality management systems (Skrzypek, 2012; Kafel & Sikora 2013; Książek & Ligarski, 2017, Zapłata, 2018). However, there are not many studies on how organizational characteristics influence the development of a pro-quality culture and organizational maturity in organizations with implemented quality management systems.

Wolniak (2019) conducted a comprehensive analysis of factors influencing the level of maturity of quality management systems in Polish organizations. The research showed a significant correlation between QMS maturity and organization size, with smaller organizations exhibiting higher levels of maturity. However, current research yields different conclusions, no significant statistical relationship was observed between the organization size and the level of QMS maturity. The results regarding the relationship between organization size and QMS maturity are inconsistent in other countries as well. For instance, Xiaofen

(2013) found that there is an exact opposite relationship (i.e., the larger the enterprise, the higher the level of QMS maturity). The ambiguity of the results may stem from the application of different QMS maturity assessment models, as well as differences between the tested samples. However, at this point, it can be stated that it is not possible to unambiguously determine that the size of the organization has a significant impact on achieving the level of QMS maturity. Other factors analyzed in the current study, as income or scope of activity have not been identified in the literature as potentially significant for QMS maturity level. However, the relationship between the number of recertification cycles of the Quality Management System (QMS) and the level of QMS maturity, identified in current research, is confirmed in the literature. For example, Souza & Voss [2001) established that maturity occurs as a function of the number of years in the implementation and certification of QMS.

The conducted research has shown that organizations have implemented restrictions resulting from legal regulations (DDM strategy), and these actions were not dependent on the QMS maturity. However, the maturity of the QMS had a statistically significant relationship with actions such as the establishment of a crisis team and the implementation of remote work elements such as electronic document flow and complete or partial switch to remote audits (including audits of newly created remote positions).

During pandemic the traditional approach to auditing processes on-site has been significantly curtailed, and it was unclear when, and under what conditions, it might resume in full. Internal audits require independent auditors who are usually employees from other processes that audited one (Clastka at al., 2020), and in remote work conditions, meetings between both parties were significantly hindered. In case of

external audits, requirements for auditing management systems are included in the ISO/IEC 19011:2018 and this standard indicate the possibility of using both direct and indirect contact with the auditee (Nowicki & Kafel, 2022). However, before pandemic the remote approach was not a frequently used method in the certification audit of the quality management system, where the traditional approach in the certification process was preferred (Fonseca et al., 2021).

Current research has shown that there was a statistically significant correlation between the level of QMS maturity and the challenge of implementing audits in a new, remote form. The main factors supporting this decision were management involvement and a positive opinion on the effectiveness of audits as QMS improvement tools. Based on a deeper analysis of remote auditing in surveyed organizations, it was also found that the vast majority of organizations that had experience with remote audits considered that remote work did not affect the credibility of the results of external audits (Kafel & Nowicki, 2022). Furthermore, although most audits could not take place in the previously planned time and/or form due to restrictions related to the pandemic, the transition to remote auditing enabled a decisive majority to carry out their audits (Rozmund & Dziadkowiec, 2022).

The partial correlation analysis revealed that in the factors influencing QMS maturity had an uneven impact on crisis management. It is not surprising that the factor with the greatest impact was the involvement of top management, while the motivating and supporting role of the quality management representative also played a significant role. The ISO 9001 standard requires top management to demonstrate leadership and commitment to the quality management system by establishing a quality policy, setting quality objectives, and ensuring the availability of resources. In a quality-oriented

organization, the leader creates conditions for utilizing organizational resources, including the development and abilities of employees. By setting an example, the leader demonstrates identification with the organization's quality goals (Hamrol, 2009). Some researches show that QMS maturity is closely related to leadership. Silva & Matos (2022) found a significant positive correlation between leadership practices and some QMS maturity dimensions in their research on leadership styles in systemic quality management. Wolniak (2019), in his study of QMS maturity in Polish organizations, noted weaknesses in leadership related to "soft" management aspects. In this context, it can be concluded that current research confirms the role of leadership in systemic quality management, and for the studied organizations, it was also a stimulating factor in implementing actions to prevent the loss of continuity of operations.

## 5. Conclusion

For the purposes of the article, a simplified QMS maturity assessment tool was developed, which on the one hand is a limitation of this study, but on the other hand contributes to the approach to the QMS maturity problem. Unlike systemic QMS maturity assessment measures, the proposed tool is not comprehensive, but despite this, it is quite effective in allowing for an approximate assessment levels of QMS maturity. Evidence of this is the fact that the use of statistical tool allowed for the identification of organizations at different levels of maturity, and the differences between levels are fully interpretable in terms of content. It can therefore be stated that in analyses where QMS maturity is an auxiliary variable, as in this study, simplified algorithms can be applied. However, this requires further analysis. At this stage of research, it can be stated that depending on the research objective, different factors can

probably be selected for QMS maturity assessment. Selection can be made, eg. by expert method, as in this study.

The conclusion of the research is that despite the limited set of factors defining the level of QMS maturity, only 4 out of 10 included in the model played a significant role in responding to pandemic-related restrictions. This was surprising, as both the experts selecting variables for the study and the project authors expected many more correlations to be identified. However, it is not surprising that among the factors influencing QMS maturity, leadership has particularly significant importance. In this study, leadership was represented by the involvement of top management and supportive and motivating role of QMS representative.

In summary, the results of this study have shown that organizations with implemented the ISO 9001 system, coped well in the unexpected situation of the Covid-19 pandemic. It can therefore be stated that even just implementing QMS makes organizations more resilient to crises, regardless of QMS maturity level. It has also been shown that there is a statistically significant correlation between the level of QMS maturity and crisis actions that can be described as "systemic".

This leads to the conclusion that a pro-quality culture has a positive impact on expanding the quality management system to new areas, even in situation of unforeseeable circumstances. Therefore, the thesis that ISO standards are designed to help organizations build their resilience and improve their processes has been confirmed, and that with the development of these systems, organizations are better prepared to deal with crisis situations.

The main achievement of the project is that research was conducted during drastic restrictions. It allowed for insight into the functioning of QMS in atypical conditions. However, the main limitation of this study is the fact that there is relatively little opportunity to verify both the research tool used and the results obtained, due to the fact that the Covid-19 pandemic no longer exists. However, further research is planned, aimed at verifying which of the changes implemented during the pandemic are continued and what impact they have on the functioning of quality management systems.

## KEY PERFORMANCE INDICATORS (KPIs) IN THE QUALITY MANAGEMENT SYSTEM

**Abstract:** *Key Performance Indicators (KPIs) are often used in business of various sizes and industries to assess operational efficiency and evaluate process effectiveness. A universal model for implementing and utilizing KPIs has been elaborated in the company, and its functionality has been verified in a selected enterprise. In accordance with the developed model, efficiency indicators have been proposed, and among them, key performance indicators (KPIs) have been selected. In addition to commonly used financial indicators, indicators evaluating the performance of the quality management system have been included, along with the need for quality cost optimization.*

**Keywords:** *Key Performance Indicators (KPI), Quality Management System (QMS), functioning model of KPIs*

### 1. Introduction

A quality management system compliant with the requirements of ISO 9001 is a system based on risk and opportunity analysis and continuous improvement processes. The implementation and application of the requirements outlined in the standard should ensure stability and repeatability of identified processes within an organization. The fundamental concept embedded in the standard is the process approach, which involves identifying the processes taking place within the organization and managing the relationships between these processes. Applying the process approach in a quality management system allows for the identification of processes, considering them in terms of value-added, achieving effectiveness in executing the processes, and continually improving them based on data and information assessment (ISO 9001:2015). Within the process approach, the organization should determine the necessary processes for the quality management system, their application within the organization, and

should also:

- identify the required inputs and expected outputs of the processes,
- determine the sequences of these processes and their interactions,
- define and apply criteria and methods (including monitoring, measurements, and related performance indicators) needed to ensure the effective execution and monitoring of these processes,
- identify the resources required for these processes and ensure their availability,
- assign responsibilities and authorities within these processes,
- consider the risks and opportunities,
- evaluate these processes and implement any necessary changes to ensure that they achieve the expected results,
- continuously improve the processes and the quality management system.

Managing processes and the system as a whole can be achieved in an organization by

applying the PDCA cycle: Plan - Do - Check - Act. During the planning stage (Plan), the organization should establish the objectives of the system and its processes, identify the resources needed to deliver results in line with customer requirements and organizational policies, and identify and consider risks and opportunities. The next stage is Do, where the planned actions are implemented, followed by the Check stage, which involves monitoring and, where applicable, measuring processes and the products and services that result from them against policies, objectives, requirements, and planned activities. Based on the obtained and presented results, actions (Act) should be taken for improvement if necessary.

If an organization wants to achieve success, it should be continuously focused on improvement. Improvement in the organization is a process that has its inputs (such as potential areas for improvement), actions (representing its course), and outputs (being an enhanced form of a process, product, or service). This process is crucial for the organization to maintain the current level of performance, respond to changes in internal and external conditions, and create new opportunities. Improving the quality management system is a necessary action in the face of a changing environment, increasing requirements, and customer expectations. It is a continuous process that seeks opportunities to enhance all aspects of organizational functioning in the interest of both the organization and its customers, aiming to improve effectiveness and deliver products that meet expectations. Improvement should be treated as a tool for managing processes and as corrective action to ensure their implementation. The organization should promote the establishment of improvement objectives, develop and implement processes for implementing improvement projects within the organization, establish improvement mechanisms and an evaluation system for

implementing improvement projects, evaluate the achieved results, and standardize tools and methods to solve problems and achieve improvement goals. It should also integrate ideas for improvement with the development of new or modified products, services, and processes. All actions carried out in the organization, comprising the identified processes related to leadership, planning, support, operational activities, performance evaluation, and improvement, should strive for the outcome of customer satisfaction. Operational actions, among others, include planning, determining product requirements, design and development, production, acceptance of products, handling nonconformities in output processes, and overseeing processes, products, and services delivered externally. The requirements for products and services also strongly emphasize the importance of customer contact.

In the process approach to management, it is assumed that every process within the organization creates value for the customer (external - end customer or internal - colleague). Therefore, it is necessary to assess the capability of processes to deliver products or services of a specified quality. Consequently, an analysis of the key attributes of each process should be conducted in the following aspects (Rydzewski-Włodarczyk, Sobieraj, 2015):

- a) process costs, which include all costs incurred in carrying out activities within a given process,
- b) process duration, which refers to the average time required to complete all operations within the process,
- c) process flexibility, which is the ability to completely improve, combine, or divide tasks,
- d) process quality, which is measured by its variability level or the number of errors,

- e) significance for the organization, which represents the benefits generated by the process for the organization,
- f) significance for the customer, which is measured by their satisfaction.

In the improvement of processes, indicators play an important role as they provide information about the results of actions, trends, and opportunities for change. Each organization should individually select indicators and tools through which measurements will be conducted.

The ISO 9001 standard includes requirements related to the evaluation of performance, which is associated with the process of monitoring and measuring processes. The organization should determine what needs to be monitored and measured, the methods to ensure the accuracy of the results, the frequency of monitoring and measuring, as well as how to analyze and evaluate the results of monitoring and measurements. The results of the analysis should be used to assess:

- conformity of products and services,
- level of customer satisfaction,
- effectiveness of actions and the effectiveness of the quality management system,
- whether planning has been effectively implemented,
- effectiveness of actions taken to address risks and opportunities,
- performance of external suppliers,
- needs for improvement of the quality management system.

According to the literature review (Ostapko, 2018; Grycuk, 2010; Zbierowski, 2011), it is evident that there are difficulties in selecting and formulating appropriate indicators, as well as conducting measurements and obtaining relevant information. However, every organization uses various indicators to assess the performance of processes, their effectiveness, achieved results, and resource

consumption.

## 2. Key Performance Indicators (KPI)

Monitoring of the production process, which involves recording and collecting detailed data regarding its course, is a crucial element of enterprise management. The collected data can be used to assess the functioning of processes, identify emerging non-conformities, improve and optimize processes, as well as enhance the efficiency of resource utilization and increase production capabilities. Analyzing processes using raw data of diverse nature from different positions can be challenging. It is much more convenient to utilize synthetic numerical indicators that combine information from various sources. For this purpose, key performance indicators (KPIs) are used, which enable the evaluation of the functioning of the production system in terms of its performance, quality, and maintenance (Barecki et al., 2018; Czerwińska, Pacana, 2020).

Key Performance Indicators (KPIs), according to ISO 22400-1:2014 and ISO 22400-2:2014 standards, are defined as measurable and strategic metrics that reflect critical success factors of an organization. KPIs are essential for understanding and improving production performance from both a production perspective, enabling the elimination of waste, and a strategic goal achievement perspective.

KPIs are indicators that allow organizations to assess the extent to which their strategic objectives and plans are being achieved. They serve as a management control tool that enables the detection of problems even in the early stages, facilitates prompt decision-making, prioritizes actions appropriately, and promotes process improvement within the company. They also enable the identification of areas of inefficiency, monitoring changes

over time, and evaluating employee effectiveness. A set of indicators developed for a specific organization, which fulfills its role and is utilized for management purposes, should meet the following conditions (Rydzewski-Włodarczyk, Sobieraj, 2015; Grycuk, 2010; Grabowska, 2017):

- a) Indicators should address issues that are important to the organization.
- b) Indicators should be tailored to the situation and specific sector in which the organization operates.
- c) The number of indicators should not be excessive, and measurement should focus on monitoring key processes rather than measuring everything.
- d) Each indicator must have a defined benchmark or standard for the specific assessment period, such as results achieved by the organization in previous periods.
- e) Benchmarks should be adjusted in subsequent periods to stimulate continuous improvement.
- f) Only indicators that employees can realistically influence should be selected.
- g) The majority of indicators should focus on processes related to meeting customer needs and measuring customer satisfaction.
- h) The costs of data collection should not exceed the benefits of using indicators.

Therefore, it is important to select and choose indicators appropriately, measuring and analyzing only those that are most important to the company and provide information about the organization's performance. From all the possible calculable indicators, only a few or a dozen should be selected that best reflect the level of achieving strategic goals. The developed KPI indicators should be simple, and the method of calculation should be understandable to employees. The indicators should be clearly and precisely

defined to ensure reliable and comparable results across different periods. Measuring and assessing processes using key performance indicators aim to obtain information about their functioning and the need for improvement actions.

KPI indicators are used to measure economically, technically, and organizationally fundamental parameters characterizing the functioning of a company. They enable not only the determination of the values of applied KPI indicators but also the identification of selected factors influencing their values (Bartecki et al., 2018; Hollender, 2016).

### **3. Model and results**

Key performance indicators are used not only for evaluating processes but can also be used for assessing the functioning of the quality management system and evaluating individual actions carried out within this system. The aim of the study was to determine whether efficiency indicators can be used to improve processes and the quality management system.

A medium-sized manufacturing company operating in Poland, which sells its products not only to the domestic market but also to the European Union, was selected for the study. This organization operates and develops quite dynamically. The investigated company is characterized by a high level of quality in its offered products as well as the executed processes. It typically runs large production batches but also has the capability to fulfill small batches if the need arises.

The organization has implemented and maintains a quality management system in accordance with the requirements of ISO 9001, which operates effectively and has obtained certification for compliance. Due to collaboration with the automotive industry, the investigated company has obtained certification for a quality management system

in the automotive industry in accordance with the requirements of IATF 16949. It has also implemented the requirements of VDA standards and incorporates elements of sustainable development.

Due to the implemented quality management system, the investigated organization, as part of its improvement efforts and in line with the principle of evidence-based decision-making, has decided to introduce process evaluation, including the use of effectiveness indicators. The main objective of focusing on KPIs was to increase production efficiency and eliminate unnecessary activities that do not benefit the company. A team was established within the company to oversee the monitoring, functioning, and improvement of KPI-related activities. The team consisted of representatives from different processes as well as a person from the analysis department. The first step taken by the team to implement key effectiveness indicators was the development of a universal model for their implementation, operation, and improvement. This model is presented in Figure 1. The developed model was verified within the researched company.

According to the developed model, the first step to be taken is to identify the processes or areas for which counting and analyzing KPIs are planned. In organizations that have implemented a QMS, processes are already identified and described.

The investigated organization has identified areas where it deemed it valuable to calculate effectiveness indicators. These areas include production, research and development of new products, orders, human resource management, financial area, customer relations, and maintenance.

The next step was to characterize the processes, determine their inputs and outputs, and identify the key attributes that are specific to each process. Then, as many indicators as possible were collected to describe the identified processes. These indicators were

developed based on available literature, as well as the experience and knowledge of the employees.

The next crucial step is to select, from the prepared indicators, those that are most important, significant, and provide the most relevant information for the process owner during management. The chosen indicators should be linked to the company's objectives and identify the needs of process stakeholders. They should be indicators that can be influenced by employees. By performing their tasks and responsibilities, they can actively respond to process parameters and affect their change.

Having such prepared efficiency indicators, it is necessary to establish and provide target values for these indicators. Target values for Key Performance Indicators (KPIs) represent the level of expectations, the value of the indicator that the organization should strive for when undertaking improvement actions. Determining target values for KPIs constitutes:

- 1) Progress Indicator - serves as a reference point for evaluating the organization's progress towards its goals. Comparing the current values of KPIs with the target values allows determining whether the organization is moving towards its defined objectives and to what extent it has already achieved them.
- 2) Motivation and Performance Management - target values for KPIs are used to motivate employees and teams. Setting realistic goals can inspire employees to greater engagement and effort in pursuing desired outcomes.
- 3) Prioritization and Resource Allocation - target values for KPIs help in establishing priorities and allocating resources within the organization. Identifying areas where KPI values fall below the

expected values enables focusing efforts on improving those areas.

- 4) Monitoring Strategy Effectiveness - Target values for KPIs should be aligned with the organization's strategic objectives. Monitoring the achieved KPI results in relation to the target values allows for evaluating the effectiveness of the strategy and taking corrective actions.

Target values should be established in a measurable, achievable, and contextually appropriate manner for the organization's activities. It is also important for these values to be realistic and monitorable, enabling effective management and continuous improvement of the organization's operations. Determining the value of a given indicator at the initial stage of its implementation, and subsequently verifying its changes within specified timeframes, enables the organization to examine the impact of its actions on the indicator values. The implementation of key performance indicators should be an important component of any system, allowing for the identification, measurement, and monitoring of its functioning. After setting the target values, the organization should measure its processes to calculate the performance indicators and then compare the obtained values with the target values. If the target values are achieved, the organization should analyze what contributed to the success and continue striving for improvement. It should establish new, more ambitious target values for KPIs. Through this approach, the organization can continue to grow and increase its efficiency.

If the target values are not achieved, the organization should also thoroughly analyze what contributed to their non-achievement. In such a situation, areas and processes that require corrective and improvement actions should be identified. Implementing such solutions should improve the functioning of the processes in question and contribute to achieving the target values or getting closer to them in the next period.

In the analyzed company, most of the developed indicators were calculated and analyzed, but not all of them were included in the key performance indicators. The primary indicators verified within the proposed model are:

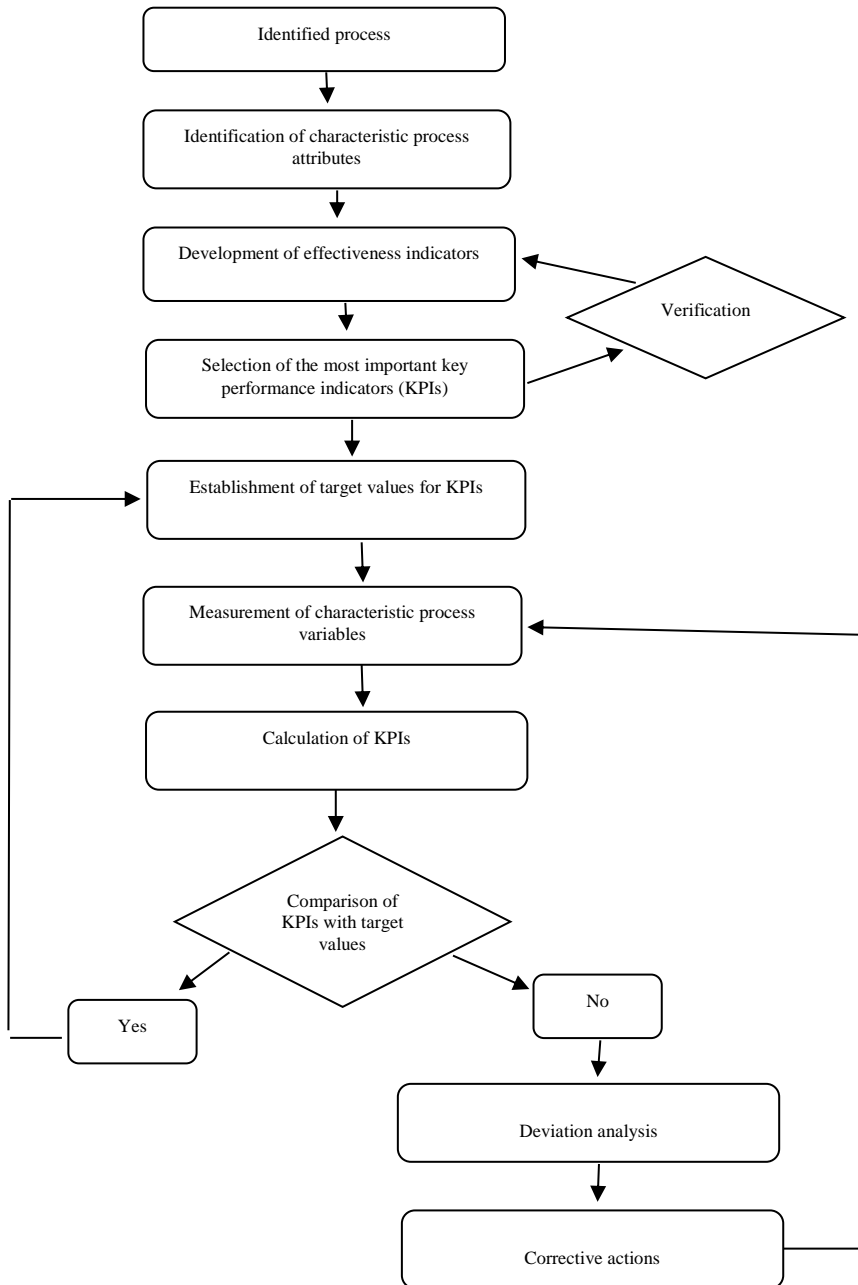

- Return on Equity (ROE);
- Overall Equipment Effectiveness (OEE);
- Inventory turnover;
- Number of complaints;
- Cost of quality indicator;
- Customer satisfaction indicator.

These indicators should provide necessary information about the functioning and effectiveness of individual processes, and they should also be helpful in making managerial decisions at both operational and strategic levels. The indicators have been defined according to the SMART rule, which means they should be: Specific, Motivational, Attainable, relevant, and time-bound (Otręba, Knop, 2019; Kazimierska, Lachowicz, Piotrowska, 2014; Bjerke, Renger, 2017; Mourtzis 2018; Podgórski, 2015; Zhou and He, 2018).

The next step was to establish the target values for KPIs, which are the expected values that the organization should strive for as part of improvement efforts. When setting the target values, the organization followed the SMART methodology. The established target values for KPIs were both realistic and motivating for improvement actions. After determining the target values, the actual values of the KPIs were calculated to evaluate the performance of the analyzed processes. If the actual value of the indicator does not differ from the target value, it indicates that the process exhibits high efficiency, and according to the developed model (Figure 1), the target value of the KPI should be increased to enable further improvement of the process by the organization. Typically, goals are set to be 2-5% more ambitious than in the previous period, which stimulates continuous improvement processes. In case of deviation between the target value and the

actual value, the reason for not achieving the expected value should be examined. The analysis of the process should lead to identifying the cause of such a situation and proposing corrective and improvement

actions. Implementation of these actions should contribute to the improvement of the process functioning and, consequently, to the improvement of KPIs.

**Figure 1.** Implementation, maintenance, and improvement model of KPIs

In the examined company, the target values for KPIs were determined in April, and the actual values were calculated in the following month. The KPIs were recalculated at the end of July. The data regarding target and actual values are presented in Table 2.

Return On Equity (ROE), is an important indicator in ratio analysis that illustrates the profitability of equity. It represents how much

profit has been generated in the company from the contributed equity. The higher the value of this indicator, the more favorable the company's situation. The value of the indicator is determined on an annual scale. In the examined company, this indicator is higher than the set target value, which means that there is no need for improvement actions to be implemented.

**Table 1.** Key Performance Indicators (KPIs) established for selected areas.

<b>Area</b>	<b>Indicator</b>	<b>Information obtained from the calculation of the indicator</b>
<b>Production</b>	Parts per Million (PPM)	Number of defective units per million pieces
	Overall Equipment Effectiveness (OEE)	Efficiency of machine and equipment utilization
	Material consumption in production	Material usage during production
	Production cycle time	Time required to complete one cycle of the process
	Inventory turnover	Flow of goods in the warehouse over a specified period, e.g., a year
	Defect rate	Percentage of defective products in relation to the total number of units produced
<b>Quality Management System</b>	Cost of Quality Indicator	Measures the magnitude of costs incurred for quality (costs related to quality control, prevention of defects, costs of non-conformance) in relation to production costs.
	Effectiveness of Corrective Actions Indicator	Measures the effectiveness of corrective actions taken to eliminate the causes of product or service defects.
	Product Quality Indicator	Measures the level of product conformity with quality requirements, the percentage of products that meet quality standards.
	Customer Complaint Response Time Indicator	The time measured from receiving a complaint to taking corrective actions.
	Customer Satisfaction Indicator	The level of customer satisfaction measured through surveys and/or customer satisfaction studies.
	Audit Effectiveness Indicator	Level of Effective Implementation of Corrective and Improvement Actions Proposed in Post-Audit Activities
<b>Development of New Products</b>	Project Completion Time	The time required to complete a project for the implementation of a new product or changes/improvements to existing products.
	Percentage of Development Costs	The percentage of costs dedicated to activities

		related to product development in relation to the costs of other processes.
	Time to Market	The time required to design, produce, and launch a new product into the market.
<b>Logistics</b>	Inventory Turnover	The ratio of inventory value to sales value.
	Order Picking Accuracy	The correctness of order picking.
	Order Fulfillment Cost	The cost incurred in fulfilling an order.
	Order Fulfillment Cycle Time	The time required to complete one order fulfillment cycle.
	Percentage of Logistics Costs	The percentage of costs dedicated to logistics activities in relation to the costs of other processes.
<b>Human Resource Management</b>	Employee Hiring Cost	The cost associated with hiring an employee.
	Training Cost	The cost associated with conducting training per employee.
	Recruitment Costs	The cost of recruitment activities.
	Employee Satisfaction	The level of employee satisfaction.
<b>Financial Area</b>	Return on Sales (ROS)	The amount of net profit earned per one unit of sales revenue.
	Return on Assets (ROA)	The amount of net profit earned per unit of total assets.
	EBITA Earnings Before Interest, Taxes and Amortization (EBITA)	The profitability of the company before interest, taxes, and depreciation, calculated as a percentage of equity.
	Earnings Before Deducting Interest and Taxes (EBIT)	The profitability of the company before interest and taxes, calculated as a percentage of total assets.
<b>Customer Relations</b>	On Time in Full (OTiF)	The percentage of deliveries that are in accordance with the order,
	On Time Delivery (OTD)	Measuring the timely and complete delivery to customers.
	Customer Acquisition Cost	The cost associated with acquiring a new customer.
	Number of Complaints	The percentage of complaints in relation to the sales volume.
	Customer Satisfaction	The level of customer satisfaction.
<b>Supplier Management</b>	On Time in Full OTiF	Percentage of Deliveries in Accordance with the Order
	On Time Delivery (OTD)	The percentage of deliveries received from suppliers that are delivered on time.
	Number of Rejected Deliveries	The percentage of deliveries that are rejected due to quality issues in relation to the total number of deliveries.
<b>Maintenance</b>	Maintenance Cost	Costs incurred in connection with machine and

<b>Management</b>		equipment maintenance.
	Reporting time for performed maintenance.	The time required to prepare a report after maintenance has been conducted.
	Mean Time To Repair (MTTR)	Average time required to resolve a breakdown.
	Mean Time to Failure (MTTF)	Average uptime of the device/machine before a breakdown occurs.
	Mean Time Between Failures (MTBF)	Mean time between failures

After setting the target values, the organization should measure its processes to calculate the performance indicators and then compare the obtained values with the target values. If the target values are achieved, the organization should analyze what contributed to the success and continue striving for improvement. It should establish new, more ambitious target values for KPIs. Through this approach, the organization can continue to grow and increase its efficiency.

If the target values are not achieved, the organization should also thoroughly analyze what contributed to their non-achievement. In such a situation, areas and processes that require corrective and improvement actions should be identified. Implementing such solutions should improve the functioning of the processes in question and contribute to achieving the target values or getting closer to them in the next period.

In the analyzed company, most of the developed indicators were calculated and analyzed, but not all of them were included in the key performance indicators. The primary indicators verified within the proposed model are:

- Return on Equity (ROE);
- Overall Equipment Effectiveness (OEE);
- Inventory turnover;
- Number of complaints;
- Cost of quality indicator;
- Customer satisfaction indicator.

These indicators should provide necessary information about the functioning and effectiveness of individual processes, and they should also be helpful in making managerial decisions at both operational and strategic levels. The indicators have been defined according to the SMART rule, which means they should be: Specific, Motivational, Attainable, relevant, and time-bound (Otręba, Knop, 2019; Kazimierska, Lachowicz, Piotrowska, 2014; Bjerke, Renger, 2017; Mourtzis 2018; Podgórski, 2015; Zhou and He, 2018).

The next step was to establish the target values for KPIs, which are the expected values that the organization should strive for as part of improvement efforts. When setting the target values, the organization followed the SMART methodology. The established target values for KPIs were both realistic and motivating for improvement actions. After determining the target values, the actual values of the KPIs were calculated to evaluate the performance of the analyzed processes. If the actual value of the indicator does not differ from the target value, it indicates that the process exhibits high efficiency, and according to the developed model (Figure 1), the target value of the KPI should be increased to enable further improvement of the process by the organization. Typically, goals are set to be 2-5% more ambitious than in the previous period, which stimulates

continuous improvement processes. In case of deviation between the target value and the actual value, the reason for not achieving the expected value should be examined. The analysis of the process should lead to identifying the cause of such a situation and proposing corrective and improvement actions. Implementation of these actions should contribute to the improvement of the process functioning and, consequently, to the improvement of KPIs.

In the examined company, the target values for KPIs were determined in April, and the actual values were calculated in the following month. The KPIs were recalculated at the end

**Table 2.** Target and Actual Values of Selected KPIs in the Examined Company

KPI Indicator	Target Value	Actual Value May 30th	Actual Value July 30th
ROE	Min. 0,15 / year	0,16	0,16
OEE	Min. 90% / month	89,87%	89,93%
Inventory Turnover	Min. 0,85 / month	0,84	0,81
Number of Complaints	Max 1 / month	0	0
Quality Cost Index	Max 35%	39%	38%
Customer Satisfaction Index	95%	92%	93%

The Overall Equipment Effectiveness (OEE) indicator reflects the efficiency of machine and equipment utilization in the company. Its main component is the measurement of time, and the calculation result, in simplified terms, represents the portion of plans and expectations that have been achieved at the current level of process organization. The OEE indicator reveals improper resource utilization in processes. By implementing improvement actions, these inefficiencies can be easily eliminated. Therefore, a decision has been made to implement improvement actions. Proposals for these actions were developed based on consultations with the implementation team and included in the actions to be carried out in the near future. The first improvement actions were implemented in the first month. The effects are visible as there was an increase in the indicator in the following month. Due to the proper trend of the indicator's change, it was

of July. The data regarding target and actual values are presented in Table 2.

Return On Equity (ROE), is an important indicator in ratio analysis that illustrates the profitability of equity. It represents how much profit has been generated in the company from the contributed equity. The higher the value of this indicator, the more favorable the company's situation. The value of the indicator is determined on an annual scale. In the examined company, this indicator is higher than the set target value, which means that there is no need for improvement actions to be implemented.

decided to continue applying the same improvement actions.

The inventory turnover ratio indicates how many times the inventory has been turned over in the warehouse during a specified time period, in the analyzed company, it is analyzed on a monthly basis. It allows calculating how long it takes for the financial resources invested in goods to be recovered. In the initial measurement, the actual value of the ratio in the analyzed company was nearly close to the target value. Therefore, it was decided not to implement improvement actions but to observe its performance in the following month. In the subsequent month, the ratio value was even lower and significantly below the target value. This situation was attributed to the holiday period and production downtime. In July, the number of planned orders to be fulfilled decreased, which in turn affected the decrease

in the inventory turnover ratio. Therefore, no improvement actions have been taken for now. Actions will be initiated if such a situation continues in the upcoming months.

The indicator regarding the number of complaints determines how many complaints have been reported to the company. The target value for this indicator was set at 1. However, in the analyzed company, the actual value of this indicator during both measurements remained at 0, indicating that the quality of the products sold is satisfactory for customers.

The cost of quality indicator determines the costs associated with quality control, costs of defects, deficiencies, and non-compliance, as well as the costs of preventive actions in relation to production costs. The actual value of the cost of quality indicator calculated in both periods deviates from the target value. A higher cost of quality indicator indicates that the company incurred higher costs related to quality management than planned. These costs may include quality control, repairs, addressing non-compliance, or preventive actions to avoid non-compliance in the future. Actions taken in the area of cost of quality contribute to the elimination of defects and non-compliance in the production process and the implementation of preventive measures aimed at improving the process. The costs incurred in the analyzed period may only yield results in subsequent periods. This indicator demonstrates the effectiveness of the implemented improvement actions.

The customer satisfaction indicator represents the percentage of surveyed customers who are satisfied with the products purchased from the surveyed company. A lower value of the indicator may indicate that not all customers are satisfied with the quality of the offered products. The lower level of customer satisfaction is not due to product quality issues, as no complaints have been received by the company during this time, as indicated by the complaint indicator being 0 in the current period. Comparing both indicators, it

can be concluded that customer dissatisfaction does not stem from product defects, but rather from a mismatch with customer expectations. It would be worthwhile to conduct surveys among customers to obtain information about the reasons behind such evaluations of the products.

In the examined company, it is necessary to continue monitoring processes and analyzing KPI indicators. The research conducted indicates that there is currently no need to take actions to change the target values. These values are currently properly established, and the company should continue its improvement efforts to enhance processes and consequently improve KPI indicators.

## 4. Conclusions and Discussion

Key performance indicators (KPIs) are important navigational tools used by managers and executives. They allow them to assess and understand whether the company is on track for success. A properly selected set of KPIs enables the determination of the performance of the analyzed processes and highlights areas that require attention.

The implementation of KPIs requires certain assumptions from the company, such as understanding the processes, aligning KPIs with the company's goals, selecting an appropriate set of indicators focused on outcomes, process effectiveness, and providing the necessary information for managers and stakeholders. The indicators should be chosen in a way that allows employees to measure the real impact of their actions and responsibilities (Grycuk, 2010; Torbacki, Torbacka, 2015; Ostapko, 2018; Bhadani et al., 2020; Kaganski et al., 2017).

In the examined company, KPIs have been implemented based on the developed model for introducing, maintaining, and improving KPIs. Literature presents various models for implementing KPIs, but they mainly focus on

the preparation and introduction stages in a company (Lindberg et al., 2015; Grycuk, 2010; Orłowski et al., 2015). The presented model may provide less detailed information on the process of identifying and developing indicators, but it includes actions to be taken depending on the actual results achieved. In case of discrepancies between the target and actual values, it is necessary to identify the area or location within the company or process that contributed to the deviation. Then, the cause of the deviation should be identified, and corrective and improvement actions should be implemented. These actions aim to eliminate the reasons for the discrepancies and prevent similar occurrences in the future.

KPI indicators are used in companies of various sizes and industries. The impact of properly selecting KPI indicators on the decision-making process in small and medium-sized enterprises (SMEs) has been studied by Pîrlog and Balint (Pîrlog, Balint, 2016). According to the authors, KPI indicators serve as early warning signals for a company. Properly approaching this information, making appropriate decisions, and implementing corrective actions can lead to overall improvement in the company's performance. In Business Intelligence (BI) systems, the Key Performance Indicators (KPIs) are considered measurement tools that assess and demonstrate how effectively a company achieves its business goals. A long list of KPIs that lacks clear connections to the overall company objectives may indicate a larger problem: a lack of strategic alignment. Properly selected KPI indicators lead to:

- a) great business insights;
- b) clear and relevant information;
- c) easy access to historical data;
- d) faster and better decisions;
- e) overview of overall company performance.

Therefore, it is important to select key relevant indicators for which data can be obtained. They should be applied in

circumstances that provide the organization with necessary information to determine factors contributing to inefficiencies in key supply chains and performance improvement strategies/policies.

Chae (Chae, 2009) also emphasizes the importance of proper selection of indicators. According to him, the correct selection of KPIs is not easy. He believes that "less is more" when it comes to developing performance indicators. Companies should focus only on a small list of KPIs that are crucial for managing operations, customer service, and financial profitability. Potential KPIs should be developed, measured, reported, and managed in order for the company, department, or project to be perceived as successful. Monitoring KPIs reveals the gap between planning and execution and helps identify and address potential issues and problems. These indicators make it easier to achieve the proposed goal set at the beginning.

KPI indicators are also used in companies to assess the performance of quality management systems, where meeting customer requirements is an important element. This is a crucial factor for companies in terms of survival in the market and generating profits in the medium and long term. Building trust with customers and achieving a high level of customer satisfaction are important attributes. The quality of products is examined during the production process as well as during customer usage. Implemented quality management systems help monitor quality. Additionally, audits are conducted within the system to identify process non-conformities. Non-conformities often lead to defects and discrepancies, which, if unnoticed within the company, appear in the market and are purchased by customers. In such cases, customers have the right to file complaints and express their dissatisfaction during customer satisfaction surveys. Therefore, KPI indicators are also necessary in quality

management systems to assess the effectiveness of improvement actions, the number of complaints, and the level of customer satisfaction. Additionally, quality costs and related indicators can be measured to determine the extent to which improvement actions have optimized costs and reduced non-conformance costs, consequently impacting production costs (Balon, 2012; Sulowska, 2012; Sadowski, 2020; Ayach et al., 2019).

Key Performance Indicators (KPIs) are one of the most important management tools in organizations. Their proper implementation and use support the improvement and control of both processes and the effectiveness of actions taken within the organization. Well-

chosen indicators are a key element in the proper utilization of control and management in an organization. When applied in a manufacturing company, key performance indicators (KPIs) need to be integrated into the company's structure and management system. Monitoring the production process through the use of indicators serves as a tool for steering the organization and identifying problems within the company, enabling dynamic response and documenting actions and their effects.

## **THE EVOLUTION OF BIBLIOMETRIC INDICATORS FOR SCIENTIFIC PAPERS PREPARED BY POLISH AUTHORS IN THE FIELD OF ECONOMICS**

**Abstract:** *In the first part of the presentation, the analysis of publication achievements of academic staff from five main public universities of economics in Poland will be presented. The survey will be conducted for publications occurred in the last five and will cover:*

- *number of publications,*
- *citations,*
- *structure of authors' teams,*
- *journals,*
- *topics presented on papers.*

*Next, some concepts and measures used for quality evaluation of research papers will be discussed.*

*In the following part of the presentation, potential factors shaping the number of publications and citations will be studied:*

- *publication topics,*
- *number of authors,*
- *journal publishing a paper,*
- *internationalization of the author's team,*
- *the evaluation of authors' previous works.*

*Finally, the model of the evaluation of the number of citations will be presented.*

*All calculations will be based on data retrieved from the Scopus database and conducted by authors with the use of programs prepared in R and Python language.*

**Keywords:** *quality of reserach publications, citations and their determinants.*

## **QUALITY MANAGEMENT CONCEPT IN INDUSTRY 4.0: TRENDS AND CHALLENGES**

**Abstract:** Industry 4.0 is a philosophical transformation of the society and Quality 4.0 proposes the adoption of advanced ICT to enhance quality efficiency and competency. The introduction of an Industry 4.0 based quality management and control necessitates integration steps within and outside the manufacturing company. Furthermore, company partners or customers have to be integrated into the development as they are all part of the overall value chain. Two the biggest challenges will be: Understanding and knowledge: both in industry and academy and Designing Quality / Industry 4.0 systems involves complexity, systems from the high dimensionality and complexity. The aim of this manuscript is to explore directions and trends in development of quality management concepts in the scope of Industry 4.0.

## **PRODUCTION AND CONSUMPTION IN CIRCULAR ECONOMY AND SUSTAINABLE DEVELOPMENT APPROACH OF THE EUROPEAN UNION COUNTRIES**

**Abstract:** *Production and consumption area is monitored independently, both in the context of progress towards a circular economy and sustainable development. In every case, the number and types of the used indicators are different. It justifies a question on comparability of information produced by two composite measures for equivalent research subjects: production and consumption, which is a thematic area of the EU Action Plan for the Circular Economy as well as responsible consumption and production, which is the 12th goal of UN Agenda 2030. To scrutinize this problem in the context of the European Union countries, this research aims at identification of similarity between the production and consumption indicator (applied within the Circular Economy Action Plan) as well as responsible consumption and production indicator (used by the UN Agenda 2030). For this purpose, the linear ordering method was applied to make the ranking of European Union countries according to their advance in production and consumption sphere for two different years. The comparison of outcomes gave evidence to prove the thesis that the application of the two analysed composite indicators on production and consumption area generates significantly different results.*

## **THE REFERENCES TO THE ISO 9001 QUALITY MANAGEMENT SYSTEM IN JUDGMENTS AND LEGAL DISPUTES OF POLISH AND SPANISH COURTS**

**Abstract:** *The study describes references to the ISO 9001 quality management system in judgments and legal disputes in Polish and Spanish courts. Results indicate that there are significant differences between Polish and Spanish cases within the studied materials. In general, quality management issues are visible not only B2B legal disputes but also in terms of customer complaints and even private family disputes.*

## **INNOVATIONS AS A TOOL FOR IMPROVING THE QUALITY OF PUBLIC SERVICES – CITIZENS' EXPECTATIONS ON THE EXAMPLE OF STUDENTS OF KRAKOW'S UNIVERSITIES**

***Abstract:** The aim of the article is to diagnose citizens' expectations regarding innovations implemented in the public service sector. The authors present the results of surveys conducted on a representative group of students of Krakow universities. The specificity of the academic city of Krakow makes students one of the largest groups of recipients of public services available in the city. The respondents expressed opinions, m.in, on the assessment of the quality of public services, progress in implementing the smart city concept in Krakow and areas in which innovations should be implemented. On the basis of the conducted research, the conclusion was formulated that citizens expect greater innovation activity in the public service sector. Therefore, the action of demand factors can be observed, although the mechanisms of their impact on innovative activity in the public sector are different than in the corporate sector. The empirical research presented in the article was preceded by a theoretical introduction, in which the authors describe the essence of innovation in the public sector, the conditions for their implementation and the importance of citizens' participation in this process.*

## GRAPHICAL REPRESENTATION OF ATTRIBUTES OF QUALITY TOOLS IN AN EDUCATIONAL INFORMATION SYSTEM - RESEARCH RESULTS

**Abstract:** *One of the main goals of sustainable development of societies is access to high-quality education, in accordance with the principle that social well-being is significantly dependent on the level of education. The implementation of this goal is ensured, among others, by the development of digital technologies that are changing the education system. Information technology has emerged to disseminate shared knowledge and is a major driver of change. Examples of these changes include: new solutions supporting the education process, mobile devices, dynamic visualizations, AV and others. The process of change concerns not only pupils and students, but also a group of people who formally finish their education and enter the labor market.*

*In accordance with the idea of continuous learning, employees of enterprises at all levels continue to develop their competences and skills through self-education, participation in training, post-graduate studies, etc. One of the challenges is to change the form of education of employees of enterprises who are encouraged and engaged in quality assurance activities in their area of work should use appropriate quality management instruments. Access to materials in the form of books, guides, materials posted on the Internet is common, however, this form of elaboration of the material is inconvenient from the perspective of action "here and now", i.e. in production and operational conditions.*

*As part of the research project, the authors create an IT system that facilitates the search, selection and effective use of quality tools. The basis for building the system is the attributive presentation of knowledge about quality tools. One of the current challenges while working on the system turned out to be the graphical representation of recording information about tools. The article*

*presents the results of research on the evaluation of designed graphic symbols (defining various attributes of quality tools in the system under construction) among potential users.*

## **APPLICATION OF A NEW MODEL FOR AN OPTIMAL COMBINATION OF THE LEAN SIX SIGMA APPROACH AND THE THEORY OF CONSTRAINTS**

**Abstract:** *Today's Manufacturing firms requires a higher level of quality in processes, services, and products to achieve greater market share and economic success. Most businesses today are global, whether it's a car manufacturer, an electronic company or a construction company, they operate from the world. To achieve excellence, various approaches can be employed such as; lean manufacturing, six sigma and theory of constraints (TOC).*

*The present research proposes an enhancement model which aims to determine the most advantageous product in multi-product manufacturing processes. In addition, the proposed model is a combination between lean Six Sigma and TOC to define the critical step and identify the optimal product mix in order to measure and analyze the operational performances for the optimal product mix. Indeed, we apply the VSM tool (from Weighted DPMO and sigma level ) of lean Six sigma approach and financial and quality indicators (CMPS, CPM) of TOC.*

*The proposed model is implemented in an Algerian automotive industry*

**Keywords:** *Lean Manufacturing, Six Sigma, Theory of constraints, extended Value Stream Mapping, Defects per million opportunities*

## THE INFLUENCE OF COVID-19 PANDEMIC ON FOOD SAFETY AND QUALITY ASSURANCE STANDARDS IN SELECTED COMPANIES IN POLAND

**Abstract:** Food safety is the basic characteristic of food and the most important one because food has the direct impact on our health. Companies operating along the food chain are obliged by food law to implement the mandatory food standards such as HACCP, GHP, GMP. If they want, they can also use many voluntary food standards. The COVID-19 pandemic influenced the whole food chain and consumer behavior by the restrictions, shutdowns and fear of being infected. This paper presents the results of the survey conducted among 71 enterprises operating in the food industry in Poland in 2022. The representatives were asked to assess the influence of the pandemic on food safety standards and their usefulness during the pandemic. They were also asked about the positive and negative aspects of the pandemic from the perspective of the food industry. It was shown that the pandemic strengthened the need and understanding of the hygienic standards, collaborations with suppliers and employee training. On the other hand, caused the more frequent food quality and safety inspections, shortages of the employees and supplies, and economic losses. For some companies the pandemic was a chance for new form of sales and obtaining additional funding to minimize the negative effects.

## **PSYCHOLOGICAL FLEXIBILITY AND HIGHER LEVELS OF QUALITY OF LIFE**

**Abstract:** *Psychological flexibility allows individuals to cope more effectively with stress, regulate their emotions, and maintain positive relationships with others. This can lead to a greater sense of meaning and purpose in life, as well as an increased ability to handle difficult situations. Furthermore, individuals who are more psychologically flexible are often able to set and achieve meaningful goals, which can contribute to a greater sense of accomplishment.*

*We suggest here that there is a strong connection between psychological flexibility and quality of life. That is, that individuals who are more psychologically flexible tend to have better mental health, higher levels of resilience, and greater satisfaction with life.*

**Keywords:** Psychological flexibility, positive relationships, cope with stress, sense of accomplishment

## **CULTURALLY UNIQUE SUSTAINABLE PRODUCT DESIGN IN EGYPT**

**Abstract:** *This paper presents a research study on sustainable product design in Egypt, which considers the cultural context of the country. This study aims to identify and understand ecodesign strategies that are culturally unique to Egypt, using the Okala Ecodesign Strategy Wheel as a framework. The study examines sustainable design practices in Egypt, highlighting the unique opportunities for ecodesign that arise from the country's cultural heritage. The methodology of the study involves a case study analysis of Egyptian companies that have implemented sustainable product design practices. The study will employ document analysis and field observations to gain insights into the ecodesign strategies used by these companies and how they align with cultural values in Egypt. The expected outcomes of the study are to provide a comprehensive understanding of sustainable product design practices in Egypt, identify ecodesign strategies that align with cultural values, and highlight the importance of considering cultural context in sustainable design practices. The study aims to contribute to the development of a more culturally appropriate and sustainable design approach in Egypt, one that celebrates local culture, promotes environmental and social sustainability, and creates economic opportunities. In conclusion, this research study highlights the potential for sustainable product design to contribute to environmental and social sustainability while also celebrating local culture in Egypt. By identifying and understanding ecodesign strategies that are culturally unique to Egypt, this study aims to promote the development of more sustainable and culturally appropriate design practices in the country.*

## THE USING CONVOLUTION NEURAL NETWORK FOR AUTOMATIC QUALITY CONTROL ON ASSEMBLY SYSTEM

**Abstract:** *The integration of quality management with the technologies of the fourth industrial revolution (Industry 4.0) enables organizations to adequately respond to the conditions in the modern dynamic business environment characterized by digitization, shorter product life cycles and increasing customer expectations regarding product quality, price and delivery time. At traditional assembly workstations, which are characterized by long-term, monotonous, repetitive and tiring activities of assembling parts and components into the final product, product inspection is performed manually by operators and that takes a lot of time and represents a production bottleneck. Also, due to the appearance of mental fatigue, a drop in concentration in some situations, it is almost impossible for workers to notice the appearance of defects and irregularities. Therefore, in modern assembly systems, the implementation of advanced quality control through quality inspection, visually detect the quality of a product and recognition of irregularities has a crucial role. In this way, the compliance of the final products with the requirements and expectations of customers is achieved and one of the basic goals of Industry 4.0 and Quality 4.0 is achieved, which is zero defects manufacturing.*

*The main aim of this study is to research the possibility of involving neural networks for defects detection of assembly parts in the production process. The research includes using images of two classes (with defect and well done part) and training the neural network with convolution layer for automatic classification produced part. The success of 96 % of applied algorithms using this methodology in automatic detection of defects and non-conformity and on this way reducing cost. One key benefit of the proposed method is the relatively small number of input data set images which*

*enables fast implement method in production environment.*

## **VALUE STREAM DESIGN (VSD) AS A TOOL SUPPORTING QUALITY MANAGEMENT AT THE STAGE OF PROTOTYPE PRODUCTION LINES**

**Abstract:** *This paper presents the way of designing and quality engineering in production processes. Based on the Value Stream Design, the specificity of quality control of products manufactured in special processes (chemical and thermal) was designed. Based on the big map picture of the prototype process, the areas of the greatest threats to the process, from the point of view of product quality management, have been identified. The paper discusses the specifics of designing and improving production processes with the usage of Value Stream Design method - based on the production of precise products from magnetic materials.*

## **AI BASED SMART SHOPPING LIST TO IMPROVE QULAITY OF LIFE**

**Abstract:** Shopping for daily supplies and keeping track of your shopping list may be a time-consuming and tedious process. mySmartCart is a responsive web application designed to transform the traditional handwritten shopping list or NLP input into a digitalized smart list, to enhance and assist the online shopping experience of a user. The application implements line finding algorithm based on Google Tesseract Engine and DeepNet based Speech Recognition algorithm for processing natural language of the user. An autocorrect module based on Jaccard distance is introduced to enhance the accuracy of handwritten text recognition in an image. Upon generating a digital list, web scraping technique is adopted to find relevant product details from various e-commerce websites for every item. The results are then aggregated, filtered based on price, rating and the top deals are provided to the user providing a qualitative smart digital shopping experience.

## **VEHICLE-TO-EVERYTHING**

**Abstract:** *Vehicle-to-everything (V2X) is communication between a vehicle and any entity that may affect, or may be affected by, the vehicle. It is a vehicular communication system that incorporates other more specific types of communication as V2I (vehicle-to-infrastructure), V2N (vehicle-to-network), V2V (vehicle-to-vehicle), V2P (vehicle-to-pedestrian), V2D (vehicle-to-device).*

*The main motivations for V2X are road safety, traffic efficiency, energy savings, and mass surveillance. The U.S. NHTSA estimates a minimum of 13% reduction in traffic accidents if a V2V system were implemented, resulting in 439,000 fewer crashes per year.[1] There are two types of V2X communication technology depending on the underlying technology being used: (1) WLAN-based, and (2) cellular-based.*

## METHODS FOR IMPROVEMENT OF 3D PRINTED PARTS QUALITY

**Abstract:** Additive manufacturing is production technology for manufacturing geometrical complex parts. It is applicable in different fields such as mechanical engineering, civil engineering, medicine, food industry and so on. Manufactured parts from additive manufacturing can be very diverse depending on used technology and applied material. On qualitative features of 3D printed part can be influenced through various segments of additive manufacturing production from 3D modeling (optimizing model for 3D printing), 3D models slicing and production parameters adjustments (from the applied slicing software), 3D printer settings and used printing technology (applied material and used printing technology such as FDM or SLA, etc.) to 3D part post process treatment. Also, features of 3D printed parts that are needed for quality improvement and quality verification are dependent on the part general or specific purpose. This paper describes various methods for improvement of 3D printed parts quality regarding different features such as mechanical properties, surface finish, etc.

## **MEDICAL ASSISTANCE SYSTEM USING BRAIN COMPUTER INTERFACE FOR DIFFERENTIATING CONSCIOUS, SEMI- CONSCIOUS AND MINIMALLY CONSCIOUS STATES**

**Abstract:** *Bionics has undergone an entirely new evolution because of BCI. In the course of additional research, it has also been feasible to assist non-communicative and impaired patients by enhancing their residual cognitive performance. To develop a system that will benefit those who are incapable of triggering their bodily muscles and who require continuous supervision in an intensive care unit, particularly patients in a minimally conscious state and those with locked-in syndrome, a brain computing analysis using EEG spectrum with a three-electrode channel BCI headset was performed on six people ranging in age from 18 to 80 years old, three of whom were healthy controls and three of whom were intensive care patients. Using two forms of stimulation on each individual, raw EEG data was obtained. There were 48 epochs in total. Applied machine learning algorithm such as k-nearest neighbour with a multilayer feed-forward network, which gave preference to the classifier that divided the group of individuals into three distinct factions, including conscious (C), semi-conscious (SC), and minimally conscious (MCS) conditions. The trained data set and test data set after validation revealed a contraction of 10% for the semi-conscious, whereas the aware and minimally conscious data set revealed an increase of 40%, resulting in model overfitting. After refitting and cross-validation, the error rate reached a final value of 30% and gave the accuracy rate of 70%. This study led to the development of a transportable robot-based alert system for critical care unit patients who have been unconscious for 24 hours and require immediate diagnosis. It reduces the effort, saves time, and expedites each patient's prognosis*

## EVALUATING THE SUSTAINABILITY OF SUGAR VALUE CHAIN: EVIDENCE FROM VIETNAM

**Abstract:** *This paper investigates the sugar value chain in Vietnam and evaluates its sustainability using integrative indicators based on the Triple Bottom Line (TBL) approach. A set of 50 indicators were used in our survey of key stakeholders in the sugar value chain of Vietnam. After 2 months, we received 218 valid responses. Our findings show that there are still many challenges for the Vietnam sugar value chain to grow sustainably. Thus, we proposed some suggestions to enhance the sustainability of the Vietnamese sugar value chain.*

## **SURFACE MORPHOLOGY AND ITS STUDIES OF AL-17SI ALLOYS DURING FRICTION STIR WELDING PROCESSES**

***Abstract:** In this paper, the effects of process parameters on surface morphology during the friction stir welding processes were studied. The joining process was carried out with three different rotational speeds and feed rates. The increase in the rotational speed and feed rate increases and decreases respectively the heat input, which affects the surface morphology. The metal transports during the process were discussed in all the cases. The decrease in adhesion due to the large rotational speed and low feed rate also results in poor metal transport and weld quality. The adhesion can be improved with the increase in the feed rate, where the decrease in the diffusion rate makes the alloy more viscous and adhere to the tool circumference during its rotation. The microstructure formation at the nugget and TMAZ zone, and tensile strength properties during the processes were discussed finally.*

**Abstract:** *In this paper, a semantic analysis of the published research results, through the literature review, about maintenance strategies in the Industry 4.0 for a sustainable development of companies is presented. By the analysis, major trends in current maintenance policies were verified. The results allow to identify the key enablers that support the application of maintenance strategies in the Industry 4.0 in the companies' strategies and sustainable development. The analysis is based on application of the Latent Dirichlet Allocation (LDA) methodology for extraction of "hidden" topics from the given data base, in the case of this paper the data base represents the texts published on the maintenance strategies in the Industry 4.0. The database analyzed in this paper consists of the articles published from 2016 to 2023, extracted from the SCOPUS data base.*
